Documentation Notes

First Edition, November 2012

Information in this document details general features and functionality of the **SELCOPY Product Suite 3.10** component, **SELCOPYi**.

This document replaces any previous edition of *SELCOPYi Training Material* which are now obsolete.

Copyright in the whole and every part of this document and of the SELCOPY Products Suite system and programs, is owned by Compute (Bridgend) Ltd (hereinafter referred to as CBL), whose registered office is located at 8 Merthyr Mawr Road, Bridgend, Wales, UK, CF31 3NH, and who reserve the right to alter, at their convenience, the whole or any part of this document and/or the SELCOPY Product Suite system and programs.

SELCOPY Product Suite for z/OS, z/VM (CMS) and z/VSE operating systems, which includes SELCOPY, SELCOPY/i and CBLVCAT, is available for download and install from <http://www.cbl.com/selcdl.html>.

The following publications for SELCOPY Product Suite and its component products are available in Adobe Acrobat PDF format at CBL web page <http://www.cbl.com/selcdoc.html>:

- SELCOPY Product Suite Customisation Guide
- SELCOPY User Manual
- CBLVCAT User Manual
- SELCOPYi Reference and User Guide
- SELCOPYi Text Editor (CBL*e*) Manual
- SELCOPYi Structured Data Editor Manual
- SELCOPYi Training Material Manual

No reproduction of the whole or any part of the SELCOPY Product Suite system and programs, or of this document, is to be made without prior written authority from Compute (Bridgend) Ltd.

At the time of publication, this document is believed to be correct. Where the program product differs from that stated herein, Compute (Bridgend) Ltd reserve the right to revise either the program or its documentation at their discretion. CBL do not warrant that upward compatibility will be maintained for any use made of this program product to perform any operation in a manner not documented within the user manual.

The following generic terms are used throughout this document to indicate all available versions and releases of IBM mainframe operating systems:

MVS - z/OS, OS/390, MVS/ESA, MVS/XA, MVS/SP, OS.

VSE - z/VSE, VSE/ESA, VSE/SP, DOS.

CMS - z/VM, VM/ESA, VM/XA, VM/SP.

All - All MVS, VSE and CMS operating systems.

Summary of Changes

The SELCOPYi Training material and documentation were introduced for Release 3.10 in PTF RS00021.

First Edition (2012/12/14)

Option 2 - Data Edit

- ◇ *The SDE Edit/Browse Entry Panel*
 - ◇ *Display Modes*
 - ◇ *LAYOUT Command*
 - ◇ *Scrolling the Display to a specific field/record*
 - ◇ *Selecting/Ordering Visible Fields*
 - ◇ *Adjusting Field Display Column-widths*
 - ◇ *Using FIND, EXCLUDE and ONLY commands*
 - ◇ *Using CHANGE commands*
 - ◇ *Filtering records using ALL(WHERE)/MORE/LESS commands*
 - ◇ *Using a FILTER to Select Records on Load*
 - ◇ *Working with Multiple Record-Types*
 - ◇ *Creating a Structured Data Object (SDO)*
 - ◇ *Modifying Data*
 - ◇ *Working with Segmented Records*
-

Second Edition (2013/01/31)

Option 5 - File Copy/Reformat

- ◇ *The File Copy/Reformat (FCOPY) Panel*
 - ◇ *Copying a Standard Sequential Dataset*
 - ◇ *Copying PDS/PDSE Library members*
 - ◇ *Record Selection*
 - ◇ *Specifying Start Record / Number of Records to Copy*
 - ◇ *Browse the Output File (F11)*
 - ◇ *Using a FILTER to Select Records for Copy*
 - ◇ *Browse Output File*
 - ◇ *Specifying brackets in the FILTER expression.*
 - ◇ *Generate FCOPY primary command*
 - ◇ *Modify/Execute Generated FCOPY primary command*
 - ◇ *Reformat*
 - ◇ *Create Output Copybook*
 - ◇ *Updating the Output Copybook*
 - ◇ *Force Recompile of Updated Output Copybook*
 - ◇ *Running File Copy Reformat in Batch*
-

Third Edition (2013/02/27)

Option 6 - File Search/Update

- ◇ *The File Search/update (FSU) Panel*
- ◇ *Searching a PDS/PDSE Library*
- ◇ *Search Report Output (Standard 80-column Screen Width)*
- ◇ *Displaying Additional Hit Information Fields*
- ◇ *Using F6 to edit the Hit File/Record*
- ◇ *Adjusting Report Table View*
- ◇ *Selecting Library Members for Search/Update*
- ◇ *Condensing Selected Members by Timestamp/Size/Userid*
- ◇ *Condensing Selected Members using FIND*
- ◇ *Condensed Member Selection List*
- ◇ *Condensed Member Search Results*

Fourth Edition (2013/10/09)

Updated to reflect SELCOPYi Rel 3.20 revised Function Key defaults.

Fifth Edition (2014/09/23)

Option 1 - Text Edit

- ◇ *Function keys, shortcuts and convenience features*
- ◇ *UNDO/REDO*
- ◇ *Multiple (windowed) views*
- ◇ *Marked Line- and Box-block features*
- ◇ *String Coloring*

Option 12 - DB2

- ◇ *Setting up sample DB2 Tables*
- ◇ *Display of DB2 Table detailed Information (INFO)*
- ◇ *DB2 Table Edit*
- ◇ *Editing selected table rows (using the "WHERE" dialog)*
- ◇ *Editing Related Tables (REDIT)*
- ◇ *Generating CSV or XML from selected table rows/columns*
- ◇ *Handling Relational Constraint Errors*

Sixth Edition (2015/01/19)

SELCOPYi Rel 3.30 (cover change only).

Setup Training Material

Sample data files and COBOL/PL1 copybooks are supplied with the SELCOPYi program.

To create your own personal copies of these datasets, allowing you to follow the training manual in real time, select option **T** from the SELCOPYi Primary Option Menu.

```
SELCOPY/i - Primary Option Menu
File SwapList Window Help QuickRef          wS wR
Command>                                     Scroll> Csr
ZZSGPRIM                                     Lines 1-22 of 22

0 Settings          Set SELCOPY/i options                User: USER123
1 Text Edit        Edit/View small text-type files      Version: 3.20
2 Data Edit        Edit/Browse potentially large data files  Date: 2013/11/06
3 List             List Volumes,VTOCs,Datasets,Members etc  Time: 14:42:01
4 Home            Edit and execute point-and-shoot commands  OpSys: z/OS 1.11.0
5 Copy/Reformat   File Copy with optional copybook reformat  System: ADCD
6 Search/Update   File Search/Update/Copy/Reformat  VM User: ZOS111
7 Compare         File/Library Compare Utilities
8 Utilities       General utilities
9 Structure       Create structure from copybooks etc
10 Filter        Create record selection filter
11 Print         Print Dataset (Batch)
12 DB2          Work with DB2, browse/edit tables etc
T Training       Setup SELCOPY/i Training Material
WL Window List   Display active windows, select with cursor to switch focus
X Exit          Exit SELCOPY/i

Use F4 (WINDOW) to switch between SELCOPYi display windows.

Use "=" command(+optional fastpath e.g. =3.4) to access this menu/sub-options.

F1=HELP      F2=SPLIT      F4=WINDOW      F9=SWAP      F12=CRETRIEV  F14=EXPAND
```

Figure 1. SELCOPYi - Setup SELCOPYi Training Material.

Windowed Display System

Mainframe **z/OS** sessions are typically connected via a **3270 Emulation** package running on the user's PC.

Most users logon to **TSO/ISPF** with one of the following "**standard**" screen sizes:

Model	Rows	Columns
2	24	80
3	32	80
4	43	80
5	27	132

Via their settings, modern 3270 emulators may be configured to run with large "**dynamic**" screen sizes, such as **62 lines by 160 columns**.

SELCOPYi takes advantage of large screen sizes by employing a multi-windowed display system.

If you would like to use a large screen for your z/OS (TSO/ISPF) session, configuration is usually very simple, taking only a few minutes. For assistance with your setup please contact CBL (support@cbl.com).

Note that **ISPF** restricts screen width to **160 columns**, and requires an update via its own Settings (=0).

```
Terminal Characteristics
Screen format 3 1. Data 2. Std 3. Max 4. Part
```

During this section you will learn how to:

- *Open multiple display windows*
- *Switch focus between open windows*
- *Move windows*
- *Resize windows*
- *Save/Restore favourite dataset window locations*

Opening Multiple Display Windows

When started with a 3270 screen width of 132 or higher and a screen depth of 32 or higher, SELCOPYi will operate in "windowed" mode, with its **Primary Options Menu** located centralised at the top of the screen by default.

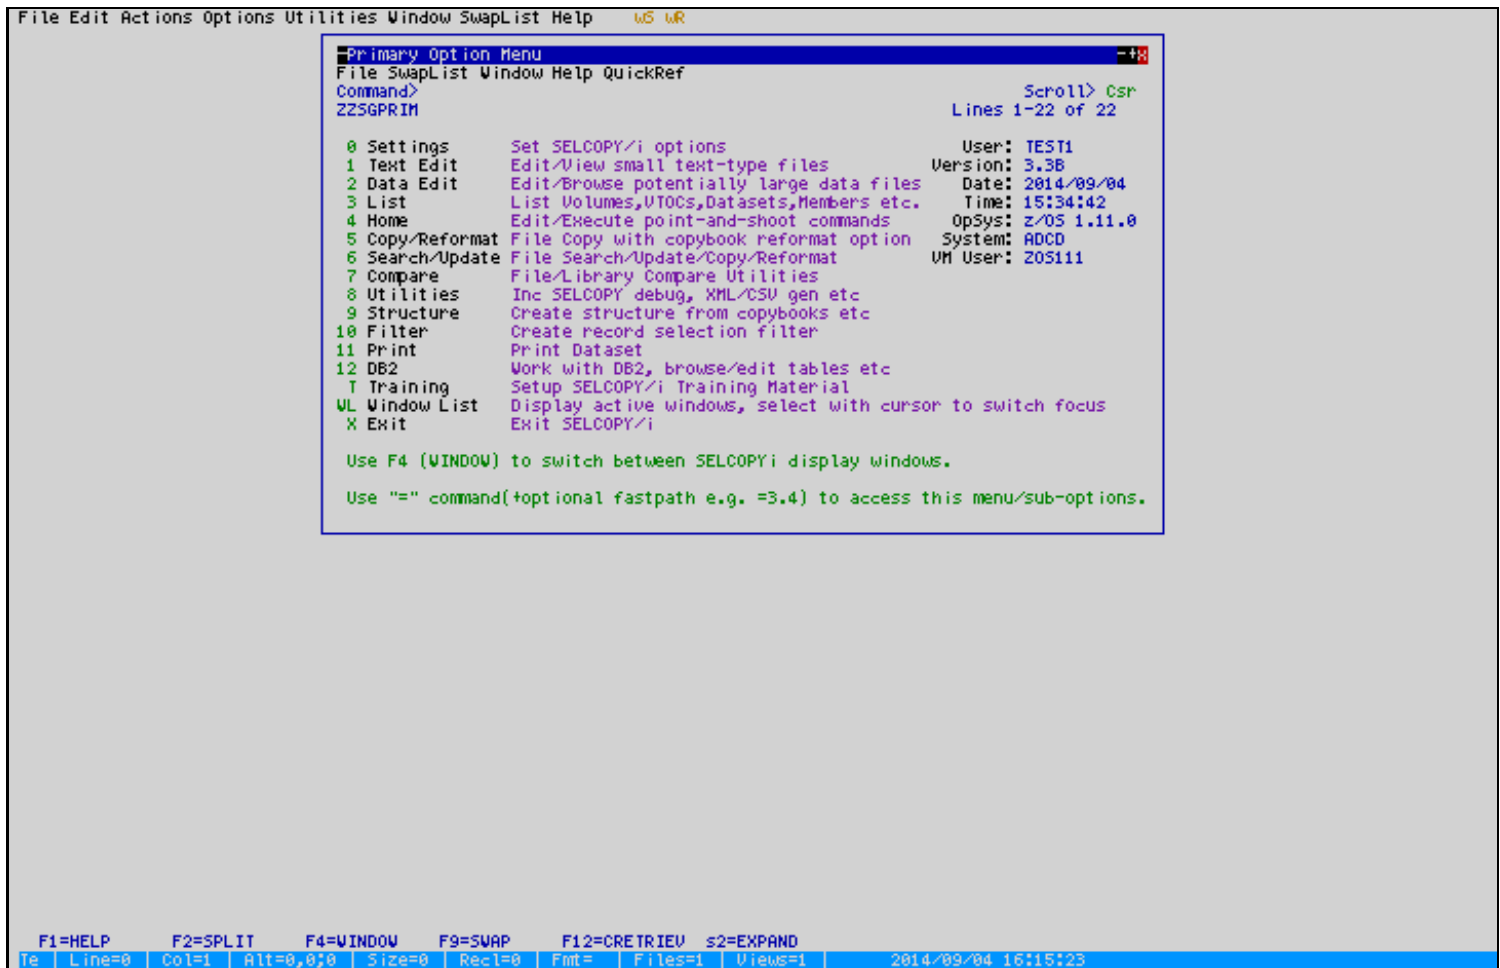

Figure 2. SELCOPYi - POM Window.

Menu/Panel Windows

Select option 1 to open the **Text Edit** panel in a separate window.

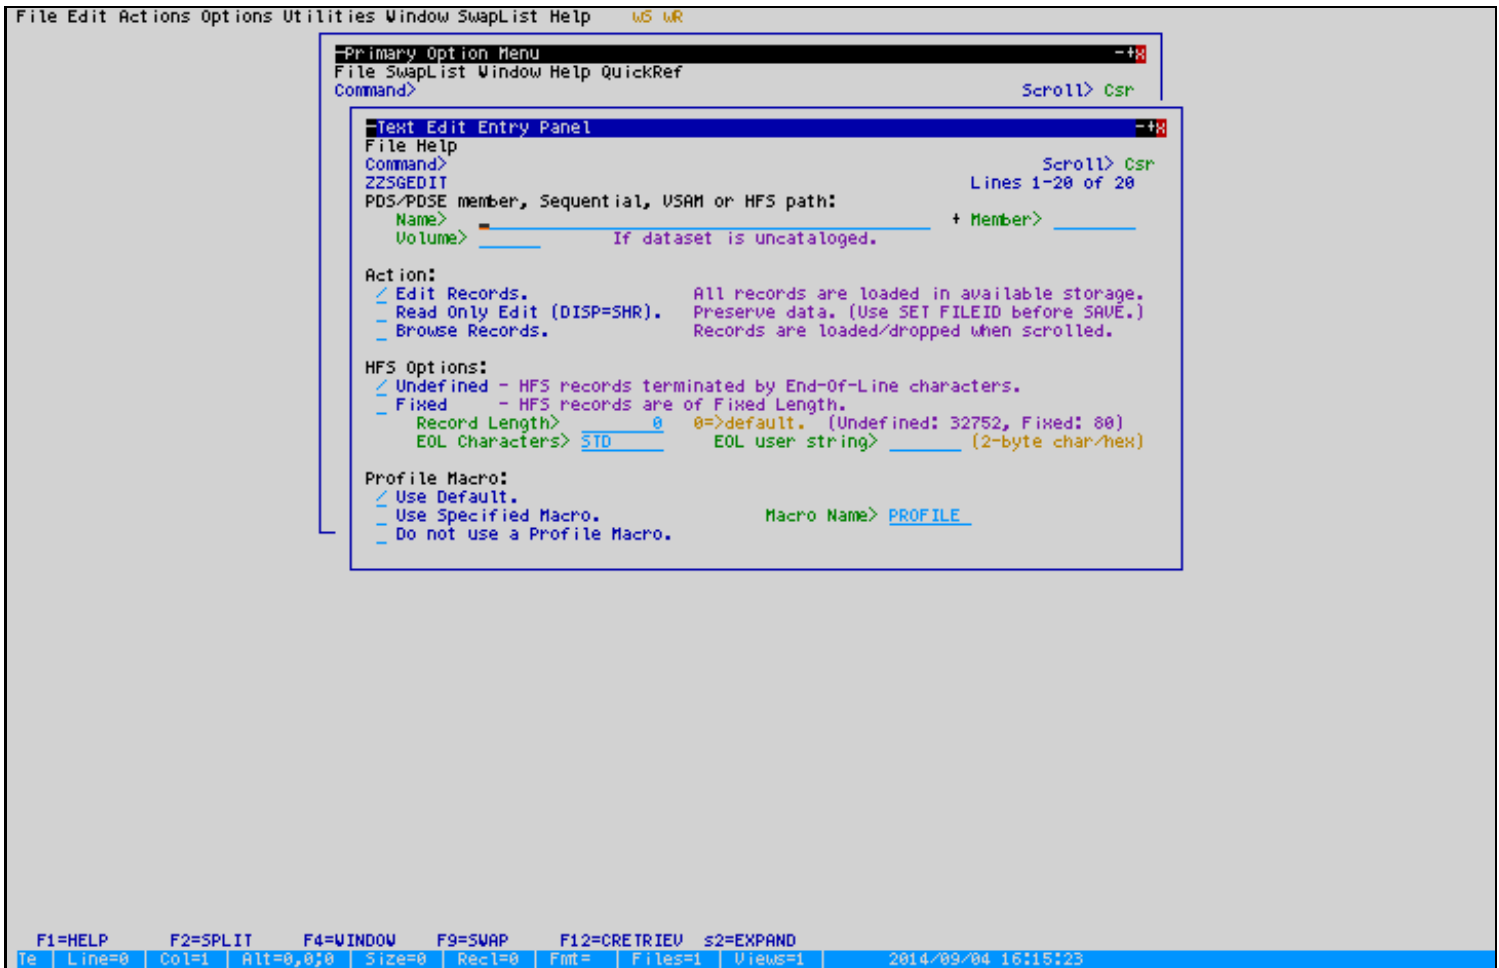

Figure 3. SELCOPYi - Text Edit Panel Window.

Help (HTML) Windows

Press Function Key **F1** to open the context sensitive **Help** in a further separate window.

Help (HTML) documents are automatically positioned to display right-justified on the screen.

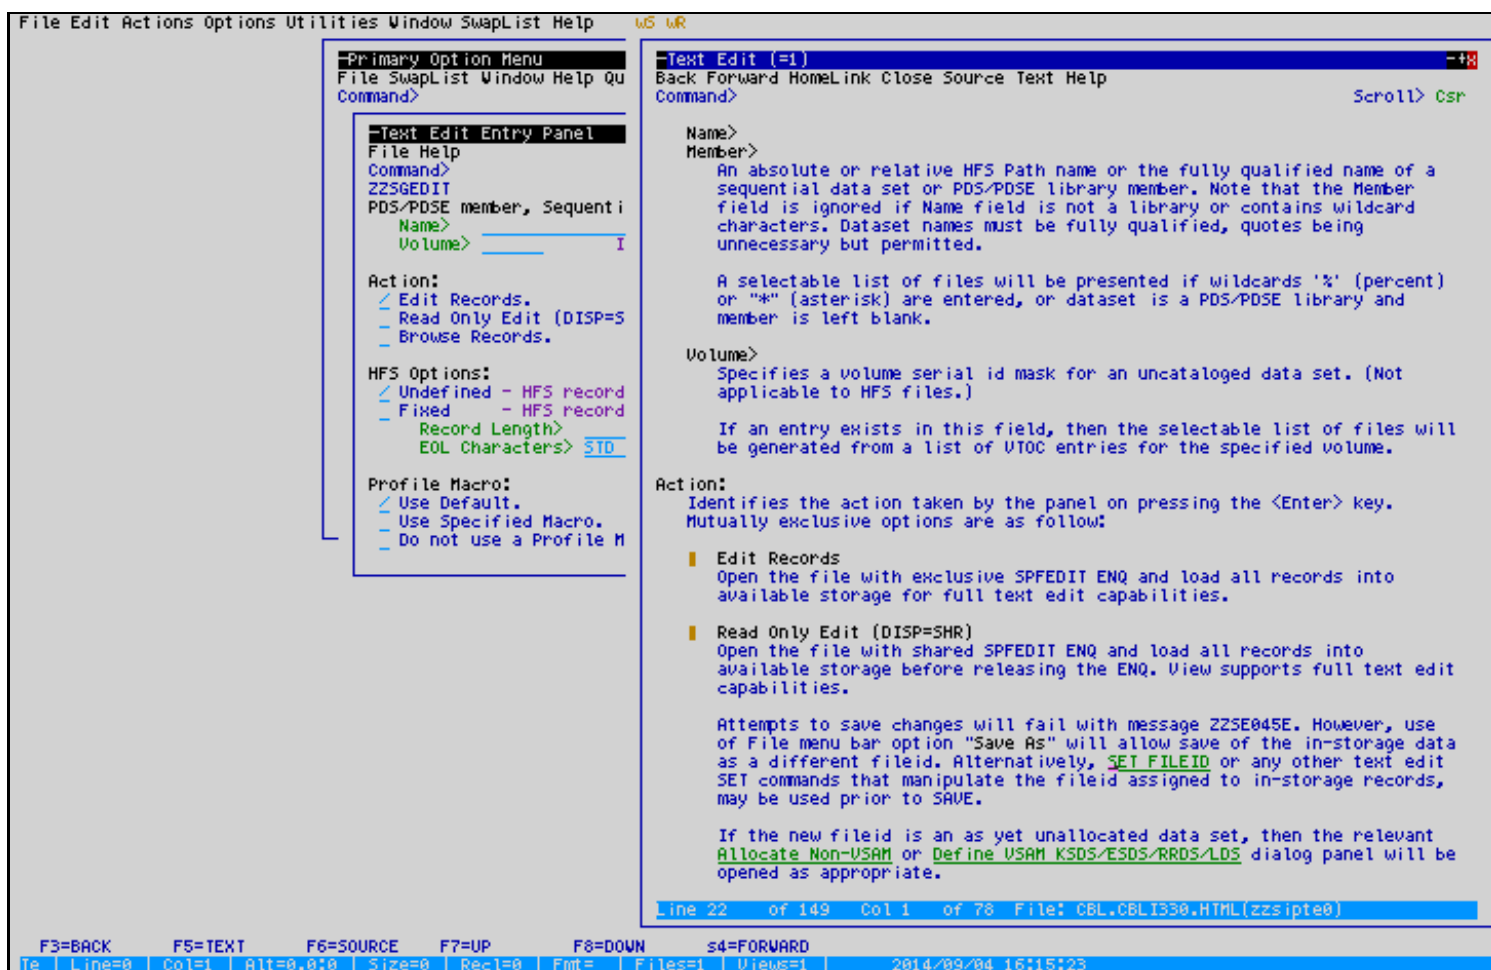

Figure 4. SELCOPYi - Help Window.

Switching focus between open windows

- The **"focus"** window is indicated by a blue (reverse-video) title-bar.
- Other windows have a white (reverse-video) title-bar. (Shown as black in these screen shots!)
- Only the command-line and input fields of the focus-window are enterable.
- Press the **WINDOW** key (default is **F4**) to switch focus to the **next** window. The Primary Options window should now overlay the others as shown below.
- Type "-" (minus-sign) on the command line, then press the **WINDOW** key to switch focus to the **previous** window.

Figure 5. SELCOPY/i - Focus Window.

WindowList (WL) Command

Other ways to switch window focus:

1. Place your cursor on any visible part of a window, then press **ENTER**.
2. Type the **WINDOWLIST (WL)** primary command to display a list of open windows. Place your cursor on the title of a window, then press **ENTER**.

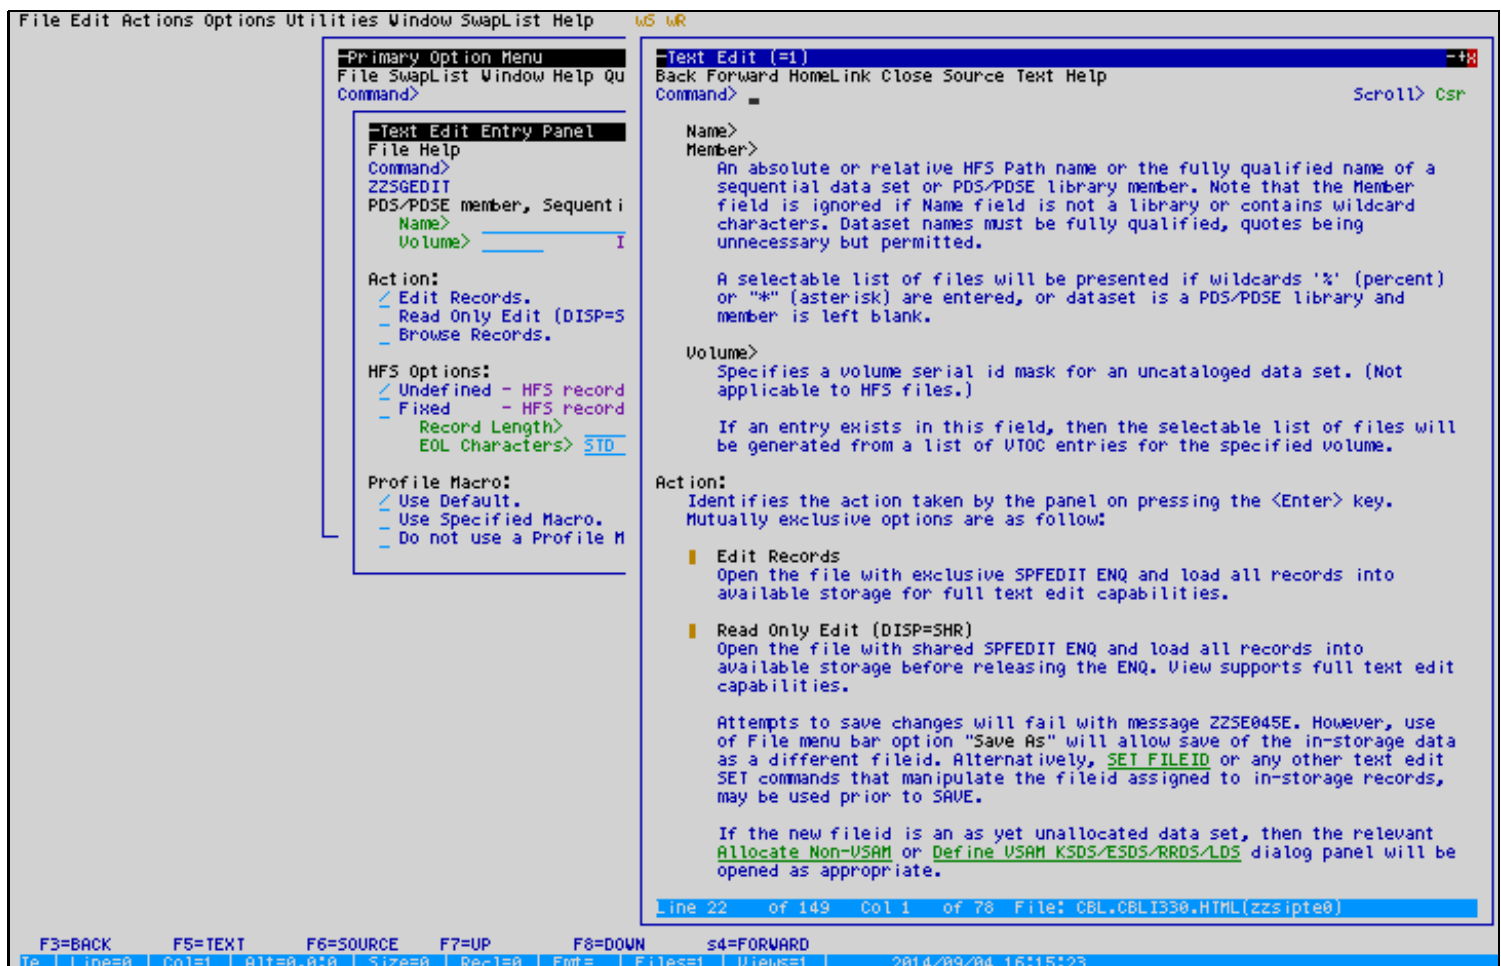

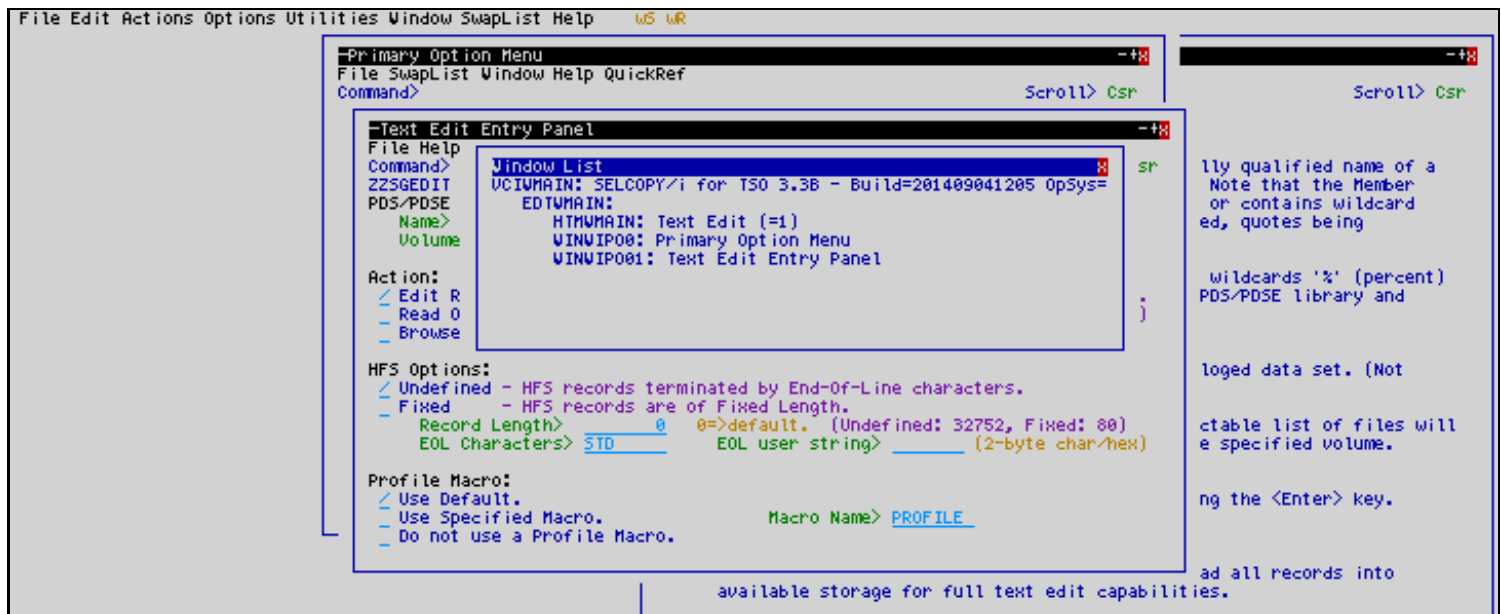

Figure 6. SELCOPYi - Focus Window.

Moving Windows

- Press **F3** to close the HELP window.
- At the "Text Edit Entry Panel", enter the name of a sample file:
 - ◆ Type **userpfx.SELCTRN.SAM1** in the *Dsn* field, to specify the PDS library containing the supplied COBOL copybook.
 - ◆ Type **ZZST1CPC** in the *Member* field.
- Press **ENTER** to edit the sample COBOL copybook.

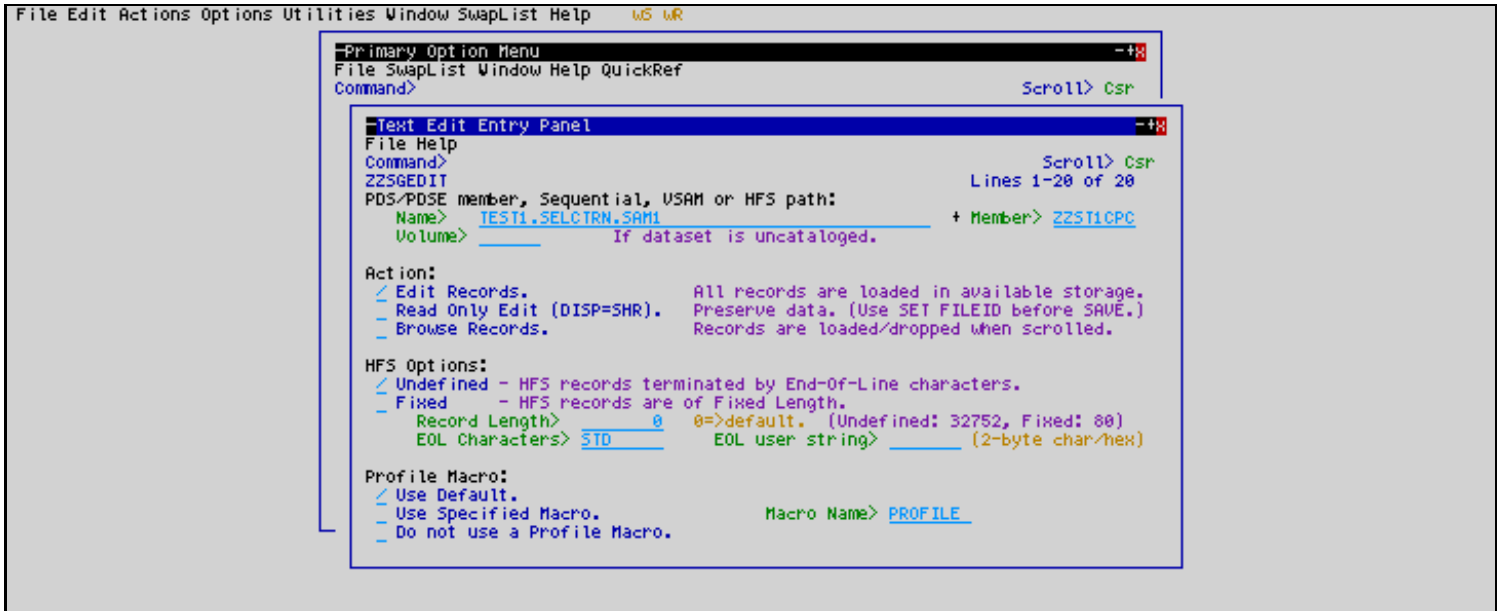

Figure 7. SELCOPYYi - Focus Window.

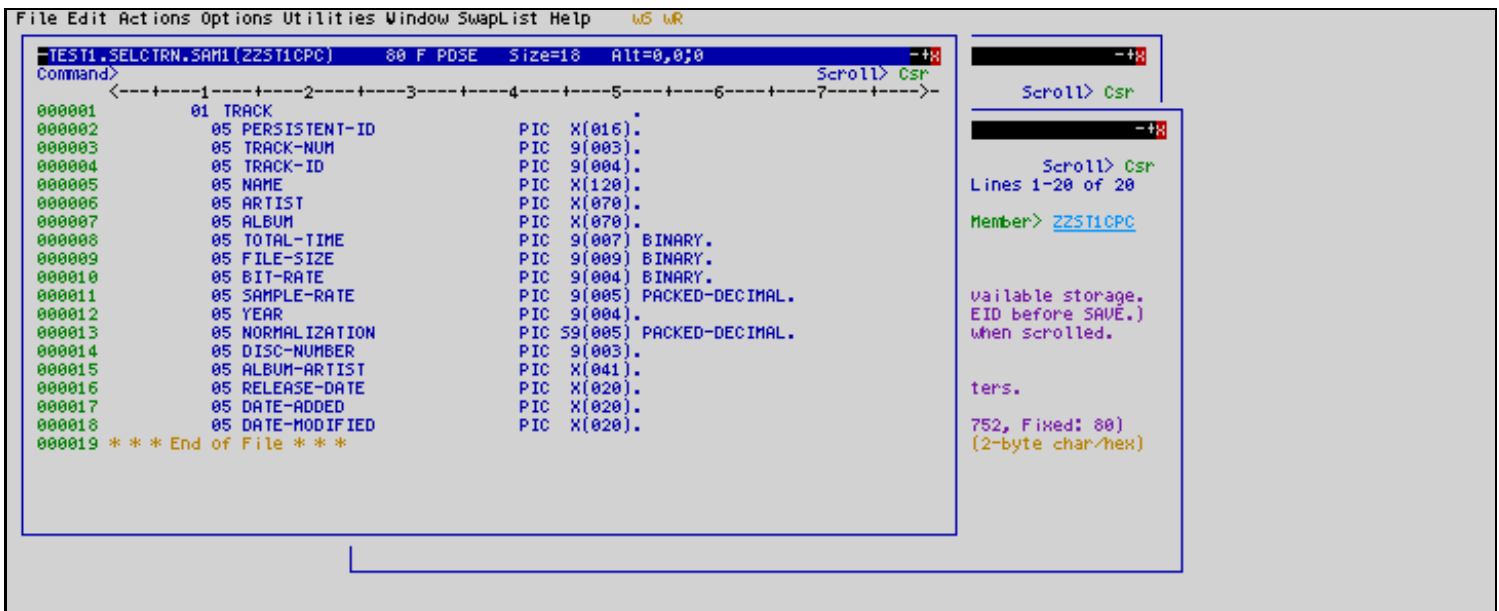

Figure 8. SELCOPYYi - Focus Window.

Moving Windows (2)

- Move the cursor anywhere into the window "Title-Bar" then press **ENTER**.
- The window title-bar and borders will be highlighted in reverse-video.
- This indicates that the window is in move/resize pending state.
- Move the cursor elsewhere on the SELCOPYi "Desktop", then press **ENTER** again.
- The window will be moved to your desired location.

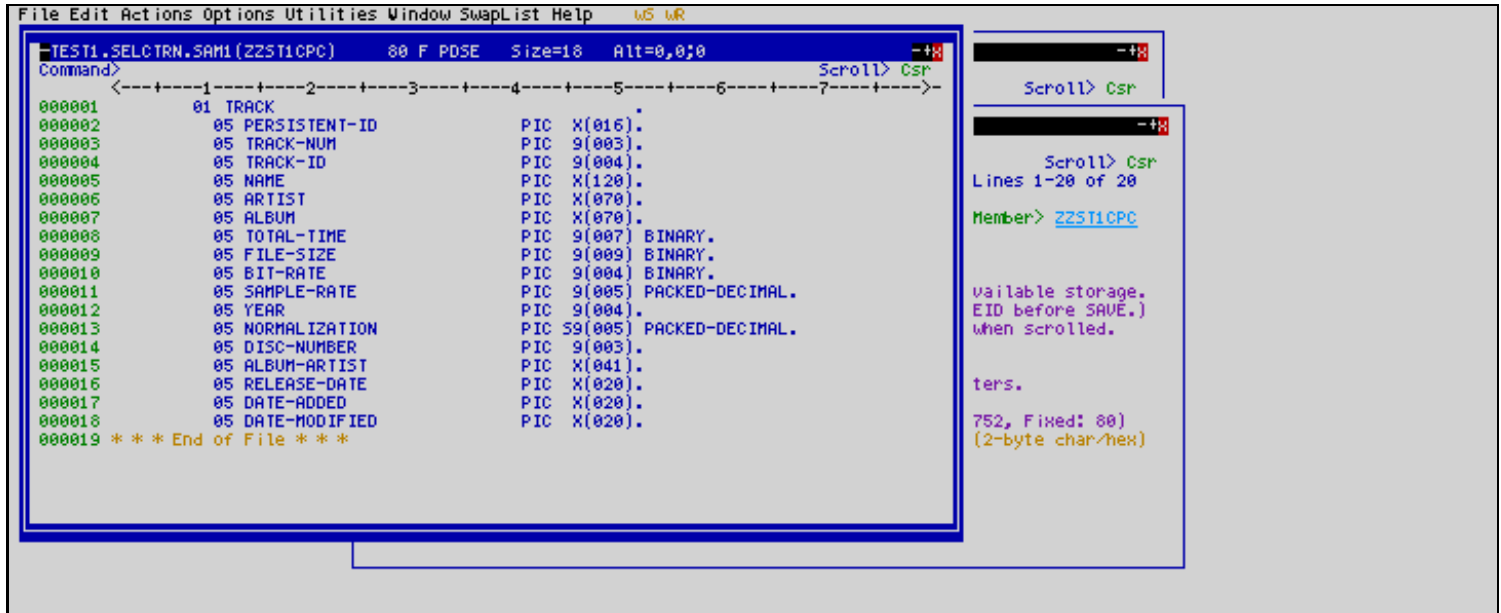

Figure 9. SELCOPYi - Focus Window.

Dragging Windows

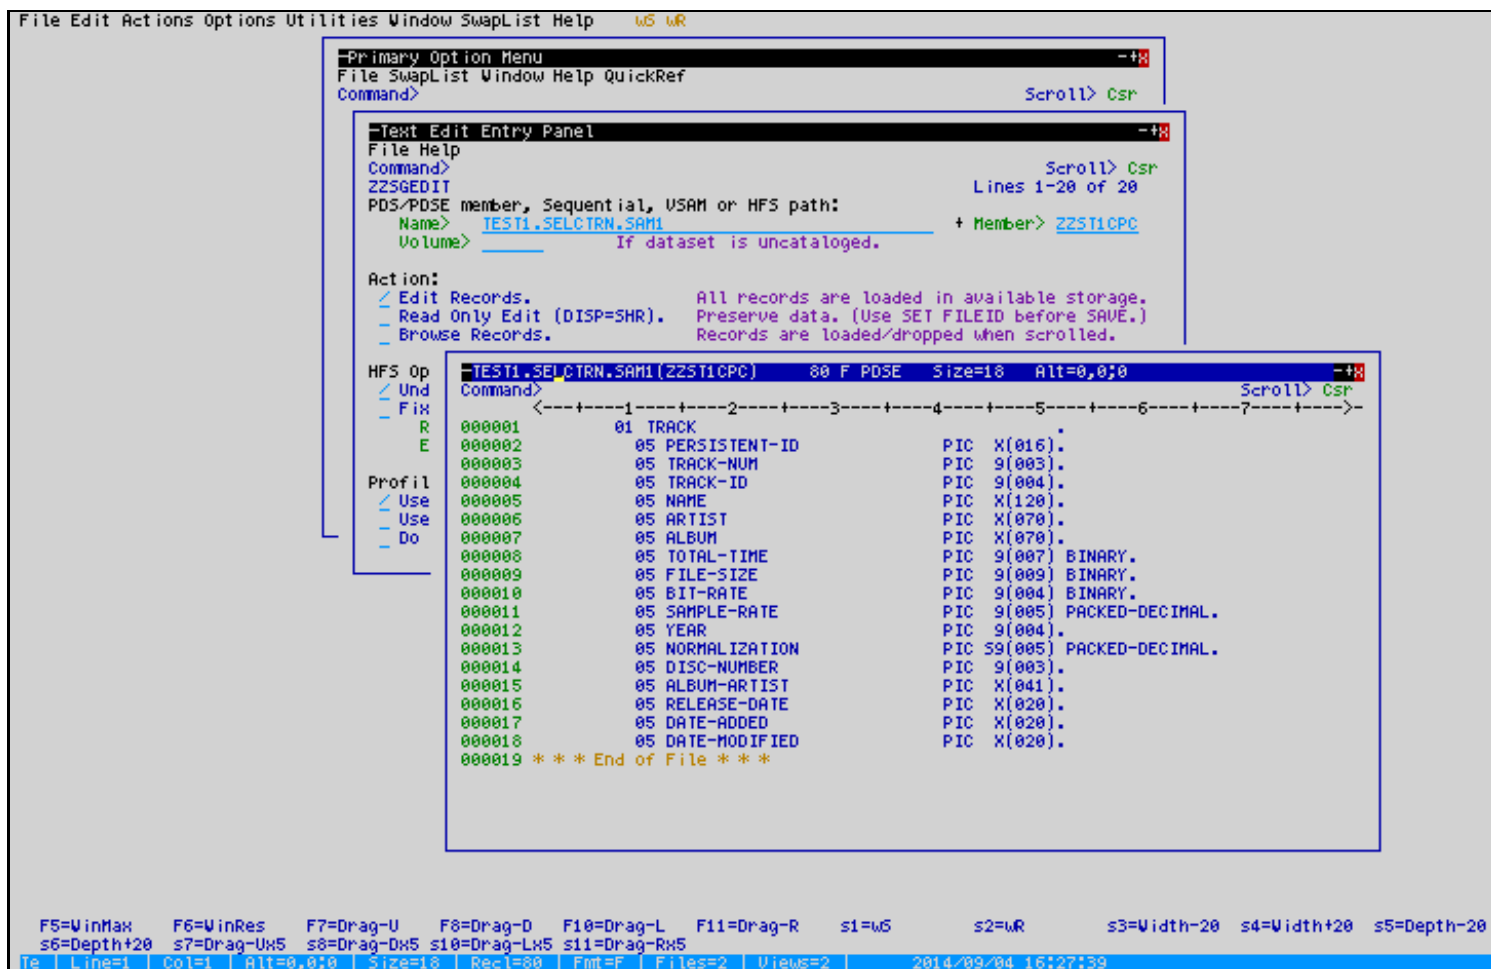

Figure 10. SELCOPY1 - Focus Window.

With the cursor in the window title-bar:

- Press function key **F7** to "**drag**" the window **up 1** position.
- Press function key **F8** to drag the window **down 1** position.
- Press function key **F10** to drag the window **left 1** position.
- Press function key **F11** to drag the window **right 1** position.
- Simultaneously hold down the "Shift" key to drag the window **5** positions.

Resizing Windows

- Move the cursor anywhere into the window top "Border" then press **ENTER**.
- The window title-bar and borders will be highlighted in reverse-video.
- This indicates that the window is in move/resize pending state.

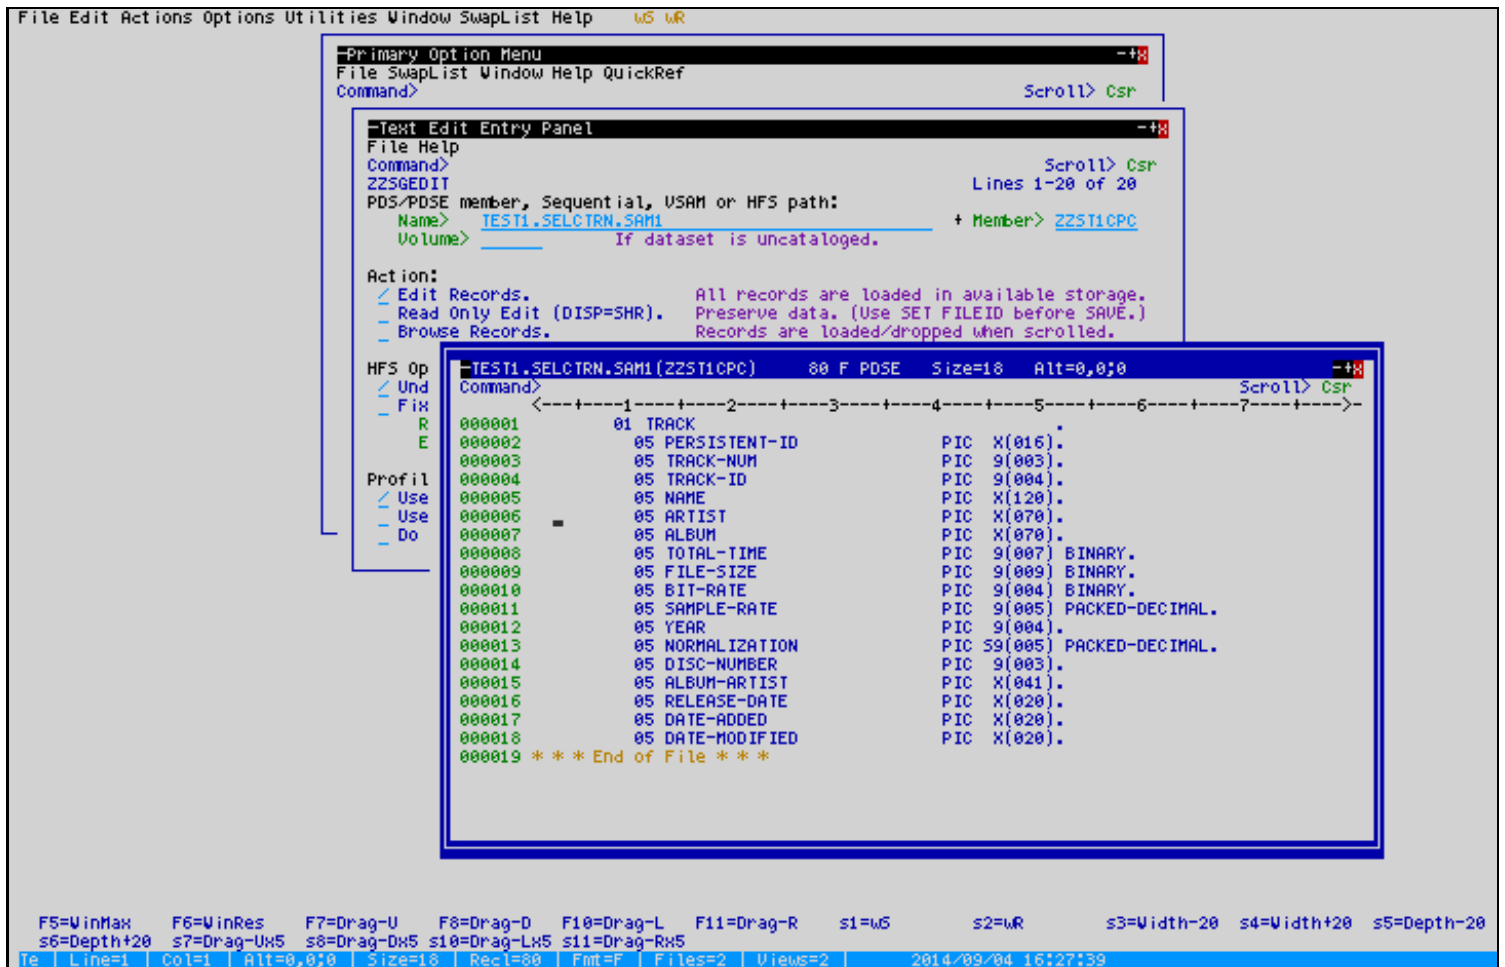

Figure 11. SELCOPY1 - Focus Window.

Resizing Windows (2)

- Move the cursor up or down a number of lines, then press **ENTER** again.
- The window depth will grow or shrink as desired.

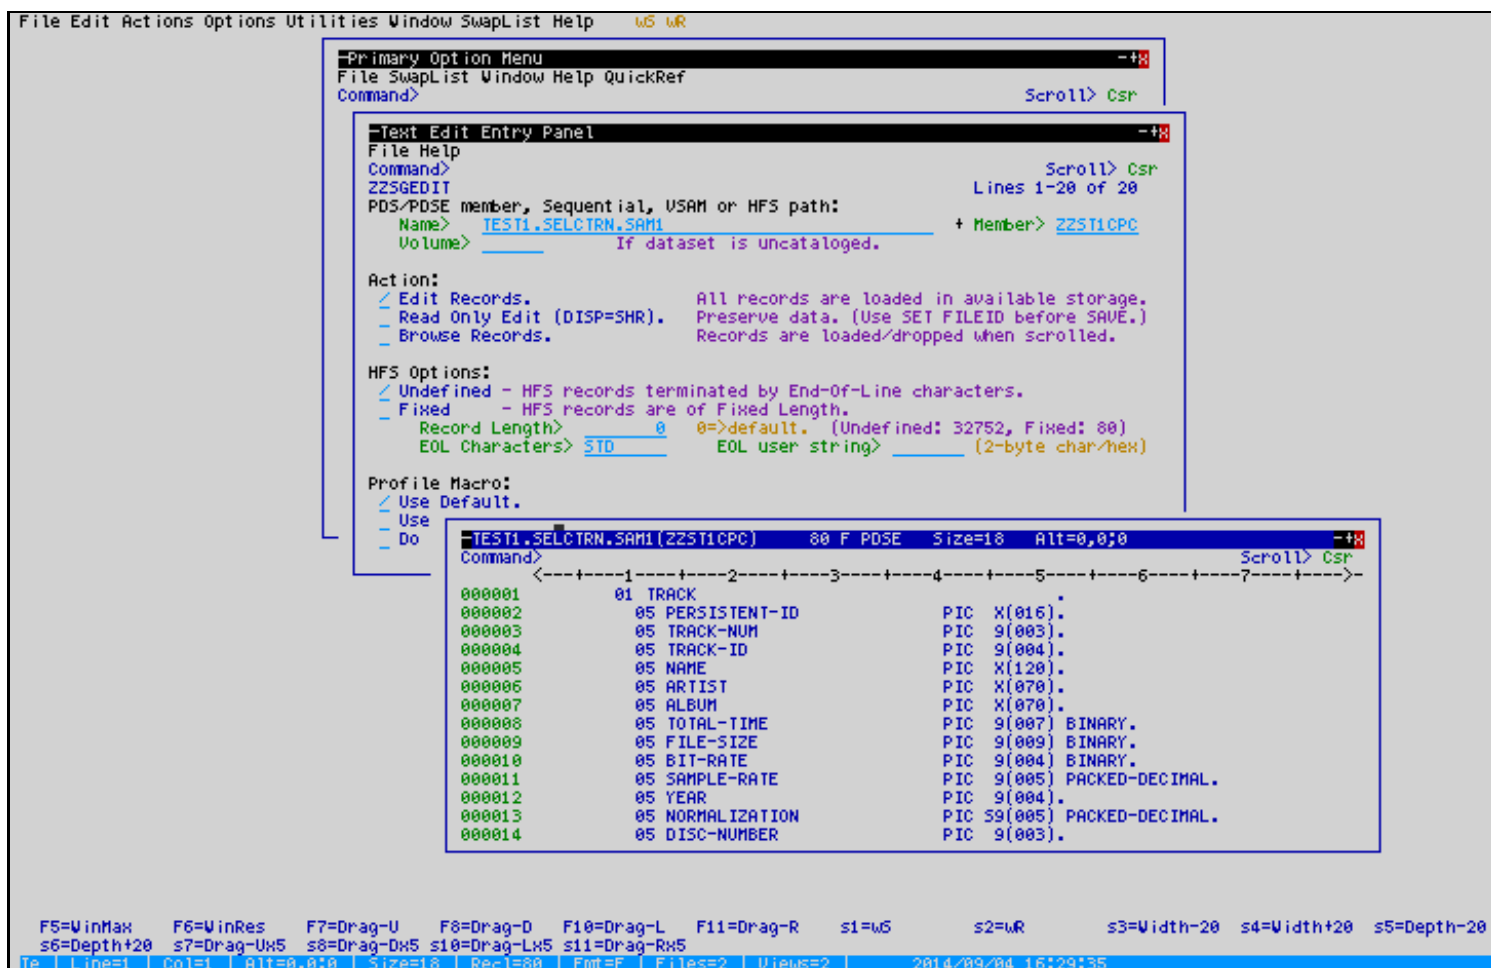

Figure 12. SELCOPY1 - Focus Window.

Dragging Window Borders

This technique may be repeated on the bottom, left, right or border corners.

With the cursor in the window borders:

- Press function key **F7** to "drag" a horizontal border **up 1** position.
- Press function key **F8** to drag a horizontal border **down 1** position.
- Press function key **F10** to drag a vertical border **left 1** position.
- Press function key **F11** to drag a vertical the border **right 1** position.
- Simultaneously hold down the "Shift" key to drag the window **5** positions.

Figure 13. SELCOPYi - Focus Window.

Also with the cursor in either the window borders or title-bar:

- Press function key **Shift-F3** to **decrease the width** by 20.
- Press function key **Shift-F4** to **increase the width** by 20.
- Press function key **Shift-F5** to **decrease the depth** by 20.
- Press function key **Shift-F6** to **increase the depth** by 20.
- Press function key **Shift-F1** to **save** the location.
- Press function key **Shift-F2** to **restore** from a saved location.

Note: Window location save/restore (Shift-F1/F2) is supported for Text-Edit and Data-Edit windows. (Menu and panel windows are automatically restored to their previous location).

Maximise/Minimise

At the right edge of each window's title-bar you will find the minimise (-), maximise (+) and close (x) buttons.

To "press" any of these buttons simply place your cursor on it and hit ENTER.

Figure 14. SELCOPYi - Min/Max/Close Buttons.

Note that as soon you maximise any window, then all windows will display in maximised state.

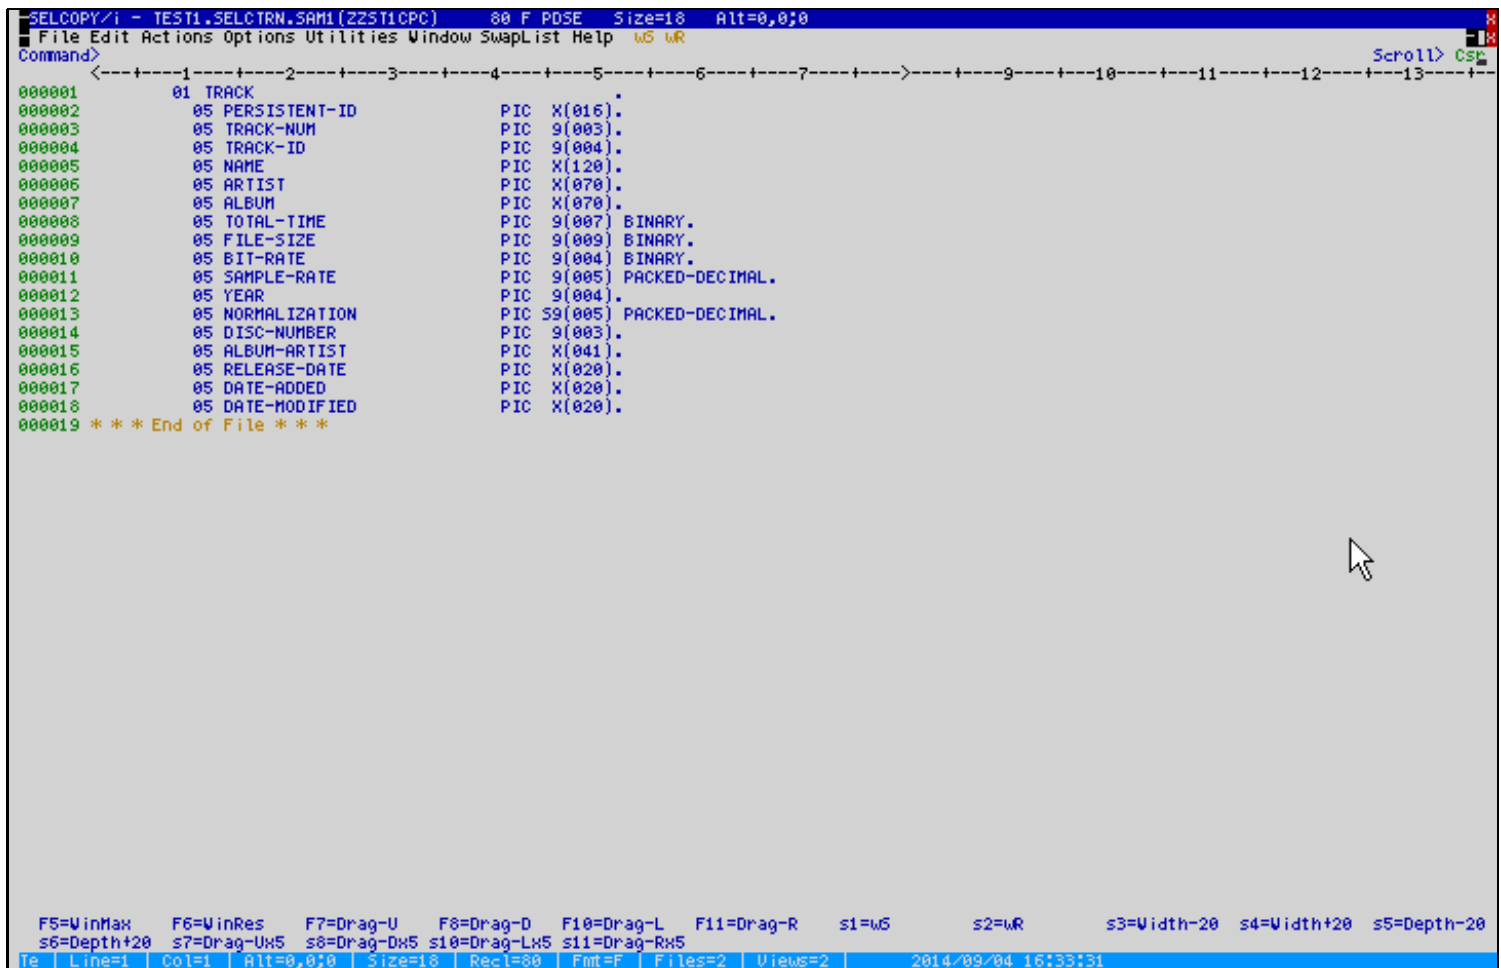

Figure 15. SELCOPYi - Focus Window.

Maximise/Minimise (2)

In maximised state the maximise button is replaced by the restore () button.

Note that there are now two close (x) buttons displayed one above the other. The bottom button will close the individual window, while the top one will close the entire SELCOPYi application.

Figure 16. SELCOPYi - Min/Max/Close Buttons.

Minimised windows are displayed at the bottom left of the "desktop".

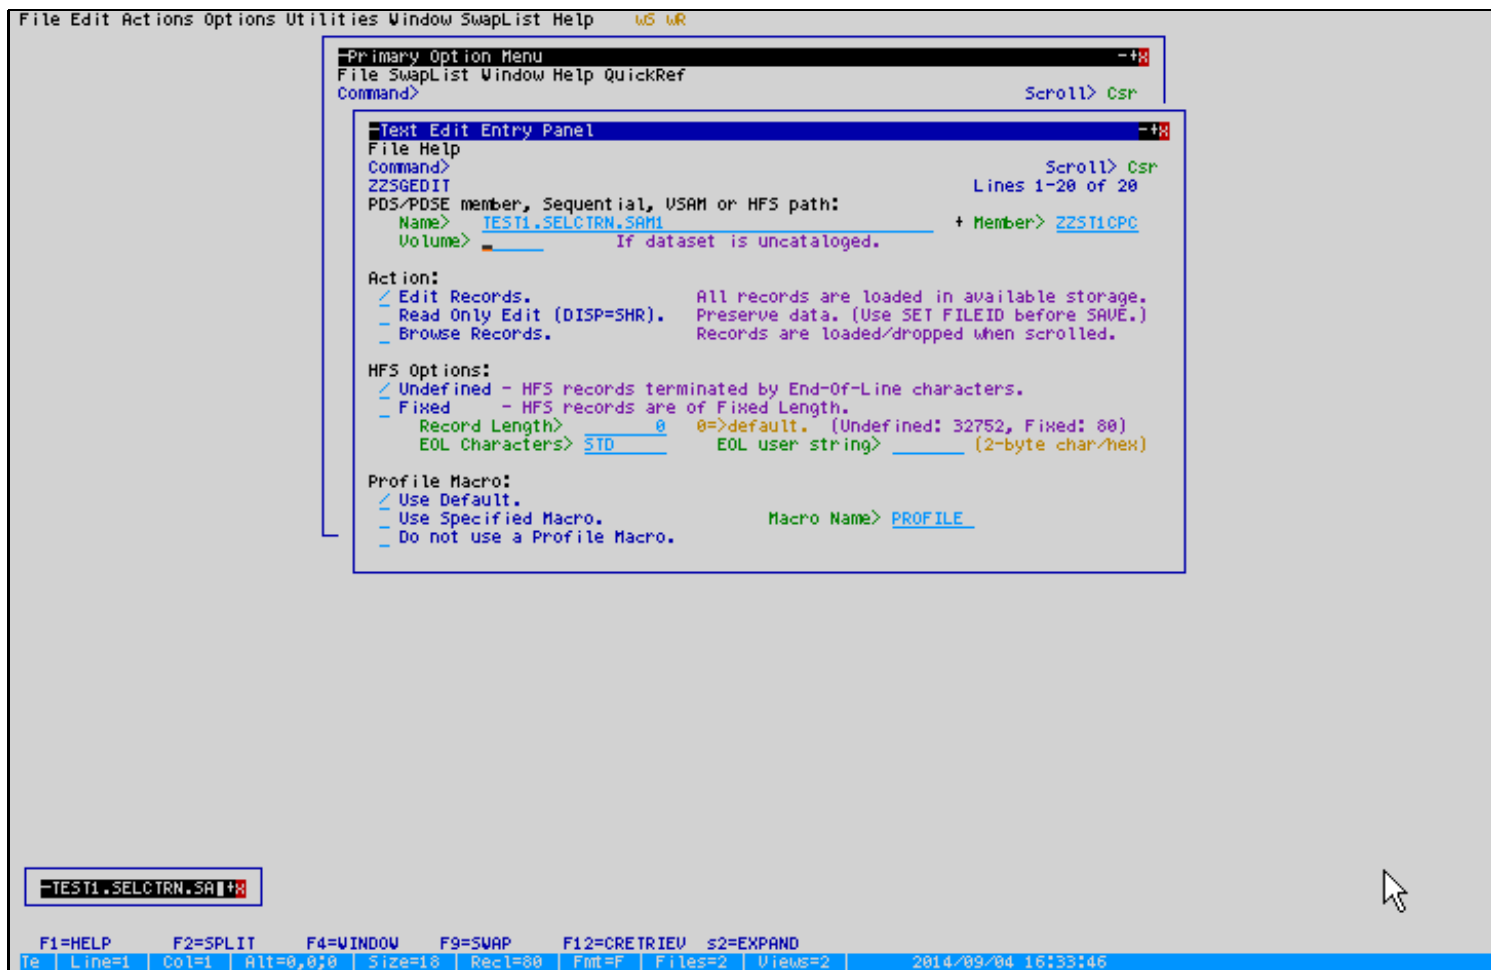

Figure 17. SELCOPYi - Focus Window.

Option 1 - Text Edit

SELCOPYi's own **Text Editor**, while running in ISPF compatibility mode for ease and familiarity, has some significant advantages over the **standard ISPF-Editor**.

The most obvious of these is that it uses the SELCOPYi "**windowed-display**" system providing movable, resizable overlapping views of many files at once. It even allows multiple simultaneous views of the same file.

During this section you will learn about:

- *Function keys, shortcuts and convenience features*
- *UNDO/REDO*
- *Multiple (windowed) views*
- *Marked Line- and Box-block features*
- *String Coloring*

Function keys, shortcuts and convenience features

Running on z/OS systems, the SELCOPYi Text Editor operates in **ISPF-Edit (ISREDIT)** compatibility mode, meaning that its look and feel is very similar and it supports all the commonly used primary and line commands of the original standard editor.

There are however some differences you should be aware of, as well as some additional features that you may enjoy using.

- Select option **1** to open the **Text Edit** panel.
- At the "**Text Edit Entry Panel**", enter the name of a sample file that was created for you during the "Setup Training Material" section.
 - ◆ Type **userpfx.SELCTRN.SAM1** in the *Dsn* field, to specify the PDS library containing the sample COBOL copybook.
 - ◆ Type **ZZST2CPC** in the *Member* field.
- Press **ENTER** to edit the library member.

```

Figure 18. SELCOPYi - POM Window.

Inserting, Deleting, Replicating, Splitting and Joining lines

- By default, a scale line is provided at the top of the screen that remains permanently visible as you scroll down the file.
- Type **SCALE OFF** to remove it, and **SCALE ON** to restore it.
- You will notice a difference from the standard ISPF editor when you type **"I"** in the prefix area of line 1 to insert a new line.
- Whereas the standard ISPF editor will allow you to type data on the inserted line then press **ENTER** to automatically insert another line, the SELCOPYi Text Editor simply inserts a single line.
- Type **"Inn"** (where nn is a number) in the normal was to insert multiple lines at once.
- While you may, of course, use any of the standard line-commands if you prefer, SELCOPYi provides some convenient default Function Key definitions.
 - ◆ Instead of having to move the cursor into the prefix area then enter **I**, just press **F13 (Shift-F1)** to **insert** new lines.
 - ◆ Instead of having to move the cursor into the prefix area then enter **D**, just press **F14 (Shift-F2)** to **delete** the current line.
 - ◆ Instead of having to move the cursor into the prefix area then enter **R**, just press **F15 (Shift-F3)** to **replicate** the current line.
 - ◆ To split a line so that text following the the cursor is inserted as a new line, press the **SPLTJOIN** key **F19 (Shift-F7)**.
 - ◆ Place your cursor at the end of a line then use the same key to join on text from the next line.
- Use the **PFSHOWSTYLE (PFS)** primary command to control the way Function Keys F13-F24 are displayed at the bottom of the screen.

Type **HELP PFS** for more information on how to get **"F13"** to display as **"s1"** (indicating **Shift-F1**) etc as shown in the following screen shots.

This feature is also available via the Settings->Function Keys (=0.8) panel.

Selective Line Editing

- SELCOPYi supports the primary command **ONLY (O)** as a shortcut to EXCLUDE/FIND.
- Type **ONLY 'X' 46** to display only the lines containing letter 'X' in column 46.

In the standard ISPF editor you would need to type two commands.

1. **X ALL** to exclude all lines.
 2. **FIND ALL 'X' 46** to show only the required lines.
- Type the primary command **HIDE** to remove the display of "shadow" lines representing excluded records.
 - Type **RES HIDE** (or SHAD ON) to redisplay shadow lines.
 - Type **ALL** (or RES) to redisplay excluded lines.

Figure 19. SELCOPYi - Text Edit Panel Window.

Displaying HEX Data

- Just like in the standard ISPF-Editor, you may type the primary command **HEX ON/OFF** to display the hexadecimal representation of each text line.
- In addition the SELCOPYi text-editor supports the **HEX** line-command which opens a separate "dump" style storage display for the focus line.

If you are operating in windowed display mode you'll notice this display appears in a separate window.

Multiple dump windows may be opened for several different lines.

- Enter the **HEX** line-command on line 6.
- Now modify the data at offset **X'28'** from **X'D7'** (c'P') to **X'FF'** and press ENTER.

You should see the screen shot below.

```

```

Figure 20. SELCOPYi - Help Window.

Non-Display Characters

- Now press **F3** to close the hex-dump window. You should see the screen shot below.
- Notice that the colour of the modified line has changed to **(TURQUOISE) UNDERSCORE**.

This is to alert the user to the presence of non-display characters within the visible text.

- Display characters are overtypable, and are indicated by the **underscore**.

Non-display characters (e.g. X'FF') are **protected** from input using a 3270 attribute byte which displays as blank **without** an underscore.

- You can type the primary command **NOND** to toggle on/off this feature.

Figure 21. SELCOPYi - Focus Window.

UNDO/REDO

SELCOPYi supports multi-level **UNDO** and **REDO** of changes made during your Text-Edit sessions.

UNDO/REDO is file independent, meaning you can be editing and changing many files within your SELCOPYi session, each of which may have their changes separately undone/redone.

To demonstrate this feature, first use the features described earlier to insert, delete, replicate, split and join lines of text in our sample COBOL copybook, then ...

- Press Function Key **F22 (Shift-F10)** repeatedly to **UNDO** each of the changes 1 at a time.
- Press Function Key **F23 (Shift-F11)** repeatedly to **REDO** each of the undone changes.

The UNDO/REDO feature is unaffected by the **SAVE** command.

Type **HELP UNDOING** for full information on how to configure this feature.

Multiple (Windowed) views

Whether running in windowed display mode (on a large screen) or not, the SELCOPYi Text-Editor supports multiple views of any edited dataset.

To demonstrate this we'll edit a second slightly larger file.

- Type the primary command "=" to display (or return focus to) the SELCOPYi **Primary Options Menu**.

If you are running on a standard screen size it is worth noting that this action does not close any of the "windows" we have already seen. Press the **WINDOW** key (F4) to scroll through each of the open windows.

- From the **Primary Options Menu** select option **4** to edit your "**HOME**" file, which will be discussed in more detail later in this section.

Alternatively you may type the **HOME (HO)** primary command to directly edit this special file.

- Type **M** on the command line and press Function Key **F8** to scroll to the bottom of this file.

```

SELCOPY/i - TEST1.SELCOPYI.CMX      32752 V SEQ      Size=132      Alt=0,0;1

Command>                               Scroll> Csr
<---+---1---+---2---+---3---+---4---+---5---+---6---+---7---
.WIN          ** Windowed Display System          *** .win
000080  While running on a wide (greater than 80-char) screen, SELCOPYi
000081  will automatically operate in a windowed display mode.
000082
000083  All SELCOPYi display-windows may then be moved, resized, maximised,
000084  minimised and restored in a fashion similar to those on your PC.
000085
000086  This is achieved by 'clicking' the window-borders, title-Bar
000087  or '-+x' buttons.
000088      (Clicking means move-cursor, then hit-ENTER.
000089      'Try setting your Mouse to do this!' )
000090  Grab the window-border with the first click, move cursor to a new
000091  location, second click reshapes the window. Try it now!
000092
000093  Also try 'dragging' using the scrolling keys 'F7/F8' and 'F10/F11'.
000094  To drag at '5 x speed', just hold down the 'shift' key.
000095
000096
000097  Having found your perfect window size/shape/position for a
000098  particular file, you may wish to 'Save' its characteristics,
000099  allowing 'Restore' in this and future sessions.
000100
000101  Use the yellow 'wS' and 'wR' buttons in the main menu bar, or
000102  the following primary commands.
000103 <WinX Save      | Save current window size/pos - Same as 'wS' button.
      s1=InsLine   s2=DelLine   s3=DupLine   s4=ACTION   s5=MrkBox   s6=MrkLine
      s7=SPLTJOIN s8=BoxFuncs s10=UNDO    s11=REDO    s12=ResetBox
Te | Line=79 | Col=1 | Alt=0,0;1 | Size=132 | Recl=32752 | Fmt=V | Files=3 | Vi

```

Multiple (Windowed) Views (2)

Now imagine you're editing a large program source file and are focused on a point of interest.

You then need to look at other parts of the file, but don't want to lose your place.

To return to your original location you could use the prefix area to set a line name e.g. **.HERE**, then return to it by typing **LOC .HERE** on the command line.

But SELCOPYi users can just open a 2nd, 3rd, 4th etc view of the file in order to look at other areas, then return to their original location just by pressing **F3** to close the additional view(s).

To demonstrate ...

- Type the primary command "**WIN NEW**" to open a new view of the current file.
- Type **M** on the command line and press Function Key **F7** to scroll to the top of the file.
- Just press **F3** to close the new view returning to your original location.

```

Figure 22. SELCOPYi - Focus Window.

The "WW" Primary Command

Particularly useful when running in windowed display mode the "WW" command will perform like "WIN NEW", but will also "clone" the original window's **width** and **depth**.

In addition, "WW" allows you to add a command to be executed in the new view e.g.

- Type the primary command "WW ONLY '<' 1" to open a new view displaying only lines with a less-than sign in columns 1.

Figure 23. SELCOPYi - Focus Window.

Note that changes to data made in one view will immediately be reflected in all other views of the same data.

Furthermore changes made in one view may be **UNDO**ne/**REDO**ne in any other view of the same file.

Marked Line- and Box-Block features

Lines of data may be deleted, copied or moved within the same file using the familiar line-commands supported by the standard **ISPF Editor**. Also lines of data may be copied or moved between different files using a very similar **CUT/PASTE** feature.

In addition, **SELCOPYi** provides features to manipulate a "**marked block**" of data within an edited file.

There are two types of marked blocks:

1. A **Line-Block** consists of one or more complete lines of text.

The top/bottom edges of a Line-Block are marked using the "**MrkLine**" key (**Shift-F6** by default).

2. A **Box-Block** consists of one or more columns within one or more lines of text.

The diagonal corners of a Box-Block are marked using the "**MrkBox**" key (**Shift-F5** by default).

A marked block is "unmarked" using the "**ResetBox**" key (**Shift-F12** by default).

Marked blocks of data may be:

- **Deleted**.
- **Moved** or **copied** to SELCOPYi's **clipboard**.
- Moved or copied to another location within the same or any other edited file.
- **Overlaid** on top of data at another location within the same or any other edited file.
- **Filled** with a single propagated character or left adjusted string.
- Used to **restrict the scope** of many primary commands, such as **CHANGE**.
- Used to define a column of incrementing **sequence numbers**, or to adjust existing numbers.

To demonstrate some of these features ...

- Edit the sample copybook as before.
- Type **ONLY PIC 41**.

File Command Help
Command>
ZZSTBXSQ
--- BoxSeq ---

Use this panel to insert or modify a numeric column defined by a marked
"Box-block" in a Text-Edit view.

Use the "MrkBox" key (default is Shift-F5) to mark the corners of a
box-block before entering this panel.

The box corners define the start/end line and columns to receive
the sequenced numbers, incremented/decremented for each line.

Base: DEC          DECimal or HEXadecimal.

Start Value: 100   Number inserted on 1st line.
Increment: 20     +/- number adjustment to 2nd and subsequent lines.
Leading Zeros: YES

/ Use above specified start value.
- Use the first line existing value as start value.
_ Adjust every each existing value by the increment number.

F1=HELP  F2=SPLIT  F4=WINDOW  F9=SWAP  F12=CRETRIEV  s2=EXPAND

```

Figure 38. SELCOPYi - Focus Window.

Adjusting Sequence Numbers (1)

We can also use the same panel to adjust the existing numbers in a box block.

As an exercise we'll add 3 to each of the original existing numbers.

- First press the **UNDO** key (**Shift-F10**) to restore the previous values.
- Press the **"BoxFuncs"** key (**Shift-F8**).
- Type **"S"** in the option field and press **ENTER**.
- Enter **"3"** in the **"Increment:"** field.
- Select option **"Adjust every existing value by the increment number"**.

String Coloring

"Syntax" coloring, similar to that supported by the standard **ISPF-Editor**, is available within the SELCOPYi Text-Editor, and is controlled by the **HILITE** primary command. Type **HELP HILITE** for more information on this feature.

In addition, **SELCOPYi** provides the ability to control color highlighting of all occurrences of one or more **user defined strings**.

- Use primary command **SCOLOR** to assign a color to all occurrences of a defined string.
- Use primary command **LCOLOR** to assign a color to the whole of each line that contains a defined string.

To demonstrate, we'll edit another of the sample files that was created during the "**Setup Training Material**" section.

- Select option **1** from the **Primary Options Menu** to open the **Text Edit** panel, then enter the name of the sample file:
 - ♦ Type **userpfx.SELCTRN.ZZST2DAT** in the *Dsn* field.
- Press **ENTER** to edit the sample sequential file.
This file represents a recorded music collection comprising "**Artist**", "**Album**" and "**Track**" records.
- Navigate to the artist "**U2**" by typing the primary command "**FIND 'U2' 1**".
- Type the primary command "**SCOLOR 'World' YELLOW**".
This will highlight all occurrences of the string "**World**" (case-sensitive) in **yellow**.
- Type the primary command "**SCOL '(Live)' RED USC**".
This will highlight all occurrences of the string "**(Live)**" (case-sensitive) in **underscored red**.
- Place your cursor at **column 1** of any visible line, then press the "**MrkBox**" key (**Shift-F5**).
The single character "box-block" will be highlighted.
- Type the primary command "**BOX LCOLOR '1' GREEN REV**".
This will highlight all "**Artist**" lines (character "**1**" at **column 1**) in **green reverse-video**.
- Type the primary command "**BOX LCOL '2' PINK REV**".
This will highlight all "**Album**" lines (character "**2**" at **column 1**) in **pink reverse-video**.

Figure 47. SELCOPYi - SCOLOR/LCOLOR.

Option 2 - Data Edit (SDE)

Data set records may have an associated file structure that maps field information (position, length and data type) for all data within each data set record. These structures often exist as a PL/1 or COBOL copybook.

The **SELCOPYi** Structured Data Environment (**SDE**) allows users to display and process structured data sets using a pre-defined SDE structure so that record data is formatted and arranged in field columns. An SDE structure may be generated from a copybook or using SDE's Create Structure internal syntax, and can contain a number of mappings, one for each different type of data set record.

During this section you will learn how to:

- *Change Display Modes*
- *Use the LAYOUT command to display the active structure*
- *Scroll the display to an individual Field*
- *Select/Order visible Fields*
- *Adjust Field display column-widths*
- *Use the SELECT panel*
- *Use the FIND, EXCLUDE and ONLY commands*
- *Use the CHANGE command*
- *Use UNDO/REDO*
- *Filter records using ALL/MORE/LESS commands*
- *Work with Multiple Record Types with different Layouts*
- *Modify record data/length*
- *Work with Segmented Records*

The SDE Edit/Browse Entry Panel

The SDE panel may be started using any of the following methods:

- Select option **2** from the **SELCOPYi** Primary Option Menu (=).
- At any primary command prompt type **=2**.
- At any primary command prompt type **SDE**.
- From any dataset, library or HFS path list window, use the **SD** line-command.

```

```

Figure 48. SELCOPYi - Data Edit (SDE) Panel (=2).

To follow the demonstration use the panel to edit the sample dataset using the supplied **COBOL** or **PL1** copybook.

- Specify the *Data File*:
 - ◆ Type **userpfx.SELCTRN.ZZST1DAT** in the *Name* field, where *userpfx* is your own user prefix. If wildcards are specified then a dataset list will be displayed from which you can make a selection.
 - ◆ The *Member* field may be left blank, but regardless will be ignored when the *Name* field refers to a non-PDS dataset. If wildcards are specified then a member list will be displayed from which you can make a selection.
- Specify the *Action*:
 - ◆ Activate option *Edit Full* by entering a / in the left margin field.
- Specify the *Structure/Copybook overlay*:
 - ◆ Activate the option by entering a / in the left margin field. This option is provided so that you may deactivate / reactivate structure formatting without needing to remove / retype the dataset / member name.
 - ◆ Type **userpfx.SELCTRN.SAM1** in the *Dsn* field, to specify the PDS library containing the supplied COBOL / PL1 copybook. If wildcards are specified then a dataset list will be displayed from which you can make a selection.
 - ◆ Type **ZZST1CPC** in the *Member* field (for COBOL installations). Type **ZZST1CPP** in the *Member* field (for PL1 installations). If wildcards are specified then a member list will be displayed from which you can make a selection.
 - ◆ Check the *Type* option for *Cobol* or *PL1* as appropriate for your installation.
- Press **ENTER** to edit the sample dataset.

Note: The following sample commands and screen-shots depict use of the **COBOL** copybook.

Editing Sample Dataset 1

- The first sample dataset represents a music collection, with each "Track" described by a separate logical record.
- The initial view of the data is presented in formatted multi-record (table) display mode.
- Press **F10** / **F11** to scroll the display left/right in order to view further data fields.

MAP/FMT Line-Command

- You may also use **MAP** or **FMT** as a line-command (typed in the prefix area) to display the marked line in formatted single-record mode.
- Alternatively press **F17 (Shift-F5)** to open a separate window displaying the focus record in formatted single-record (zoomed) mode.
- Note that on a standard 80-column screen **SELCOPYi** operates in *window-maximised mode* so that the new window will entirely obscure the original display.
- On a **wide screen** operating in **windowed mode**, the new window will open top-right justified, with the intention that both the table view and single record view are simultaneously visible.
- Significantly for **windowed mode**, multiple "zoomed" windows may be opened for different records, with the ability to **move and resize each window** as desired.

Unformatted Single-Record (UNFMT) Display Mode

- Type **UNFMT** to set unformatted single-record display mode.
- Type **HEX** to toggle hexadecimal display on/off.
- Press **F7 / F8** to scroll along the record.
- Press **F10 / F11** to scroll the display to the previous/next record.

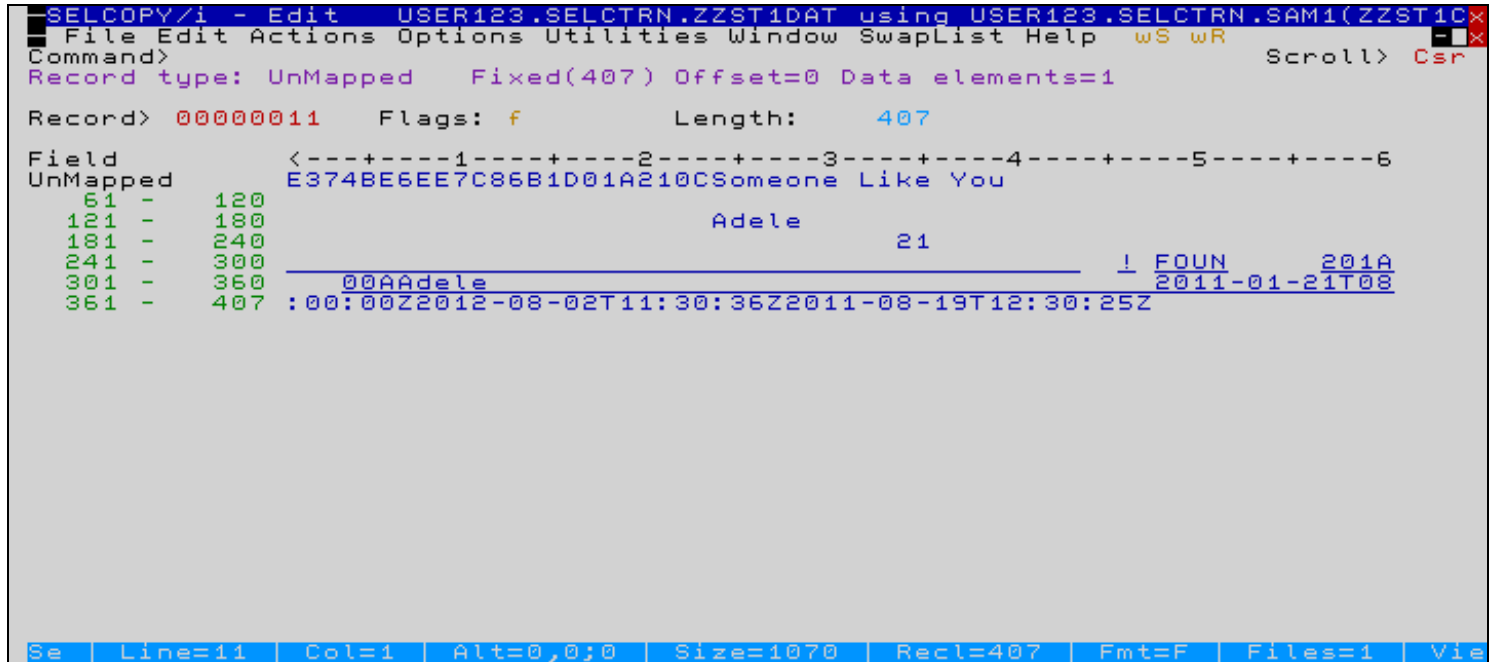

Figure 55. SELCOPYi - SDE UNFMT.

Hex Dump (HEXD) Display Mode

- Type **HEXD** to set hex-dump display mode.
You may add the **NEW** parameter in order to open the display in a new window.
- Press **F7 / F8** to scroll along the record.
- Press **F10 / F11** to scroll the display to the previous/next record.
- Use the **SPM** command to show a popup menu providing display options for the hex-dump screen.
Type **Help HEXD** for full information.
- The offset field on the first displayed line of data may also be overtyped in order to scroll the display to the specified offset within the record.
- While in multi-record (table) view the **HEXD** line-command may also be typed into record the prefix area to show the selected record in hex-dump format.

Figure 57. SELPCOPYi - SDE VFMT.

Controlling Table Headings

- A fixed heading displays the **Record Type** name. Other items on this line are described in the following table.

Item	Description
Fixed(n)	Displayed when the record-type is of a fixed length n .
Variable(n1,n2)	Displayed when the record-type may vary in length. Its lower length limit being n1 . Its upper length limit being n2 .
Offset=n	Indicates the offset (n) into the record at which record-type mapping is applied.
Data Elements=n	Indicates the number of fields (n) mapped by this record-type.

- The first **column heading** is fixed and displays the **Field Name**.
- Subsequent **column headings** are optional. The table below indicates the primary commands used to control each one.

Item	Description	Primary Commands
Field Number	Displays the field reference number (#n).	REF ON REF OFF
Data Type	Optionally displays one of the following: 1. A combination field of the format data-type position:length . e.g. AN 111:30 2. A combination field of the format length/format . e.g. 30/CHAR 3. The position or offset defining the field's location within the record. e.g. 111 4. The field's picture string . e.g. X(30)	TYPE ON TYPE OFF TYPE FMT TYPE OFFSET TYPE PIC
Scale	Displays the scale. Use command OFST X to display a hexadecimal offset scale.	SCALE ON SCALE OFF OFST P OFST X

LAYOUT Command

- Type **LAY**out to display the current structure details in a separate list-window.
- Select the *Text* menu-bar item or type **TEXT** to place the information in a text-edit document window, which may be saved in the usual fashion.
- From the LAYOUT window, press **F3** to return to the edit/browse view.

Scrolling the Display to a specific field/record.

Locating a Field

- Use the **LOCATE** command to scroll a formatted (either multi- or single-record) display to a specific field. LOCATE may be abbreviated to **L**.
 - Field names may be abbreviated.
 - The field may be referred to either by its name or by its field reference number, e.g. using the supplied sample COBOL copybook the following commands are functionally equivalent.
 - ◆ L SAMP
 - ◆ L #11
- The result of issuing either of these commands from a VFMT display is shown below.

- The parameters **FIRST**, **LAST**, **NEXT** or **PREV** may optionally be added to the command, with **NEXT** being the default.

Figure 59. SELCPYI - SDE LOCATE field.

Locating a Record

- Use the **LOCATE nnn** command to scroll to a specific record number **nnn**.
- Alternatively you may use **:nnn**
e.g. the following commands are functionally equivalent.
 - ◆ L 1001
 - ◆ :1001
 The result of issuing either of these commands from a VFMT display is shown below.
- The LOCATE command may also be used to
 - ◆ scroll a VSAM ESDS to the record at a specific RBA.
 - ◆ scroll a VSAM KSDS to the record at a specific key, partial key or RBA.
- Type **Help Locate** for full information.

Figure 66. SELPCOPYI - SDE VFMT.

The SELECT panel

- The **SELECT** panel provides an interactive alternative to typing both the SELECT and COLWIDTH primary commands.

During Data-Edit/Browse, the SELECT panel may be started for the focus record-type using any of the following methods:

- Type **SELECT** (SEL) from the command line.
- Type **SEL** in the prefix area.
- Press the **Options** key (default is F16), then select option 8.

```

```

Figure 67. SELCOPY/i - SDE SELECT panel.

- Enter S in the "S" column to make a field visible.
- Enter H in the "H" column to HOLD a field.
- Enter a number in the "Seq" to control the order of visible fields.
- Enter a number in the "Width" to control the column width of a field.
- Selected fields that are not given an explicit Sequence number will be displayed in the order they appear in the panel table.
- The panel table may be manipulated using standard line-commands entered into the numeric "suffix" area on the right hand side of each table row. Table rows may be moved or excluded, but not deleted.
- Use primary command **SELALL** (on function key **F5** by default) to select all (unexcluded) fields.
- Use primary command **DESELALL** (on function key **F6** by default) to deselect all (unexcluded) fields.
- Use primary command **RESET** without parameters to reset (to blank) all enterable columns, or add the column name to reset each individual column. e.g. *RES H*
- Selecting **Y** in the "Show unselected fields at the end" option is the equivalent of adding ",*" to the end of the SELECT command, as discussed earlier.
- If option **PERM** is selected then the select/colwidth combination will saved in the applied structure (SDO). If mapping direct from a COBOL/PL1 copybook then you will be prompted to create a structure or continue without saving.
- Panel input will be obeyed on normal (F3) exit. The **EXECUTE** (EXEC) primary command (on function key **F16** by default) may be used to obey input without exiting the panel. This is particularly useful when running in "windowed" display mode on a large dynamic screen, where both the SELECT panel and the Data-Edit window to which it will apply are simultaneously visible.

Using FIND, EXCLUDE and ONLY commands

Searching for Data (FIND/F)

Type the following commands to produce the results displayed below.

- SEL *
- L 1
- F HEART

Press **F5** (RFIND) to search for the next occurrence.

Searching Numeric Data-Type Fields

- Numeric fields may also be searched without needing to be concerned about the underlying data-type (i.e. zoned-decimal, packed-decimal, binary or floating-point). e.g.
 - ◆ **ONLY 1 (TRACK-NUM)**
- Type **HIDE** to suppress display of shadow records.
- Type **RES HIDE** or **SHAD ON** resume display of shadow records.

Figure 73. SELCPYI - SDE ONLY 2.

Using a Relational Operator (EQ/NE/GT/GE/LT/LE)

- A relational operator (defaulting to EQ) may also be specified before the search value. Supported operators are as follow:

Operator	Description
EQ	Data must be equal to <i>value</i> . (Default)
NE	Data must be not equal to <i>value</i> .
GT	Data must be greater than <i>value</i> .
GE	Data must be greater than or equal to <i>value</i> .
LT	Data must be less than <i>value</i> .
LE	Data must be less than or equal to <i>value</i> .

- Type the following commands to produce the results displayed below, illustrating record selection based on the content of the **binary** numeric field *BIT-RATE*.
 - ◆ SEL BIT-RATE,*
 - ◆ ONLY GT 300 (BIT-RATE)

```

Figure 75. SELCOPYi - SDE ONLY 4.

Using CHANGE commands

- Type the following commands to produce the results displayed below.
 - ◆ **SEL TRACK-NUM,NAME HOLD,ALBUM,ARTIST,***
 - ◆ **;C'&:'&'**
- Note:** Semi-colon (;) is the default command-separator character. In order to use the separator character as a legitimate part of a command string we must suspend its normal handling. This can be done by either
 - Updating the separator character in the Settings panel, issuing the command, then resetting the separator character. This is cumbersome and upsetting!
 - As in the above example, let **SELCOPYi** automatically suspend separator handling for the duration of a single command, simply by prefixing that command with semi-colon (i.e. the prevailing separator character).
- Press **F5** (RFIND) to search for the next occurrence.
- Press **F6** (RCHANGE) to change it.
- Or add the **ALL** parameter to the CHANGE command to change all occurrences.
- Type **Help Change** for full information.

UNDO / REDO

Note that all modifications may be individually undone/redone using **F22** / **F23** (normally Shift-F10 / F11) which are set to execute the **UNDO/REDO** primary commands.

- Consecutive modifications may be undone by pressing **F22** repeatedly.
- Consecutive modifications may be redone by pressing **F23** repeatedly.
- The **UNDOING** primary command controls the following aspects:
 - Whether the UNDO/REDO facility is activated.
 - The number of modification levels maintained.
 - The maximum amount of storage allocated.
- Type **Query UNDOING** to determine your current settings.

Selecting only records affected by CHANGE

After applying the above **CHANGE** to all records, you may wish to display only the changed records. To do this type

- **ALL Changed**
- Type **Help ALL** for full information.

Figure 79. SELCOPYi - SDE CHANGE 3.

Filtering records using ALL(WHERE)/MORE/LESS commands

As an alternative to using the ONLY, FIND and EXCLUDE commands, records may be 'filtered' by a (potentially complex) SQL-style expression using the ALL, MORE and LESS commands.

- **ALL** excludes all records except those that match the selection criteria.
- **MORE** adds to the included records any excluded records that match the selection criteria.
- **LESS** excludes any included records that match the selection criteria.
- **Where** is a synonym for **ALL**.

Type the following commands to produce the results below.

- **SELECT #10,#3,#5 H,#7,#6,***
- **ALL BIT-RATE > 300**

```

Increasing the size of the Command Input Area

Complex expressions may require more space to type than is available on a single command line.

Type **CLN** to show an options dialog, allowing you increase the number of command lines visible for the current display window.

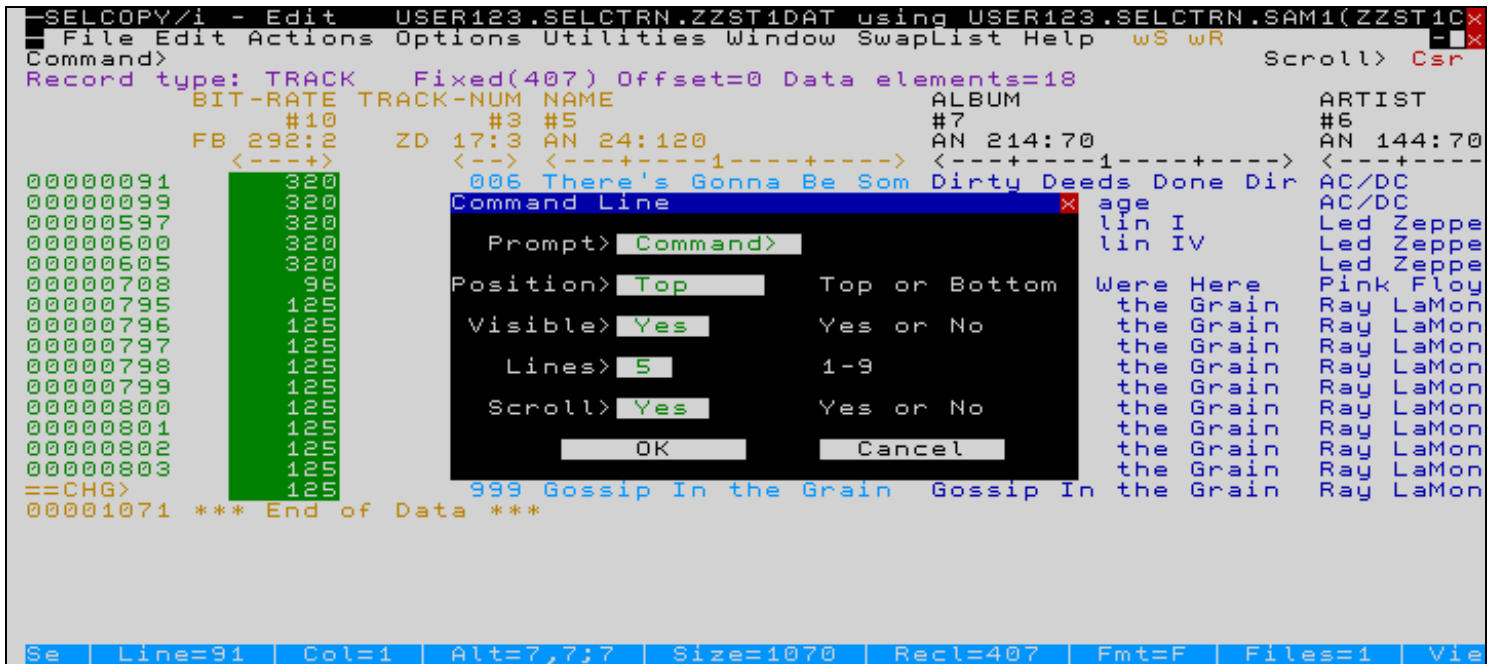

Figure 82. SELCOPYi - SDE Command Line Options.

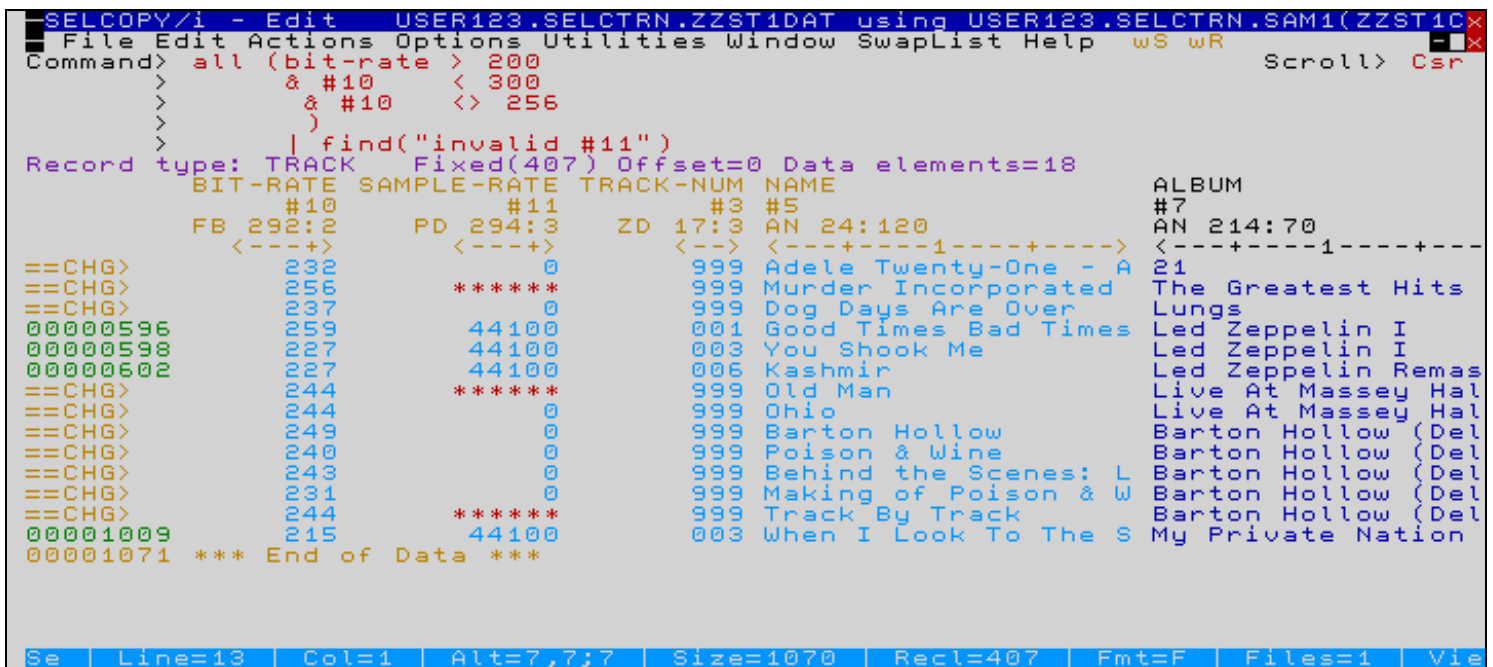

Figure 83. SELCOPYi - SDE ALL 3.

Using a FILTER to Select Records on Load

You may wish to select records based on specific criteria during initial load of the file into the **SELCOPYi** Structured Data Editor.

For example, to load only the first 20 records that contain a value in **position 348** (the year component of RELEASE-DATE)

- that is **greater than '0000'**
- but **less than '1980'**

Choose the **Quick Filter** feature from the SDE Edit / Browse Entry Panel (=2).

- Activate the *Filter* option by entering a / in the left margin field.
- Enter **Q** to select *Quick* filter.
- Type **FILT** (or press **F6**) to define or modify the filter selection-criteria.

```

```

Figure 84. SELCOPYi - SDE Quick Filter 1.

Specifying Simple FILTER Selection Criteria

- Enter **20** in the *Limit*> field to restrict the number of records selected.
- Enter **I** in the *Type*> field to specify that selected records should be **included** in the load.
- Enter **348** into the *Position* column of table row 1.
- Enter **4** into the *Length* column.
- Enter **>** (greater-than) into the *ROp* (Relational Operator) column.
Alternatively enter blank to get a list of available operators from which you may make your selection (by placing the cursor and pressing ENTER).
- Enter **'0000'** into the *Value* column.
 - ◆ For simple case-insensitive character strings there is no need to add quotes (this will be done automatically).
 - ◆ You may specify the string using **C'ABCD'** notation if case-sensitivity is required.
 - ◆ Hex strings may be specified using **X'1234'** notation.
- Replicate table entry line 1 by typing **R** into the table prefix area (*000001*).
The *AND/OR* column will automatically set to **AND**.
- Enter **<** (less-than) into the *ROp* (Relational Operator) column of inserted table row 2.
- Enter **'1980'** into the *Value* column.

Figure 85. SELPCOPYi - SDE Quick Filter 2.

Activating/Deactivating a FILTER

- Press **F3** to return to the SDE Edit/Browse Entry Panel.
- Press **ENTER** to edit the sample file using the active filter.
- To **activate/deactivate** the filter simply check/uncheck the *Filter* option.
- A **saved filter** may be activated by specifying filter type **F** and entering the saved filter dataset / member name.
- To define a **saved filter** either:
 1. Select the *Filter* option (=10) from the **SELCOPYi** Primary Option Menu.
 2. At the SDE Edit / Browse Entry Panel, specifying filter type **F**, enter the saved filter dataset/member name then press **F6** (or type **FILTer**).
- A **saved filter** may define selection criteria referring to the values of named (formatted) fields.
- Formatted selection criteria are individually specified for each defined record-type.

Figure 86. SELCOPYi - SDE Quick Filter 3.

Working with Multiple Record-Types

Files with multiple record-types may be mapped by:

1. Multiple (COBOL or PL1) copybooks.
2. A single copybook with multiple **01-LEVEL** entries, each defining a separate record-type.
3. A **SELCOPYi Structured Data Object (SDO)** which may be generated from one or more copybooks, using the **Structure** option from the Primary Option Menu (=9).

The second sample dataset contains the same information as the first, but is comprised of three distinct record-types:

1. ARTIST
2. ALBUM
3. TRACK

To reproduce the following screen-shot browse the sample dataset in its raw state, i.e. without applying a copybook / structure overlay.

Use the Data Edit (=2) panel to:

- Specify the *Data File*:
 - ◆ Type **userpfx.SELCTRN.ZZST2DAT** in the *Name* field, where *userpfx* is your own user prefix. If wildcards are specified then a dataset list will be displayed from which you can make a selection.
- Specify the *Action*:
 - ◆ Activate option *Browse Data* by entering a *.*
- Deactivate the *Structure/Copybook overlay*:
 - ◆ Uncheck the option by removing the a *.*. This option is provided so that you may deactivate / reactivate structure formatting without needing to remove / retype the dataset / member name.
- Press **ENTER** to edit the sample dataset.
- Type **RECLen** to switch on/off the display of record length column, which displays each individual record's length in front of the data.

You will notice that:

- Record 1 is **length=71** and contains '1' in position 1 indicating it is an **ARTIST** record.
- Record 2 is also **length=71** but contains '2' in position 1 indicating it is an **ALBUM** record.
- Records 3 - 15 are **length=268** and contain '3' in position 1 indicating they are **TRACK** records.

Figure 87. SELCPYi - SDE Sample Dataset 2.

Automatic Record-Type Association (for Direct Copybook Overlay)

Exit unformatted browse of Sample Dataset 2, then re-edit specifying Structure / Copybook overlay using sample copybook #2, which contains **01-LEVEL** entries for each of the 3 record-types.

- Specify the *Structure/Copybook overlay*:
 - ◆ Activate the option by entering a / in the left margin field.
 - ◆ Type **userpfx.SELCTRN.SAM1** in the *Dsn* field, to specify the PDS library containing the supplied COBOL / PL1 copybook. This dataset name should already be in place (same as previous sample).
 - ◆ Type **ZZST2CPC** in the *Member* field (for COBOL installations).
Type **ZZST2CPP** in the *Member* field (for PL1 installations).
 - ◆ Check the *Type* option for *Cobol* or *PL1* as appropriate for your installation.
- Press **ENTER** to edit the sample dataset.

Unlike some other products, **SELCOPYi** is able to display files with multiple record-types in Formatted Multi-Record (VFMT) Display Mode with all record-types simultaneously visible, a set of record-type column headings being displayed for each new group of one or more consecutive records of the same type.

You will notice that **SELCOPYi** has attempted to automatically assign record-types, by matching between the individual record-length to the length defined by the copybook for each record-type. Where this process is unable to uniquely identify a record-types, the first matching record-type is assigned.

The initial view of the sample dataset shows that:

- **ARTIST** record #1 has been assigned the correct record-type.
(unique match on fixed record length=268).
- **ALBUM** record #2 has automatically been assigned the **incorrect** record-type (ARTIST).
(first match on fixed record length=71).
- **TRACK** record #3 has been assigned the correct record-type.
(first match on fixed record length=71).

Figure 88. SELCOPYi - SDE Automatic Record-Type Id.

Record-Identification Criteria (for Direct Copybook Overlay)

Where it is not possible to automatically infer the correct record-type association from the record-length, record-identification must be explicitly specified.

As formatting is provided directly by our sample COBOL or PL1 copybook, then in order to specify record-identification we must use **either** of the following methods.

- Press **F16 (Shift-F4)** to display the **Utilities Menu** then:
 1. Select option **6 - Modify record-type Identification criteria**.
 2. In the **Use When** column for the ALBUM table entry, type any of following equally valid expressions:
 - ◊ **RT='2'**
 - ◊ **substr(record,1,1)='2'**
 - ◊ **left(record,1)='2'**
 3. Press **ENTER** to register the update..
 4. Press **F3** repeatedly to return to the browse/edit view..
- Type any of the following primary commands:
 1. **USE ALBUM WHEN RT='2'**
 2. **USE ALBUM SUBSTR(RECORD,1,1)='2'**
 3. **USE ALBUM LEFT(RECORD,1)='2'**

```

Figure 89. SELCOPYi - SDE Explicit Record-Identification.

Record-Identification criteria defined for direct copybook overlay will persist throughout the **SELCOPYi** session, but will need to be reestablished beyond that.

A **SELCOPYi Structured Data Object (SDO)** permanently consolidates the information defined by one or more copybooks, potentially defining multiple record-types, along with the Record-Identification criteria for each.

An SDO is stored in a dataset (typically a library member), and provides significant performance improvement over direct copybook overlay for all **SELCOPYi** Structured Data components that are capable of record formatting e.g. Browse / Edit, File-Search, File-Reformat, File-Compare.

Locating NEXT/PREV record by Record-Type

- In both formatted multiple-record (VFMT) and formatted single-record (FMT / MAP) display modes, the **NEXT (N)** and **PREV (P)** primary commands may be used to navigate to records, based on their record-type.
 - Type **NEXT ARTIST** to scroll to the next record of the type ARTIST.
 - Type **N /** to scroll to the next record of the same type as the focus record.
 - Type **N ?** to scroll to the next record of a different type from focus record.
 - Type **Help NEXT** for full information.
- It's often handy to set a **PF key** temporarily for the browse/edit session.

e.g. to set **F5 / F6** to jump to the previous/next ARTIST record, type the following primary commands.

- **PF 5 PREV ARTIST**
- **PF 6 NEXT ARTIST**

Selecting Visible Record-Types

Since **SELCOPYi** is capable of displaying multiple record-types simultaneously in Formatted Multi-Record (VFMT) Display Mode, it is handy to be able to select precisely which record-types are visible at any given time.

Records of any unselected record-type are represented by "shadow" lines (just like excluded records). This feature is controlled by the **SHADOW** primary command.

Record-types may be selected / deselected using either:

1. The **VIEW (V/V+/V-)** primary command. e.g.
 - ◆ To select only **TRACK** records type:
 - ◇ **V TRACK**
 - ◆ To reselect **all** record-types type:
 - ◇ **V ***
 - ◆ To select only **ARTIST** and **ALBUM** records type:
 - ◇ **V ARTIST,ALBUM**
 - ◆ To deselect **ARTIST** and **ALBUM** records type:
 - ◇ **V- ARTIST,ALBUM**
 - ◆ To additionally select **ALBUM** and **TRACK** records type:
 - ◇ **V+ ALBUM,TRACK**
2. The **V, V+ or V-** line-commands.
 - ◆ Use **V** to select only records of the focus record-type.
 - ◆ Use **V+** to additionally select records of the focus (shadow line) record-type.
 - ◆ Use **V-** to deselect records of the focus record-type.

```

Figure 90. SELCOPYi - SDE Select Visible Record-Types.

Note: In Formatted (VFMT/FMT) Display Modes, some primary commands are record-type specific (i.e. they act on records of one type only), and are sensitive to the **focus record-type** i.e. the record-type of the record at the cursor (or at the top of screen if the cursor is on the command line).

e.g. the following commands are **record-type sensitive**:

- FIND, CHANGE, EXCLUDE and ONLY
- LOCATE, ALL(WHERE), MORE and LESS

To avoid ambiguity when issuing any of these commands you may wish to either:

1. Select a single record-type using the **VIEW** command.
2. Temporarily suspend record-type formatting using the **CHAR** command.

Creating a Structured Data Object (SDO)

An **SDO** may be generated from COBOL/PL1 copybooks using any of the following methods:

- Select option **9 - Structure** from the **SELCOPYi** Primary Option Menu, then select option **1 - Copybook**.
- At any primary command prompt type **=9.1**.
- At any primary command prompt type **SDO**.

The following example will use the panel to generate an SDO from the **ZZST2CPC** (sample #2) COBOL copybook, containing three record-types along with their respective record-identification criteria.

- Specify the *Structure File to Create*:
 - ◆ Type **userpfx.SELCTRN.SDO** in the *Dsn* field, where *userpfx* is your own user prefix.
 - ◆ Type **ZZST2** in the *Member* field.
- Optionally Specify a *Title*:
 - ◆ Activate the option by entering a / in the left margin field.
 - ◆ Type a short (up to 30 characters) title e.g.
SELCOPYi Training - Sample 2
- Optionally Specify a *Description*:
 - ◆ Activate the option by entering a / in the left margin field.
 - ◆ Type a longer (up to 124 characters) description e.g.
**Training Material: Sample Record Collection Structure
Multiple Record-Types (ARTIST,ALBUM,TRACK)**

```

```

Figure 91. SELCOPYi - SDE Main Panel 1.

Specifying Copybook Libraries

Select option 1 to specify the dataset name(s) of the libraries containing your COBOL / PL1 copybooks using an editable table.

- Insert a new line into the Copybook Library table by typing **I** into the table prefix area (000001).
- Type **userpfx.SELCTRN.SAM1** into inserted table row 1.
- Press **F3** to return to the SDO main panel.

```

```

Figure 92. SELCOPYi - SDE Copybook Libraries Panel.

Specifying Record-Type Details

Select option 2 to specify the source (copybook member name), identification criteria and other optional details for each **record-type**.

- Define the **ARTIST** record-type as follows:
 1. Insert a new line into the table by typing **I** into the table prefix area (000001).
 2. Type **ZZST2CPC** (ZZST2CPP for PL1 installations) into the *Copybook Library Member* field of inserted table row 1.
 3. The *Type* field will automatically be set to **PRI** indicating a **primary** record-type (requiring explicit record-type identification criteria). You may accept this default.
Press **F1** with cursor in this field for additional information.
 4. The *Start Level* field will automatically be set to **1** indicating the record-type is defined at **LEVEL 01**.
You may accept this default also.
Press **F1** with cursor in this field for additional information.
 5. Type **ARTIST** into the *Record-Type Name* field of inserted table row 1.
 6. The *Record Offset* field will automatically be set to **0** indicating the layout describes data from the beginning of the record. You may accept this default also.
Press **F1** with cursor in this field for additional information.
 7. The *Lang* field will automatically be set to **COBOL**. Update this to **PL1** if necessary.

```

Figure 93. SELCOPYI - SDE Define Record-Types 1.

Specifying Record-Type Identification Criteria

- Define the **identification criteria** for the **ARTIST** record-type as follows:
 1. With the cursor anywhere on inserted table row 1, press **F6** (ZOOM) to access a screen where details may be added / updated using a form.
 2. In the **Id** field, type any of following equally valid expressions:
 - ◊ **RT='1'**
 - ◊ **substr(record,1,1)='1'**
 - ◊ **left(record,1)='1'**
 Longer expressions may be entered via a text-edit window by pressing **F14** (EXPAND).
 3. Press **F3** to return to the record-types definition table panel.

```

Press PF3 to return to the record-types list table.
  
```

Figure 94. SELCOPY/1 - SDE Define Record-Type Identification Criteria.

Specifying Additional Record-Types

- Define the **ALBUM** record-type as follows:
 1. Replicate table entry line 1 by typing **R** into the table prefix area (000001).
 2. The *Copybook Library Member* field will already be correct as all of our sample record-types are defined by the same copybook.
 3. The *Type* field will already be correct.
 4. The *Start Level* field will already be correct.
 5. Type **ALBUM** into the *Record-Type Name* field table row 2.
 6. The *Record Offset* field will already be correct.
 7. The *Lang* field will already be correct.
 8. Press **F6** (ZOOM) to access the form screen.
 9. In the **Id** field, type any of following equally valid expressions:
 - ◊ **RT='2'**
 - ◊ **substr(record,1,1)='2'**
 - ◊ **left(record,1)='2'**
 10. Press **F3** to return to the record-types definition table panel.
- Define the **TRACK** record-type as follows:
 1. Replicate table entry line 2 by typing **R** into the table prefix area (000002).
 2. Type **TRACK** into the *Record-Type Name* field table row 2.
 3. Press **F6** (ZOOM) to access the form screen.
 4. In the **Id** field, type any of following equally valid expressions:
 - ◊ **RT='3'**
 - ◊ **substr(record,1,1)='3'**
 - ◊ **left(record,1)='3'**

Figure 95. SELCOPYi - SDO Define Record-Types 2.

Generating the SDO

- Press **F3** to return to the record-types definition table panel.
- Press **F3** again to return to SDO main panel.
- Select option **3** should you wish to supply any **COBOL Replacing Options** (not necessary for our sample).
- Select either:
 - ◆ Option **4** to **Create the SDO in the foreground**.
 - ◆ Option **5** to **Create a Batch Job** to generate your SDO.

Note: To specify a **//JOB** statement that will be automatically inserted at the start of any z/OS batch job generated using **SELCPYi**, select option **6 Batch** from the **Settings** panel (=0.6).

- If created in the foreground, a message similar to the following should appear on completion:

```
ZZSD145I Structure USER123.SELCTRN.SDO(ZZST2) created with 3 record type(s).
Maximum record length 268, minimum record length 71.
```

Figure 97. SELCOPYI - SDO Browse/Edit using an SDO.

Modifying Data

- In **Edit** mode individual record data may be modified by
 - ◆ Overtyping, inserting or deleting data in character or hex.
 - ◆ Executing a **CHANGE** command.
- In **Full Edit** mode, records may be inserted and deleted by
 - ◆ Typing the **INSERT** primary-command.
e.g. to insert a new **ALBUM** record:
 - ◇ Type **I ALBUM**
 - ◇ The new record will be inserted following the focus record.
In multi-record (VFMT / CHAR) display modes focus is defined by the cursor position.
 - ◆ Using the **DELETE** primary-command.
- Additionally, in formatted (VFMT) or unformatted (CHAR) multi-record display modes, records may be inserted and deleted using the **standard line-commands**
 - ◆ **Inn** to **insert** records.
 - ◆ **Dnn, DD-DD** to **delete** records.
 - ◆ **Mnn, MM-MM** to **move** records.
- Modifications may be individually undone/redone using **F22 / F23** (normally Shift-F10 / F11) which are set to execute the **UNDO/REDO** primary commands.
 - ◆ Consecutive modifications may be undone by pressing F22 repeatedly.
 - ◆ Consecutive modifications may be redone by pressing F23 repeatedly.
 - ◆ The **UNDOING** primary command controls the following aspects:
 1. Whether the UNDO/REDO facility is activated.
 2. The number of modification levels maintained.
 3. The maximum amount of storage allocated.
 - ◆ Type **Query UNDOING** to determine your current settings.
 - ◆ Type **Help UNDOING** for full information.

Modifying Record Lengths

- In **Full Edit** mode, the length of a variable length record may be altered in the following ways:
 - ◆ In multi-record (VFMT / CHAR) modes,
 1. Type **RECLEN ON** to display the *Length* record prefix column.
 2. Overtyping the current *Length* value for any individual record.
 - ◆ In single-record (FMT / MAP / UNFMT / HEXD) modes,
 - ◇ Overtyping the current *Length* value.
 - ◆ Using the shift-left / right line-commands:
 - ◇ **(nn** or **((nn-((** to shift-left.
 - ◇ **)nn** or **)nn-))** to shift-right.

Note: Record-length modification may occur only where the right **BOUNDS** setting is higher than the individual record's length.
 - ◆ Using the **SHIFT** primary-command.
Type **Help SHifT** for full information.
 - ◆ Using the **CHANGE** primary-command, in particular when the **DATA** parameter is specified with different length search and replace values.
Type **Help Change** for full information.

Working with Segmented Records

Records may be organised in such a way that they are split into a number of logical segments, each segment being mapped by a unique structure (COBOL group or PL1 major/minor structure).

Segmented records begin with a single primary (base) segment immediately followed by any number of non-overlapping, secondary segments. A secondary segment may have the same or different segment record-type (RTO) mapping as other secondary segments in the record. e.g.

```
Record: 1
+-----+-----+-----+-----+-----+
| Primary_1 | Secondary_1 | Secondary_1 | Secondary_1 | Secondary_1 |
+-----+-----+-----+-----+-----+

Record: 2
+-----+-----+-----+-----+
| Primary_1 | Secondary_1 | Secondary_2 | Secondary_2 |
+-----+-----+-----+-----+

Record: 3
+-----+-----+-----+-----+
| Primary_2 | Secondary_1 | Secondary_4 |
+-----+-----+-----+-----+

Record: 4
+-----+-----+-----+-----+
| Primary_1 | Secondary_1 | Secondary_2 | Secondary_3 |
+-----+-----+-----+-----+
```

The record data must contain ID fields that identify which segment mapping is to be used to format individual segments of the record.

ID fields that identify a primary segment mapping must exist within the primary segment data. ID fields that identify a secondary segment mapping may exist within the secondary segment data, within the data of any previously mapped segment belonging to the same record, or, specifically, within the primary segment data.

The third sample dataset contains the same information as the second, but each physical record is comprised of three distinct segment-types:

- A single PRIMARY (BASE) (**ARTIST**) segment followed by....
- a number of SECONDARY (**ALBUM**) segments, each one followed by...
- a number of SECONDARY (**TRACK**) segments

To reproduce the following screen-shot browse the sample dataset in its raw state,

Use the Data Edit (=2) panel to:

- Specify the *Data File*:
 - ◆ Type **userpfx.SELCTRN.ZZST3DAT** in the *Name* field, where *userpfx* is your own user prefix.
- Deactivate the *Structure/Copybook overlay*.
 - ◆ Uncheck the option by removing the */*.

Figure 98. SELCOPY/1 - SDE Sample Dataset 3.

Creating an SDO defining Segmented Record-Types

Files with segmented record-types should be mapped by a **SELCOPYi Structured Data Object (SDO)** generated from one or more copybooks.

The sample #3 segmented SDO (member name ZZST3) should be created using the (=9.1) panel in exactly the same way as for (non-segmented) sample #2, except that:

1. The **ARTIST** record-type is defined as *Type DEF*.
DEF record-types **must** be specified **without** identification criteria.
2. The **ALBUM** record-type is defined as *Type SEC*.
 Identification criteria is required.
3. The **TRACK** record-type is defined as *Type SEC*.
 Identification criteria is required.

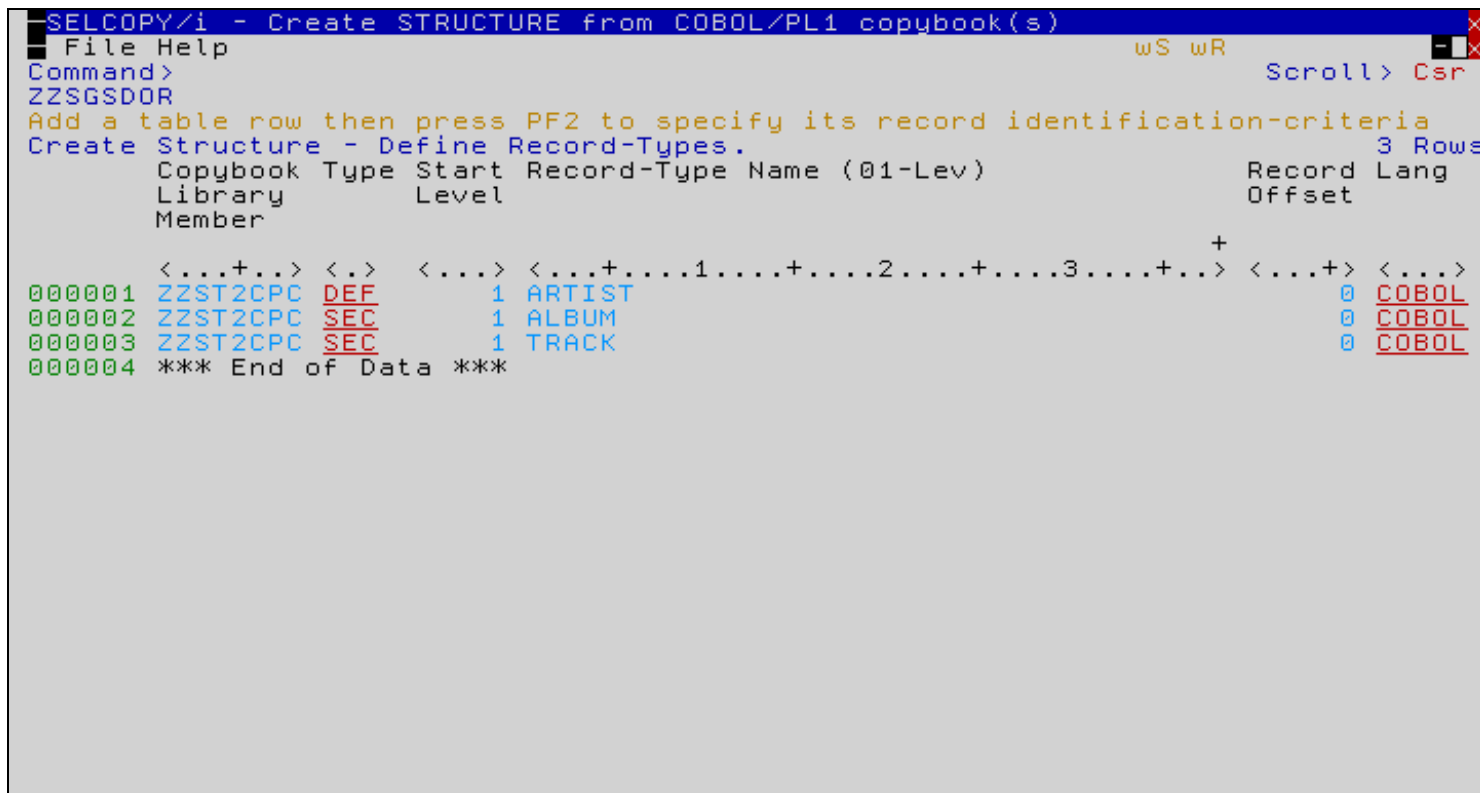

Figure 99. SELCOPYi - SDO Create Segmented Structure.

If created in the foreground, a message similar to the following should appear on completion:

```
ZZSD403I Segmented Structure USER123.SELCTRN.SDO(ZZST3) created with 1 primary
(base) segment type(s) and 2 secondary type(s). Maximum segment length 268,
minimum segment length 71.
```

Browse/Edit using a Segmented SDO

At the SDE Browse / Edit panel:

- Specify the *Data File*:
 - ◆ Type **userpfx.SELCTRN.ZZST3DAT** in the *Name* field, where *userpfx* is your own user prefix.
- Specify the *Structure/Copybook overlay*:
 - ◆ Activate the option by entering a / in the left margin field.
 - ◆ Type **userpfx.SELCTRN.SDO** in the *Dsn* field, to specify the PDS library containing the generated Structured Data Object (SDO).
 - ◆ Type **ZZST3** in the *Member* field.
 - ◆ Check the *Type* option for *SDO*.
- Press **ENTER** to edit the sample dataset.

```

Figure 100. SELCPYi - SDO Browse/Edit using a Segmented SDO.

Notes:

- By default, the prefix area indicates the **physical record number** to which each segment is attached.
- Type **PREFix LOGical** to display individual segment numbers in the prefix area.
- Type **PREFix Physical** to reset the prefix to display physical record numbers.
- Type **Help PREFix** for full information.
- The **LOCATE** command is sensitive to the **PREFix** setting (PHYSICAL|LOGICAL) when used to locate an absolute record / segment number.

Navigating Segmented Datasets

- Whether in formatted (VFMT / FMT) or unformatted (CHAR / UNFMT / HEXD) display modes, all logical segments are displayed individually. To display the data in its raw state you must edit / browse the dataset with the structure (SDO) deactivated.
- For efficiency reasons the process of separating each physical record into its logical segment is performed once only, at initial load.
- In single-record modes, display is sensitive to the PREFIX setting (PHYSICAL|LOGICAL).

PREFIX Mode	Display
PHYSICAL	Segment> pppppppp / llllll ♦ "pppppppp" denotes the physical record number. ♦ "llllll" denotes the logical segment number within that physical record.
LOGICAL	Segment> ssssssss ♦ "sssssss" indicates the logical segment number within the whole file.

```

Figure 101. SELCOPYi - SDE Formatted Single-Segment Display Mode (FMT/MAP).

- In formatted (FMT / MAP) or unformatted (UNFMT / HEXD) single-record modes, the scrolling keys **F10** / **F11** will navigate to the next/prev **visible segment**, regardless of its type (PRIMARY/SECONDARY).
- In both formatted multiple- (VFMT) and single-record (FMT / MAP) display, the **NEXT (N)** and **PREV (P)** primary commands may be used to navigate more specifically to segments, based on their segment-type.
 - ♦ Type **N B** to scroll to the next base (primary) segment.
 - ♦ Type **N ALBUM** to scroll to the next segment of the type ALBUM.
 - ♦ Type **N /** to scroll to the next segment of the same type as the focus segment.
 - ♦ Type **N ?** to scroll to the next segment of a different type from focus segment.
 - ♦ Type **Help NEXT** for full information.

Modifying Segmented Datasets

- Individual segment data may be modified by
 - ◆ Overtyping, inserting or deleting data in character or hex.
 - ◆ Executing a **CHANGE** command.
- Segments may be inserted and deleted by
 - ◆ Typing the **INSERT** primary-command. e.g. to insert a new **ALBUM** segment:
 - ◇ Type **I ALBUM**
 - ◇ The new segment will be inserted following the focus segment.
In multi-segment (VFMT / CHAR) display modes focus is defined by the cursor position.
 - ◆ Using the **DELETE** primary-command.
- Additionally, in formatted (VFMT) or unformatted (CHAR) multi-segment display modes, both PRIMARY and SECONDARY segments may be inserted, deleted and moved using the **standard line-commands**
 - ◆ **Inn** to **insert** segments.
 - ◆ **Dnn, DD-DD** to **delete** segments.
 - ◆ **Mnn, MM-MM** to **move** segments.

Note that secondary segments may be **detached** and **reattached** to different primary segments using **move operations**.
- Modifications may be individually undone/redone using **F22 / F23** (normally Shift-F10 / F11) which are set to execute the **UNDO/REDO** primary commands.
 - ◆ Consecutive modifications may be undone by pressing F22 repeatedly.
 - ◆ Consecutive modifications may be redone by pressing F23 repeatedly.
 - ◆ The **UNDOING** primary command controls the following aspects:
 1. Whether the UNDO/REDO facility is activated.
 2. The number of modification levels maintained.
 3. The maximum amount of storage allocated.
 - ◆ Type **Query UNDOING** to determine your current settings.
- Modifications to fields referenced by **segment identification criteria** will result in the segment prefix area being flagged with **==ID>**.

This indicates that the modification will potentially cause the segment-type to re-assigned. Immediate re-assignment does not take place automatically. This is deliberate, since the user may be in the midst of several changes.

Re-assignment of segment-type may be explicitly requested using:
 - ◆ The **ID** line-command.
 - ◆ The **IDentify** primary-command.
Type **Help IDentify** for full information.
- The status of a segment being either **PRIMARY** or **SECONDARY** will not be altered by an **IDENTIFY** process.
To alter an individual segment's PRIMARY / SECONDARY status use:
 - ◆ The **STP** line-command to make the selected record a **PRIMARY** segment.
 - ◆ The **STS** line-command to make the selected record a **SECONDARY** segment.

Inserting/Deleting Primary (Base) Segments

- **Insert** of a primary (base) segment will cause a new physical record to be created in the file.
- **Delete** of a primary (base) segment will cause all its secondary segments to become attached to the **previous primary segment**. Beware that this may result in the creation of a physical record that exceeds the file's defined maximum

Modifying Segment Lengths

- The length of a segment may be altered in the following ways:
 - ◆ In multi-segment (VFMT / CHAR) modes,
 1. Type **RECLEN ON** to display the *Length* segment prefix column.
 2. Overtyping the current *Length* value for any individual segment.
 - ◆ In single-segment (FMT / MAP / UNFMT / HEXD) modes,
 - ◇ Overtyping the current *Length* value.
 - ◆ Using the shift-left / right line-commands:
 - ◇ **(nn** or **((nn-((** to shift-left.
 - ◇ **)nn** or **)nn-))** to shift-right.
 - ◆ Using the **SHIFT** primary-command.
 - ◆ Using the **CHANGE** primary-command.

Option 5 - File Copy/Reformat (FCOPY)

The SELCOPY/i File Copy/Reformat utility (FCOPY) copies records from one or more input file to a single output file, or to one or more members of a (PDS/PDSE) library. Input and output access methods, record-format and geometry may be mixed without restriction, and the copy process may be executed either online or in batch.

The output may be specified as:

- a single PDS/PDSE library member
- a PDS/PDSE library DSN (multiple member names implied by the input)
- a flat sequential dataset
- a VSAM KSDS, ESDS, RRDS/VRDS.
- a Hierarchical File System (HFS/ZFS) file.

The input may similarly be specified, with multiple input files defined using wildcards within each of the following file name components:

- Dataset name
- HFS path file-name (not directory)
- PDS/PDSE Member name
- Volume name

Access method, record-format and geometry for multiple input file may also be mixed without restriction.

Records may be selectively copied by specifying any combination of the following, which are applied to each input file:

- Start record number
- Start record key, or partial key (VSAM KSDS files only)
- Start relative-byte address (RBA) (VSAM ESDS/KSDS files)
- Number of records to process
- Record selection criteria (FILTER)

Records may be reformatted as they are copied by specifying an input and output structure/copybook. Specification of an input structure also enables record selection based on record-type and/or the content of fields defined by the structure.

Additionally, although not recommended for high volume output, copy to a VSAM KSDS may optionally be performed for records out of key sequence.

A handy aspect of the File Copy/Reformat utility is the ability to peek at the relevant files directly from the panel.

- F19 (Shift-F7) to browse the Input Data file
- F20 (Shift-F8) to browse the Output Data file
- F22 (Shift-F10) to browse the Input Copybook
- F23 (Shift-F11) to browse the Output Copybook

The File Copy/Reformat (FCOPY) Panel

The FCOPY panel may be started using any of the following methods:

- Select option **5** from the **SELCOPYi** Primary Option Menu (=).
- At any primary command prompt type **=5**.
- At any primary command prompt type **FCOPY** (FC).
- From any dataset, library or HFS path list window, use the **C** line-command.

Copying a Standard Sequential Dataset

```

SELCOPY/i - File Copy
File Help JCL Command                               wS wR
Command>
ZZSGFC00                                           Lines 1-21 of 21
Input  PDS/PDSE Library, Sequential, VSAM DSN mask or HFS path mask:
  DSN/Path Mask> USER123.SELCTRN.ZZST1DAT
  Member Mask>
  Volume Mask>
  (All mask matches will be copied,
  press PF5 to view/deselect matches)

Output PDS/PDSE Library, Sequential, VSAM DSN or HFS path:
  DSN/Path  > USER123.SELCTRN.ZZST1DAT.FCOPY1
  Member    >
  Volume    >
  Strip/Pad Char> e.g. X'FF' (If copying fixed->var length records)
  (If output file is uncataloged)

Record Selection:  For each input file, copy only selected records.
  Start>
  For> @ # records

  File> + Member>

Options:
  Reformat using structure/copybook layouts  _ Recurse HFS Sub-directories
  Append to existing Output                  _ Ignore HFS fileid case
  
```

Figure 102. SELCOPYi - File Copy/Reformat (FCOPY) Panel (=5).

To follow the demonstration use the panel to make a complete copy of supplied sample dataset 1.

- Specify the *Input File*:
 - ◆ Type **userpfx.SELCTRN.ZZST1DAT** in the *DSN/Path Mask* field, where *userpfx* is your own user prefix.

If wildcards are specified then a dataset list will be displayed from which you can select one or more files for processing. Initially **ALL** files are selected, but you may press **F5/F6** to toggle back and forth between all files being selected or deselected. Further selection/deselection may be made by manually overtyping the *Sel* column for each individual entry.

Where PDS/PDSE datasets are to be processed a further member selection list may be accessed by placing the cursor on the library name and pressing **ENTER**. Within the dataset list, the member mask field may be overtyped to refine member selection individually for each library.

Press **F3** to return to the FCOPY panel once all input selections have been confirmed.
 - ◆ The *Member Mask* field should be left blank in this case, otherwise the dataset list will be restricted to PDS/PDSE libraries only.
 - ◆ The *Volume Mask* field should be left blank in this case, otherwise the dataset list will be restricted to files residing on matching volumes only.
- Specify the *Output File*:
 - ◆ Type **userpfx.SELCTRN.ZZST1DAT.FCOPY1** in the *DSN/Path* field. If wildcards are specified then a dataset list will be displayed from which you can make a selection.
 - ◆ If the name entered is for a dataset that does not yet exist, then you will be prompted to create it.
 - ◆ The *Member* field should be left blank. otherwise the dataset list will be restricted to PDS/PDSE libraries only.
 - ◆ The *Volume* field should be left blank.
 - Press **ENTER** to continue.

Choose New Output File Access Method

- If the output file does not yet exist, you will be prompted to create it and given the choice of the access method to be used.
- The *Dataset Organisation* input field will automatically be primed to match the input file, **N** for a **Non-VSAM** standard sequential file in this case.
- Permitted options are:

Option	Description
L	To allocate a new PDS/PDSE library.
N	To allocate a new standard sequential (Non-VSAM) file.
K	To define a new VSAM KSDS.
E	To define a new VSAM ESDS.
R	To define a new VSAM RRDS.

- Press **ENTER** or select the **OK** button to continue.

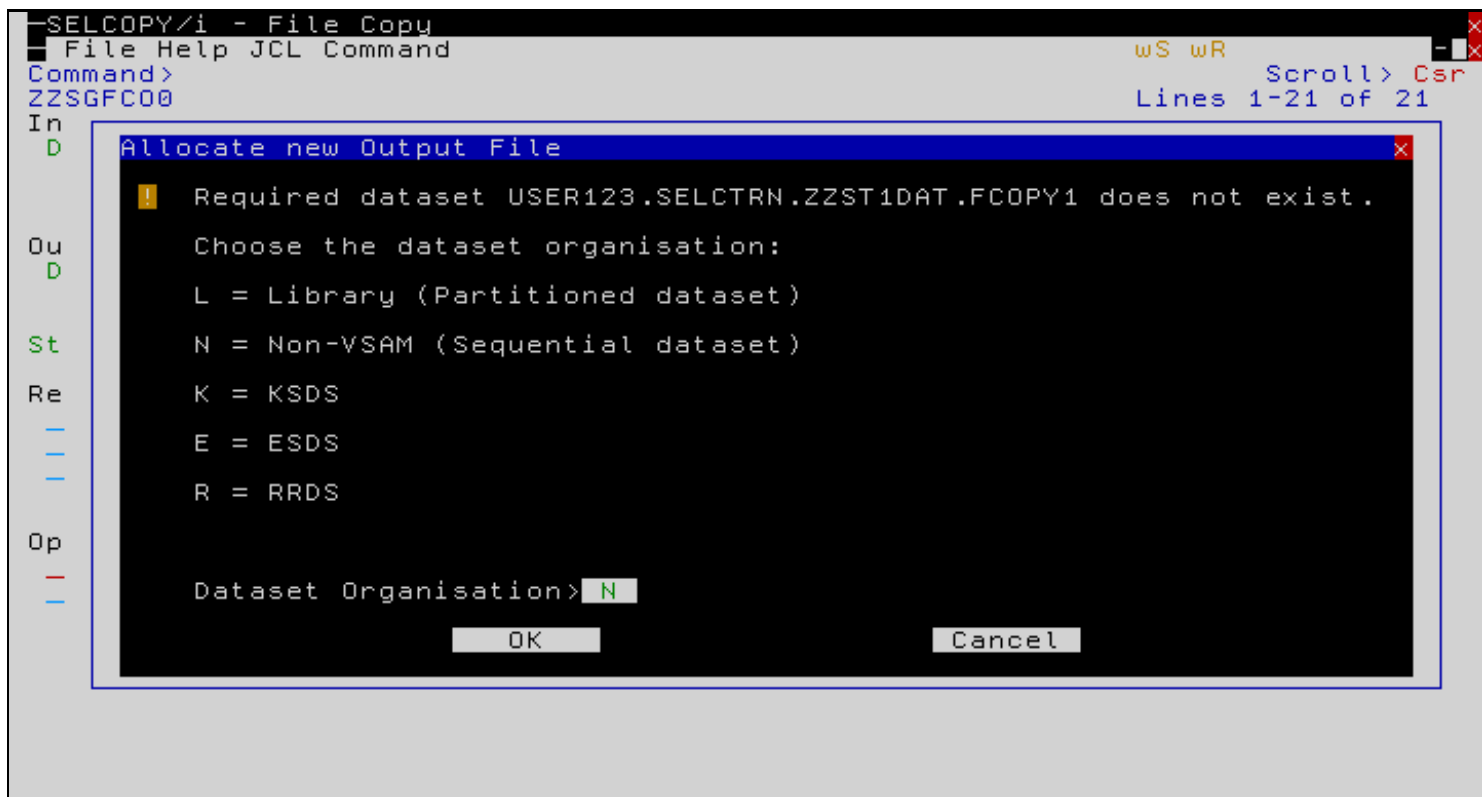

Figure 103. SELCOPYi - Choose new Output file Access Method.

Allocate New Output File

- The allocation dialog will be displayed next allowing you to enter various details for your new file.
- Initial values will be primed using the input file as a model, provided it is of a compatible type.
- You may overwrite any of the values displayed in green, and/or enter an alternative model dataset then press ENTER to call up its details.
- Select the **Allocate** button to create the file (note that pressing ENTER will place the cursor on the **Allocate** button).
- A message box will appear confirming the new file has been created.
- Press **F3** to continue with the copy process.
- For large file copies a progress window will be displayed, indicating how many records have so far been read, selected etc.
- You may use the **3270 Attention key** to interrupt the copy process. But remember to first unlock the keyboard by pressing the **3270 Reset key**. Please consult your 3270 emulator's keyboard settings/help if you're unsure of which physical keys are mapped to these 3270 functions.
- A summary message (detailing the number of records copied etc), will be displayed once the copy process has completed.

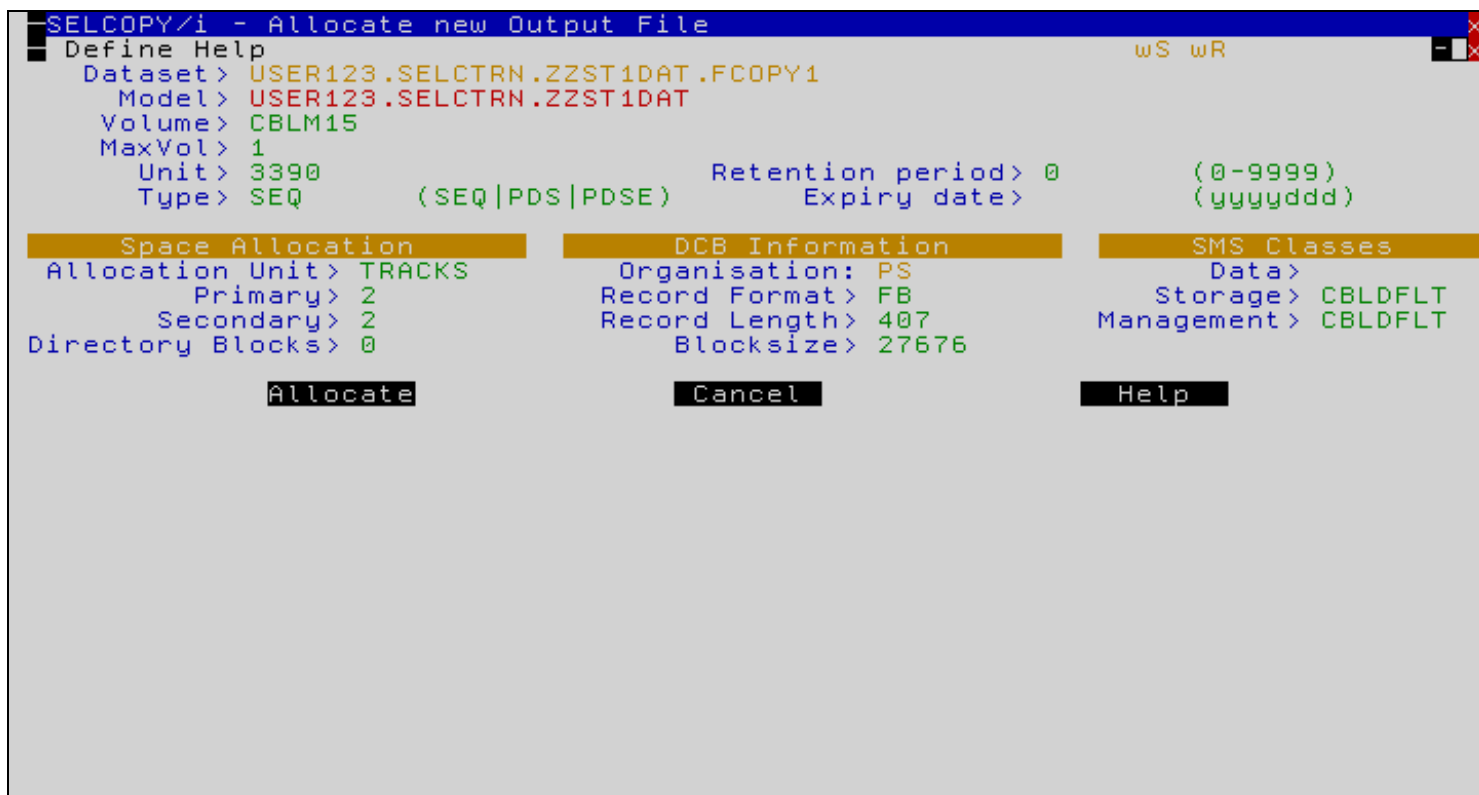

Figure 104. SELCOPYi - Allocate new Non-VSAM file.

Copying PDS/PDSE Library members

- Specify the *Input File*:
 - ◆ Type **userpfx.SELCTRN.ZZST5DAT** in the *DSN/Path Mask* field, where *userpfx* is your own user prefix.
 - ◆ Type **TRACK02*** in the *Member Mask* field.
- Specify the *Output File*:
 - ◆ Type **userpfx.SELCTRN.ZZST5DAT.FCOPY1** in the *DSN/Path* field.
- Press **ENTER** to continue.

Figure 111. SELCOPYi - Browse Input File.

Specifying Start Record / Number of Records to Copy

- Press **F3** to return to the File Copy panel.
- In the **Record Selection** section, activate the *Start* option by entering a / in the left margin field.
- Enter the start record number **16** in the *Start* field.
- Ensure that the *Record/Key/RBA* selectable option to the right is set to **Record**. This switch indicates the type of *Start* value provided.

Option	Meaning
Record	Start value is a record number. Value may be specified using 1234 or X'1234' notation.
Key	Start value is a VSAM KSDS key or partial key. Value may be specified using xxxx, 'xxxx', C'xxx' or X'1234' notation.
RBA	Start value is a VSAM ESDS/KSDS relative byte address (RBA). Value may be specified using 1234 or X'1234' notation.

- Activate the *For* option by entering a / in the left margin field.
- Enter the number of records to copy **5** in the *For* field.
- Press **ENTER** to continue.

```

Figure 112. SELCOPYi - Start Record/For.

Choose New Output File Access Method

- The *Dataset Organisation* input field will automatically be primed to match the input file, **N** for a **Non-VSAM** standard sequential file in this case.
- But we wish to create a VSAM ESDS, so enter **E** instead.
- Press **ENTER** to continue.

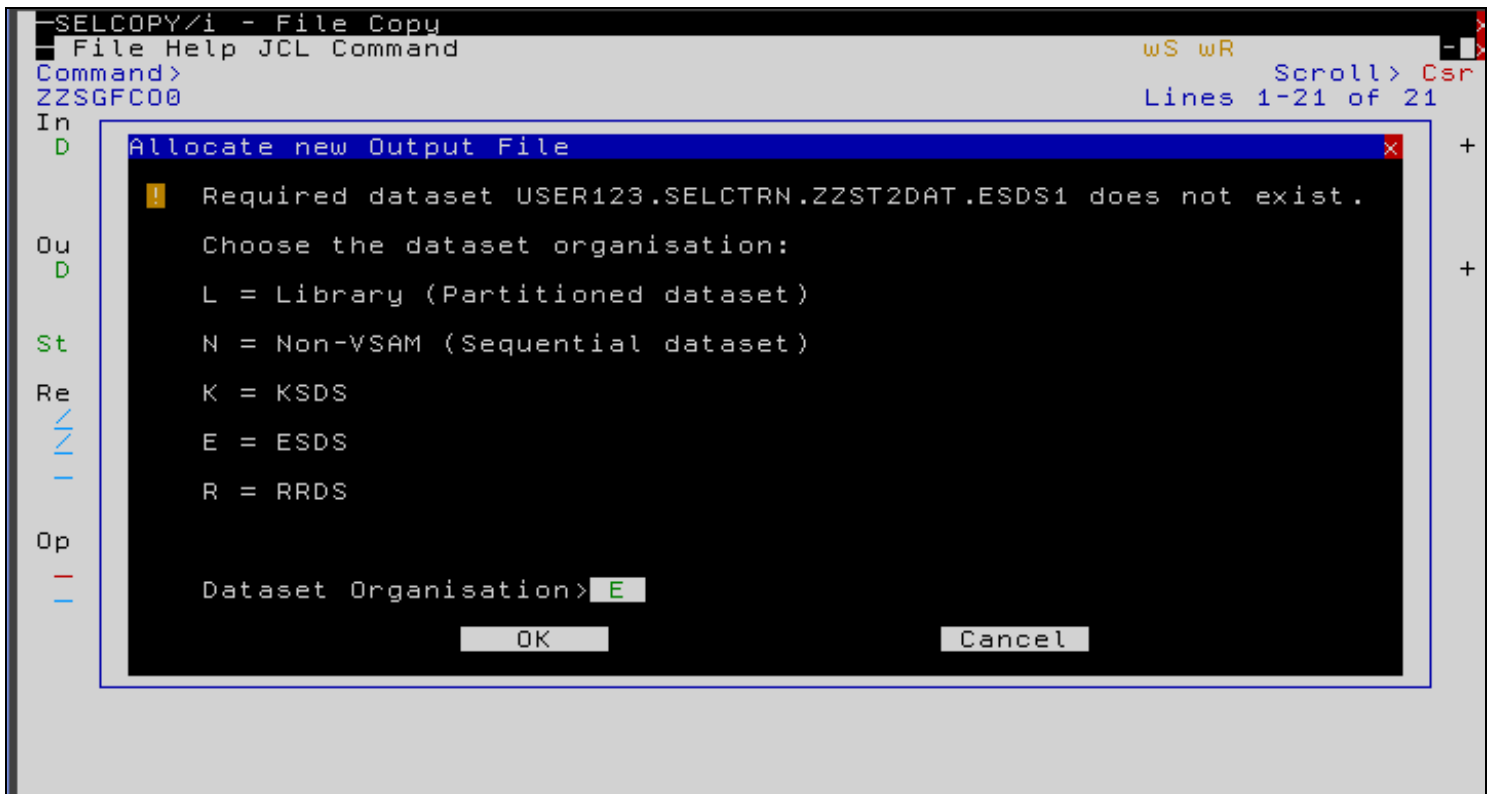

Figure 113. SELCOPYi - SDE LOCATE field.

Define New VSAM Output File

- The Define ESDS dialog will be displayed next allowing you to enter various details for your new file.
- Initial values will NOT be primed using the input file as a model since, in this case, it is not of a compatible type.
- You may overwrite any of the values displayed in green, and/or enter an alternative model dataset then press ENTER to call up its details.
- Enter the value **268** in the *Avg rec len* field.
- Enter the value **268** in the *Max rec len* field.
- Select the **Define** button to create the file (note that pressing ENTER will place the cursor on the **Define** button).
- A message box will appear confirming the new file has been created.

Figure 114. SELCOPYi - Define ESDS.

Copy Summary Message

- Press **F3** to return to the File Copy dialog.
- Press **ENTER** to continue with the copy process.
- For large file copies a progress window will be displayed, indicating how many records have so far been read, selected etc.
- You may use the **3270 Attention key** to interrupt the copy process. But remember to first unlock the keyboard by pressing the **3270 Reset key**. Please consult your 3270 emulator's keyboard settings/help if you're unsure of which physical keys are mapped to these 3270 functions.
- A summary message (detailing the number of records copied etc), will be displayed once the copy process has completed.

```

Using a FILTER to Select Records for Copy

You may wish to select records for copy based on specific selection criteria.

For example, to copy only the first 7 records that contain '3' in record position 1, and the string 'BLUES' anywhere in the record,

- Update the *Output File*:
 - ◆ Type `userpfx.SELCTRN.ZZST2DAT.ESDS2` in the *DSN/Path* field.
- In the **Record Selection** section, activate the *Filter* option by entering a `/` in the left margin field.
- Enter **Q** (Quick Filter) in the *Filter* field.
- The *Start* and *For* fields may be used to restrict records eligible for selection by the filter, but for our example these options should be deactivated.

```

Figure 117. SELCOPYi - Specify Quick Filter.

Specifying Simple FILTER Selection Criteria

- Enter **7** in the *Limit* field to restrict the number of records selected.
- Enter **I** in the *Type* field to specify that selected records should be **included** in the copy process.
- Enter **1** into the *Position* column of table row 1 (this is the default).
- Enter **1** into the *Length* column.
- Enter **=** (equals) into the *ROp* (Relational Operator) column (this is the default).
Alternatively enter blank to get a list of available operators from which you may make your selection (by placing the cursor and pressing ENTER).
- Enter **3** into the *Value* column.
- Replicate table entry line 1 by typing **R** into the table prefix area (*000001*).
The *AND/OR* column will automatically set to **AND**.
- Enter **1** into the *Position* column of inserted table row 2 (this is the default).
- Enter **0** into the *Length* column of inserted table row 2 (this is the default). A length value of zero has a special meaning indicating the length of data from the start position to end of the record.
- Enter **<<** (contains) into the *ROp* (Relational Operator) column of inserted table row 2.
- Enter **blues** into the *Value* column.
 - ◆ For simple case-insensitive character strings there is no need to add quotes (this will be done automatically).
 - ◆ You may specify the string using **C'ABCD'** notation if case-sensitivity is required.
 - ◆ Hex strings may be specified using **X'1234'** notation.

Figure 120. SELCOPYi - Browse Output File.

Specifying brackets in the FILTER expression.

Multiple **AND/OR** conditions may be defined through the filter definition panel, but complex bracketed expressions may only be specified by manually modifying the FCOPY command generated by the panel.

For example, to select records based on the following complex filter criteria:

```
where position 1 = '3'
and
(   record contains "BLUES"           anywhere
  or record contains "ROCK 'N' ROLL" anywhere
  or record contains "SOUL"          anywhere
)
```

- Update the *Output File*:
 - ◆ Type **userpfx.SELCTRN.ZZST2DAT.ESDS3** in the *DSN/Path* field.
- Press **F6** (FILTER) to enter the filter definition panel.
- Type in the conditions as depicted in the following screen shot.

```

Figure 122. SELCOPYi - Generated Command.

Modify/Execute Generated FCOPY primary command

Brackets may now be added to the filter expression as required.

Although the filter expression is fairly free format, care must be taken to maintain a **backslash (\)** character in the right-most position of any newly added lines (the backslash character indicates that the command is continued on the following line). This is typically achieved by replicating, then modifying, existing lines rather than inserting new ones.

The modified FCOPY command may then be executed simply by placing your cursor on the first line of the command (beginning with the **less-than (<)** sign), then pressing the **ACTION** key, which by default is **F16** (Shift-F4).

You may also want to consider copying the generated command into your **HOME file**, saving it there for future repeat executions.

```

Figure 123. SELCOPYi - Modified Command.

Browse Output from Generated Command Window

You may wish to browse your output file before exiting (and discarding precious changes to) your generated FCOPY command. One handy way to do this is to:

1. Type the command **DSN B** on the command line (but do not press ENTER).
2. Place your cursor on the name of the dataset that you wish to browse, within the generated FCOPY command.
3. Press **ENTER**.

Alternatively, type the command **DSN** (without the **B**rowse option) to get a drop-down list of available utility functions including edit, delete and rename.

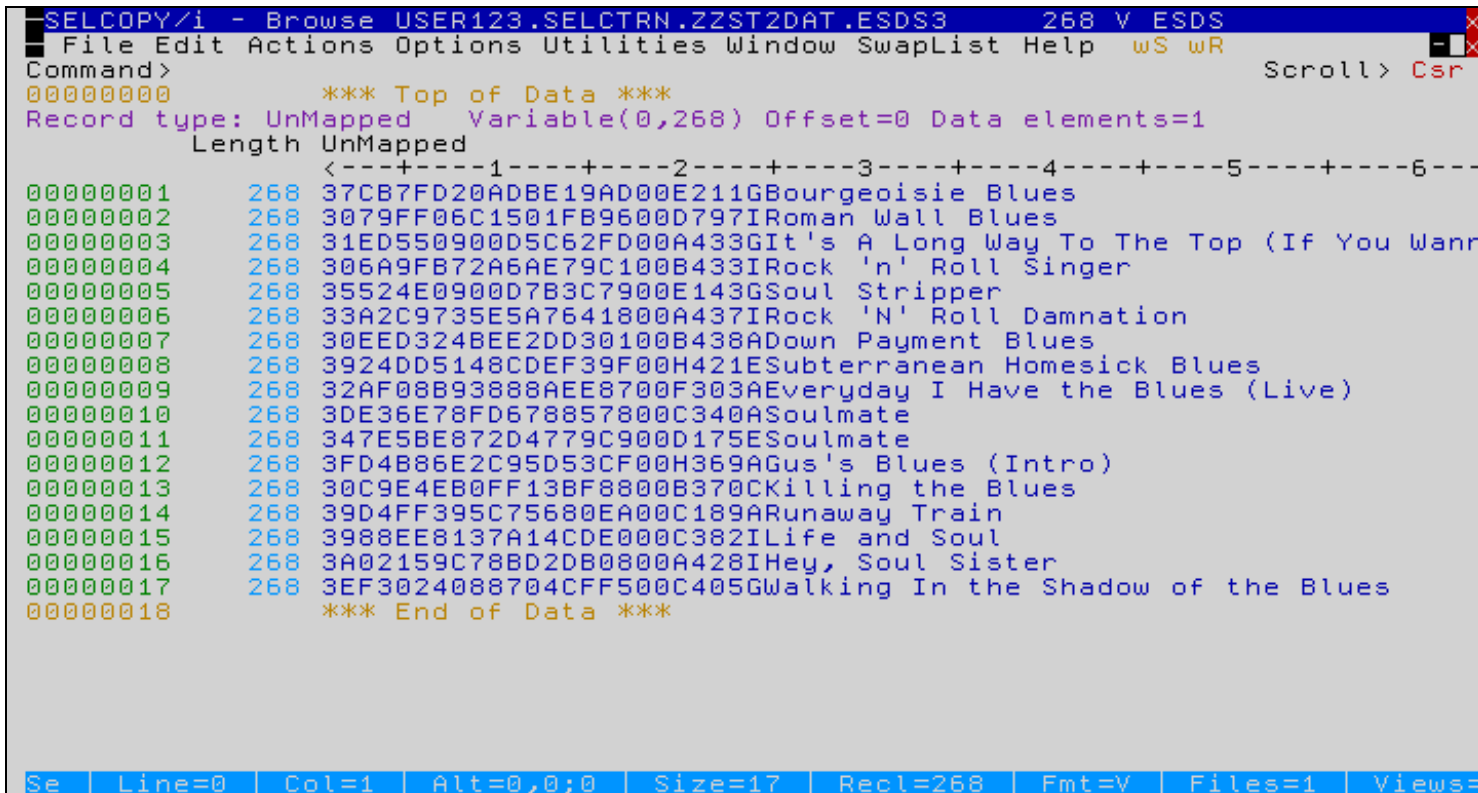

Figure 124. SELCOPYi - Browse Filtered Output File.

Reformat

The **FCOPY** utility may also be used to reformat records as they are copied to the output file.

Reformat requires use of two, similar but not identical, structures that define the layout of the input and output records, with each output field being sourced from the corresponding input field of the same name (within the same record-type).

Input and output fields for any given record-type may (but need not necessarily) be:

- in a different order
- a different length
- a different data-type

Additionally fields may exist in either input or output without existing in the other.

- Specify the *Input File*:
 - ◆ Type **userpfx.SELCTRN.ZZST1DAT** in the *DSN/Path Mask* field, where *userpfx* is your own user prefix.
- Specify the *Output File*:
 - ◆ Type **userpfx.SELCTRN.ZZST1DAT.FCOPY2** in the *DSN/Path* field.
- Select *Reformat using structure/copybook layouts* from the **Options** section of the FCOPY panel.

Figure 126. SELCOPYi - Input Copybook.

Use Input Copybook as Model

We'll now create an output copybook using a selection of the fields from the input copybook, but in a different order, and with some of the fields shortened.

- Press **F22 (Shift-F10)** to browse the input copybook. You should see that it has 18 records as below (assuming COBOL installation).
- Type **GO E** to switch from browse mode to text-edit.

Figure 132. SELCOPY/1 - Update Output Copybook.

Force Recompile of Updated Output Copybook (1)

If your structure/copybook file-id refers to a COBOL, PL1 or ADATA source file (not an SDO) then a compile step must be performed in order to turn the source copybook into SELCOPYi's own internal structure (SDO) format.

A temporary SDO will be created, lasting the duration of the SELCOPYi session, making subsequent reference to the same copybook during the session much faster by bypassing the compile stage.

If, however as in our case, the output copybook (or any of its included components) should be modified during the session, then a recompile of the source will normally be required.

For performance reasons **Recompile> N** (meaning no recompile should occur) is the default.

Specify **Recompile> Y** to force a copybook recompile each time the reformat process is executed.

Alternatively type the primary command:

```
SD DROP copybook_name
```

- Enter **Y** in the **Recompile** field for the Output Copybook.
- Press **ENTER** to repeat the reformat, using the updated copybook.

```

Option 6 - File Search/Update/Copy/Reformat (FSU)

The File Search/Update/Copy/Reformat utility allows you to:

- Globally search and optionally update multiple sequential, PDS/PDSE, GDG, HFS and/or VSAM data sets.
- Restrict PDS/PDSE library search/update/copy:
 - ◆ to members with names that match a member name mask
 - ◆ to members satisfying directory element selection criteria (e.g. select on timestamp, size, userid etc combinations)
 - ◆ to members selected by one or more previous searches.
- Specify an output file to which **all** input records will be copied regardless of whether record data has been changed.
- Apply a filter in order to restrict search/update/copy to records matching specific selection criteria.
- Search and optionally update uncataloged data sets by generic volume id.
- Specify the start record for search/update/copy operations.
- Restrict the number of records read for search/update/copy operations.
- Restrict the search/update operation to specific columns within the file records.
- Apply a **structure** (copybook) overlay to format **input** file records.
- Optionally restrict search/update to records assigned to specific record types, and specific fields within those record-types.
- For **Formatted File Search/Update**, optionally specify an output file **and** output structure (copybook) to reformat input record fields (i.e. alter field data type, re-order and/or delete fields).
- Update character data using different length search and update CHANGE strings.
- Control use of blank padding or blank absorption when character search and update CHANGE strings are of different length. Note that the CHANGE operation will fail if the length of the updated record is greater than the file's maximum record length.

Following File Search/Update/Copy/Remap execution, report output is generated in a structured format suitable for presentation to the user in an SDE window view.

During execution, a progress window is displayed which allows the user to interrupt processing at any point using the **Attention key**.

The File Search/Update (FSU) Panel

The FSU panel may be started using any of the following methods:

- Select option **6** from the **SELCOPYi** Primary Option Menu (=).
- At any primary command prompt type **=6**.
- At any primary command prompt type **FSU**.
- From any dataset, library or HFS path list window, use the **F** line-command.

```

Figure 136. FSU - File Search/Update (FSU) Panel (=5)

To follow the demonstration use the panel to search the supplied sample library for a the character string **"blues"** (case-insensitive).

- Specify the *Input Library*:
 - ◆ Type **userpfx.SELCTRN.ZZST5DAT** in the *DSN/Path Mask* field, where *userpfx* is your own user prefix.
 - ◆ The *Member Mask* field may be left blank in order to search all members of the input library. Alternatively type "" or a member mask of your choice.
 - ◆ The *Volume Mask* field should be left blank in this case, otherwise the input dataset list will be restricted to files residing on matching volumes only.
- Specify the *Search Options*:
 - ◆ Enter **EQ** in the *Relational Operator (Op)* field.
 - ◆ Type **blues** in the *String* field.
 - ◇ For simple case-insensitive character strings there is no need to add quotes (this will be done automatically).
 - ◇ You may specify the string using **C'ABCD'** notation if case-sensitivity is required.
 - ◇ Hex strings may be specified using **X'1234'** notation.
 - ◆ Enter **0** in the *Limit* field in order to display **all hits** in each member. Alternatively, enter **1** to display the first hit only.
- Press **ENTER** to run the search. For operations lasting more than a second, a progress window will be displayed with the report in the background, (continually updating at one second intervals).
- Long running processes may interrupted by pressing the **Attention key**.

Search Report Output (Standard 80-column Screen Width)

Following execution, the structured report output file is displayed as a formatted table view, with search matches displayed under the heading:

Record type: Hit

- The first record (Record type: Command) displays the following fields:

Field	Description
Timestamp	The date/time of execution.
Command	The FSU primary command generated by the panel.

- The second record (Record type: Summary) among other fields displays the following:

Field	Description
RecordsTot	The number of records processed.
FilesTot	The number of files/members processed.
Hits	The number of occurrences of the search value encountered.
RecordsHit	The number of records encountered with at least once occurrence of the search value.
FilesHit	The number of files/members encountered with at least once occurrence of the search value.

- For library searches on standard 80-column screens, view of the Hit records is restricted to two columns:

Field	Description
zMember	The name of the hit library member. zMember is a held field, meaning it will remain visible when the display is scrolled right.
zRecord	The contents of the hit record.

Displaying Additional Hit Information Fields

To view additional information fields that are normally suppressed from view on a narrow screen, place the cursor on the hit record of interest then press the ZOOMW key, **F17 (Shift-F5)**.

The chosen hit record will be displayed individually, in a separate **single-record (zoomed) format** window with the following additional fields made visible.

Field	Description
zDsn	The library dataset name.
zRecNo	The hit record number.
zHitNo	The hit record number within the file/member.
zLrecl	The logical record length of the hit record.
zHits	The number search value occurrences within this hit record.

Press **F3** to return to the table view.

```

Figure 139. FSU - Edit Hit Member

Adjusting Report Table View

If you wish to display suppressed fields while in table view, you may use the **SELECT** primary command as depicted below.

Note that, by default, the **SELECT** command operates on the **focus record-type** (i.e. the record at the top of the screen, or at the cursor if it is placed in the file-area).

To avoid this complication add **"FROM HIT"** to your usual **SELECT** primary command. e.g.

```
select zMember,zRecNo hold, zRecord from Hit
```

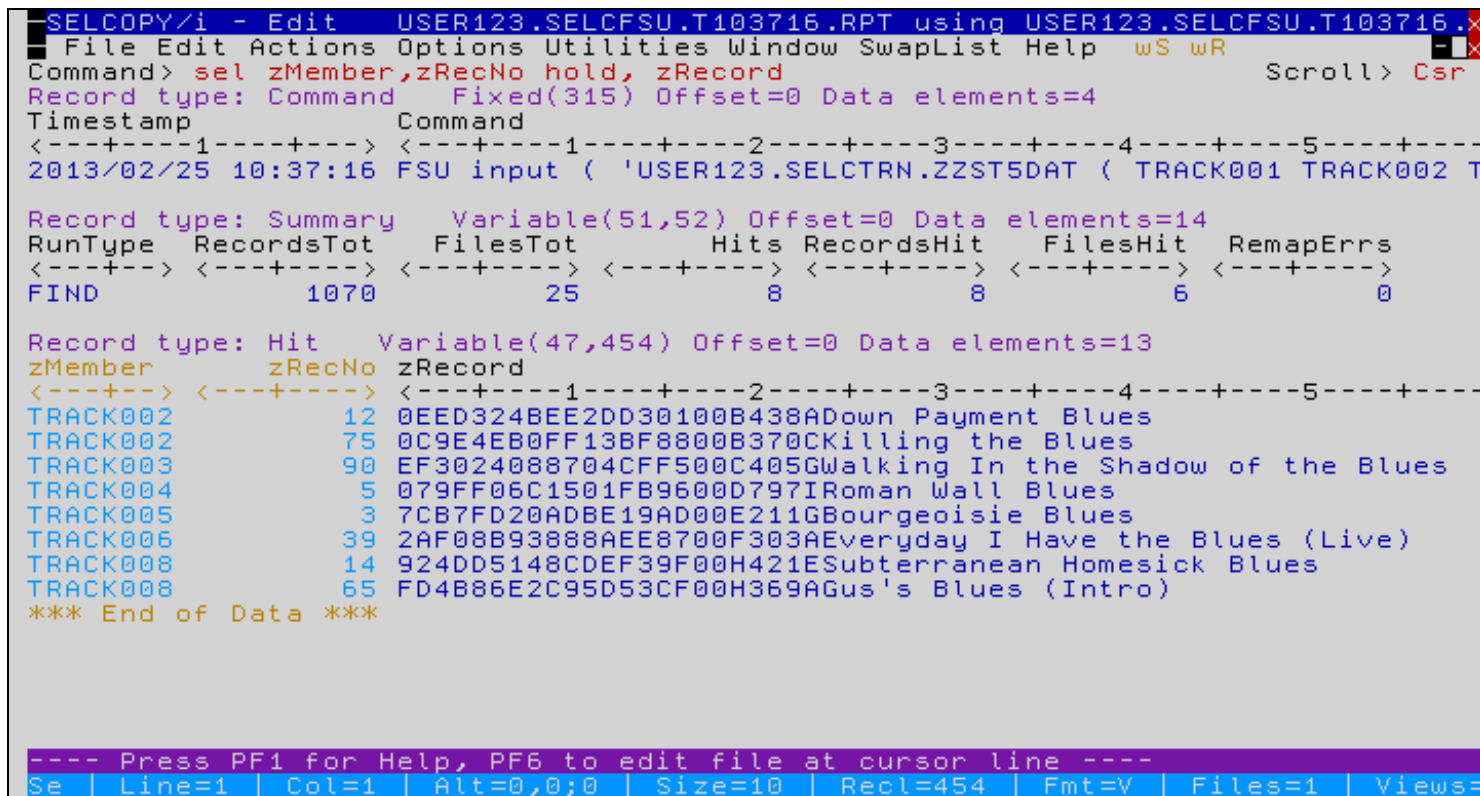

Figure 140. FSU - Report with Tailored SELECT

Selecting Library Members for Search/Update

At the Search/Update front panel, if input refers to a library and the **Member Mask** field is either left blank, or includes wildcard characters, then by default **all** member mask matches will be processed, without the need to confirm via a member selection list.

However, you may press the SELECT key **F5** to access the member selection list, when required.

Initially all members matching the mask will be selected.

Manual selection for individual members is made by removing/adding "S" in the **Sel** column.

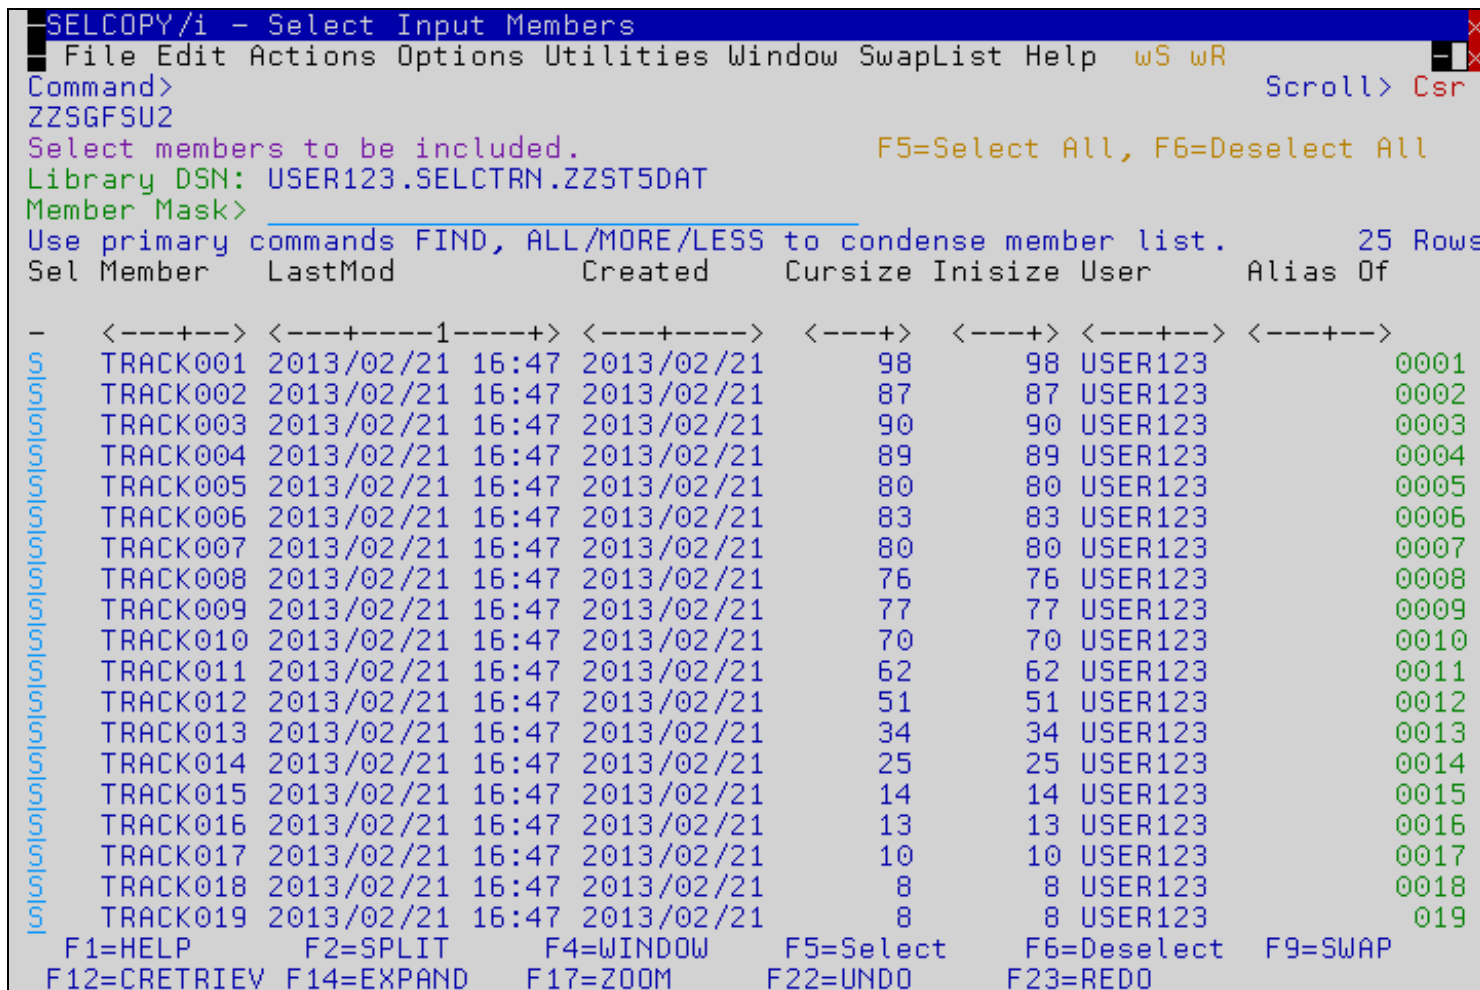

Figure 141. FSU - Member Selection List

Condensing Selected Members by Timestamp/Size/Userid

Listed members will be **active in the Search/Update process** provided **both** of the following are true.

1. The list entry is **selected**.
2. The list entry is **not excluded**.

List entries may be **selected/deselected** as follows:

1. Individually, by entering or removing **"S"** from the **Sel** column.
2. On mass, by pressing **F5/F6**, which will select/deselect, all entries.
Note: **Excluded** entries are not affected by pressing F5/F6.

List entries may be **included/excluded** as follows:

1. By entering **"X"** and other related "line-commands" into the numeric area at the right-hand side, as if working in an edit environment.
2. Using the **ALL**, **MORE** and **LESS** primary commands with an associated selection criteria **expression**.

Option	Action
ALL	Includes only entries satisfying the expression.
MORE	Additionally includes entries satisfying the expression.
LESS	Excludes entries satisfying the expression.

- **ALL** with no parameters will re-include all list entries. **LESS** with no parameters will exclude all list entries.

Excluded entries are represented in the display by **shadow-lines**.

Type primary command **HIDE** to suppress display of shadow-lines, and **RESET HIDE (RES H)** to redisplay them.

Examples:

- To include only members whose last modified date is in the range **2010/05/01** to **2010/12/12**, type:
`all LastMod >= 2010/05/01 & LastMod < 2011`
- To exclude all members whose current size is zero records, type:
`less CurSize=0`
- To reinclude all excluded members whose last modified userid is **USER123** or begins with **USER321**, type:
`more user=user123 | user >> user321`

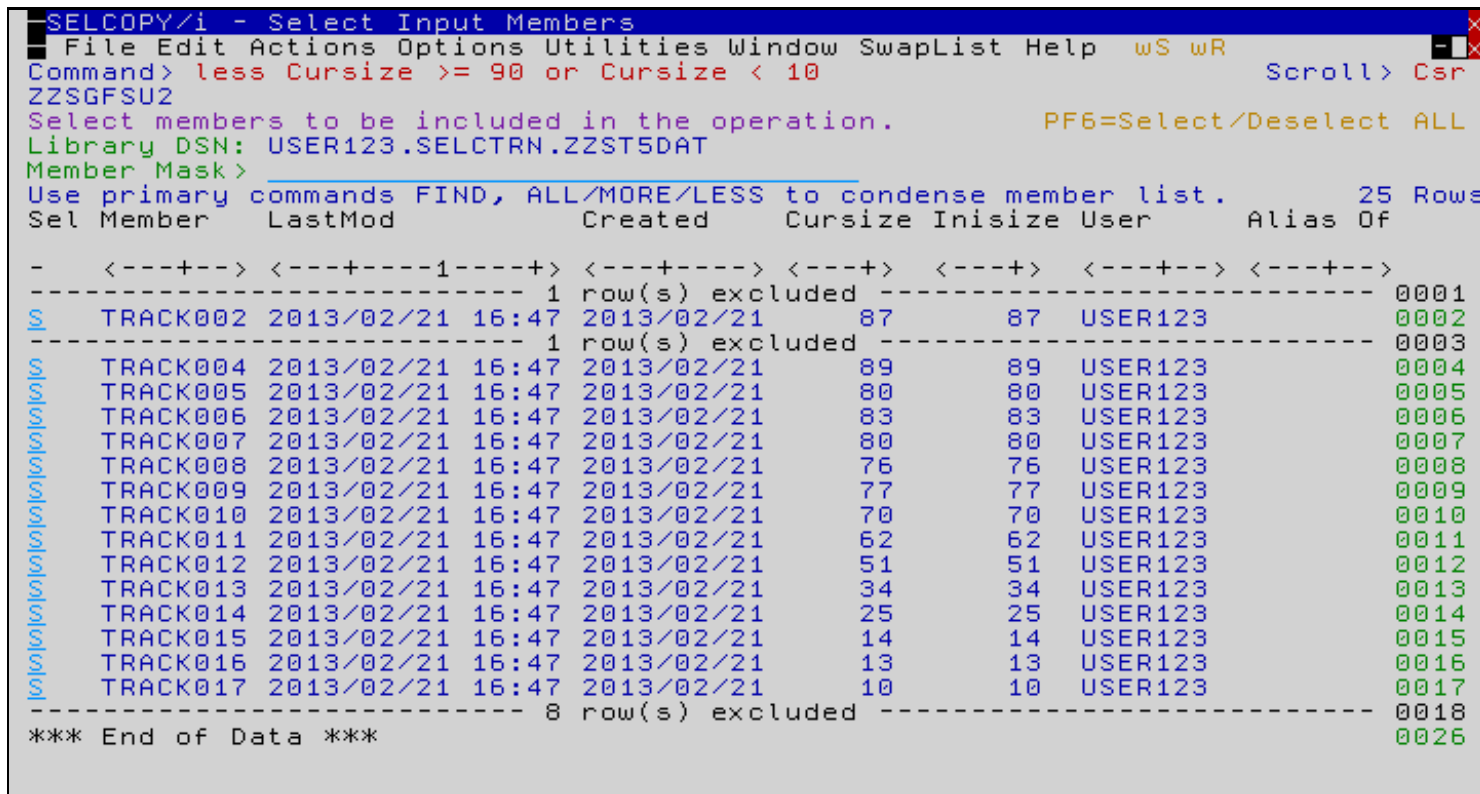

Figure 142. FSU - Member Selection (ALL/MORE/LESS)

Condensing Selected Members using FIND

The FIND panel is displayed when primary command **FIND (F)** is executed from a member selection list and may be used to condense the list of selected members. Only those members that contain at least one record which satisfies the find operation are selected for subsequent processing.

Following execution of the find operation, the FIND panel remains open to allow further find/condense operations on the list of remaining members.

To follow the demonstration use the panel to pre-select members containing the string **"soul"** (case-insensitive).

- Type **soul** in the *Find string* field.
 - ◆ For simple case-insensitive character strings there is no need to add quotes (this will be done automatically).
 - ◆ You may specify the string using **C'ABCD'** notation if case-sensitivity is required.
 - ◆ Hex strings may be specified using **X'1234'** notation.
- Enter **1** in the *Limit* field in order to display the first hit only. Since the purpose of running the FIND is only to condense the member selection list for a subsequent search, then establishing the presence of more than one hit would be wasteful.
- Enter **Yes** in the *View report* field in order to display the FIND report. This will allow us to use the **F6** facility from the report to edit the hit member. Set this option to **No** if you are not interested in the detail.
- Enter **Yes** in the *Condense member list* field so that, for subsequent FSU operations, any member without at least one search match will be deleted from the selection list.

Press **ENTER** to execute the search.

Figure 146. FSU - Condensed Member Search Results"

Option 12 - DB2

DB2 support is included as a standard component of the SELCOPYi program. i.e. it is not a separately licensable product.

As well as browsing and editing DB2 tables, SELCOPYi provides tools to

- issue DB2 commands,
- execute SQL,
- list DB2 objects with extended functionality,
- create DB2 object (Tables, Indexes etc) using "wizard" style dialogs to generate SQL,

Focusing on table edit, during this section you will learn about:

- *Setting up sample DB2 Tables*
- *Display of DB2 Table detailed Information (INFO)*
- *DB2 Table Edit*
- *Editing selected table rows (using the "WHERE" dialog)*
- *Editing Related Tables (REDIT)*
- *Generating CSV or XML from selected table rows/columns*
- *Handling Relational Constraint Errors*

Setting up sample DB2 Tables

SELCOPYi will create some sample DB2 Tables for you.

Note: The feature to generate personal copies of the training tables will be formally introduced with SELCOPYi 3.20 at PTF level RS32007.

To check your current software level, type the primary command "**ABOUT**".

In the meantime, an email containing a REXX macro that will generate your sample tables, is available from CBL on request (support@cbl.com).

Note also that the **DB2 Relational Table Edit (REDIT)** facility, that features heavily in this section, was introduced with SELCOPYi 3.20 at PTF level RS32006.

The table data will be copied from your own SELCOPYi sample datasets (See chapter "Setup Training Material") and represents a simple recorded music collection.

The sample database comprises a hierarchy of **Artist**, **Album** and **Track** table rows.

To create your own personal tables, allowing you to follow the training manual in real time, first select option **12** from the main SELCOPYi Primary Options Menu to display the **DB2 Primary Options Menu** as shown below.

If necessary fill in the name of the **DB2 Subsystem** and your **SQLID** in the enterable fields.

A further optional check box may be selected to request that SELCOPYi DB2 auditing should occur. Audit of DB2 table edit views is managed separately and is not affected by this check box setting. If **Create Audit File** is selected, an audit log file will be allocated immediately before attempting to connect to the DB2 subsystem and closed when the connection is dropped.

Figure 147. SELCOPYi DB2 Figure 01

Setting up sample DB2 Tables (2)

- Select option **T - Setup DB2 Training Material**.

A new panel will be displayed as shown below.

- Enter the name of a DB2 Database in which you wish to create the sample tables.

This option defaults to your **current SQLID**.

If the database does not already exist, then it will be created using DB2 defaults and **CCSID EBCDIC**.

- Press **ENTER** to start the setup procedure.

While the setup is running you can expect the screen to update a few times, and for a number of messages to appear and disappear.

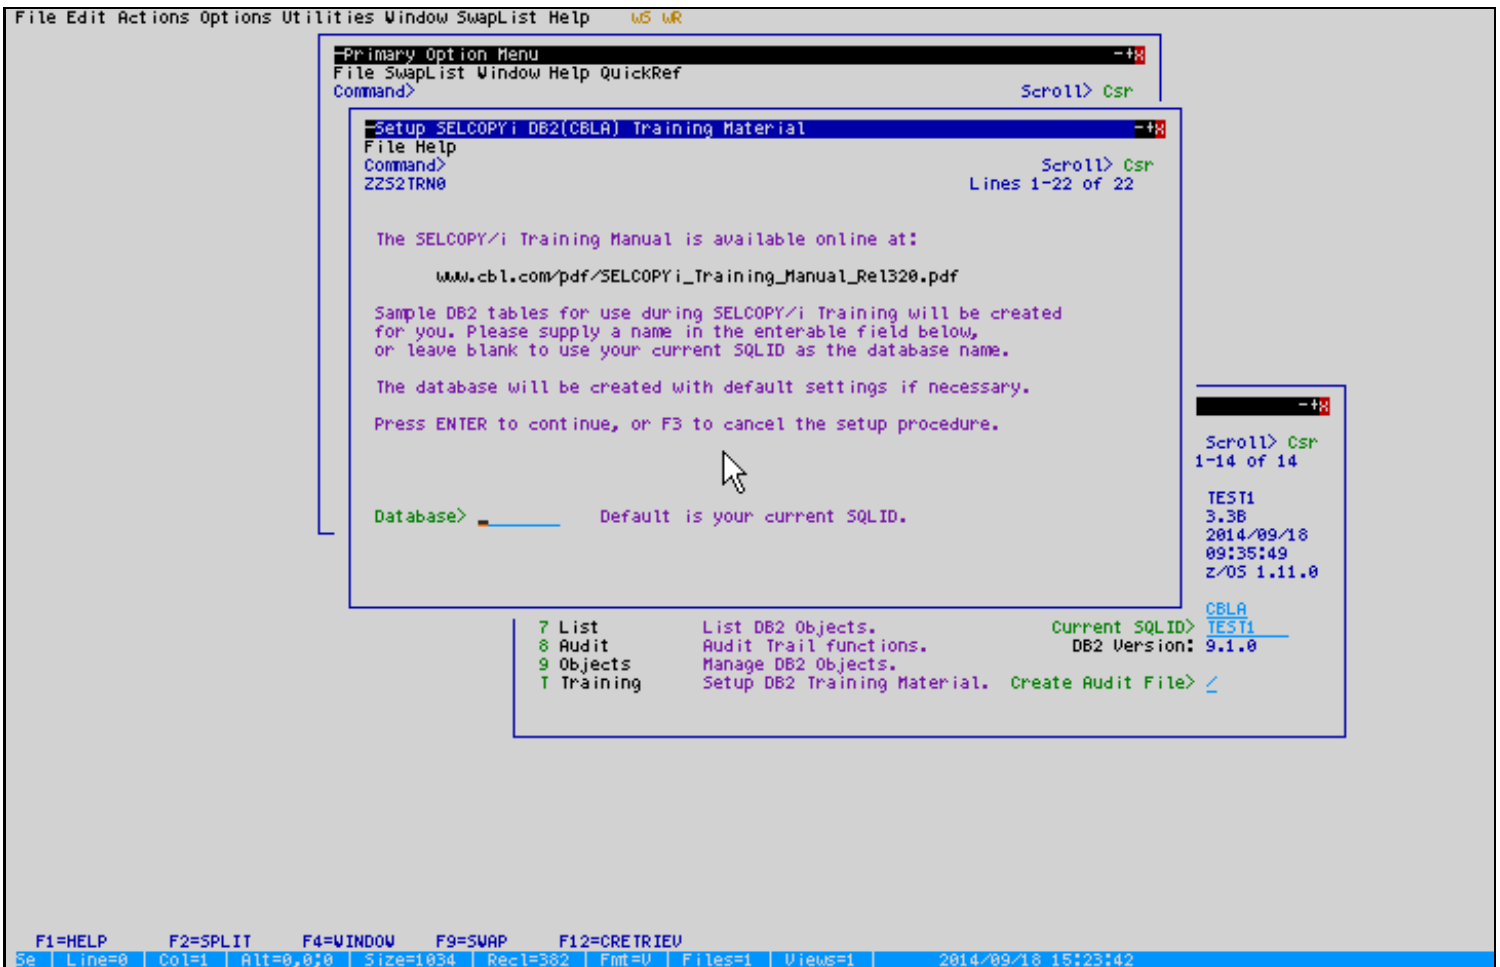

Figure 148. SELCOPYi DB2 Figure 02

- Eventually, provided no serious errors occur, you should expect to see the following message box.

```

Setting up sample DB2 Tables (3)

- The sample tables will be displayed in a "List Tables" window, as shown below.
- "List" windows to display tables, and many other DB2 objects, may be opened by selecting **Option 7** from the DB2 Primary Options Menu.

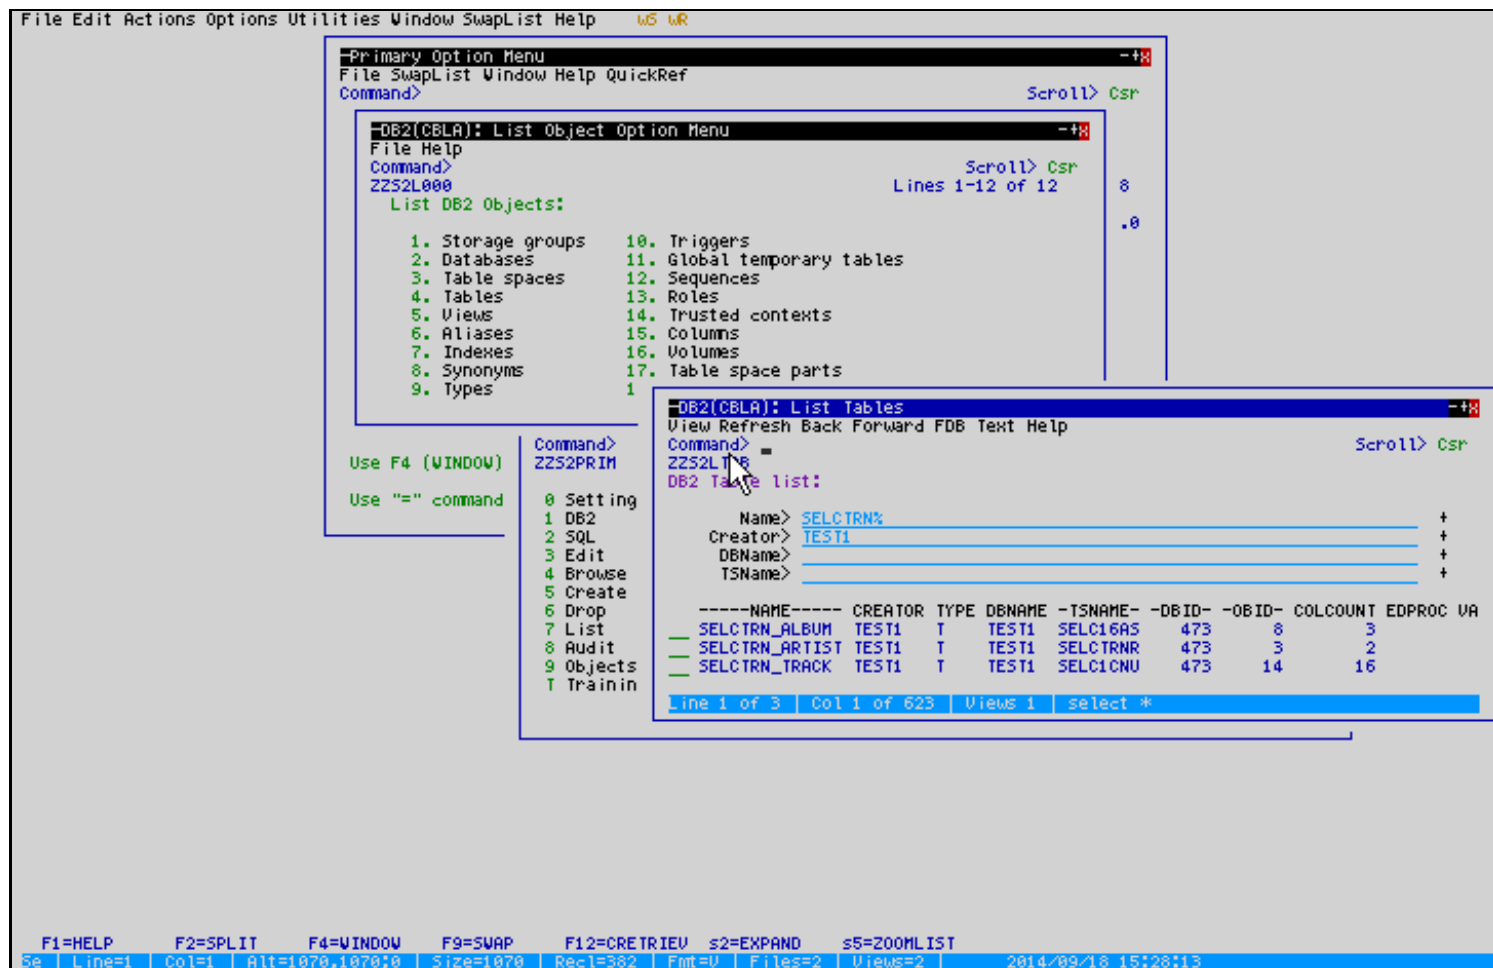

Figure 149. SELCOPYi DB2 Figure 03

DB2 Table Information

- At the "List Tables" window, enter "/" (forward slash) in the prefix area for table *sqlid.SELCTR_N_ALBUM* (the first table in the list).

A popup window will be displayed detailing all of the line-commands available to this type of object list.

- Place your cursor anywhere on the "I - Table Information" entry in the popup list, then press ENTER.

Alternatively, enter the "I" line-command directly into the prefix area for table *sqlid.SELCTR_N_ALBUM*.

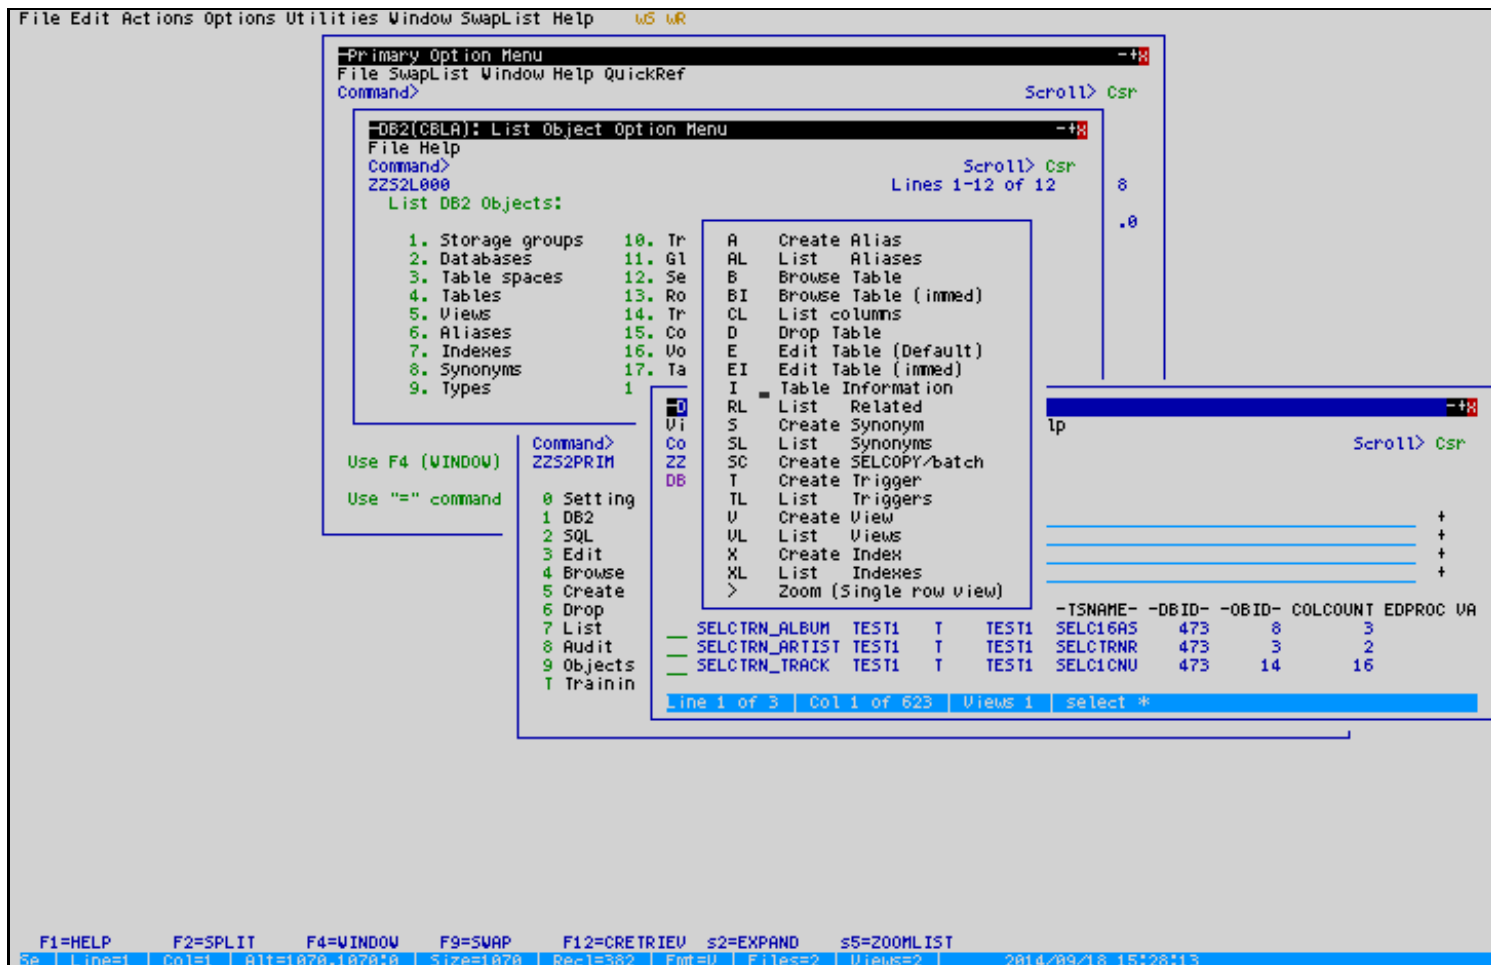

Figure 150. SELCOPYi DB2 Figure 04

DB2 Table Information (2)

- An **HTML** document window will display detailed information about the selected DB2 table.
 - Underlined text denotes a **hyperlink** to other significant parts of the document.
- Use the **TAB** key to move the cursor immediately to the next/previous hyperlink.
- With your cursor on a link, press **ENTER** to make the jump.
- Press **F3** repeatedly to return from any number of nested hyperlink jumps.

The screenshot displays a DB2 command window with the following content:

DB2 Table Information (3)

- Place your cursor on the link for "**Referential constraints:**" then press ENTER.
- We can see that **SELCTR_N_ALBUM** has both
 - ◆ a **parent** table (SELCTR_N_ARTIST), and
 - ◆ a **child** table (SELCTR_N_TRACK).
 and that the **Delete Rule** is **Restrict** in both cases.
- Press **F3** to exit the Table Information window and return to the Table List.

Figure 151. SELCOPYi DB2 Figure 05

DB2 Table Edit

- In the prefix area for table **SELCTRN_TRACK** enter the line-command "E" to start the DB2 Edit Table dialog.

Since "E" is the default line-command, you can actually just place your cursor anywhere on the line and press **ENTER**, or select it by double-clicking with your mouse.

- The DB2 Table edit dialog will appear with the selected table name already filled in.

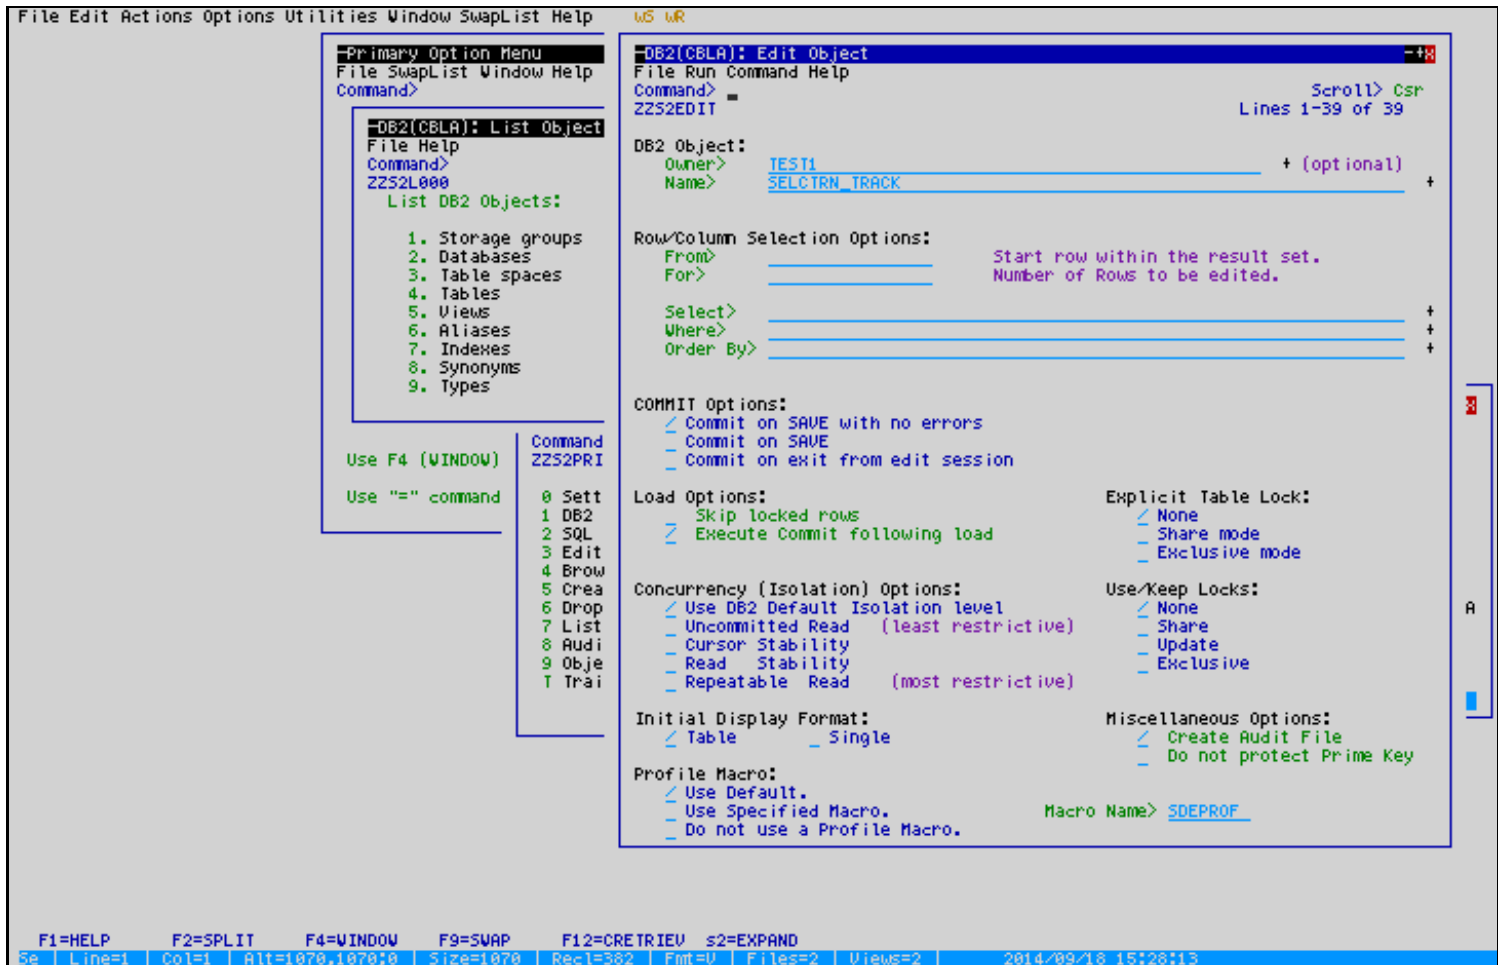

Figure 152. SELCOPYi DB2 Figure 06

DB2 Table Edit (2)

- Ensure that none of the **Row/Column Selection Options** are set, then press **ENTER** to edit the **TRACK** table.
- The table will be displayed in default multi-row format.

Scroll up/down using **F7/8** to view and edit further rows.
 Scroll left/right using **F10/F11** to view and edit further columns.

- Type the **INFO** primary command to display detailed information about the currently edited DB2 table.
- All the power of the SELCOPYi **Data-Editor** is now at your finger tips.

e.g. to open another separately scrollable view of te same table just type the primary command **WIN NEW** or **WW**.

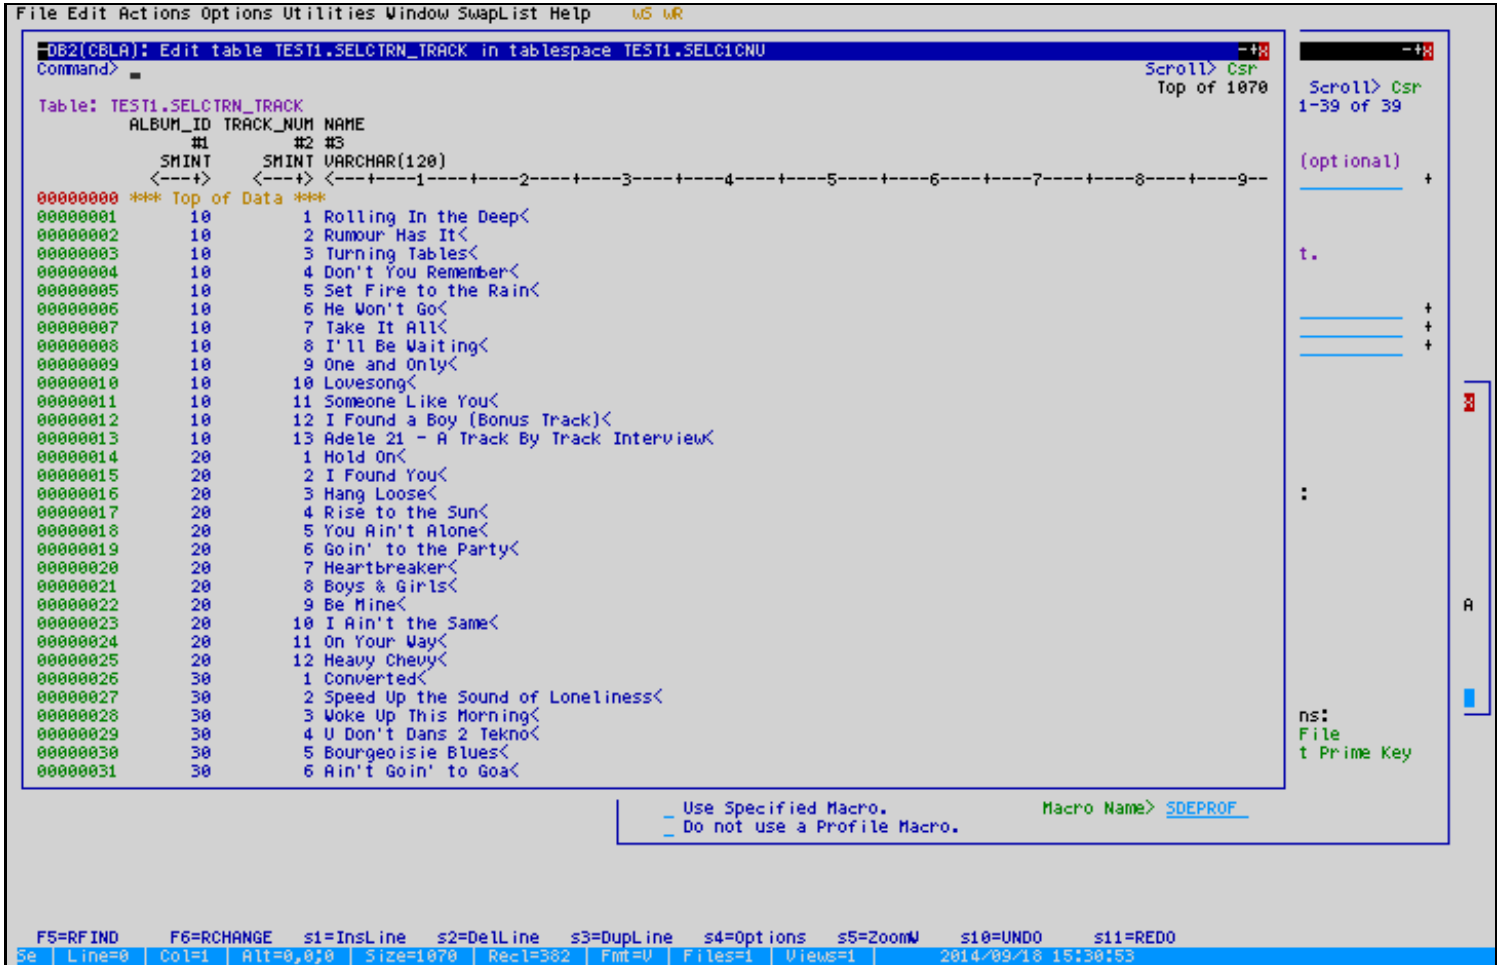

Figure 153. SELCOPYi DB2 Figure 07

The Zoom Window

- With your cursor anywhere on a particular row, press the "ZoomW" key (Shift-F5) to open a separate window displaying the selected row in "zoomed" format.
- Additional DB2 specific column attribute information is displayed in a zoomed view.
Type primary command "HELP COLATTR" (H COLA) for more details on the content of these columns.
- Any number of zoomed view windows may be opened at the same time, then moved/resized as desired, making visual comparison of multiple rows beautifully simple.

The screenshot shows a DB2 command window with two panes. The main pane displays a table named TEST1.SELCTR_TRACK with columns ALBUM_ID, TRACK_NUM, and NAME. The data is presented in a grid format with column headers and row numbers. The second pane, titled 'Zoomed View', shows a detailed view of row 00000005, including column names, types, lengths, and values. The zoomed view also includes a table of column attributes (Ref, Column, Type, PKUIFCND, Length, Value) for the selected row.

Ref	Column	Type	PKUIFCND	Length	Value
#1	ALBUM_ID	SMINT	f	10

Figure 154. SELCOPY: DB2 Figure 08

Editing selected table rows

- Press **F3** to exit the edit session and return to the Table Edit dialog.
- Table rows may be selected for browse/edit using an SQL **"WHERE"** clause.
- Either type the clause directly into the enterable field e.g.
Where> NAME LK '%Blues%' OR NAME LK '%Soul%'
 or invoke the "WHERE" dialog by entering "?" in the field.

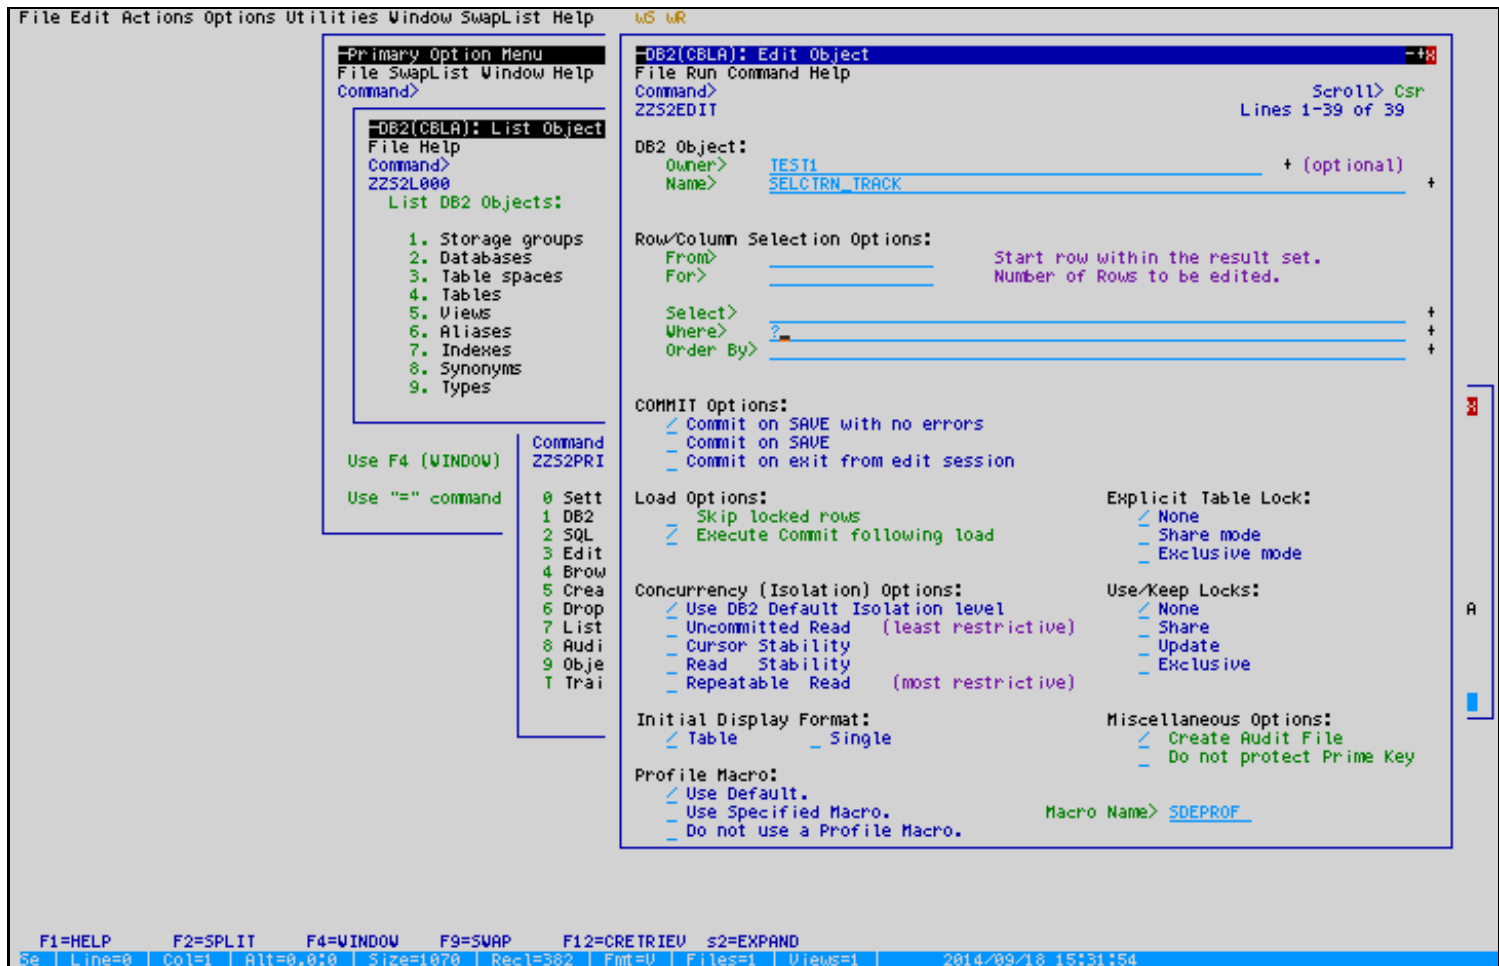

Figure 155. SELCOPY: DB2 Figure 09

Using the "WHERE" dialog

The "WHERE" dialog allows you to enter one or more row selection conditions against each of the listed table columns.

As an exercise we'll select all **TRACK** rows that have the string "Live", either in **round-** or **square-brackets**.

We'll also make the selection **case insensitive**.

Once we've selected the rows, we'll standardise by changing all the **square-bracketed** versions to use **round-brackets**.

- Place your cursor in the **Op** (Relational Operator) input field for table column "**NAME**", then enter "/" and press ENTER to display a list of valid operators.
- Select **LK** (Like) from the list by placing the cursor and pressing ENTER. Alternatively, just enter "**LK**" directly into the **Op** field.
- Tab to the **Value** input field, then enter "%(Live)%". There is no need to put the value in quotes, SELCOPYi will add them for you.
- Tab again to the **VO** (Value Option) input field, then enter "/". Select "**A - Any Case**" to indicate case insensitivity.
- Use the **Back-Tab** key to get to the numeric prefix area then enter "**R**" to replicate the dialog table row for "**NAME**". Now we can enter a second condition based on the contents of this DB2 table column.
- On the duplicate line, change the **Con** (Connector) field from "**AND**" to "**OR**", then enter "%[Live]%" in the **Value** input field.

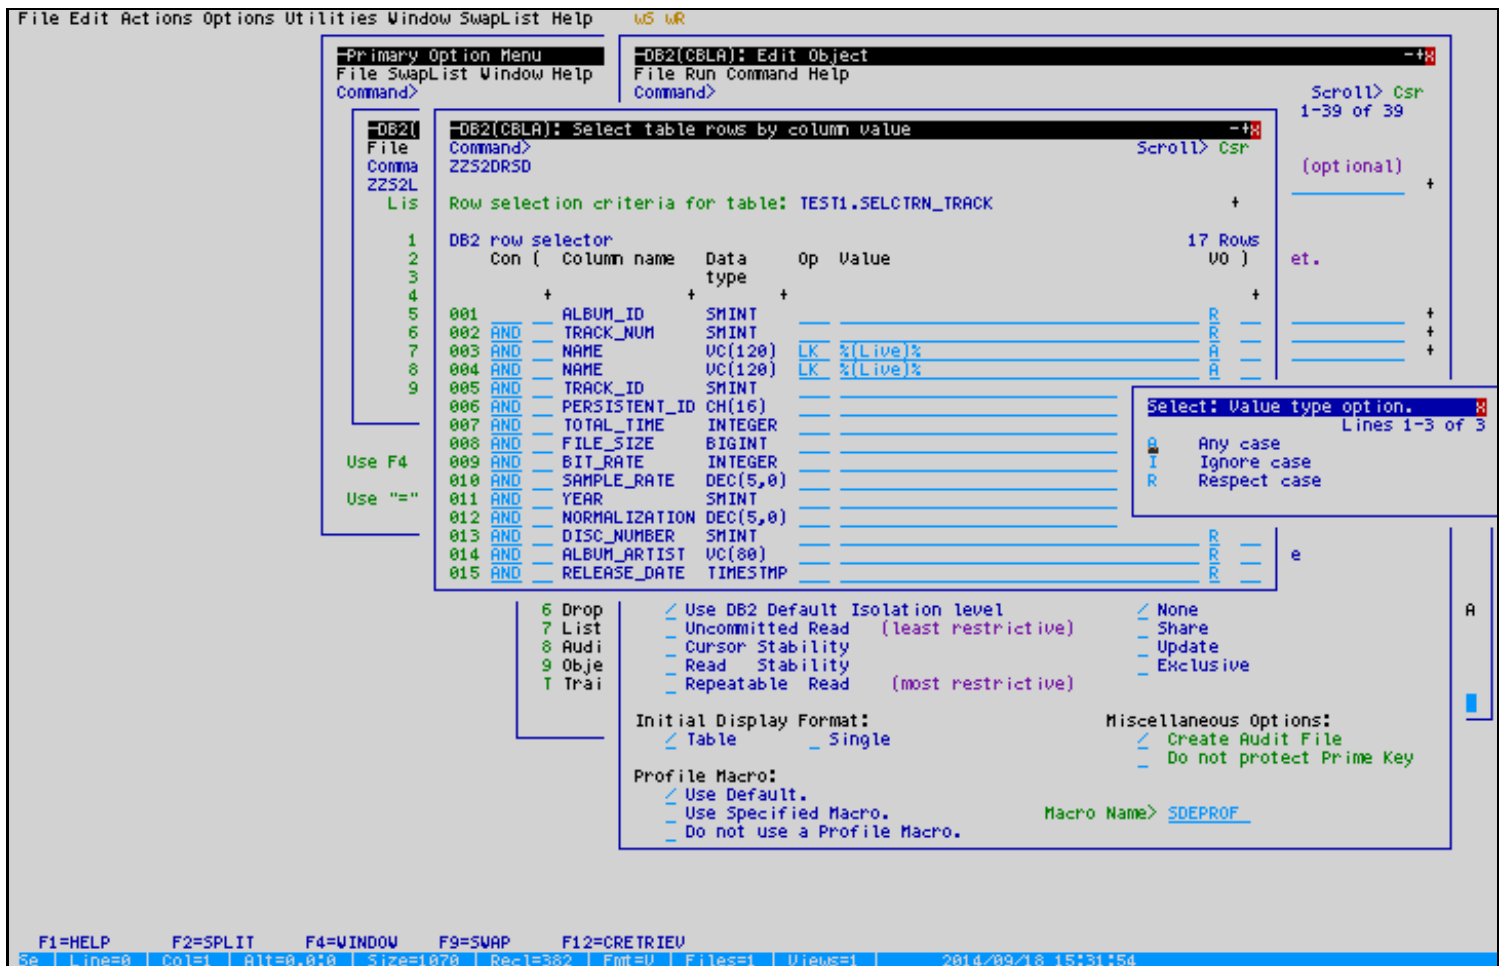

Figure 156. SELCOPYi DB2 Figure 10

Using FIND/CHANGE

- Press **F3** to exit the WHERE dialog and edit the selected rows.
- Type **FIND [LIVE]** to hilite the square-bracketed versions of the string.
- Type **CHANGE ALL [LIVE] '(Live)'** to update them all to use round-brackets.

Note that the CHANGE command requires that the string "(Live)" is enclosed in quotes, whereas "[Live]" needn't be. That is because **round-brackets** have a special meaning when used in **FIND/CHANGE** command syntax (type "HELP CHANGE" for more info).

- Press **F3** to exit and save changes.

Editing Related Tables (REDIT)

- At the "List Tables" window, enter "EI" (Edit Immediate) in the prefix area for table *sqlid.SELCTRN_ARTIST*.
- The "EI" and "BI" (Browse Immediate) line-commands bypass the dialogs that allow you to specify row selection and other edit/browse options, making them suitable only for tables small enough to be loaded completely into available storage.

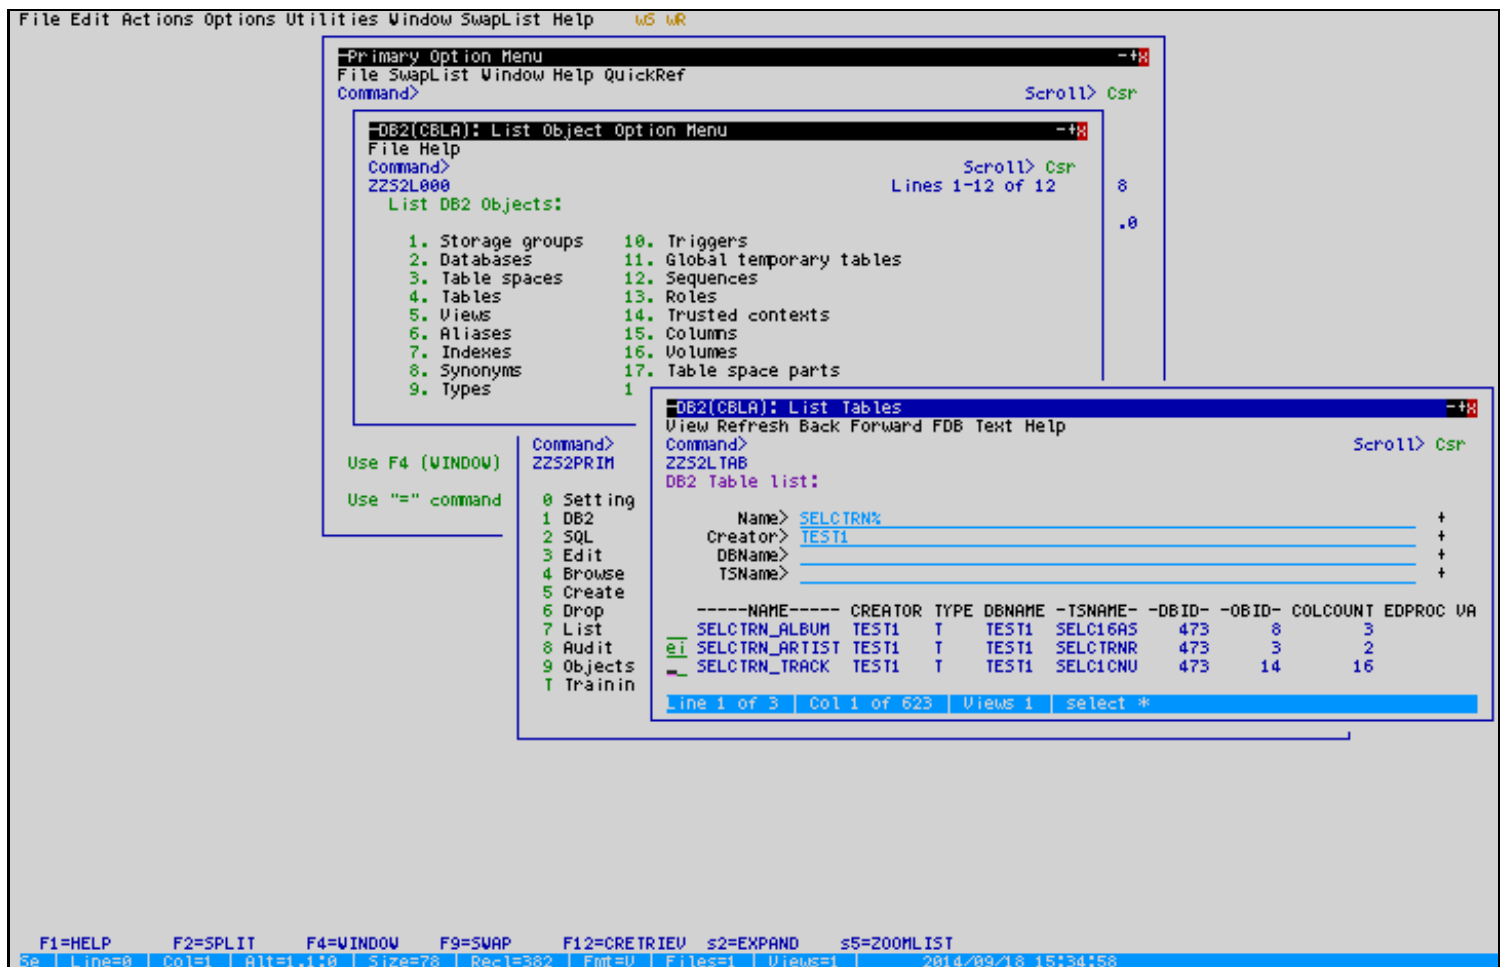

Figure 158. SELCOPYi DB2 Figure 12

The "RE" line-command

- To explore the Artist "Alanis Morissette" enter "RE" in the prefix area.

The screenshot shows the DB2 Command Editor interface. The main window displays the table `TEST1.SELCTR_ARTIST` with columns `ID`, `NAME`, `#1`, and `#2`. The data is presented in a grid format with column headers and row numbers. The artist "Alanis Morissette" is highlighted at row 40. The command `RE` is entered in the prefix area, and the results are filtered to show only rows where the name contains "Morissette".

ID	NAME	#1	#2
00000001	Adele<	10	
00000002	Alabama Shakes<	20	
00000003	Alabama 3<	30

00000029	Journey<	290	
00000030	Judas Priest<	300	
00000031	Kosheen<	310	

The command editor also shows a table with columns `PE`, `DBNAME`, `-TSNAME-`, `-DBID-`, `-OBID-`, `COLCOUNT`, and `EDPROC VA`. The data is as follows:

PE	DBNAME	-TSNAME-	-DBID-	-OBID-	COLCOUNT	EDPROC VA
TEST1	SELCL6AS		473	8	3	
TEST1	SELCTRNR		473	3	2	
TEST1	SELCL1CNU		473	14	16	

The status bar at the bottom indicates the current session details: `F5=RFIND F6=RCHANGE s1=InsLine s2=DelLine s3=DupLine s4=Options s5=ZoomW s10=UNDO s11=REDO` and the timestamp `2014/09/18 15:35:19`.

Figure 159. SELCOPY: DB2 Figure 13

The Related Tables List

- A separate window will appear listing the all related tables.
- The **ARTIST** table has only one dependent (child), the **ALBUM** table.
- Enter **"RE"** in the list entry prefix area (or just select it with the mouse).

The screenshot shows a DB2 command window with three overlapping windows:

- Left Window:** Displays the structure of the `TEST1.SELCTR_ARTIST` table. It lists columns `ID` and `NAME`, and shows a list of artists with their IDs (e.g., 10 Adele, 20 Alabama Shakes, etc.).
- Top-Right Window:** Displays the 'List Related Tables' utility. It shows the owner `TEST1` and the table name `SELCTR_ARTIST`. Below, it lists related tables with columns: `Sel`, `Related Table`, `Relationship`, `Relationship Type`, `Foreign Key Rule`, `Delete`, and `Enforced by DB2`. A single row is shown: `TEST1 SELCTR_ALBUM ALBUMR1 DEPENDENT 1 Restrict Yes`.
- Bottom-Right Window:** Displays a table with columns: `PE`, `DBNAME`, `-TSNAME-`, `-DBID-`, `-OBJID-`, `COLCOUNT`, and `EDPROC VA`. The data rows are:

PE	DBNAME	-TSNAME-	-DBID-	-OBJID-	COLCOUNT	EDPROC VA
	TEST1	SELCL16AS	473	8	3	
	TEST1	SELCTRNR	473	3	2	
	TEST1	SELCL1CNU	473	14	16	

The bottom status bar shows: `F1=HELP F2=SPLIT F4=WINDO W F5=Select F6=Deselect F9=SWAP F12=CRETRIEU s2=EXPAND s5=ZOOM s10=UNDO s11=REDO` and the timestamp `2014/09/18 15:35:19`.

Figure 160. SELCOPYI DB2 Figure 14

Related Table Edit Window (1)

- A separate edit window will display only the **ALBUM** rows for **Alanis Morissette** (ARTIST_ID = 40).
- To explore the album "**Jagged Little Pill**" enter "**RE**" in the prefix area.

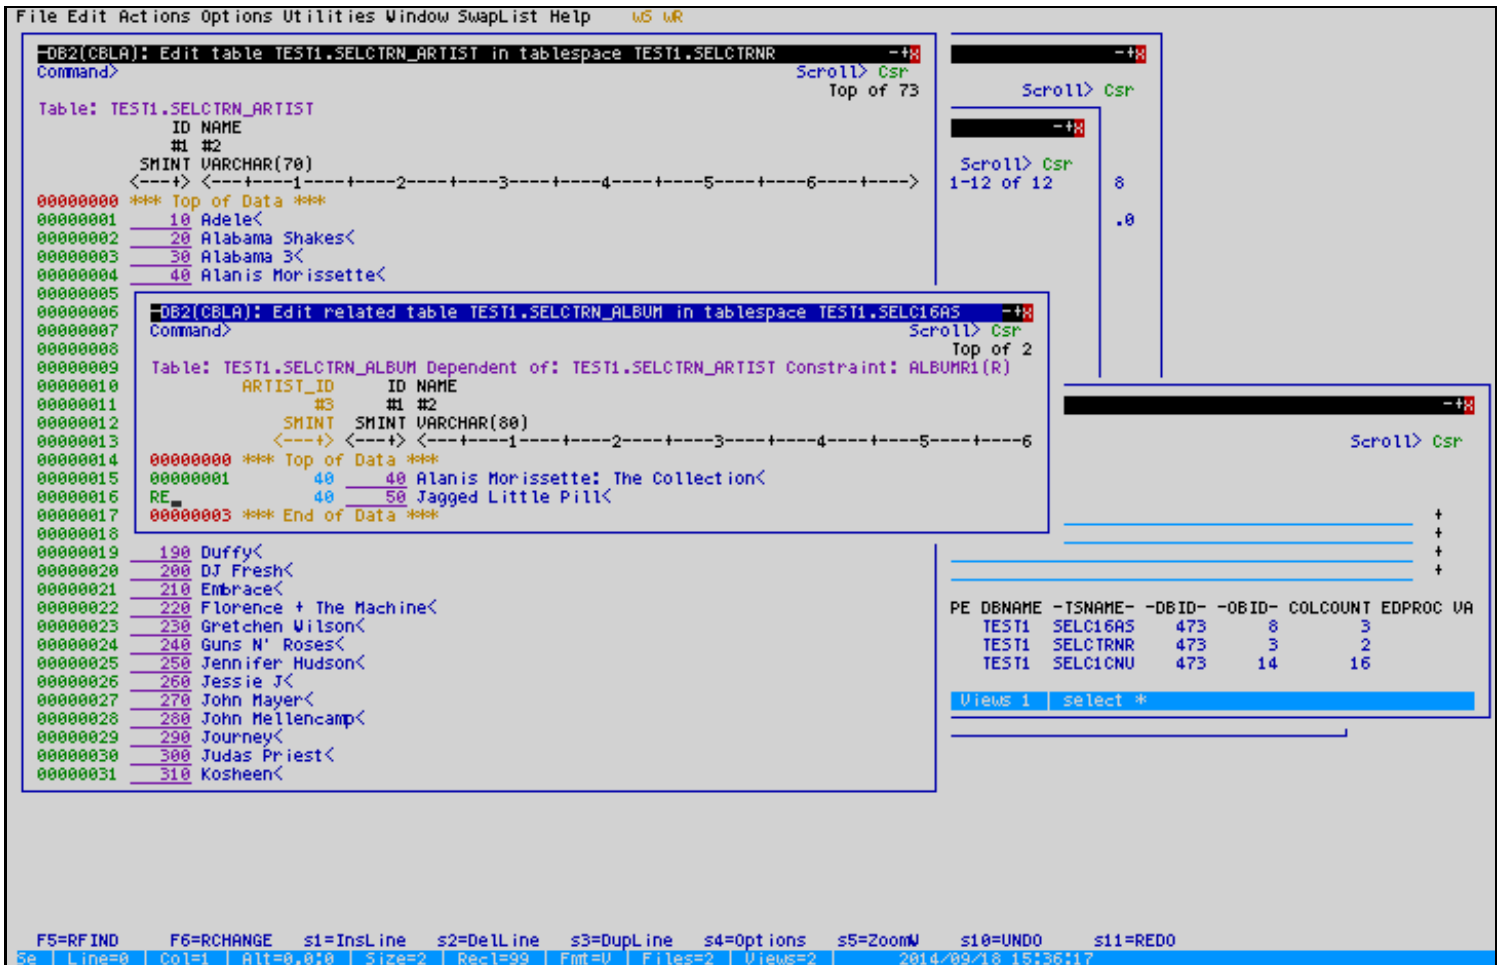

Figure 161. SELCOPY: DB2 Figure 15

Related Table Edit Window (2)

- A separate window will once again appear listing the all related tables.
- The **ALBUM** table again has only one child, the **TRACK** table.
- Enter **"RE"** in the list entry prefix area (or select it with the mouse).
- A separate edit window will display only the **TRACK** rows for **Jagged Little Pill** (ALBUM_ID = 50).

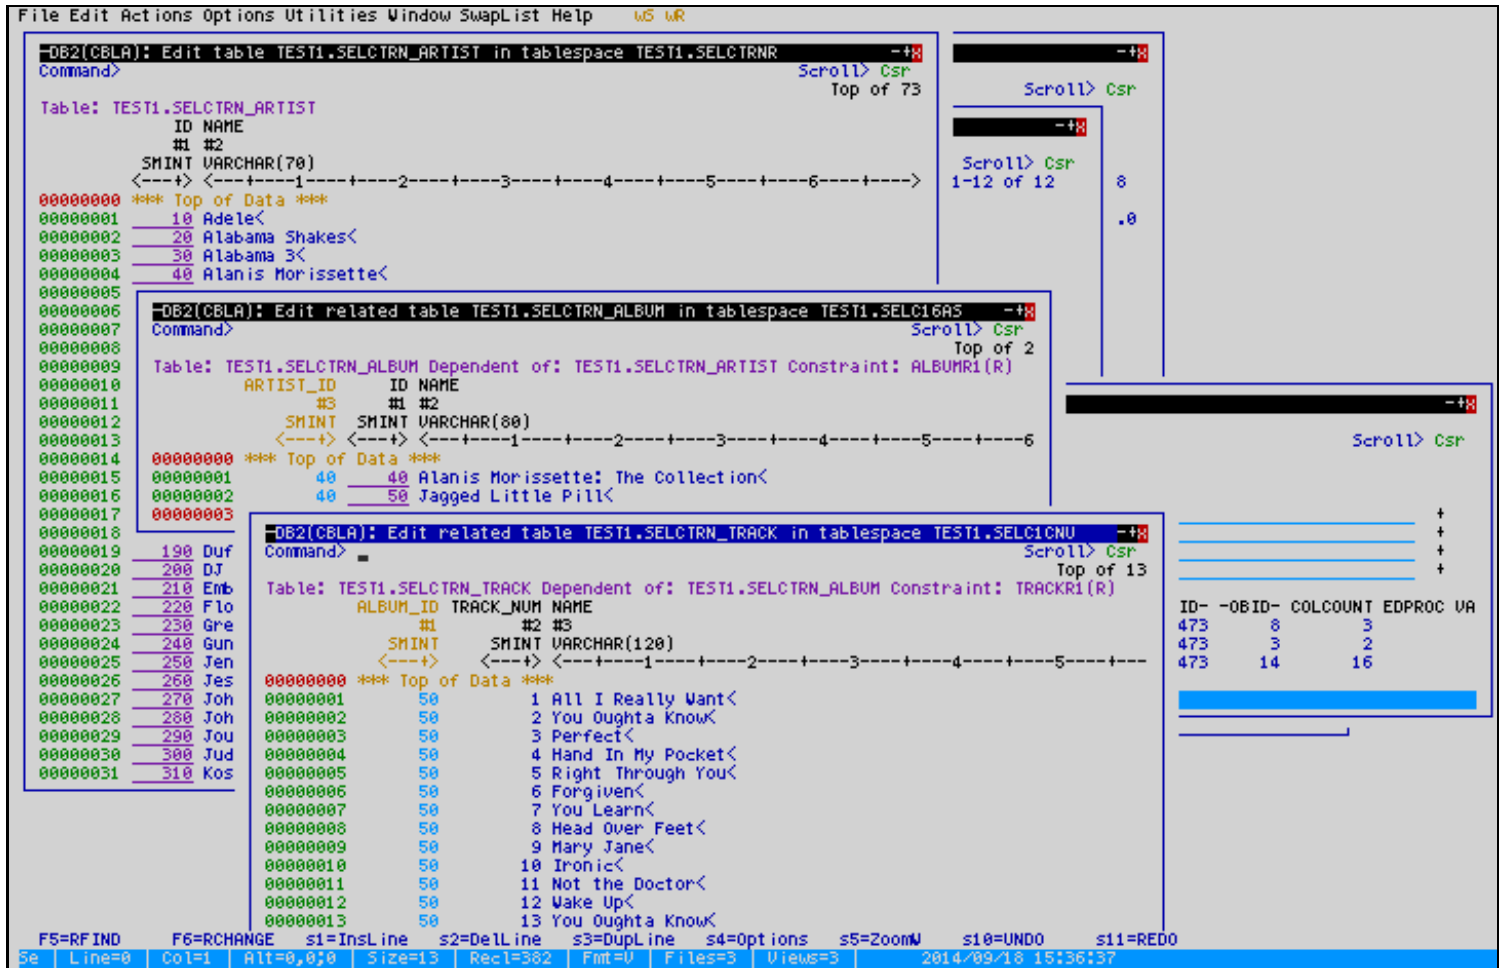

Figure 162. SELCOPYI DB2 Figure 16

Generating CSV or XML from selected table rows/columns

Typically used for export to other platforms, **Comma Separated Variable (CSV)** and **Extended Markup Language (XML)** documents may be generated from the currently viewed DB2 table data.

To select the data columns required:

1. Press the **Options** key (**Shift-F4**) to display the DB2 options popup.
2. Select **Option 1** to **Select/Exclude visible field-names**.

Alternatively, just type the **SELECT (SEL)** primary command, with no parameters to display the field selection dialog.

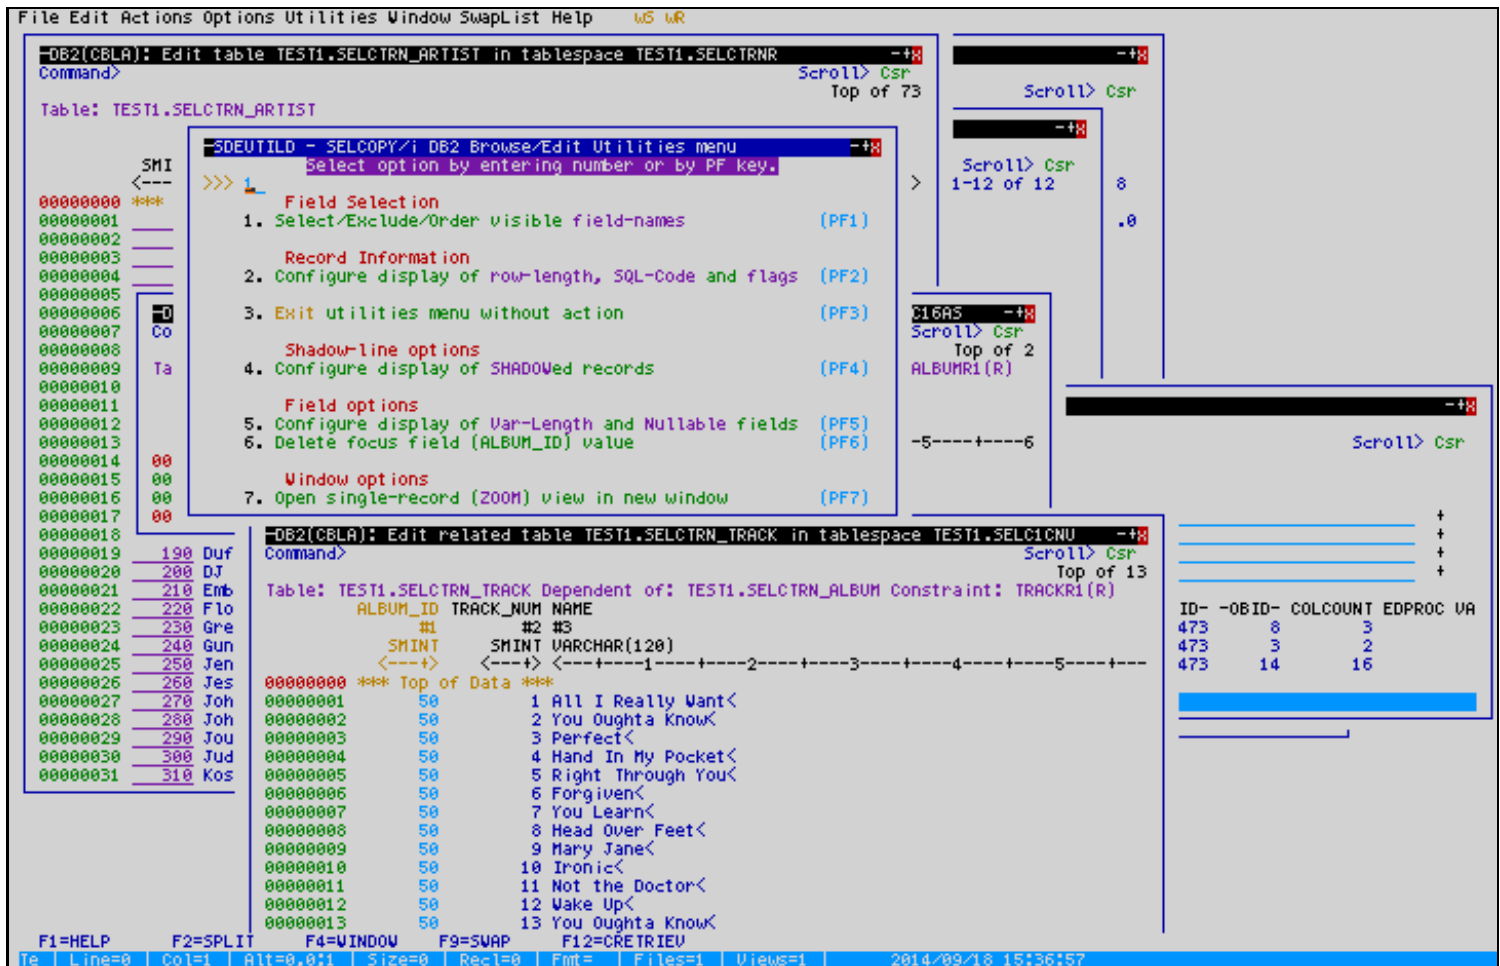

Figure 163. SELCOPY: DB2 Figure 17

The "SELECT" dialog

We'll select column **PERSISTENT_ID** first, followed by **TRACK_NUM** and **NAME**.

- Set option "Perm/Temp:" to "TEMP".
- Set option "Show unselected fields at the end:" to "N".
- Enter "S" to select each of the required columns.
- Enter "1" in **Seq** field for **PERSISTENT_ID** to ensure it's selected first.

If not explicitly ordered by entering a number in the **Seq** field, other fields will be selected in the order they appear in the selection table.

You can enter standard edit line-commands ("M" and "A") in the numeric "prefix" area on the right to re-order the selection table rows.

- Press **F3** to exit the dialog.

Your DB2 table view will be updated according to your selections.

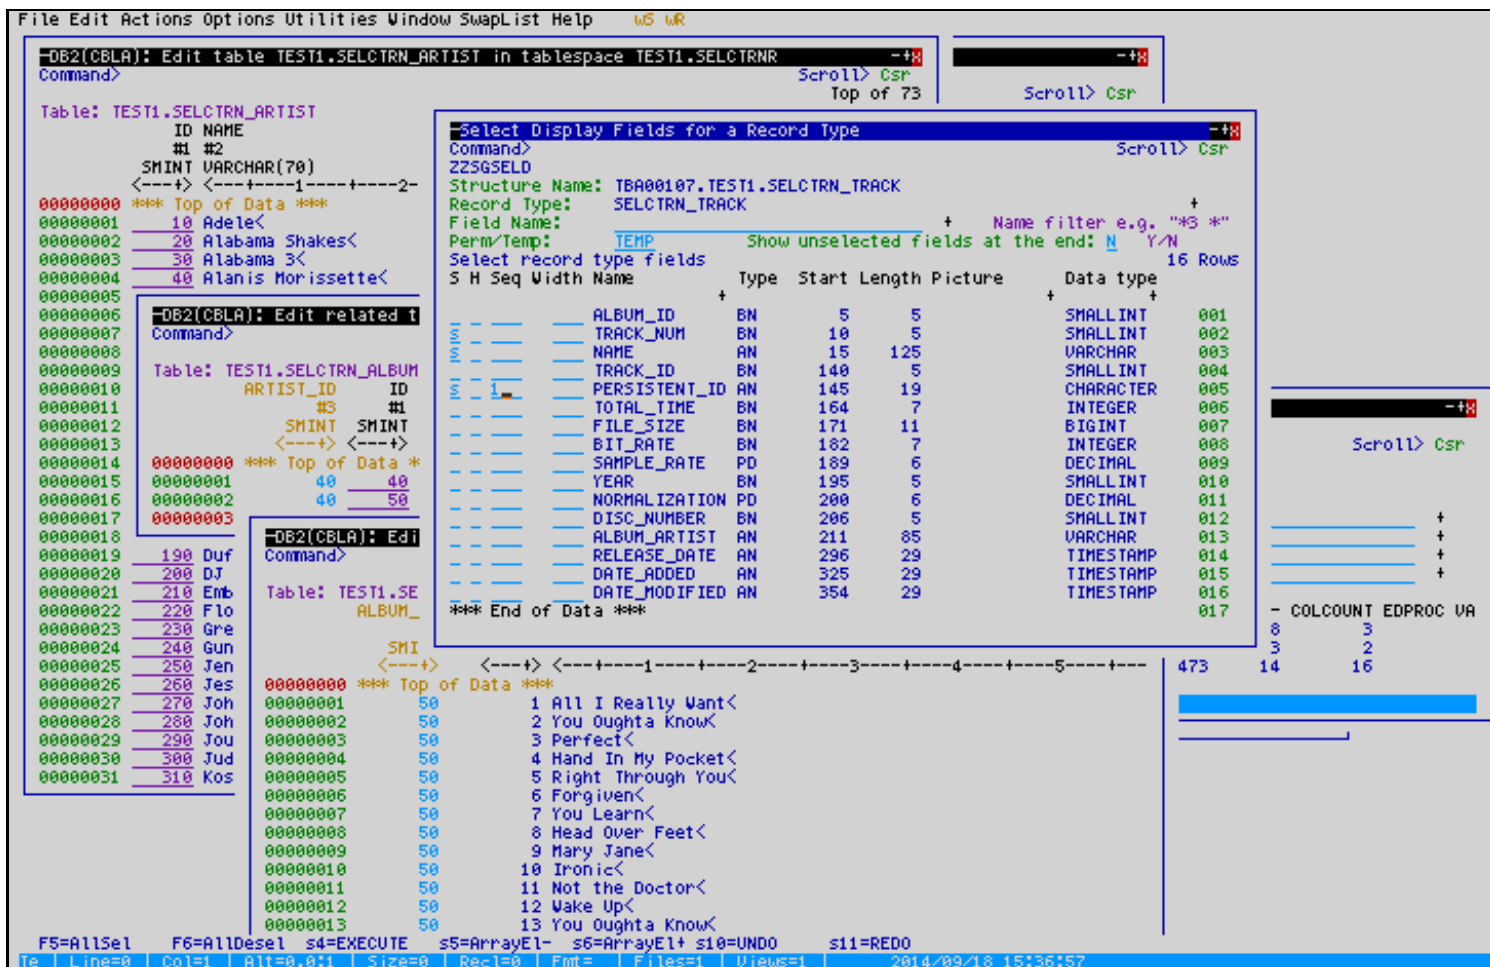

Figure 164. SELCOPYi DB2 Figure 18

The "CSVGEN" dialog

Type the primary command **CSVGEN (CSV)** with no parameters to start the CSV dialog.

- Select option **"Start at Top-of-File"**.
- Select option **"End at End-of-File"**.
- Enter an **Output CSV Text File** name of your choice.

e.g. <userid>.SELCOPYI.CSV(PILL)

The screenshot shows a DB2 console window with several overlapping windows. The main window displays the table `TEST1.SELCTR_ARTIST` with columns `ID`, `NAME`, `#1`, and `#2`. The data includes artists like Adele, Alabama Shakes, and Alanis Morissett. A `CSV Generation: Specify CSV Source/Destination` dialog is open, showing options for `Start Record` (selected: `Start at Top-of-File`), `End Record` (selected: `End at End-of-File`), and `Output CSV Text File` (selected: `TEST1.SELCOPYI.CSV` with member `PILL`). The dialog also shows `HFS Options` and `EOL Characters` set to `NL`. A status bar at the bottom shows `2014/09/18 15:38:17`.

Figure 165. SELCOPYI DB2 Figure 19

Sample "CSVGEN" output

Press the **OPTION** key (F6) if you wish to review other available CSVGEN options, otherwise just press **ENTER** to generate your **Comma Separated Variable** document.

Press the **OPTION** key (F6) if you wish to review other available XMLGEN options, otherwise just press **ENTER** to generate your **Extended Markup Language** document.

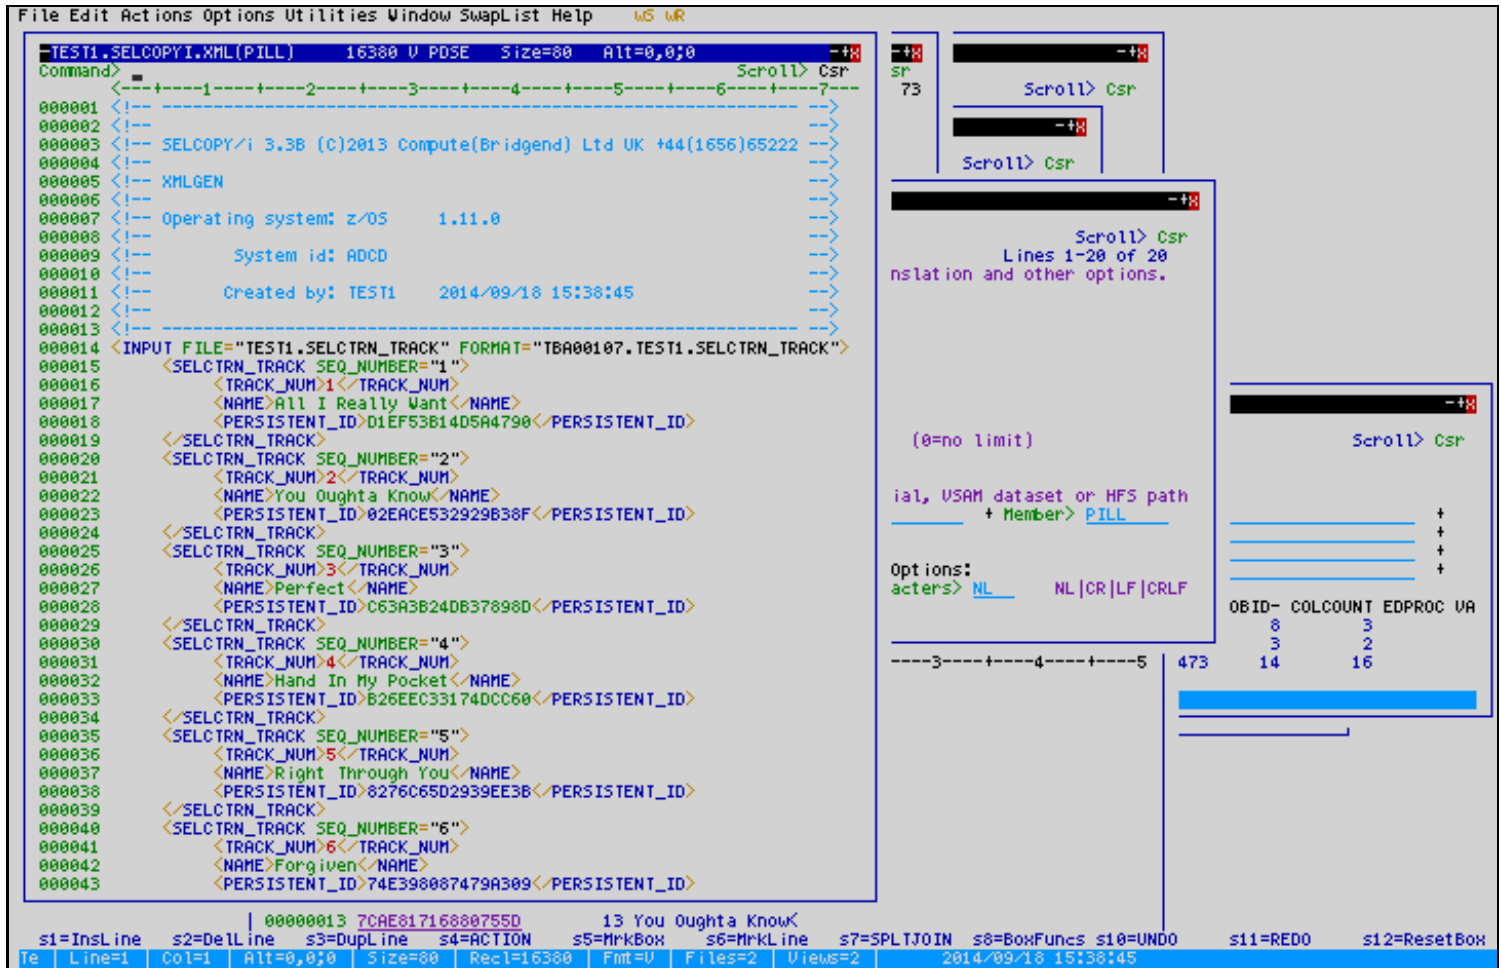

Figure 168. SELCOPYI DB2 Figure 22

Handling Relational Constraint Errors

Next, as an exercise, we'll delete the artist **Bob Dylan** from our music collection.

- Use **F3** to exit as far as the **ARTIST** table.
- Enter "**D**" in the prefix area, or press the "**DelLine**" key (Shift-F2), to delete the **Bob Dylan** (ID=70) row.
- Press **F3** to exit and save, or type primary command **SAVE**.
- Because of the table's relational constraints, DB2 prevents an **ARTIST** row from being deleted while any **ALBUM** rows exist with the same foreign key.

In this case SELCOPYi, reinserts the deleted row at the top of the screen.

The row is flagged with **R-532** in the prefix area, indicating the **SQLCODE** encountered by the **SAVE**.

```

00000031 310 Kosheen<
    
```

Overlaid on the right side of the window is a "DB2 Save SQL Error" dialog box. It contains a table with the following data:

PE	DBNAME	-TSNAME-	-DBID-	-OBJID-	COLCOUNT	EDPROC	VA
TEST1	SELCL6AS		473	8		3	
TEST1	SELCTRNR		473	3		2	
TEST1	SELCL1CNU		473	14		16	

At the bottom of the dialog, there is a "Views" section with the text "Views 1 | select *".

The status bar at the bottom of the window displays: F5=RFIND F6=RCHANGE s1=InsLine s2=DeLine s3=DupLine s4=Options s5=ZoomW s10=UNDO s11=REDO

Figure 170. SELCOPYi DB2 Figure 24

The "DB2 Save SQL Error" dialog

The "DB2 Save SQL Error" dialog provides a detailed explanation of the SQL error, and identifies the parent and dependent column names.

It also gives you the opportunity to correct the violation using the **Related Table Edit (REDIT)** feature.

- Enter "R" in the "Action>" field to start **Related Table edit**.

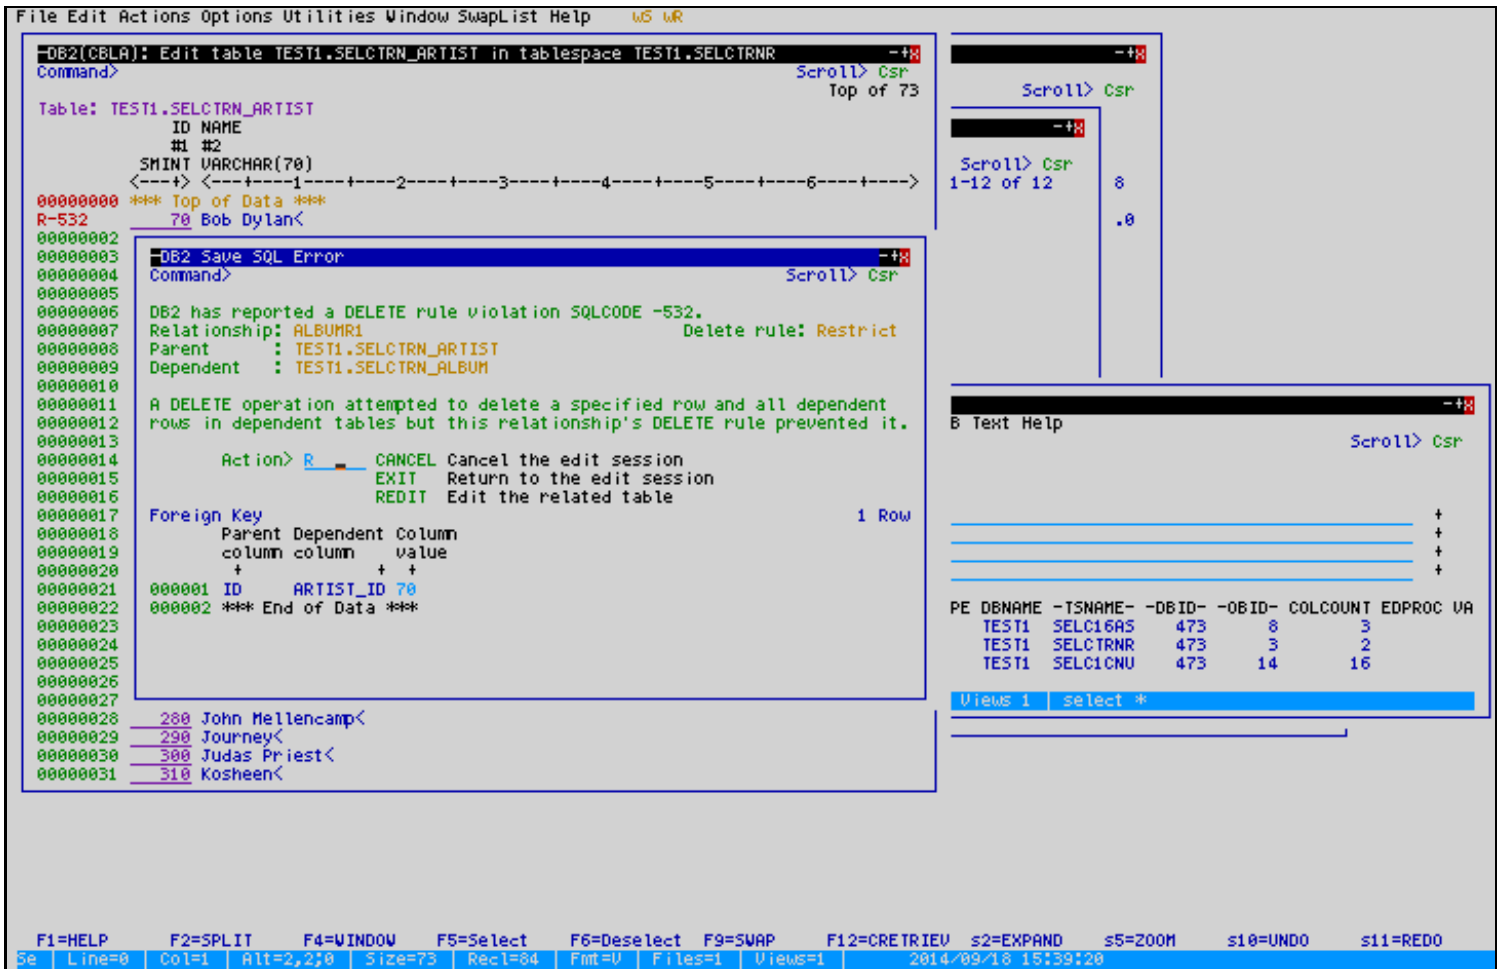

Figure 171. SELCOPYI DB2 Figure 25

Releasing locks on Dependent Tables

If locks on dependent tables are held by DB2, then they must be released before continuing.

- Enter "2" to "Rollback outstanding changes".

The screenshot shows the DB2 Command Editor interface. The main window displays the table structure for TEST1.SELCTR_ARTIST. A dialog box titled "Referential constraint error" is open, showing a message from DB2 about holding locks on dependent tables and offering three options: 1. Commit outstanding changes, 2. Rollback outstanding changes, and 3. Cancel the edit session. The user has selected option 2. Below the dialog, a table lists dependent tables with columns: PE, DBNAME, -TSNAME-, -DBID-, -OBID-, COLCOUNT, EDPROC, and VA.

PE	DBNAME	-TSNAME-	-DBID-	-OBID-	COLCOUNT	EDPROC	VA
	TEST1	SELCL6AS	473	8	3		
	TEST1	SELCTRNR	473	3	2		
	TEST1	SELCLCNU	473	14	16		

Figure 172. SELCOPYi DB2 Figure 26

Edit Dependent Table (1)

The **ALBUM** table is edited, displaying only rows matching the foreign key for the artist Bob Dylan (**ARTIST_ID=70**).

We'll attempt to delete "The Essential Bob Dylan", expecting a similar problem due to the existence of "TRACK" table rows matching this album.

- Enter "D" to delete "The Essential Bob Dylan".
- Press **F3** to exit and save, or type primary command **SAVE**.
The reinserted row is flagged with **R-532** in the prefix area.
- Enter "E" in the prefix area to display the "DB2 Save SQL Error" dialog.
- Enter "R" in the "Action>" field to start **Related Table** edit.

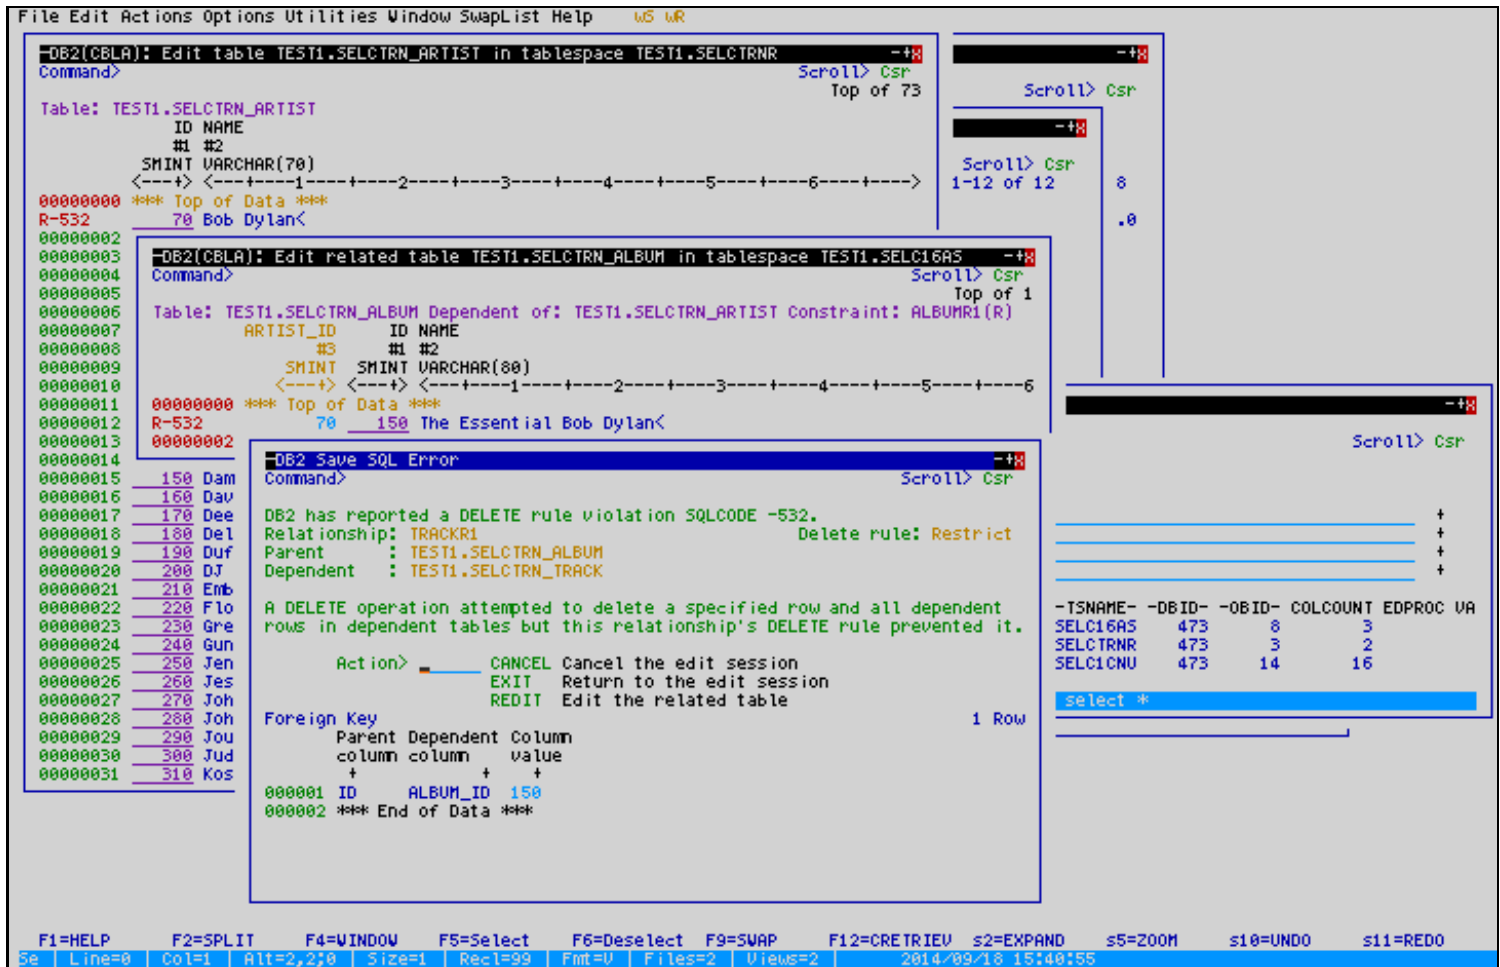

Figure 173. SELCOPYI DB2 Figure 27

Edit Dependent Table (2)

The TRACK table is edited, displaying only rows matching the foreign key for the album "The Essential Bob Dylan" (ALBUM_ID=150).

- Enter **D*** in the prefix area of the first line to delete all rows.
- Press **F3** to exit and save.

No constraint rule is broken so the save will succeed without drama.

The screenshot shows a DB2 command-line editor window titled "DB2(CBLA): Edit related table TEST1.SELCTR_TRACK in tablespace TEST1.SELC1CNU". The main display area shows the following table data:

ALBUM_ID	TRACK_NUM	NAME
#1	#2	#3
150	1	Blowin' In the Wind<
150	1	Shelter from the Storm<
150	2	Don't Think Twice, It's All Right<
150	2	Hurricane<
150	3	The Times They Are A-Changin'<
150	3	Gotta Serve Somebody<
150	4	It Ain't Me, Babe<
150	4	Groom's Still Waiting At the Altar<
150	5	Maggie's Farm<
150	5	Jokerman<
150	6	Everything Is Broken<
150	6	It's All Over Now, Baby Blue<
150	7	Mr. Tambourine Man<
150	7	Blind Willie McTell<
150	8	Subterranean Homesick Blues<
150	8	Not Dark Yet<
150	9	Make You Feel My Love<
150	9	Like a Rolling Stone<
150	10	Positively 4th Street<

150	14	When the Deal Goes Down<
150	15	Lay, Lady, Lay<
150	15	Beyond Here Lies Nothin'<
150	16	If Not for You<

At the bottom of the editor, a status bar displays the following information: F5=RFIND, F6=RCHANGE, s1=InsLine, s2=DelLine, s3=DupLine, s4=Options, s5=ZoomW, s10=UNDO, s11=REDO, Se | Line=0 | Col=1 | Alt=0,070 | Size=36 | Rec1=382 | Fmt=U | Files=3 | Views=3 | 2014/09/18 15:41:19.

Figure 174. SELCOPYI DB2 Figure 28

Edit Dependent Table (3)

Back in the **ALBUM** table, you will then be able to delete "The Essential Bob Dylan", save and exit without errors.

Back in the **ARTIST** table, you will then be able to delete "Bob Dylan" and save without errors.

The screenshot shows the DB2 Command Editor interface. The main window displays the table `TEST1.SELCTR_ARTIST` with columns `SMINT` and `VARCHAR(70)`. The data is as follows:

SMINT	VARCHAR(70)
10	Adele<
20	Alabama Shakes<
30	Alabama 3<
40	Alanis Morissette<
50	Alex Harvey<
60	AC/DC<
80	Bruce Springsteen<
90	Bruce Springsteen & The Sessions Band<
100	Burt Bacharach & Elvis Costello<
110	Christina Aguilera<
120	Christina Aguilera & Dave Navarro<
130	Coldplay<
140	Crash Test Dummies<
150	Damien Rice<
160	David Gray<
170	Deep Purple<
180	Del Amitri<
190	Duffy<
200	DJ Fresh<
210	Embrace<
220	Florence + The Machine<
230	Gretchen Wilson<
240	Guns N' Roses<
250	Jennifer Hudson<
260	Jessie J<
270	John Mayer<
280	John Mellencamp<
290	Journey<
300	Judas Priest<
310	Kosheen<
320	Led Zeppelin<

On the right side, a 'Text Help' window displays a table of dependent tables:

PE	DBNAME	-TSNAME-	-DBID-	-OBJID-	COLCOUNT	EDPROC	VA
TEST1	SELCL6AS	473	8	3			
TEST1	SELCTRNR	473	3	2			
TEST1	SELCL1CNU	473	14	16			

The status bar at the bottom shows: `F5=RFIND F6=RCHANGE s1=InsLine s2=DeLline s3=DupLine s4=Options s5=ZoomW s10=UNDO s11=REDO` and the timestamp `2014/09/18 15:41:52`.

Figure 175. SELCOPYi DB2 Figure 29

DB2 Help Pages

Further DB2 specific information is available by pressing the **HELP** key (F1).

The screenshot displays the DB2 Table Browse and Edit interface. The main window shows a table named TEST1.SELCTR_ARTIST with columns ID, NAME, SMINT, and VARCHAR(70). The table contains 31 rows of data, including artists like Adele, Alabama Shakes, and Led Zeppelin. A sidebar on the right provides help information, including a table of contents and a list of topics for starting a DB2 table edit or browse session.

ID	NAME	SMINT	VARCHAR(70)
00000001	Adele<	10	
00000002	Alabama Shakes<	20

DB2 Table Browse and Edit

The SELCOPY/i structured data editor (SDE) supports [BROWSE](#) and [EDIT](#) of DB2 tables and views.

Full reference information for structured edit is in [SELCOPY/i Structured Data Editor \(SDE\) Contents](#) and there is also an SDE section in the comprehensive [SELCOPY/i Quick Reference](#) document.

The following topics provide introductory information about working with DB2 data in structured edit:

- Starting a DB2 table edit or browse session.
- How DB2 subsystem connections are managed.
- Limiting the number of rows loaded.
- Defining a structure to use with DB2 tables.
- How DB2 rows are saved.
- Dealing with save errors.
- Auditing edit sessions.
- Editing or browsing related tables.
- Useful commands.
- Comparing DB2 table edit with dataset edit.

Starting a DB2 table edit or browse session

The [EDIT](#) and [BROWSE](#) primary commands with the DB2 subsystem parameter start a DB2 table edit or browse session. For example the command:

```
browse db2(cbla) sysibm.systables
```

will open a structured browse view and load all the rows of the table SYSIBM.SYSTABLES for subsystem CBLA into storage. A temporary structure will be generated using the DB2 catalog to define the columns and their data types.

These primary commands have many optional parameters and it is not, in

Related Tables Help

The hyperlink for "[Editing or browsing related tables](#)" provides some handy background and tips.

The screenshot shows a DB2 terminal window with two panes. The left pane displays a table named TEST1.SELCTR_ARTIST with columns ID, NAME, #1, and #2. The right pane displays the 'DB2 Table Browse and Edit' help page, which includes sections for 'Editing or browsing related tables', 'Useful commands', and 'Some commands are specifically for DB2 table edit'.

Table: TEST1.SELCTR_ARTIST

Command> Scroll> Csr

Editing or browsing related tables

SELCOPY/i has specific support for editing tables which have relationships defined by referential integrity (RI) constraints.

An RI constraint establishes a parent-dependent relationship between two tables by means of a foreign key. A foreign key is a set of columns in the dependent table which correspond to a unique key in the parent table.

When an RI constraint exists certain types of change to the tables involved are not permitted. Breaking these rules leads to an RI error of one of the following types:

- Missing parent key SQLCODE -530. This happens when an insert or update of a row in a dependent table has a foreign key which does not represent an existing row in the parent table. In other words you cannot make orphans by inserting or updating foreign keys in the dependent table.
- Parent key update error SQLCODE -531. This happens when an update of a row in a parent table changes a key which is a foreign key in a dependent table and has dependent rows in that table. In other words you cannot make orphans by changing parent keys.
- RI delete rule violation SQLCODE -532. When the RI constraint was defined with a delete rule of RESTRICT or NO ACTION this error will happen when deleting a row in the parent table which has dependent rows in the dependent table. In other words for this type of RI constraint deletes must be done from the bottom up.

The **RE** prefix command and **REDIT** primary command can be used in a number of ways with tables related by RI constraints:

- List all parent and dependent relationships for the current table.
- Edit or browse the parent row or dependent rows of the **focus row** for any RI constraint.
- After an RI error when saving changes, edit the parent row or dependent rows of the row which had the error.

Useful commands

Some commands are specifically for DB2 table edit. The following overview is not exhaustive but highlights some of the features:

Line 225 of 389 Col 1 of 78 File: CBL.CBLI330.HTML[zzscdb2e]

F3=BACK F5=TEXT F6=SOURCE F7=UP F8=DOWN s4=FORWARD

Se | Line=0 | Col=1 | Alt=0,070 | Size=72 | Recl=84 | Fmt=U | Files=1 | Views=1 | 2014/09/18 15:41:52

Figure 177. SELCOPYi DB2 Figure 31

REDIT Example (1)

In the ARTIST table scroll down to "Ray Lamontagne" (ID=480), and notice we also have an entry for "Ray LaMontagne" (ID=490).

We'll consolidate these two, then remove (ID=490).

- Enter "RE" in the prefix area for artist ID=490.

The screenshot shows a DB2 REDIT session with the following components:

- Main Table:** TEST1.SELCTR_ARTIST. The table contains 73 rows of artist data. The entry for ID=490 is highlighted with a red prefix 'RE'.
- Summary Table:** A table with columns PE, DBNAME, -TSNAME-, -DBID-, -OBID-, COLCOUNT, EDPROC, and VA. It lists three tables: SELC16AS, SELCTRNR, and SELC1CNU.
- Command Line:** Shows the current table and row information: 'Table: TEST1.SELCTR_ARTIST' and 'Row 47 of 72'.
- Status Bar:** Displays various keyboard shortcuts and the current session date and time: '2014/09/18 15:42:52'.

PE	DBNAME	-TSNAME-	-DBID-	-OBID-	COLCOUNT	EDPROC	VA
	TEST1	SELC16AS	473	8	3		
	TEST1	SELCTRNR	473	3	2		
	TEST1	SELC1CNU	473	14	16		

Figure 178. SELCOPY: DB2 Figure 32

REDIT Example (2)

- A separate edit window will display only the **ALBUM** rows for (**ARTIST_ID=490**).
- Type primary command "**CHANGE ALL 490 480 #3**", then exit and save changes.

The screenshot displays the DB2 REDIT environment with the following components:

- Main Command Window:** Shows the table `TEST1.SELCTR_ARTIST` with columns `ID`, `NAME`, `#1`, `#2`, and `SMINT VARCHAR(70)`. It lists records for artist ID 480 (Ray Lamontagne) and 490 (Ray LaMontagne).
- Secondary Command Window:** Shows the table `TEST1.SELCTR_ALBUM` with columns `ARTIST_ID`, `ID`, `NAME`, `#3`, `#1`, `#2`, and `SMINT VARCHAR(80)`. It displays a list of albums, including "Gossip In the Grain", "Jolene (Live from Union Chapel) - Single", "Raycharles LaMontagne", "Till the Sun Turns Black", "Trouble", and "Trouble - Live Session (Live at The Chapel, London) - EP".
- Summary Table:** A table with columns `PE`, `DBNAME`, `-TSNAME-`, `-DBID-`, `-OBJID-`, `COLCOUNT`, `EDPROC`, and `VA`. It lists three tables: `TEST1.SELC16AS`, `TEST1.SELCTRNR`, and `TEST1.SELC1CNU`.
- Status Bar:** Shows keyboard shortcuts like `F5=RFIND`, `F6=RCHANGE`, and system information like `2014/09/18 15:46:37`.

Figure 179. SELCOPY: DB2 Figure 33

REDIT Example (3)

We can now delete (**ARTIST_ID=490**), save and exit without error.

DB2(CBLA): Edit table TEST1.SELCTR_ARTIST in tablespace TEST1.SELCTRNR

Command>

ZZ5D346I SAVE inserts=0 deletes=0 updates=6 SQL errors=0 for DB2 object TEST1.SELCTR_ALBUM.

ZZ5D347I Commit changes issued.
