Documentation Notes.....	1
Introduction.....	2
Overview.....	2
Online/Offline SMF Records.....	2
SMF Record Types.....	2
SELCOPYi Structure User Library.....	5
SELCOPYi Structure Usage.....	5
Browse and Extract Record Mapping.....	6
Report Record Mapping.....	6
Primary/Secondary Segments.....	6
Structure Definition Source.....	7
Using SMF Utilities.....	8
BROWSE.....	8
Browse Basic Layout.....	8
Browse Basic Layout Display.....	9
Browse Full Layout.....	10
Browse Full Layout Display.....	11
View Lines of Suppressed Segment Types.....	11
Hide Excluded or Suppressed Record Shadow Lines.....	12
Display Focus Record Layout.....	13
View a Single Record in a new Display.....	14
Scrolling in Single Record View.....	14
Browse Commands.....	15
NEXT / PREV.....	15
PRINT / XMLGEN / CSVGEN / JSONGEN.....	15
SELECT.....	15
SMFFLD.....	15
VBASE.....	15
VIEW.....	15
ZoomW Key.....	15
EXTRACT.....	17
Extract SMF Record Types.....	17
Extract Batch Job.....	18
Extract Selection Criteria.....	20
REPORT.....	22
Report - Basic.....	22
Report - Basic Definition.....	22
Report - Basic Panel Input.....	24
Report - Basic Output.....	25
Report - SORT, BREAK and TOTALS.....	26
Report - SORT, BREAK and TOTALS Definition.....	26
Report - SORT, BREAK and TOTALS Panel Input.....	27
Report - SORT, BREAK and TOTALS Job Stream.....	28
Report - SORT, BREAK and TOTALS Output.....	30
Report - REPEAT.....	31
Report - REPEAT Definition.....	31
Report - REPEAT Panel Input.....	32
Report - REPEAT Output.....	33
Report - FILTER.....	34
Report - FILTER Definition.....	34
Report - FILTER Panel Input.....	35
Report - FILTER Output.....	37

SMF Utilities Reference

REPORT.....	74
VBASE - SET/QUERY/EXTRACT Option.....	80
Creating your own "Commands".....	81
Example 1 - User command "SMFB30" to Browse SMF Type 30 records.....	81
Example 2 - User command "SMFR14" to Report on SMF Type 14 records.....	82
REPORT Definition.....	83

Appendix A: Sample Reports.....87

SMF 14 - Dataset Usage Statistics.....	87
SMF 42 - Usage and Performance Report for Selected DSNAME.....	87
SMF80 - RACF Event Log.....	89

Appendix B: SMF Record Layouts.....90

Record Type 0 - IPL.....	91
Primary segment: SMF000_IPL.....	91
Record Type 2 - Dump Header.....	93
Primary segment: SMF002_SMF_Dump_header.....	93
Secondary segment: SMF002_01_Sig_Group.....	93
Secondary segment: SMF002_01_Self_Def.....	94
Secondary segment: SMF002_01_ARECSIGN.....	94
Secondary segment: SMF002_02_Sig_Interval.....	95
Secondary segment: SMF002_02_Self_Def.....	96
Secondary segment: SMF002_02_ARECSIGN.....	96
Record Type 3 - Dump Trailer.....	98
Primary segment: SMF003_SMF_Dump_Trailer.....	98
Record Type 4 - Step Termination.....	99
Primary segment: SMF004_Step_Termination.....	99
Secondary segment: SMF004_Relocate.....	101
Record Type 5 - Job Termination.....	103
Primary segment: SMF005_Job_Termination.....	103
Record Type 6 - External Writer.....	106
Primary segment: SMF006_External_Writer.....	106
Secondary segment: SMF006_External_Writer_Enhanced_SYSOUT.....	107
Secondary segment: SMF006_External_Writer_IO_Data.....	107
Secondary segment: SMF006_External_Writer_Common.....	108
Record Type 6 - JES2 Output Writer.....	109
Primary segment: SMF006_JES2_Output_Writer.....	109
Secondary segment: SMF006_JES2_Output_Writer_IO_Data.....	110
Secondary segment: SMF006_JES2_Output_Writer_3800_NonImpact_Printing.....	111
Secondary segment: SMF006_JES2_Output_Writer_Common.....	111
Secondary segment: SMF006_JES2_Output_Writer_Enhanced_SYSOUT.....	112
Record Type 6 - JES3 Output Writer.....	114
Primary segment: SMF006_JES3_Output_Writer.....	114
Secondary segment: SMF006_JES3_Output_Writer_IO_Data.....	115
Secondary segment: SMF006_JES3_Output_Writer_3800_NonImpact_Printing.....	116
Secondary segment: SMF006_JES3_Output_Writer_Common.....	116
Secondary segment: SMF006_JES3_Output_Writer_Enhanced_SYSOUT.....	117
Record Type 6 - Print Services Facility.....	118
Primary segment: SMF006_Print_Services_Facility.....	118
Secondary segment: SMF006_Print_Services_Facility_IO_Data.....	119
Secondary segment: SMF006_Print_Services_Facility_NonImpact_Printing.....	120
Secondary segment: SMF006_Print_Services_Facility_Common.....	120
Secondary segment: SMF006_Print_Services_Facility_AllPoints_Printing.....	121
Secondary segment: SMF006_Print_Services_Facility_MultiBins_Header.....	123
Secondary segment: SMF006_Print_Services_Facility_MultiBins_Counter.....	123
Secondary segment: SMF006_Print_Services_Facility_Enhanced_SYSOUT.....	123
Secondary segment: SMF006_Print_Services_Facility_File_Transfer.....	124
Record Type 6 - IP PrintWay.....	125
Primary segment: SMF006_IP_PrintWay.....	125
Secondary segment: SMF006_IP_PrintWay_IO_Data.....	126
Secondary segment: SMF006_IP_PrintWay_Common.....	127
Secondary segment: SMF006_IP_PrintWay_Enhanced_SYSOUT.....	127
Secondary segment: SMF006_IP_PrintWay_File_Transfer.....	128
Record Type 7 - Data Lost.....	129
Primary segment: SMF007_SMF_Data_Lost.....	129
Record Type 8 - I/O Configuration.....	130
Primary segment: SMF008_IO_Configuration.....	130
Secondary segment: SMF008_Device.....	130
Record Type 9 - VARY Device ONLINE.....	131
Primary segment: SMF009_VARY_Device_ONLINE.....	131
Secondary segment: SMF009_Device.....	131
Record Type 10 - Allocation Recovery.....	132
Primary segment: SMF010_Allocation_Recovery.....	132
Secondary segment: SMF010_Device.....	132
Record Type 11 - VARY Device OFFLINE.....	133
Primary segment: SMF011_VARY_Device_OFFLINE.....	133

Contents

Appendix B: SMF Record Layouts

Secondary segment: SMF011_Device.....	133
Record Type 14 - INPUT or RDBACK Dataset.....	134
Primary segment: SMF014_INPUT_or_RDBACK_Dataset.....	134
Secondary segment: SMF014#1_Compressed_format_Dataset.....	141
Secondary segment: SMF014#2_SMS_Class.....	142
Secondary segment: SMF014#3_Step_Info.....	143
Secondary segment: SMF014#4_ISO_ANSI_V4_CCSID_Info.....	143
Secondary segment: SMF014#5_Additional_Dataset_Char.....	144
Secondary segment: SMF014#6_PDSE_Statistics.....	145
Secondary segment: SMF014#7_Tape_Encryption.....	145
Secondary segment: SMF014#8_RAS.....	146
Secondary segment: SMF014#9_Dataset_Encryption.....	147
Record Type 15 - OUTPUT UPDAT INOUT or OUTIN.....	148
Primary segment: SMF015_OUTPUT_UPDAT_INOUT_or_OUTIN.....	148
Secondary segment: SMF015#1_Compressed_format_Dataset.....	155
Secondary segment: SMF015#2_SMS_Class.....	156
Secondary segment: SMF015#3_Step_Info.....	157
Secondary segment: SMF015#4_ISO_ANSI_V4_CCSID_Info.....	157
Secondary segment: SMF015#5_Additional_Dataset_Char.....	158
Secondary segment: SMF015#6_PDSE_Statistics.....	159
Secondary segment: SMF015#7_Tape_Encryption.....	159
Secondary segment: SMF015#8_RAS.....	160
Secondary segment: SMF015#9_Dataset_Encryption.....	161
Record Type 16 - DFSORT.....	162
Primary segment: SMF016_DFSORT.....	162
Secondary segment: SMF016_Product_Section.....	163
Secondary segment: SMF016_Data_Section.....	163
Secondary segment: SMF016_Record_Length.....	169
Secondary segment: SMF016_SORTIN_Dataset.....	169
Secondary segment: SMF016_SORTOUT_Dataset.....	171
Secondary segment: SMF016_OUTFIL_Dataset.....	173
Record Type 17 - Scratch Dataset Status.....	176
Primary segment: SMF017_Scratch_Dataset_Status.....	176
Record Type 18 - Rename NonVSAM Dataset Status.....	177
Primary segment: SMF018_Rename_NonVSAM_Dataset_Status.....	177
Record Type 19 - Direct Access Volume.....	179
Primary segment: SMF019_Direct_Access_Volume.....	179
Record Type 20 - Job Initiation.....	182
Primary segment: SMF020_Job_Initiation.....	182
Secondary segment: SMF020_Relocate_Section.....	182
Record Type 21 - Tape Error.....	184
Primary segment: SMF021_Tape_Error.....	184
Record Type 22 - Configuration.....	187
Primary segment: SMF022_Configuration.....	187
Secondary segment: SMF022_CPU.....	187
Secondary segment: SMF022_Storage.....	188
Secondary segment: SMF022_CHP.....	188
Secondary segment: SMF022_Reconfig_CHP.....	188
Secondary segment: SMF022_Reconfig_PCIE.....	189
Secondary segment: SMF022_Expanded_Storage.....	189
Secondary segment: SMF022_Storage_Control.....	189
Secondary segment: SMF022_Storage_Element.....	192
Secondary segment: SMF022_IO_Config_Change_Hdr.....	192
Secondary segment: SMF022_IO_Config_Change.....	193
Secondary segment: SMF022_Device_Entry.....	194
Secondary segment: SMF022_Device_Expansion.....	194
Secondary segment: SMF022_Phys_Control_Unit.....	194
Secondary segment: SMF022_CHPID.....	195
Secondary segment: SMF022_Log_Partn.....	195
Secondary segment: SMF022_PCI_Func.....	195
Secondary segment: SMF022_Continuation.....	195
Record Type 23 - SMF Status.....	196
Primary segment: SMF023_SMF_Status.....	196
Secondary segment: SMF023_Product.....	197
Secondary segment: SMF023_System.....	197
Secondary segment: SMF023_Stats.....	198
Secondary segment: SMF023_LogStream.....	199
Secondary segment: SMF023_SpinLock.....	200
Secondary segment: SMF023_BindBreak.....	201
Record Type 24 - JES2 Spool Offload.....	202
Primary segment: SMF024_JES2_Spool_Offload.....	202
Secondary segment: SMF024_Product.....	203
Secondary segment: SMF024_General.....	203
Secondary segment: SMF024_Job_Sel_Crit.....	204
Secondary segment: SMF024_SYSOUS_Sel_Crit.....	204
Secondary segment: SMF024_Affinity.....	205

Contents

Appendix B: SMF Record Layouts

Secondary segment: SMF024_Affinity_SysName.....	205
Secondary segment: SMF024_Enhanced_SYSOOT.....	205
Record Type 25 - JES3 Device Allocation.....	207
Primary segment: SMF025_JES3_Device_Allocation.....	207
Record Type 26 - JES2 Job Purge.....	209
Primary segment: SMF026_JES2_Job_Purge.....	209
Secondary segment: SMF026_Descriptor.....	210
Secondary segment: SMF026_Events.....	211
Secondary segment: SMF026_Actuals.....	212
Secondary segment: SMF026_Network.....	212
Secondary segment: SMF026_Routing.....	213
Secondary segment: SMF026_Print.....	213
Secondary segment: SMF026_Triplet.....	214
Secondary segment: SMF026_Accounting.....	214
Secondary segment: SMF026_Workload_Management.....	214
Secondary segment: SMF026_Job_Correlator.....	215
Secondary segment: SMF026_Encryption_Compression.....	215
Record Type 30 - Common Address Space Work.....	216
Primary segment: SMF030_Common_Address_Space_Work.....	216
Secondary segment: SMF030_Subsystem.....	219
Secondary segment: SMF030_Identification.....	220
Secondary segment: SMF030_IO_Activity.....	221
Secondary segment: SMF030_Completion.....	223
Secondary segment: SMF030_Processor_Accounting.....	224
Secondary segment: SMF030_EXCP.....	229
Secondary segment: SMF030_Accounting.....	229
Secondary segment: SMF030_Storage_and_Paging.....	229
Secondary segment: SMF030_Performance.....	234
Secondary segment: SMF030_Operator.....	238
Secondary segment: SMF030_APPC_MVS_Resource.....	238
Secondary segment: SMF030_APPC_MVS_Cumulative_Resource.....	239
Secondary segment: SMF030_z_OS_UNIX_Process.....	239
Secondary segment: SMF030_Automatic_Restart_Management.....	240
Secondary segment: SMF030_Usage_Data.....	241
Secondary segment: SMF030_Multisystem_Enclave_Remote_System_Data.....	242
Secondary segment: SMF030_Counter_Data.....	242
Secondary segment: SMF030_zEDC_Usage_Statistics.....	243
Record Type 32 - TSO/E User Work Accounting.....	244
Primary segment: SMF032_TSO#E_User_Work_Accounting.....	244
Secondary segment: SMF032_Product.....	245
Secondary segment: SMF032_Identification.....	245
Secondary segment: SMF032_Command.....	246
Record Type 33 - APPC/MVS TP Accounting.....	247
Primary segment: SMF033_APPC#MVS_TP_Accounting.....	247
Secondary segment: SMF033_Product.....	248
Secondary segment: SMF033_Address_Space_ID.....	248
Secondary segment: SMF033_01_TP_Ident.....	249
Secondary segment: SMF033_01_TP_Name.....	249
Secondary segment: SMF033_01_TP_Usage.....	249
Secondary segment: SMF033_01_TP_Accounting.....	250
Secondary segment: SMF033_01_TP_Detail.....	250
Secondary segment: SMF033_01_TP_Scheduler.....	251
Secondary segment: SMF033_02_Conversation.....	251
Secondary segment: SMF033_02_LUWID.....	253
Secondary segment: SMF033_02_Partner_TP_Prog.....	253
Secondary segment: SMF033_02_Local_TP_Prog.....	253
Secondary segment: SMF033_02_User_Data.....	253
Record Type 34 - TS-Step Termination.....	254
Primary segment: SMF034_TS_Step_Term.....	254
Secondary segment: SMF034_EXCP.....	256
Secondary segment: SMF034_Accounting.....	256
Secondary segment: SMF034_Relocate.....	257
Record Type 35 - LOGOFF.....	259
Primary segment: SMF035_LOGOFF.....	259
Record Type 36 - ICF Catalog Report.....	261
Primary segment: SMF036_ICF_Catalog_Export.....	261
Record Type 40 - Dynamic DD.....	263
Primary segment: SMF040_Dynamic_DD.....	263
Record Type 41 - DIV Objects and VLF Statistics.....	265
Primary segment: SMF041_DIV_and_VLF.....	265
Secondary segment: SMF041_Product.....	266
Secondary segment: SMF041_Object_ACCESS.....	266
Secondary segment: SMF041_02_Object_UNACCESS.....	266
Secondary segment: SMF041_02_IO_Activity.....	267
Secondary segment: SMF041_03_VLF_Stats.....	267
Record Type 42 - DFSMS Statistics and Configuration.....	269

Contents

Appendix B: SMF Record Layouts

Record Type 42 Subtype 1 - BMF Cache Summary.....	269
Primary segment: SMF042#01_DFSMS.....	269
Secondary segment: SMF042#01_Product_Section.....	270
Secondary segment: SMF042#01_BMF_Totals.....	270
Secondary segment: SMF042#01_Storage_Class_Summary.....	271
Record Type 42 Subtype 2 - Cache CUs with SMS-managed Device(s).....	272
Primary segment: SMF042#02_DFSMS.....	272
Secondary segment: SMF042#02_Product_Section.....	273
Secondary segment: SMF042#02_Control_Unit_Cache.....	273
Secondary segment: SMF042#02_Volume_Status.....	274
Record Type 42 Subtype 3 - SMS Configuration Changed.....	276
Primary segment: SMF042#03_DFSMS.....	276
Secondary segment: SMF042#03_Product_Section.....	277
Secondary segment: SMF042#03_Event_Audit.....	277
Record Type 42 Subtype 4 - System Data Mover Session Statistics.....	279
Primary segment: SMF042#04_DFSMS.....	279
Secondary segment: SMF042#04_Product_Section.....	280
Secondary segment: SMF042#04_Concurrent_Copy_Session.....	280
Secondary segment: SMF042#04_Concurrent_Copy_SSID_Header.....	281
Secondary segment: SMF042#04_Concurrent_Copy_Volume.....	281
Secondary segment: SMF042#04_Extended_Format_Data_Set.....	282
Secondary segment: SMF042#04_Virtual_Concurrent_Copy_Session.....	282
Secondary segment: SMF042#04_Virtual_Concurrent_Copy_SSID_Header.....	283
Secondary segment: SMF042#04_Virtual_Concurrent_Copy_Volume.....	283
Record Type 42 Subtype 5 - Storage Class VTOC and VVDS I/O Statistics.....	284
Primary segment: SMF042#05_DFSMS.....	284
Secondary segment: SMF042#05_Product_Section.....	285
Secondary segment: SMF042#05_Storage_Class_Response_Time.....	285
Secondary segment: SMF042#05_Volume_Header.....	286
Secondary segment: SMF042#05_Volume_Header_VTOC_Data_IO.....	288
Secondary segment: SMF042#05_Volume_Header_VTOC_Index_IO.....	289
Secondary segment: SMF042#05_Volume_Header_VVDS_IO.....	290
Secondary segment: SMF042#05_Sync_IO.....	291
Secondary segment: SMF042#05_Volume_Metrics.....	292
Secondary segment: SMF042#05_System_IO.....	292
Secondary segment: SMF042#05_System_IO_Stats.....	293
Secondary segment: SMF042#05_System_IO_High_Response.....	293
Secondary segment: SMF042#05_Volume_Background.....	294
Secondary segment: SMF042#05_Volume_Cloud.....	294
Record Type 42 Subtype 6 - Data Set level I/O Statistics.....	295
Primary segment: SMF042#06_DFSMS.....	295
Secondary segment: SMF042#06_Product_Section.....	296
Secondary segment: SMF042#06_Job_Header.....	296
Secondary segment: SMF042#06_Data_Set_Header.....	297
Secondary segment: SMF042#06_Data_Set_IO.....	298
Secondary segment: SMF042#06_Data_Access_Method.....	299
Secondary segment: SMF042#06_Sync_IO.....	300
Secondary segment: SMF042#06_Sync_IO2.....	301
Secondary segment: SMF042#06_Sync_IO3.....	302
Record Type 42 Subtype 7 - NFS File Timeout Statistics.....	304
Primary segment: SMF042#07_DFSMS.....	304
Secondary segment: SMF042#07_Product_Section.....	305
Secondary segment: SMF042#07_NFS_File_Timeout.....	305
Secondary segment: SMF042#07_NFS_File_Timeout_Client_Id.....	305
Secondary segment: SMF042#07_NFS_File_Timeout_Client_Id_IPv4.....	306
Secondary segment: SMF042#07_NFS_File_Timeout_Client_Id_IPv6.....	306
Record Type 42 Subtype 8 - NFS User Logout Statistics.....	307
Primary segment: SMF042#08_DFSMS.....	307
Secondary segment: SMF042#08_Product_Section.....	308
Secondary segment: SMF042#08_NFS_User_Session.....	308
Secondary segment: SMF042#08_NFS_User_Session_Client_Id.....	308
Secondary segment: SMF042#08_NFS_User_Session_Client_Id_IPv4.....	309
Secondary segment: SMF042#08_NFS_User_Session_Client_Id_IPv6.....	309
Record Type 42 Subtype 9 - B37/D37/E37 Abend Information.....	310
Primary segment: SMF042#09_DFSMS.....	310
Secondary segment: SMF042#09_Product_Section.....	311
Secondary segment: SMF042#09_B37_D37_E37_Aband_Data.....	311
Secondary segment: SMF042#09_SMS_Data.....	312
Record Type 42 Subtype 10 - Volume Selection Failure.....	313
Primary segment: SMF042#10_DFSMS.....	313
Secondary segment: SMF042#10_Product_Section.....	313
Secondary segment: SMF042#10_Volume_Selection_Failure.....	314
Record Type 42 Subtype 11 - Extended Remote Copy Session Statistics.....	315
Primary segment: SMF042#11_DFSMS.....	315
Secondary segment: SMF042#11_Product_Section.....	316
Secondary segment: SMF042#11_XRC_Session.....	316

Contents

Appendix B: SMF Record Layouts

Secondary segment: SMF042#11_XRC_SSID_Data.....	316
Record Type 42 Subtype 14 - ADSM Session Resource Usage.....	318
Primary segment: SMF042#14_DFSMS.....	318
Secondary segment: SMF042#14_Product_Section.....	318
Secondary segment: SMF042#14_ADSM_Accounting.....	319
Record Type 42 Subtype 15 - VSAM RLS CF Storage Class Response Time.....	320
Primary segment: SMF042#15_DFSMS.....	320
Secondary segment: SMF042#15_Product_Section.....	321
Secondary segment: SMF042#15_VSAM_RLS_StorClass_SysplexWide.....	321
Secondary segment: SMF042#15_VSAM_RLS_StorClass_CF_SYS.....	330
Secondary segment: SMF042#15_VSAM_RLS_StorClass_SysplexWide_64.....	339
Secondary segment: SMF042#15_VSAM_RLS_StorClass_CF_SYS_64.....	348
Record Type 42 Subtype 16 - VSAM RLS CF Data Set Response Time.....	357
Primary segment: SMF042#16_DFSMS.....	357
Secondary segment: SMF042#16_Product_Section.....	358
Secondary segment: SMF042#16_VSAM_RLS_Dataset_SysplexWide.....	358
Secondary segment: SMF042#16_VSAM_RLS_Dataset_CF_SYS.....	366
Secondary segment: SMF042#16_VSAM_RLS_Dataset_SysplexWide_64.....	375
Secondary segment: SMF042#16_VSAM_RLS_Dataset_CF_SYS_64.....	383
Record Type 42 Subtype 17 - VSAM RLS CF Lock Structure Usage.....	392
Primary segment: SMF042#17_DFSMS.....	392
Secondary segment: SMF042#17_Product_Section.....	393
Secondary segment: SMF042#17_VSAM_RLS_CF_Lock_Activity.....	393
Secondary segment: SMF042#17_VSAM_RLS_CF_Lock_Summary.....	395
Record Type 42 Subtype 18 - VSAM RLS CF Cache Partition Usage.....	397
Primary segment: SMF042#18_DFSMS.....	397
Secondary segment: SMF042#18_Product_Section.....	398
Secondary segment: SMF042#18_VSAM_RLS_CFCache_Activity.....	398
Secondary segment: SMF042#18_VSAM_RLS_CFCache_Summary.....	399
Secondary segment: SMF042#18_VSAM_RLS_CFCache_DirElem.....	401
Record Type 42 Subtype 19 - VSAM RLS Buffer Manager LRU Activity.....	402
Primary segment: SMF042#19_DFSMS.....	402
Secondary segment: SMF042#19_Product_Section.....	403
Secondary segment: SMF042#19_VSAM_RLS_Local_Buffer_Manager_Sysplex.....	403

Documentation Notes

First Edition, February 2019

Information in this document details use of the SMF record processing utilities provided by the **SELCOPY Product Suite** component, **SELCOPYi**.

Copyright in the whole and every part of this document and of the SELCOPY Product Suite system and programs, is owned by Compute (Bridgend) Ltd (hereinafter referred to as CBL), whose registered office is located at 8 Merthyr Mawr Road, Bridgend, Wales, UK, CF31 3NH, and who reserve the right to alter, at their convenience, the whole or any part of this document and/or the SELCOPY Product Suite system and programs.

SELCOPY Product Suite for z/OS, z/VM (CMS) and z/VSE operating systems, which includes SELCOPY, SLC, SELCOPYi and CBLVCAT, is available for download and install from www.cbl.com/selcdl.php.

The following publications for SELCOPY Product Suite and its component products are available in Adobe Acrobat PDF format at CBL web page www.cbl.com/documentation.php:

- SELCOPY Product Suite Customisation Guide
- SELCOPY User Manual
- SELCOPY C++ (SLC) Language Reference
- CBLVCAT User Manual
- SELCOPYi Reference and User Guide
- SELCOPYi Text Editor
- SELCOPYi Data Editor (SDE)
- SELCOPYi Quick Reference
- SELCOPYi SMF Utilities
- SELCOPYi Training Manual

No reproduction of the whole or any part of the SELCOPY Product Suite system and programs, or of this document, is to be made without prior written authority from Compute (Bridgend) Ltd.

At the time of publication, this document is believed to be correct. Where the program product differs from that stated herein, Compute (Bridgend) Ltd reserve the right to revise either the program or its documentation at their discretion. CBL do not warrant that upward compatibility will be maintained for any use made of this program product to perform any operation in a manner not documented within the user manual.

The following generic terms are used throughout this document to indicate all available versions and releases of IBM mainframe operating systems:

z/OS	-	z/OS, OS/390, MVS/ESA, MVS/XA, MVS/SP, OS.
z/VSE	-	z/VSE, VSE/ESA, VSE/SP, DOS.
z/VM CMS	-	z/VM, VM/ESA, VM/XA, VM/SP.
All	-	All z/OS, z/VSE and z/VM CMS operating systems.

Introduction

MVS System Management Facilities (SMF) may be configured and activated to collect and record system and job-related information. This information is organised into data records and written to the allocated SMF dataset (SYS1.MANx) or to a log stream.

Each of these SMF records is assigned a distinct record type number and has a well defined (though often complex) structure. This structure may comprise a number of sections where each section may occur once, many times or not at all within the record data of the specific SMF record type.

SELCOPYi supports utilities that process, extract and display relevant information from the records generated by SMF.

Overview

SELCOPYi SMF utilities are included within the SELCOPY product licence as part of SELCOPYi product element. The utilities use features provided by the SELCOPYi Structured Data Editor (SDE) to map field data within the SMF records.

Each section of data within an SMF record is treated as a record segment and SDE **segmented record** processing will be used to interpret and present the data. (See [Primary/Secondary Segments](#).)

The SELCOPYi product is distributed with libraries *hlq.SZZSDIST.SMFMAP* and *hlq.SZZSDIST.SDO*.

Library *hlq.SZZSDIST.SDO* contains SELCOPYi structures (SDO) that each map the layout of fields in an SMF record type (or sub-type) as defined by IBM SMF or individual product documentation. Members of library *hlq.SZZSDIST.SMFMAP* correspond to SDO structures of the same name in library *hlq.SZZSDIST.SDO*. These members contain the source SELCOPYi SDE **CREATE STRUCTURE** primary command syntax used to generate the corresponding SDO structure.

The SELCOPYi SMF utilities provide features to perform the following tasks:

1. Browse formatted SMF record segments in tabular or single format.
All standard Data Editor functionality for browsed data is available (e.g. Multiple views, FIND, EXCLUDE, ONLY, etc.)
2. Based on record selection criteria, write a dataset containing a subset of SMF records extracted from an on-line SMF dataset or from one or more SMF DUMP archive datasets.
3. Generate a text report from SMF record data using report definition syntax.
4. Generate CSV, XML or JSON output from SMF record data.
5. Filter SMF records on input to browse and report utilities based on selection criteria.
6. Support for many standard and product specific SMF record types.

Online/Offline SMF Records

Utility processing may occur directly on records in an on-line SMF dataset or on records in SMF DUMP (IFASMF DL or IFASMF DP) output. Processing records directly from an SMF log stream is not supported.

SELCOPYi SMF panel and utility programs have an option that identifies the input SMF dataset as being online or offline. The only difference being that online records have an additional 4-byte field at the start of each SMF record.

Note: Any application that processes records directly from an online SMF dataset may prevent successful execution of an IFASMF DP CLEAR operation (usually triggered by the IEFU29 exit) which requires exclusive access to the SMF dataset.

SMF Record Types

The SELCOPYi SMF library members map all fields belonging to each defined SMF record type.

The field names used to map the SMF record segments broadly follow naming conventions used in IBM publications except that the name prefix, common to fields within the same SMF record section, is replaced by "z". e.g. Field "**SMF17DSN**" in SMF record type 17 has a prefix of "**SMF017**" which is common to all fields in that record type. Therefore, it is assigned field name "**zDSN**" within the SELCOPYi structure for that record type.

The following table identifies the SMF records types currently supported by SELCOPYi SMF utilities. A full expansion of the SMF record fields mapped by each member may be found under [SMF Record Layouts](#).

Record Type		Description	Library Member Name
DEC	(HEX)		
00	(00)	IPL	T000
02	(02)	Dump Header	T002
03	(03)	Dump Trailer	T003
04	(04)	Step Termination	T004

SELCOPYi Structure User Library

The first time a user executes the SELCOPYi SMF record browse utility, a copy of the distributed structure library (*hlq.SZZSDIST.SDO*) is created using the DSN prefix high level qualifiers specified by the `SYSTEM.USERDSNPREFIX` variable defined in the user's INI dataset (normally this is simply your userid). This library will contain the user's personal copy of the SELCOPYi structure (SDO) members.

Having a personal copy of this library allows the user to add "permanent" alterations to the SMF record field display using the Browse utility. (Note that permanent alterations apply only to the display of browsed data and so Report and Extract utilities use only the structure members in the the distributed SDO library.) Permanent updates to the browsed data display will be saved to the user's copy of the SDO structure member. By default, these changes will be applied to all subsequent browse displays of the same data. These "permanent" overrides may include:

- Field sequencing, field selection and field column-width resizing changed via the **SDE SELECT Columns** panel.
- Row colour highlighting specified via the **RCOLOUR** command.
- Column colour highlighting specified via the **CCOLOUR** command.

SELCOPYi Structure Usage

By default, SELCOPYi will only load the record mapping structures it needs to format the set of input SMF record types (and sub-types) it has to deal with. Note that, no user intervention is required.

The method used by SELCOPYi to select the required structures ensures that the amount of storage required to load the structure and the time taken to format each SMF record is kept to a minimum.

Browse and Extract Record Mapping

When the Browse or Extract utility is started, SELCOPYi generates a temporary, in-storage SDO structure containing a basic mapping of the SMF records header section (SDO structure "TNNN" containing record mapping "SMFnnn").

The temporary SDO structure generated for the Extract and Basic layout Browse operations is separate from that created for a Full layout Browse.

Extract and Basic Layout Browse

For Browse, the SMFnnn single record mapping is used when "Basic" layout is selected.

For Extract, SMFnnn is the only record mapping structure required as it is sufficient to apply the record selection criteria (select by date range, SMF record type, find string, Userid and Jobname) supported as standard.

Because no other record type mappings are required, the temporary SDO is unchanged.

Full Layout Browse

For Browse with "Full" layout, structures in the user's SDO library may be dynamically added to the temporary structure as required. The first time an SMF record of a particular type or sub-type is loaded, its matching SDO structure in the user's library gets added to the temporary SDO structure. The SMF record type and sub-type is identified by the record type and sub-type field values within the record's header data.

Note that a browse operation will load only 100 records at a time or only those records it needs to fill the available display area. Scrolling forwards through the display will load more records and so structure mappings may continue to be added to the temporary SDO throughout the browse session. Structures may be added until all SMF records have been loaded at least once.

Unless processing of specific types and/or sub-types is requested, the same temporary SDO structure will be used for each execution of Browse with "Full" layout. Because the temporary SDO does not need to be recreated, processing will be faster for subsequent Full layout Browse operations of SMF record types/sub-types loaded by a previous (or concurrent) browse session. The structure is kept in storage until the end of the SELCOPYi session or until it is explicitly dropped by the user.

Processing efficiency is improved if specific SMF record types are selected prior to execution of the browse operation. If types and/or sub-types are specified, then a new temporary structure will be generated which contains only the conditional logic required to include the specific record type mappings. Thus, when processing an input SMF record, fewer conditions are tested when determining the record's layout.

Report Record Mapping

Because the **COLUMNS:** section of the input report definition control statements declares which columns are to be included in the output report, SELCOPYi is able to deduce the required record mapping structures.

When the Report utility is executed, SELCOPYi first generates a temporary, in-storage SDO structure that contains only the required SMF record type structures. These structures are automatically loaded from the distributed SDO structure library.

Once the in-storage SDO structure is generated, SMF records are loaded and mapped without having to add further structures.

Primary/Secondary Segments

A feature of many SMF record-types is that they may include a number of different **repeating group** structures, each representing a map of potentially repeating areas of data within the record.

Each potentially repeating group structure may occur zero or more times within the record data to which it applies. If more than one occurrence of a particular repeating group structure exists, then each occurrence will occupy an area of the record that immediately follows the previous occurrence. All occurrences of a repeating group are typically addressed by what IBM refer to as **"triplet"** fields. Each triplet field is comprised of the following 3 consecutive fields:

1. A field (**xxxOF**) containing the **offset** within the base record to the first occurrence of the repeating group.
2. A field (**xxxLN**) containing the **length** of one instance of the repeating group.
3. A field (**xxxON**) containing the **number of occurrences** of the repeating group within the current record. (May be zero.)

SELCOPYi treats a repeating group as having a different record-type to that of the rest of the SMF record. More accurately, they are treated as separate **"Secondary"** segments of the SMF record that are subordinate to a single **"Base"** or **"Primary"** segment. Secondary segments are also assigned to areas of the SMF record that are not repeating but have a distinct sub-structure based on an SMF record sub-type (e.g. the sub-types for SMF records 14 and 15).

When browsing an SMF dataset in SELCOPYi, the initial table view of the file will display all SMF record segment types at once. The user may choose whether secondary segments are initially displayed in full with each segment occupying a new line of the display, or as **shadowed** lines (one for each group of segments having the same structure.)

If the shadowed option is not selected, then an instance of a record that has a number of secondary segments will occupy several lines within the table view. A new set of column headings will be displayed for each group of secondary segments of the same

structure that follow a segment of a different structure.

Using standard Data Editor data display editing techniques, the view of browsed SMF record data may easily be configured to exclude/include segments of any record-type and also to include/exclude/re-order the display of fields within in each segment.

For further information relating to display and navigation of segmented records, see the section [Segmented Records](#) of the Data Editor documentation.

Structure Definition Source

Library *hlq.SZZSDIST.SMFMAP* contains the source members used to generate the SDO structures found in library *hlq.SZZSDIST.SDO*. These are provided for reference purposes only.

Member "TNNN" is a generic form of the SMF record layout (record mapping SMFnnn) and can apply to any SMF record. It is used specifically to map SMF record types for which no layout has been defined. The "BASENAMS" member contains a reference to every SMF record-type layout name supported by SELCOPYi to date.

All other SMFMAP source library members correspond to SDO member structures of the same name.

The format used to define each layout is SELCOPYi's CREATE STRUCTURE for [Field Definition](#) syntax which, unlike COBOL or PL1 programming languages, supports repeating group segments defined by a **triplet** field.

Using SMF Utilities

This chapter describes how to use the SMF utilities supported by SELCOPYi.

- BROWSE
- EXTRACT
- REPORT

BROWSE

The Browse utility uses one or more SELCOPYi Data Editor window(s) to display SMF records in a multiple record (table) format view and/or a single record format view.

When processing SMF record input, each record's contents is formatted so that the data is organised within fields defined by the record layout for the particular SMF record type.

Areas of data within records of the same SMF record type may be mapped differently based on the content of the particular record. For this reason, SMF record data is partitioned into a number of record segments each having a well defined field structure layout. Each record segment is treated as a separate entry by the Data Editor and is displayed on a new line within a table format view or in a new screen display of a single record format view.

On initial display and whilst scrolling through the records, SELCOPYi automatically determines the segment field layout to be assigned to an area of an SMF record. This is based on well defined layout selection criteria. i.e. **no user interaction** is required to determine how data is mapped.

As for any data displayed via the Data Editor, multiple, independently scrollable windows may be opened on data belonging to the same data. In this way, SMF records may be viewed in both table format and single record format concurrently.

Browse Basic Layout

To start a browse of all SMF records that have been dumped to a GDG dataset "CBL.SMF.GDG(0)" using SMF DUMP (IFASMF DL or IFASMF DP):

1. Open the **Browse Utility Panel** by doing one of the following:
 - ◆ From a SELCOPYi command prompt, enter: =13.1
 - ◆ From the **SMF Features Menu**, select option 1 (Browse).
2. Under **SMF Dataset:**, enter the name of the GDG in the **DSN/Path>** field and the individual generation level (0 or -1, etc.) in the **Member>** field.
3. Since we are browsing SMF dumped output, as opposed to an SMF log data set (SYS1.MANx), ensure that **OFFLINE** (not ONLINE) is selected for **Options: field Format>**.
4. In the **Layout>** field, select **"B"** (Basic) so that we display records using a basic format that maps only the first few fields common to all SMF records. (The remainder of each record's data will be unformatted.)
5. **Options: field Segment>** can be allowed to default to **SHADOW** or **SHOW** as it will have no impact on basic layout browse.
6. Lastly, hit <Enter> to execute the Browse.

```

Figure 1. Getting started - Browse Basic Layout Panel.

Note: The first time a user starts the SMF browse or report utility following a product upgrade, the user's copy of the SMF SDO structures library is automatically refreshed with any layout members that have been added or updated. The refresh may be performed manually by selecting item **"Upd-Layouts"** from the panel menu bar.

This library DSN is derived by SELCOPYi using the installation defined user DSN prefix (*userpfx*) and fixed low level qualifiers "SELCOPYI.SMF.SDO" (i.e. library DSN "*userpfx*.SELCOPYI.SMF.SDO"). If this library does not exist, then it gets automatically allocated by SELCOPYi using DCB and SPACE values that match the distributed SMF SDO library ("*hlq*.SZZSDIST.SDO").

This library refresh accounts for a one off hit to the utility's startup time.

Browse Basic Layout Display

A Data Editor browse view is opened to display the first SMF records in the dataset formatted using the basic SMF layout.

Figure 2. Getting started - Browse Basic Layout Display.

Some temporary, informational messages are displayed at the bottom of the screen indicating the number of records loaded (base segments) and the number of secondary segments generated from the records. (Since this is a basic layout, no secondary segments will exist.)

The messages also highlight availability of the "ZoomW" and "SMFFLD" functions and the Function Keys to which they are assigned. (See ["View a Single Record in a new Display"](#) and ["Display Focus Record Layout"](#).)

The message text is removed when the <Enter> key or Function Key is pressed.

By default, the display is a table (multi-record) view and, because the same formatting is applied to every record, a single set of headers are displayed at the start of the records. The record fields displayed include the SMF record type number, a timestamp of when the record was written to the log and the system id.

Although not applicable to all SMF record types, the formatted display includes a sub-system id and record subtype value.

Records in the table display may be scrolled up and down, left and right.

The basic layout display is intended to provide a quick overview of the SMF record type and subtypes in the dataset.

Browse Full Layout

To display the SMF dataset records using their defined record layout, open the Browse Utility panel, as described for [Browse Basic Layout](#), and select "F" (Full) in the **Layout>** field.

Before pressing <Enter> to execute the browse, we may first to apply a filter to limit the display of records in the SMF dataset. (Records that do not satisfy a filter criteria will not be saved in storage.)

The SMF record type 119 pertains to TCP/IP statistics and so, to browse TCP/IP activity that occurred on 11th February 2019, we would also update the panel as follows:

1. Under **Record Selection:**, enter "119" in the **Type(s)>** field.

Note: 1. A number of blank or comma (",") separated SMF record types may be specified in the **Type>** field to identify a list of possible SMF record types to be included.

You may also specify a range of type numbers as **n1:n2** e.g. "60:69" is equivalent to "60,61,62,63,64,65,66,67,68,69".

2. The filter could be further refined to include only records of specific SMF **subtypes**. A specific subtype number may be specified following the record type number with an intervening hyphen ("-") or hash("#") character. e.g. To select only TCP/IP Connection Initiation (Subtype 1) and Termination (Subtype 2) records, type "**119-1, 119-2**" in the **Type>** field.

2. Under **Record Selection:**, enter the ISO date for 11th February 2019 in both the **Lo-Date/Time>** and **Hi-Date/Time>** fields. i.e. "**2019/02/11**".

A date relative to the current day may also be supplied as +/-nnn e.g. If today were 2016/03/05 then -5 will be treated as 2016/02/29 (leap year).

3. Hit <Enter> to execute the Browse.

Figure 3. Getting started - Browse Full Layout Panel.

Fields at static locations within certain SMF records are identified as containing a USERID or JOBNAME value (see description of BROWSE panel fields **User Id** and **Job Name** in the Utilities Reference chapter). One or more blank (or comma) separated masks may be specified in the **User Id>** and/or **Job Name>** fields providing an alternate list of userids and/or job names for which SMF records of these types may be selected. The characters "%" (percent) and "*" (asterisk) represent wild card characters in the User Id and Job Name masks.

Selection based on one or more **System Id** may be made in exactly the same way.

Further filtering of input records may be applied by adding one or more comma separated search strings in the **Find String>** field. Positioning the cursor in this field and executing EXPAND (Shift-F2 by default) will expand it to allow multiple, longer search strings to be specified. A search string may be of any format supported by the Data Editor **FIND** primary command. A find condition will give a true result if the search string exists anywhere within the SMF record.

The **Logic:** field specifies "AND" or "OR" which identifies the logical operator to be applied between the Type, Find string, User Id, Job Name and System Id field conditions (if specified). If multiple, alternate conditions are specified in one of these fields then, regardless of the Logic operator specification, a true result is returned for the field if **any** of its alternate conditions are satisfied by

the record data.

In this case, no Find String, User Id, Job Name or System Id criteria is specified. Therefore, if an SMF record is of the specified type (119) and the date on which the record was written to the SMF log falls within the specified date range, then it will be selected for browse.

Browse Full Layout Display

As for basic layout browse, temporary messages are displayed providing information on the number of records read and selected for display, and also the total number of secondary segments created from the records.

Because **SHADOW** was specified on the **Segment>** field of the browse panel, all secondary segments are displayed as "suppressed" shadow lines. Consecutive secondary segments of the same segment type are grouped together and displayed as a single shadow line.

A Data Editor browse view is opened to display the first SMF records in the dataset formatted using the full SMF record layout mappings.

View Lines of Suppressed Segment Types

The Data Editor **VIEW** primary command (or "**V**" line command) may be used to redisplay and suppress record segments as required. To display only segments in which we are interested:

1. Enter line command "**V+**" against a shadow line representing a segment type that we want to include in the display (make non-suppressed). Repeat this for all required segment types.

Note:

1. The Data Editor **VIEW** primary command (or "**V**" line command) may be used to redisplay and suppress record segments as required. "**V**" type line commands in the prefix area perform the following:

V	Segments matching the segment type of focus line will be displayed. (All other segments suppressed.)
V+	Segments matching the segment type of focus line will be displayed. (Suppressed status of other segments remains unchanged.)
V-	Segments matching the segment type of focus line will be suppressed. (Suppressed status of other segments remains unchanged.)

2. In addition to the **VIEW** commands, "**VBASE ON**" will display only base segments (all secondary segments suppressed), "**VBASE OFF**" will display all the record segments.

2. Hit <Enter> to execute the line command(s).

Display Focus Record Layout

The **SMFFLD** operation (assigned to the first available PFKey by default) will open a Help window displaying information (name, data type, length and description) on all the fields in all segments belonging to the SMF record in the focus line of the display.

A table of links to the start of each SMF record segment follows the a "Notes" section at the start of the displayed help. The SMF record segment field information is displayed in a tabular format and is identical to that found in the [SMF Record Layouts](#) chapter of this publication.

```

SELCOPY/i - SMF Mapping for T119ST05
Back Forward HomeLink Close Source Text Help wS wR Scroll> Csr
Command>
Type "TEXT" to display searchable version.

SELCOPYi Mapping for SMF Record Type 119 Subtype 5
Notes:
1. The following table(s) contain sub-headers (e.g. "SMF119#05_TCPIP_Statistics.z???"). A sub-header character string identifies the prefix that may be applied to one of the field names that follows it in order to uniquely identify that field. (z??? should be substituted with the name of the field.)

The Report utility uses fully qualified field names to identify the record group segment and field to be included as a column in the report. (See the COLUMNS: section of the SMF Report definition input.)

2. The Len column contains the internal length of the field. If the length is variable, the minimum and maximum values are displayed. If the field has a precision and scale (e.g. for FIXED or DEC data types) then it is displayed below the length as (p,s).

Record Segments:

Browse Commands

Any primary or line command supported by BROWSE in the Data Editor may be executed when browsing SMF records. However, the following commands are particularly useful and are used for navigating, extracting and formatting the display of the SMF record data.

NEXT / PREV

The **NEXT (N)** and **PREV (P)** commands are particularly useful when browsing an SMF dataset that contains many different base record types.

To navigate to the next occurrence of SMF Record Type "nn" type **N SMF0nn** e.g. **N SMF014**

To navigate to the previous occurrence of SMF Record Type "nn" type **P SMF0nn** e.g. **P SMF014**

PRINT / XMLGEN / CSVGEN / JSONGEN

The **PRINT**, **XMLGEN (XML)**, **CSVGEN (CSV)** and **JSONGEN (JSON)** primary commands may be used to create various external character based versions of the currently browsed SMF data.

SELECT

The **SELECT** command opens a dialog used to tailor the display of **focus record-type**. This includes selection of the fields to be displayed, their order on screen, their column widths and "held" status.

Modifications may be temporary or permanent. Details of permanent modifications are saved in the Structure Definition Object (**SDO**).

SMFFLD

Open a help window to display information on each field mapped by the SMF structure assigned to the segment visible in the **focus line**.

The help provides a tabular view of fields of each segment in the SMF record type (or subtype). The field names are preceded by sub-headers that identify the structure name hierarchy. These structure names, together with the field name, provide the fully qualified name of the field.

VBASE

Type **VBASE** during your browse session to display secondary segments as shadow lines. This is the initial display mode when option **"Segment> SHADOW"** is selected from the SMF Browse entry panel.

Type **VBASE OFF** during your browse session to display secondary segments in full detail. This is the initial display mode when option **"Segment> SHOW"** is selected from the SMF Browse entry panel.

Note that while secondary segments are shadowed (thereby occupying much less screen space) the detail for any single shadowed segment may be displayed in a separate window by placing the cursor on the shadow line and pressing the **"ZoomW"** key (**Shift-F5**).

The shadow lines themselves may be suppressed using the **SHADOW (SHAD)** set option and/or the **HIDE** primary command.

VIEW

The **VIEW** command may be used to restrict visible record/segment types. Excluded record-types will be represented on screen by "shadow" lines.

Line-commands **"V"**, **"V+"** and **"V-"** may also be entered into the prefix area.

ZoomW Key

The **"ZoomW"** key (**Shift-F5**) may be used from an SMF Browse session in order to display the **focus** record/segment as a **single record** formatted view.

The ZoomW key (which issues primary command "SDEZOOMW MAP") actually opens a separate window which will be right adjusted on the screen, provided the user is operating on a sufficiently large screen (e.g. 62 lines x 160 columns).

This is particularly useful when issued against a shadowed segment which then becomes visible in full detail in the new window.

Using a standard screen size (e.g. 32 lines x 80 columns) SELCOPYi does not operate in "windowed" display mode, in which case a new "full-screen" window which completely overlays the current display may be undesirable. In this case the user may prefer to use the **MAP (FMT)** and **VFMT** commands to switch display format. MAP may also be entered as a line-command in the prefix area of any record/segment/shadow line.

EXTRACT

The Extract utility provides a facility to selectively copy SMF records from one or more SMF DUMP archives or directly from an online SMF dataset (SYS1.MANx) to a DASD dataset. Processing of an SMF log stream is not supported by SELCOPYi SMF utilities.

SMF records may be selected based on record type/subtype, timestamp range and System Id. Additional filtering may be performed on specific record types for JOBNAME and/or USERID which occur in fixed positions within these records. A FIND string may also be supplied to include records containing a search string at any position within the record.

The output dataset will be a subset of the input dataset(s) and may be used as input to other applications including the SELCOPYi Browse and Report utilities.

Extract SMF Record Types

Assume that SMF records are archived to GDS datasets of a GDG "CBL.SMF.GDG" via the SMF DUMP dataset function of IFASMF DL or IFASMF DP. To begin extracting only SMF records relating to VSAM dataset and ICF Catalog activity (SMF types 60 to 69) from all GDS datasets for this GDG:

1. Open the **Extract Utility Panel** by doing one of the following:
 - ◆ From a SELCOPYi command prompt, enter: =13,2
 - ◆ From the **SMF Features Menu**, select option 2 (Extract).
2. Under **SMF Source Dataset(s)**:, enter the name of the GDG in the **DSN/Path**> field. If records are to be extracted from one of the GDG generation datasets, then enter the the generation level of the required GDS in the **Member**> field. (i.e. 0, -1 or -2, etc.)

To extract records from all GDS datasets belonging to the GDG, leave the **Member**> field empty.

Note: 1. 3 pairs of **DSN/Path**> and **Member**> fields are provided to allow specification of up to 3 input SMF record datasets/library members.

If more than 3 input datasets need to be specified, then enter "C" in the **Run Type**> field to generate an **SMFEXTRC** primary command for 1-3 of the datasets. Thereafter, the command may be edited to include additional datasets and add the "BATCH" option if necessary.

2. If a dataset or member name includes a wildcard character asterisk ("*") and/or percent ("%"), then a list of dataset/member names are displayed that match the supplied DSN/member mask. Select the required list entry to populate the source dataset input fields.

3. Under **SMF Extract Dataset**:, enter the name of the output dataset, library member or GDG (level 0) in the **DSN/Path**> and **Member**> fields as appropriate.

Note: 1. If a dataset or member name includes a wildcard character asterisk ("*") and/or percent ("%"), then a list of existing dataset/member names are displayed that match the supplied DSN/member mask. Select the required list entry to populate the extract dataset input fields.

2. If a dataset name is specified for a dataset that does not yet exist, then, when the utility executes, the "Create new file" popup window is displayed. This prompts the user to select the output dataset organisation and then opens the appropriate dataset allocation or IDCAMS define dialog window to create the new dataset.

4. Under **Record Selection**:, enter the required SMF types as a blank and/or comma (",") separated list in the **Type(s)**> field. i.e. "60,61,62,63,64,65,66,67,68,69"

You may also specify a range of type numbers as **rr1:rr2** e.g. "60:69" is equivalent to "60,61,62,63,64,65,66,67,68,69".

Note: For SMF record types that support subtypes, a specific subtype number may be specified following the record type number with an intervening hyphen ("-") or hash("#") character. e.g. "42-5" for record type 42 subtype 5.

5. Since we are extracting from SMF dumped output, as opposed to an SMF log data set (SYS1.MANx), ensure that **OFFLINE** (not ONLINE) is selected for **Options**: field **Format**>.

Note: The format of the extracted records match that of the input. Therefore, extracting records from an ONLINE SMF dataset would produce records that must also be processed as ONLINE format.

6. Select a **Run Type**> of "F" (Foreground) under **Options**: to run the extraction in TSO/E foreground. Alternative options are: "B" (Batch) to generate and display a JCL job stream and "C" (Command) to generate and display syntax based on panel input field data for primary command SMFEXTRC.

7. The **Append**> option field may be left blank to overwrite the contents of an existing output dataset.

8. Lastly, hit <Enter> to execute the extract action specified by **Run Type**>.

```

  Append >
Type OUTPUT (O) to browse the Output dataset.
Type I<n> to browse Input dataset (n). e.g. I3 to browse input file (3).

```

Figure 11. Getting started - Extract SMF Record Types Panel.

It may be useful to browse the contents of the input SMF data set(s) prior to executing the extract and then browse the output records after executing the extract. Before and/or after executing the extract utility, the contents of the input source dataset(s) and output extract dataset may be displayed as a **basic layout browse** by entering panel primary command "INPUT" (or "I") and "OUTPUT" (or "O") respectively.

"I" or "I1" will perform the browse on the input dataset/library member in the first source dataset specification. "I2" and "I3" will do the same for the second and third source datasets respectively.

Extract Batch Job

To run the extraction in batch, the SELCOPYi batch program (**SDEAMAIN**) must be executed. The control statement input (DD SDEIN) will contain an instance of the **SMFEXTRC** primary command.

The Extract utility panel may be used to generate job control with the required SDEIN SMFEXTRC command as follows:

1. Open and tailor input fields in the Extract Utility panel, as described previously for **Extract SMF Record Types**.
2. For the purpose of creating a sample set or capping execution time, the number of input source records and extracted output records may be limited via the **Input Limit>** and **Output Limit>** fields respectively.

Enter an input limit of "100000" to restrict the total number of records read from **all** input datasets to a maximum of 100,000. Also enter an output limit of "50" to restrict the number of output records of **each specified type** to a maximum of 50 (10 SMF record types are selected so no more than 500 output records in total). Extract processing will end when either of these limits is reached.

3. The number of extracted records may also be limited by timestamp at which the records were written to the SMF log stream or dataset.

Enter "2019/02/11 01:30" in the **Lo-Date/Time>** field and "2019/02/11" in the **Hi-Date/Time>** field to further restrict extraction of SMF records to those written after 01:30 on Monday 11th February 2019.

Lo-Date/Time> and/or **Hi-Date/Time>** input fields may be used to define a date and time range in which the record must have been written in order to be included in the extract operation. The format of the timestamp specification for both fields is **yyyy/MM/dd hh:mm:ss.t** but may be truncated on the right to reduce precision. (e.g. "2019/01/21 12" in the **Lo-Date/Time>** field is equivalent to "2019/01/21 12:00:00.0", "2019/01" in the **Hi-Date/Time>** field is equivalent to "2019/01/99 99:99:99.9".)

A date relative to the current day may also be supplied as +/-nnn e.g. If today were 2016/03/05 then -5 will be treated as 2016/02/29 (leap year).

If no **Hi-Date/Time>** value is provided, records are eligible for extraction provided their timestamp is greater than or equal to the **Lo-Date/Time>** value. Similarly, if the timestamp is less than or equal to the **Hi-Date/Time>** value when no **Lo-Date/Time>** is provided.

4. Select a **Run Type>** of "B" (Batch) under **Options:** to generate and display a JCL job stream. Note that menu item "JCL" would generate the job stream output regardless of the contents of this field.

5. Enter "APP" in the **Append**> option field to append the extracted records to records that already exist in the extract output dataset.
6. Lastly, hit <Enter> to generate the batch job.

Figure 12. Getting started - Extract SMF Batch Job Panel.

A Text Editor window view is opened to display the generated job stream using a temporary dataset name. The job may be saved to a member of a job library using the **REPLACE (REP)** or **SAVE** primary commands. e.g. **SAVE NBJ.SMF.JCL(EXTR001)**.

A JOB card is created as defined in the **Batch Job Settings (=0.6)** SELCOPYi options panel. Otherwise a default is used.

```

Figure 13. Getting started - Extract SMF Batch Job.

Edit primary command **SUBMIT** may be executed to submit the job to batch. Note that the contents of the Text Editor view will be submitted "as is" without the need to first save changes to a DASD dataset.

Extract Selection Criteria

In order to be copied to the output dataset, a record processed by an extract operation must satisfy **all** conditions specified by the following record selection criteria:

1. Timestamp if values specified in **Lo-Date/Time>**, **Hi-Date/Time>** or both.
2. Input record number if a value is specified in **Input Limit>**.
3. Output record number if a value is specified in **Output Limit>**.

Thereafter, additional record selection criteria provide alternative or cumulative conditions. If logical **"OR"** is selected, then in order to qualify for copy to the extract dataset a record need satisfy only **one** of the the following in which conditions are specified:

1. A match for an SMF record type or subtype in **Type(s)>**.
2. A match anywhere in the record for a search string specified in **Find String>**.
3. A match for a user id mask found at a fixed position of the record in **User Id>**.
4. A match for a job name mask found at a fixed position of the record in **Job Name>**.
5. A match for a system id mask found at a fixed position of the record in **System Id>**.

If logical **"AND"** is selected, a record must match one of the specified record types, at least one of the specified user id masks, at least one of the job name masks, at least one of the system ids and at least one of the specified Find search strings in order to qualify for copy to the extract dataset.

Building on the extract panel entries already specified, the following steps will impose additional alternate selection criteria:

1. Open and tailor input fields in the Extract Utility panel, as described previously for **Extract Batch Job**.
2. In the **Find String>** field, type " **P'INDD#'** ".

The **Find String>** field specifies a search string value which, if found **anywhere** within the raw data of the input SMF record, will flag that record for copy to the extract dataset. The FIND string may be case insensitive ('a234'), case sensitive ('C'a234'), a hex string ('X'81F2F3F4'), a picture string ('P'a####') or a regular expression ('R'a:d^3').

3. In the **User Id>** field, type " **NBJ183, TEST*** ".

The **User Id>** field identifies 1 or more userid values, one of which must match the up to 8 character user id value found at a fixed position within one of the following specific SMF record types:

004	010	017	025	034	040	061	064	067	080
005	014	018	026	035	042	062	065	068	110
006	015	020	030	036	060	063	066	069	118
									119

SMF records that are not one of these record types will not be tested for User id.

A user id value may contain wildcard characters: asterisk ("*") to represent zero or more characters and/or percent ("%") to represent exactly one character.

4. In the **Job Name>** field, type " **SMF*** ".

The **Job Name>** field identifies 1 or more job name values, one of which must match the up to 8 character jobname value found at a fixed position within one of the following specific SMF record types:

004	010	017	025	034	040	061	064	067	080
005	014	018	026	035	042	062	065	068	110
006	015	020	030	036	060	063	066	069	118

SMF records that are not one of these record types will not be tested for job name.

A job name value may contain wildcard characters: asterisk ("*") to represent zero or more characters and/or percent ("%") to represent exactly one character.

5. Allow the **Logic:** field to default to "OR" so that an SMF record that falls within the given data range is eligible for copy if any of the specified selection criteria provided by for record types/subtype, find string, user id or job name is satisfied.
6. Select a **Run Type** of "C" (Command) under **Options:** to generate and display SMFEXTRC primary command syntax. Note that menu item "**Command**" would generate the command syntax output regardless of the contents of this field.
7. Lastly, hit <Enter> to generate and display the command stream in a temporary Text Editor window view.

REPORT

The Report utility provides the means to create a printable text featuring field values from SMF records.

A basic report is typically arranged as a table of values with underlined column headings, table breaks, sub-totals and grand totals. Each page of the report output contains a header line in line 1 comprising a time and date, optional page title and page number.

Table rows may be sorted by values in one or more columns in ascending or descending order. SELCOPYi uses the installation's SORT program (e.g. DFSORT or SYNCSORT) to perform this task. The necessary SORT DD names (SORTIN, SORTOUT, etc.) are dynamically allocated and freed by the utility when executed in the SELCOPYi foreground.

Report definition control statements are supplied as input to the report generation utility. This input may be specified to the utility via a DDname or as a fileid (DSN, library member or ZFS/HFS file path).

The output report is written to DD **SDEPRINT** or, if run in the SELCOPYi foreground, to an in-storage dataset which is displayed in a Text Editor edit window view.

As well as standard "Print" style output, the Report utility may be used to generate various external formats (**CSV**, **XML** and **JSON**) typically used to load the selected values into PC programs such as **Microsoft Excel** or into database product such as **DB2**.

Only basic reporting features as they relate to SMF data will be covered here. For full information please see the separate manual [SELCOPYi Report Utility](#) where, among other things, you can also learn how to produce reports from non-SMF datasets (mapped by **COBOL/PL1** etc copybooks) or from **DB2 tables**. The Report Utility is a standard part of the SELCOPYi product and is not charged separately.

Report - Basic

Task:

Create a report of the following values found in fields defined within type 14 SMF records (records relating to INPUT or RDBACK Data Set Activity):

- Job Name.
- Date and time that the SMF record was moved to the SMF buffer.
- Job step name.
- Program name.
- DD name.
- Data set name.
- DISP=OLD/NEW/MOD indicator.
- DISP=SHR indicator.
- EXCPs performed on the dataset during the job step.
- Record Format.
- Primary (or only) Volume id.
- SMS Management Class.
- SMS Storage Class.

The 3 steps taken to generate this report are as follows:

1. Write basic **report definition** control statements.
2. Specify the input SMF dataset, report definition source and other options in the **Report Utility Panel**.
3. Display the generated **report output**.

Report - Basic Definition

Before starting to write report definition control statements, allocate a PDS or PDSE library to contain members in which the report definitions may be saved. Control statements may be of fixed or variable record format and be of any record length. However, beware that the last 8 characters of a RECFM=F record are reserved for line numbering.

1. Type "**ALLOC**" to open the **Allocate NonVSAM** dialog.
2. Tailor dialog fields as required and select the "Allocate" button to allocate the new PDS or PDSE library. (e.g. Use DSN "*userpfx.SELCOPYI.RPT*" with RECFM=VB, LRECL=256, BLKSIZE=0)

```

Figure 16. Allocate new REPORT Definition Input Library.

Next, edit a new member "SMF14" in "userpfx.SELCOPYI.RPT" and begin typing report definition statements.

1. Type "**EDIT userpfx.SELCOPYI.RPT(SMF14)**" to open a Text Editor window view for the new member.
2. Add some blank lines to the member by entering primary command "**ADD 33**".
3. Within the edit display, enter section header "**TITLE:**" and in the line below enter a title to appear in the header of each new page. Note that quotation marks (") and apostrophes (') will be treated as being part of the title text and therefore should not be used to enclose the title text.
4. On a line following the title text, enter section header "**COLUMNS:**". Column definitions are entered in the lines that follow.

Enter the required SMF field column report definitions:

```

** NBJ.SELCOPYI.RPT(SMF14) *** L=001 --- 2019/02/13 16:24:19 (NBJ)

SMF014#2_SMS_Class.zSCN

```

Figure 17. Report Basic Definition.

- Note:**
1. Apart from the line containing the **TITLE:** text, an asterisk ("*") may be specified at the start of a line to denote the start of comment data.
 2. By default, the end of the record denotes the end of the statement text. The continuation character backslash ("\") may be specified as the last non-blank character of a line. This will extend the statement by concatenating text starting in column 1 of the next line with the last character before the "\" on the current line.

Each column definition is comprised of the following:

1. **Mandatory:** A partially or fully qualified SMF record segment field name.

A table of field names belonging to SMF record type 14 may be found in [SMF Record Layouts](#) and may be displayed in the SELCOPYi session using command "**SMFFLD T014**".

- Note:** The last and first qualifiers are mandatory and identify the field and the segment to which the field belongs respectively. Intermediate qualifiers identify the names of sub-structures within the segment to which the field belongs. Specification of sub-structure name qualifiers are unnecessary if the field has a unique name within the segment.

e.g. Field "**RECFM**" belongs to sub-structure "**JFCB**" within segment "**SMF014_INPUT_or_RDBACK_Dataset**" and so has a fully qualified name:

```
SMF014_INPUT_or_RDBACK_Dataset.JFCB.RECFM
```

However, "RECFM" is a unique field name within the segment and so may be uniquely identified using field name:

SMF014_INPUT_or_RDBACK_Dataset.RECFM

2. **Optional:** A column heading name enclosed in quotation marks (") or apostrophes ('). If required, a null column header may be specified ("") but, if omitted, the column header used will be the last qualifier of the field name.
3. **Optional:** An integer value defining the width of the column. Column values will be truncated or padded with blank characters as appropriate.
4. **Optional:** "RIGHT" or "LEFT" indicating that the column will contain the rightmost or leftmost characters of the SMF field value for a length equal to the column width. The default is "LEFT".

Note: Because numeric field values are right adjusted, "RIGHT" must be specified when a shorter column width is supplied in order to prevent truncation of significant digits.

5. **"SAVE"** the changes to member "SMF14" and exit the Text Edit view.

Report - Basic Panel Input

To obtain a report using the **SMF14** report definition for the SMF records contained in the latest generation dataset belonging to "CBL.SMF.GDG":

1. Open the **Report Utility Panel** by doing one of the following:
 - ◆ From a SELCOPYi command prompt, enter: =13.3
 - ◆ From the **SMF Features Menu**, select option 3 (Report).
2. Under **Report Definition:**, enter the DSN of the report definition library ("*userpfx*.SELCOPYI.RPT") in the **DSN/Path>** field and the name of the required report member ("**SMF14**") in the **Member>** field.

Note: If a dataset or member name includes a wildcard character asterisk ("*") and/or percent ("%"), then a list of dataset/member names are displayed that match the supplied DSN/member mask. Select the required list entry to populate the source dataset input fields.

3. Under **SMF Dataset:**, enter the name of the GDG in the **DSN/Path>** field and a valid generation reference (e.g. "-1") in the **Member>** field.
4. Since the report output is based on SMF record type 14 only, it makes sense to apply a filter to select SMF 14 records only.

Under **Record Selection:**, enter the required SMF type ("14") in the **Type(s)>** field.

In this particular case it is actually unnecessary to explicitly specify the filter since the report utility knows which record-type(s) are being reported on and will automatically load only the types necessary. However, it may be necessary to filter on a particular SMF subtype e.g. to restrict your report to Record Type 30 Subtype 5 ("Job Termination") specify "30-5" in the **Type(s)>** field.

5. The number of records on which the report operates may be limited via the **Input Limit>** and **Output Limit>** fields.

Enter an output limit of "500" to restrict the number of records processed by the report definition statements to a maximum of 500.

Note that if a sort is applied then output limit is not applied until the sort (on all otherwise selected records) is completed. This means for instance that a report may be generated for the "Top nnn" (nnn = any number) values of any field, simply by combining a descending sort on that field with **Output Limit>** nnn.

6. To execute the report generation in the SELCOPYi (TSO) foreground, enter "F" in the **Run Type>** field under **Options:**.
7. To create standard "Print" style output, enter "P" in the **Output Type>** field under **Options:**.
8. Leave the **Page Depth>** field blank to allow the report pagedepth to default to the Data Editor **PAGEDEPTH** value (default 60 lines).
9. Lastly, hit <Enter> to execute the report generation.

  Type EDIT (E) to edit the Report Definition file.
  Type INPUT (I) to browse the SMF Dataset.

```

Figure 18. Report Utility Panel.

Before and/or after executing the report utility, the contents of the input SMF record source dataset may be displayed in a formatted Data Editor browse view using panel primary command "INPUT" (or "I"). The

The report definition dataset may be displayed (and edited) in a Text Editor view using panel primary command "EDIT" (or "E").

Report - Basic Output

Provided no errors occur during processing of the report definition control statements, the generated report is displayed in a Text Editor window view on completion. (If executing in batch, the report output would be written to SDEPRINT.)

The report itself is in-storage and may be saved to a DASD dataset using "REP" or "SAVE <dsname>". e.g.

```
SAVE <userpfx>.SELCOPYI.SMF.RPTOUT(SMF14)
```

The "Allocate Non-VSAM" dialog will open if library "<userpfx>.SELCOPYI.SMF.RPTOUT" does not yet exist.

PAGE 2

Figure 19. Report Basic Output.

By default, grand total values will be displayed for every report column containing numeric data. This may be controlled in the **TOTALS:** section of the Report definition input.

Report - SORT, BREAK and TOTALS

Task:

Create a report displaying information for individual job steps that have been executed. Group report records by Job name and display the total number of EXCPs performed by executions of each job.

The report should contain the following columns, the values for which are found in fields defined within SMF type 30 subtype 4 records (records relating to common address space work - Job step totals):

- SMF 30 sub type name.
- Date and time that the Reader recognised the job's JOB card.
- Job Name.
- Job Step number.
- Job Step Program name.
- Job step completion code.
- Job step CPU time.
- Job step EXCP count.
- Address space DASD I/O connect time.
- Address space DASD I/O pending and control unit queue time.
- Address space DASD I/O start subchannel count.

Instead of executing the report utility in the SELCOPYi foreground, generate a job stream to be submitted to batch. Write the report to a RECFM=VBA dataset.

1. Report Definition
2. Report Utility Panel Input
3. Report Job Stream
4. Report Output

Report - SORT, BREAK and TOTALS Definition

Edit a member to be used as input to the utility and insert report definition control statements:

1. Open a Text Edit view for new member name "SMF30#4" belonging to the Report Definition library ("*userfx.SELCOPYI.RPT*"). This can be done via any of the following methods:

- ◆ Under **Report Definition**> in the Report Utility Panel, enter the library DSN in the **DSN/Path**> field and the new member name in the **Member**> field. Type panel primary command "E" to begin edit of the new member.

- ◆ Execute the Test Editor primary command:

```
EDIT userpfx.SELCOPYI.RPT(SMF30#4)
```

- ◆ Use the Text Editor entry panel (enter "="1")

2. Add some blank lines to the member by entering primary command "**ADD 33**".
3. Within the edit display, enter section header "**TITLE:**" and in the line below enter a title to appear in the header of each new page. Note that quotation marks (") and apostrophes (') will be treated as being part of the title text and therefore should not be used to enclose the title text.
4. On a line following the title text, enter section header "**COLUMNS:**". Column definitions are entered in the lines that follow.

The required SMF field names containing values to be reported may be obtained from the description of the **SMF type 30 record layout**. Alternatively, execute "**SMFFLD 30**" to display the description on-line.

Qualified SMF field name reference, column header name, column width and value alignment parameters may be specified as described for the **basic report definition** example.

5. In order to group report entries by job name, the entries must be sorted primarily by job name. (Secondary sort columns may still be specified.)

Following the "**COLUMN:**" definitions, enter section header "**SORT:**" and below it, enter the qualified SMF field name references in order of priority in which the report entries are to be sorted.

The qualified names of the SMF fields used for sorting must appear on separate lines and must each exactly match a qualified SMF field name specified in the **COLUMNS:** section.

The job name value is found in the field named "**zJOBNAME**" in segment "**SMF030_Identification**" so enter: "**SMF030_Identification.zJOBNAME**". Add another (secondary) sort field for reader timestamp ("**SMF030_Identification.zRST**").

By default, rows will be sorted in ascending order of job name, then ascending order of reader timestamp.

6. Because the report is to be sorted by job name, a break may be defined so that a visual gap in the reported values occurs when the job name changes. When a break occurs, sub-totals are displayed for each column in which totalling is active.

Following the "**SORT:**" field definitions, enter section header "**BREAK:**" and below it, enter the qualified SMF field name of the job name field. "**SMF030_Identification.zJOBNAME**".

7. By default, totalling will occur for **all** columns containing numeric data type values.

To restrict column totalling to only the EXCP count column, enter a section header "**TOTALS:**" following the "**BREAK:**" field name, then add the SMF field name of the EXCP field ("**SMF030_IO_Activity.zTEP**").

```

Figure 20. Report Definition - SORT, BREAK, TOTALS.

Report - SORT, BREAK and TOTALS Panel Input

To obtain a report using the **SMF30#4** report definition for the SMF records contained in the latest generation dataset belonging to "CBL.SMF.GDG":

1. Open the **Report Utility Panel** and populate the **Report Definition:** and **SMF Dataset:** fields as described for **basic panel input**. Type member name **"SMF30#4"** in the **Member>** field.
2. Type **"30-4"** in the **Type(s)>** filter field so that only the required SMF record sub-types are passed to the report utility.
3. Do not impose an input record count or output record count limit by clearing the **Input Limit>** and **Output Limit>** fields.

- Note:**
1. SMF record type 30 subtype 4 corresponds specifically to job step totals in the common address space.
 2. SMF record subtypes may be specified as format **"nn#mm"** or **"nn-mm"** where **nn** is the SMF record type and **mm** is the sub-type.

4. To generate a job stream output suitable for submission to batch, enter **"B"** in the **Run Type>** field under **Options:**.
5. Type **"80"** in the **Page Depth>** field to override the default report pagedepth value.
6. Lastly, hit <Enter> to generate the job stream.

```

Figure 21. Report Utility Panel with PAGEDEPTH.

Report - SORT, BREAK and TOTALS Job Stream

To run the report generation in batch, the SELCOPYi batch program (**SDEAMAIN**) must be executed. The control statement input (DD SDEIN) will contain an instance of the **SMFRPT** primary command.

Having created the job stream, the Report utility panel opens a Text Editor window view to display the generated JCL and in-stream control input statements. The text is held in-storage and assigned a temporary dataset name.

The job may be save to a member of a job library using the **SAVE** primary command. e.g. **SAVE NBJ.SMF.JCL(RPT0001)**.

A JOB card is created as defined in the **Batch Job Settings (=0.6)** SELCOPYi options panel. Otherwise a default is used.

When executed in batch, report output is written to DD SDEOUT. To write output to a new RECFM=VBA dataset ("**userpfx.SELCOPYI.SMF.RPT0001**"), replace the SDEPRINT DD statement with one that allocates a dataset DISP=NEW.

Figure 23. Report Output with SORT, BREAK and TOTALS.

Report - REPEAT

Task:

Create a report displaying the largest size and number of EXCP blocks issued for each DDName referenced by a job within the common address space. Generate totals for number of EXCP blocks issued only.

The report should contain the following columns, the values for which are found in fields defined within SMF type 30 subtype 5 records (records relating to common address space work - Job Termination):

- Job Name.
- Date and time that the Initiator selected the job.
- Date and time that the job ended (SMF record written).
- DDName.
- Number of EXCP blocks issued.
- Size of largest block.

The SMF type 30 records contain one Execute Channel Program (EXCP) secondary segment for each DDName referenced by the job or session. Therefore, the generated report output must contain one report line for each EXCP segment of the same SMF type 30 input record.

The first report line corresponding to a new SMF type 30 subtype 5 (job termination) record will include values for all columns. Subsequent report lines for the same record will contain only values for columns defined by the EXCP segment.

Execute the report utility in the SELCOPYi foreground to display the report in a Text Editor window view.

1. [Report Definition](#)
2. [Report Utility Panel Input](#)
3. [Report Output](#)

Report - REPEAT Definition

Edit a member to be used as input to the utility and insert report definition control statements:

1. Open a Text Edit view for new member name "SMF30#5" belonging to the Report Definition library ("*userpfx.SELCOPYI.RPT*"). This can be done via any of the following methods:
 - ◆ Under **Report Definition**> in the Report Utility Panel, enter the library DSN in the **DSN/Path**> field and the new member name in the **Member**> field. Type panel primary command "E" to begin edit of the new member.
 - ◆ Execute the Test Editor primary command:

```
EDIT userpfx.SELCOPYI.RPT(SMF30#5)
```
 - ◆ Use the Text Editor entry panel (enter "=1")
2. Add some blank lines to the member by entering primary command "**ADD 33**".
3. Within the edit display, enter section header "**TITLE:**" and in the line below enter a title to appear in the header of each new page. Note that quotation marks (") and apostrophes (') will be treated as being part of the title text and therefore should not be used to enclose the title text.
4. On a line following the title text, enter section header "**COLUMNS:**". Column definitions are entered in the lines that follow.

The required SMF field names containing values to be reported may be obtained from the description of the [SMF type 30 record layout](#). Alternatively, execute "**SMFFLD T030**" to display the description on-line.

Qualified SMF field name reference, column header name, column width and value alignment parameters may be specified as described for the [basic report definition](#) example.
5. If an SMF record potentially contains multiple instances of the same secondary segment type and report columns are defined from field values belonging to that secondary segment, then REPEAT must be used in order to output a new report record for each occurrence of the secondary segment.

The report record for second and subsequent occurrences of the repeating segment will contain only column values for fields belonging to the repeating segment. All other report columns will contain blank values.

Following the "**COLUMN:**" definitions, enter section header "**REPEAT:**" and below it, enter the name of each potentially repeating SMF secondary segment from which columns have been defined. Multiple secondary segment names may be specified.

The SMF type 30 EXCP segment contains I/O information for each DDName/Device address pair for the address space. Since the report includes column definitions for field values in this segment, enter the segment name under "**SMF030_EXCP**".

Since other report columns are defined by fields in non-repeating segments, no other segment names need to be specified.

By default, a new report record will be written for each new primary segment (i.e. each new SMF record). Only the field values belonging to the last occurrence of a repeating secondary segment would be displayed in the report.

- Finally, include a "TOTALS:" entry for the Number of EXCP blocks column ("SMF030_EXCP.zEXP.zBLK") to restrict totalling to this column only.

```

Figure 24. Report Definition - REPEAT.

Report - REPEAT Panel Input

To obtain a report using the **SMF30#5** report definition for the SMF records contained in the latest generation dataset belonging to "CBL.SMF.GDG":

- Open the **Report Utility Panel** and populate the **Report Definition:** and **SMF Dataset:** fields as described for **basic panel input**. Type member name "**SMF30#5**" in the **Member>** field.
- Type "**30-5**" in the **Type(s)>** filter field so that only the required SMF record sub-types are passed to the report utility.

- Note:**
- SMF record type 30 subtype 5 corresponds specifically to job termination or termination of other work unit in the common address space.
 - SMF record subtypes may be specified as format "*nn#mm*" or "*nn-mm*" where *nn* is the SMF record type and *mm* is the sub-type.

- To execute the job in the SELCOPYi foreground, enter "**F**" in the **Run Type>** field under **Otions:**.
- Type "200" in the **Page Depth>** field to override the default report pagedepth value.
- Lastly, hit <Enter> to generate the report output.

Figure 26. Report Output with REPEAT.

Report - FILTER

Task:

Create a report displaying statistics for VSAM clusters and components at OPEN time. Group the report records by job name and apply a filter so that the report does not include VSAM components that have zero number of records or have been opened by jobs with a job name beginning "SMF".

The report should contain the following columns, the values for which are found in fields defined within SMF Type 64 records (records relating to VSAM Component or Cluster status):

- Job Name.
- Date and time that the Reader recognised the job's JOB card.
- VSAM Cluster/Component name.
- Last extent Volume id.
- Last extent Device CUU.
- Last extent beginning cylinder and track.
- Last extent ending cylinder and track.
- Total number of extents.
- Total number of logical records.
- Total number of deleted records.
- Total number of CI splits.
- Total number of CA splits.
- Number of EXCPs issued.

To improve readability, output a blank value in the number of deletes, CI splits and CA splits columns when the value is 0 (zero).

Execute the report utility in the SELCOPYi foreground to display the report in a Text Editor window view.

1. [Report Definition](#)
2. [Report Utility Panel Input](#)
3. [Report Output](#)

Report - FILTER Definition

Edit a member to be used as input to the utility and insert report definition control statements:

1. Open a Text Edit view for new member name "SMF64" belonging to the Report Definition library ("*userpfx*.SELCOPYI.RPT") and add some lines. See [report definition](#) for the SORT, BREAK and TOTALS example.
2. Enter "TITLE:", "COLUMN:", "SORT:" and "BREAK:" entries referencing the required SMF record field names as appropriate.

The required SMF field names containing values to be reported may be obtained from the description of the [SMF type 64 record layout](#). Alternatively, execute "SMFFLD 64" to display the description on-line.

3. Following the "BREAK:" definitions, enter section header "BLANKIFZERO:" (or "BIZ:") and below it, enter the name of each column field for which a blank will be substituted for a 0 (zero) value. i.e. "SMF064_VSAM_Component_or_Cluster_Status.zNDE", "SMF064_VSAM_Component_or_Cluster_Status.zNCS" and "SMF064_VSAM_Component_or_Cluster_Status.zNAS".
4. To exclude records with a job name beginning "SMF" or records with a VSAM component record count of 0 (zero) on OPEN, a **FILTER:** section header must be included.

Following this, enter a Data Editor [expression](#) that returns a numeric result. The result is Boolean in nature so that a zero value indicates a "false" condition and a non-zero value indicates a "true" condition.

Data Editor expressions support terms that are [field name](#) references, [function calls](#) and [sub-expressions](#). Each of these terms are linked by [arithmetic](#), [relational](#) and/or [logical](#) operators.

If the result of the expression is "true" then the record is selected for processing otherwise it is discarded.

```

```

Figure 27. Report Definition - FILTER.

Report - FILTER Panel Input

Prior to report generation, the **extract** utility may be executed to gather all SMF type 64 records from all generations of GDG "CBL.SMF.GDG" and write them to a physical sequential dataset "CBL.SMF.T064".

To obtain a report using the **SMF64** report definition for the SMF records contained in dataset "CBL.SMF.T064":

1. Open the **Report Utility Panel** and populate the **Report Definition:** and **SMF Dataset:** fields as described for **basic panel input**. Type member name "**SMF64**" in the **Member>** field and "**CBL.SMF.T064**" in the **DSN/Path>** field under **SMF Dataset:**
2. Remove all values from **Record Selection:** field entries.
3. To execute the job in the SELCOPYi foreground, enter "**F**" in the **Run Type>** field under **Otions:**.
4. Type "200" in the **Page Depth>** field to override the default report pagedepth value.
5. Lastly, hit <Enter> to generate the report output.

SMF Utilities Reference

This chapter contains reference information for SELCOPYi SMF utility panels, commands and Report definition syntax.

Utility Panels

SELCOPYi SMF utility panels provide a user friendly interface to execution of the individual utilities.

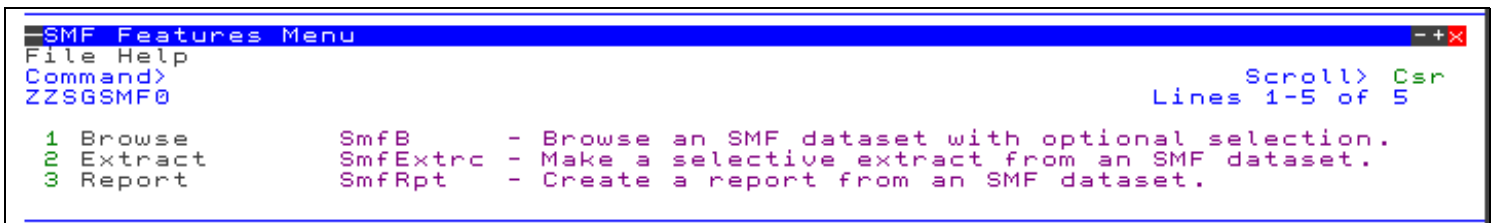

Input fields provide the method by which a user communicates requests to the utility.

- SMF Features Menu (=13)
- Browse Utility Panel (=13.1)
- Extract Utility Panel (=13.2)
- Report Utility Panel (=13.3)

SMF Features Menu (=13)

SELCOPYi SMF Utilities may be started via primary commands (that may also be executed in batch using program SDEAMAIN) or via the SELCOPYi interactive panel menus.

Select item 13 from the SELCOPYi Primary options menu (or type =13 from any SELCOPYi command prompt) to display the SMF Feature Menu.

```
SMF Features Menu
File Help
Command>

```

Figure 31. Browse Utility Panel (=13.1).

The SMF Formatted Browse Utility panel (ZZSGSMFB) is an **interactive panel window**, used to view a dataset containing SMF records.

The utility supports viewing either the "**SYS1.xxxx.MANn**" dataset format (VSAM ESDS with 4-byte "RDW" prefix) that is written to directly by SMF, or the dataset format written by the **SMF DUMP utility** (normally **RECFM=VBS** with no 4-byte "RDW" prefix).

Primary command **SMFB** provides a Command Line Interface (CLI) to the options on this panel.

The panel may be opened via the following:

- Select option 1. 'Browse' from the SMF option menu (=13).
- Execute the primary command "SMFB" with no parameters from any command line.
- Execute the line-command "SMFB /" from a file **list window**.

Storage Management

If none of the record selection options TYPES, DATELO, DATEHI, USERID, JOBNAME, SYSID or FIND are specified, then only the first group of 100 records are initially loaded. Thereafter, additional groups of 100 records are loaded (and unloaded) as required (e.g. when scrolling vertically or on execution of a search or filter command). Beyond a few hundred records, SELCOPYi will attempt to minimise the amount of storage used by unloading as many groups of 100 records as possible.

If any of these record selection options are specified, then the same technique applies except that the record group size starts at 1 and increments by 1 up to a maximum of 50 records. This is to minimize the amount of storage and I/O required in order to display each screen of selected records.

Menu Bar Items

File
The File drop-down menu contains the single item "Exit" which simply closes the panel window. Note that, unlike CANCEL, CLOSE will save field values entered in the panel so that they may be redisplayed the next time the panel is opened.

Upd-Layouts
Select this option only when you wish to refresh your own copy of SMF Record layout structures from the SELCOPYi supplied defaults.

This will typically be because Compute (Bridgend) Ltd have added layouts for previously unmapped SMF record types, or made enhancements/corrections to existing ones.

The SMF-Browse utility will normally automatically detect CBL supplied updates and carry out this operation unprompted.

Note that the user's SDO library is created and loaded the first time the SMF Browse or Report utility is started.

Mapped-Types

Views the CBL supplied 'hlq.SZZSDIST.SMFMAP(BASENAMS)' library member.

This member lists the SMF Record Types that are comprehensively mapped by SELCOPYi (others display as basic "SMFnnn" layout).

Please contact CBL if the SMF record type you are interested in is not yet handled by SELCOPYi - we will endeavour to provide a mapping as soon as possible.

Help

Display help for this panel view.

Panel Input Fields

By default, field entries are populated with arguments and options that were entered the last time the panel was used.

SMF Dataset :

Input fields which together identify a single existing, sequential or VSAM data set, GDG file generation, HFS file or PDS/PDSE library member containing the SMF records to be browsed.

DSN/Path>

Identifies the fully qualified data set name or an absolute or relative HFS file path.

Dataset names beginning with "." (dot) will be treated as having the user's DSN prefix as defined by the User INI variable System.UserDSNPrefix.

A selectable list of data sets or HFS files will be presented if the entered value contains wildcards characters "*" (asterisk) or "%" (percent).

Member>

If the **DSN/Path>** field contains the DSN of a PDS/PDSE library, then this field may specify the name of an existing member within that library.

A selectable list of members will be presented if the entered value contains wildcards characters "*" (asterisk) or "%" (percent), or is blanked out.

Alternatively, this field may also be used to enter the **relative generation number** of a **GDG** (e.g. 0 or -10). If the **DSN/Path>** field contains the name of a GDG but no generation is specified in the **Member>** field, then relative generation 0 is default.

Record Selection:

Fields which together specify values by which SMF records may be filtered. Only records that satisfy the specified selection criteria are loaded and retained for subsequent browse.

A combination of record filtering input fields values may be specified, each relating to one of the following record filtering classes:

1. Input record limit (Input Limit>)
2. Output record limit (Output Limit>)
3. Earliest timestamp (Lo-Date/Time>)
4. Latest timestamp (Hi-Date/Time>)
5. Content match (Type(s)>, Find String>, User Id>, Job Name> and System Id>)

In order to be selected, a record must return a true condition for **all** the record filtering classes for which values have been specified. If no record filtering field values are specified, then all records are selected for display.

The "Content match" class encompasses filter criteria derived from values entered in any combination of the input fields **Type(s)>**, **Find String>**, **User Id>** and **Job Name>**. Each of these fields will return a true or false condition if it contains a test value.

The overall condition returned by the "Content match" class is based on the logical relationship between each of these fields. The value specified by the **Logic:** field determines this relationship as follows:

- ◇ For value "**OR**", a true condition will be returned for the "Content match" class if at least **one** of the "Content match" input fields for which a value has been entered returns a true condition.
- ◇ For value "**AND**", a true condition will be returned for the "Content match" class if **all** of the "Content match" input fields for which a value has been entered return a true condition.

Each of the "Content match" fields (Type(s)>, Find String>, User Id> and Job Name>) support specification of multiple, **alternate** values. If any of these alternate values match the data in the record, then a true condition will be returned for that field.

e.g. If "62,64" is specified in the **Type(s)>** field, "XJH23,XNZ14" is entered in the **User Id>** field and the value of the **Logic:** field is "AND", then the "Content match" class will return a true condition if the SMF record is identified as being either type 62 or 64 **AND** it contains a userid value of either "XJH23" or "XNZ14".

Type(s) >

Type(s)> is one of the "Content match" class fields and specifies the SMF record types and/or subtypes to be selected.

A list of alternate record type numbers may be provided, each separated by either blank and/or comma.

If a record is of any of the specified SMF record types or SMF record subtypes then a true condition will be returned for the **Type(s)>** field. Otherwise a false condition is returned.

You may also specify a range of type numbers as **rr1:rr2** e.g. "60:69" is equivalent to "60,61,62,63,64,65,66,67,68,69".

To request a subtype (*ss*) of a record type (*rr*) you may specify either **rr-ss** or **rr#ss**. i.e. the record type number followed by either a hyphen "-" or a hash "#" followed by the record subtype number.

Where a subtype is not included on a type specification, a colon ":" may be inserted between 2 record type values to identify a range of record types. e.g. 60:69 may be used to identify all SMF record types between 60 and 69 inclusively.

Lo-Date/Time>

A timestamp in the format **yyyy/mm/dd hh:mm:ss.t** which identifies the earliest date and time at which an SMF record may have been written in order to be eligible for selection.

The timestamp may be abbreviated to specify a partial date and time as required. e.g. **2018/09/12** will be treated as **2018/09/12 00:00:00.0** so that any SMF record written on or after this date will satisfy the low date criterion.

A date relative to the current day may also be supplied as **+/-nnn**
e.g. If today were **2016/03/05** then **-5** will be treated as **2016/02/29** (leap year).

Hi-Date/Time>

A timestamp in the format **yyyy/mm/dd hh:mm:ss.t** which identifies the latest date and time at which an SMF record may have been written in order to be eligible for selection.

The timestamp may be abbreviated to specify a partial date and time as required. e.g. **2018/09** will be treated as **2018/09/99 99:99:99.9** so that any SMF record written on or before this date will satisfy the high date criterion.

A date relative to the current day may also be supplied as **+/-nnn**
e.g. If today were **2016/03/05** then **-5** will be treated as **2016/02/29** (leap year).

Input Limit>

The maximum number of records that may be read from the SMF Dataset for potential selection.

The input record count is incremented by 1 each time a record is read and then tested against the input limit value. If the count exceeds the input limit value, no further records are read. This processing occurs before all other record selection criteria is applied.

An input limit of "0" (zero) is not sensible and so is ignored.

See [Output Limit](#) for examples of input and output limit specification.

Output Limit>

The maximum number of records that may be selected for browse. This value applies to SMF records that satisfy all other selection criteria have been applied.

Once the output limit has been reached, no more records will be read from the SMF input dataset. Similarly, no more records are read when the input limit has been reached (even if the output limit has not yet been reached).

If record selection is based on **multiple entries** specified in the **Type(s)>** field, then the output limit applies to each of the record type entries provided that either of the following is true:

1. No record selection criteria is specified in the **Find String>**, **User Id>** and **Job Name>** fields.
2. The **Logic:** option is set to **AND**.

An output limit of "0" (zero) is not sensible and so is ignored.

Examples ...

```
| DSN/Path> CBL.SMF.GDG
|
| Type(s)    > 14
|
| Input Limit> 5000
| Output Limit>
```

Only the first 5000 records will be read from "CBL.SMF.GDG(0)" from which any number of type 14 records may be selected and those will be displayed in the browse session.

All selected records will be kept in storage for the duration of the browse session.

```
| DSN/Path> CBL.SMF.GDG
|
| Type(s)    > 14
|
```

```
|   Input Limit>
|   Output Limit> 50
```

As the browsed record display is scrolled forwards, records will be read from "CBL.SMF.GDG(0)" until 50 type 14 records have been selected.

Therefore, if the first 50 records read are all type 14, then only 50 records will be read. However, if there are fewer than 50 type 14 records in "CBL.SMF.GDG(0)" then, ultimately, the whole file may be read regardless of the number of records it contains.

```
|   DSN/Path> CBL.SMF.GDG
|
|   Type(s)    > 14
|
|   Input Limit> 5000
|   Output Limit> 50
```

No more than 5000 records will be read from "CBL.SMF.GDG(0)" regardless of whether the output limit has been reached.

If the first 100 records include 50 type 14 records, then only 100 records will be read.

```
|   DSN/Path> CBL.SMF.GDG
|
|   Type(s)    > 14 15 30
|
|   Input Limit>
|   Output Limit> 10
```

If no other selection criteria is specified or the logical operator is "AND", then records will be read from "CBL.SMF.GDG" until up to 10 of each of the specified record types (14, 15 and 30) are found.

Therefore, a maximum of 30 records may be selected in total.

Find String>

Find String> is one of the "Content match" class fields and specifies one or more alternate, comma separated strings to be located at any position within an SMF record.

If a record contains any of the search strings then a true condition will be returned for the **Find String>** field. e.g.

```
Find String> SYS1.MACLIB, SYS1.MIGLIB, SYS1.MODGEN, SYS1.MSGEN
```

Find strings may be specified as any of the following:

- ◇ An **unquoted** string.

Alpha character matching is case-insensitive unless **wildcard** characters are used. The string must not match a FIND command keyword and must not contain comma or blank characters. e.g. **ABC**.

- ◇ A **quoted** string (using either apostrophes or quotation marks).

Alpha character matching is case-insensitive unless **wildcard** characters are used. e.g. 'A,B C' and "a,b C" are equivalent.

- ◇ A **character literal** string specified as a quoted string prefixed with "C".

Alpha character matching is case-sensitive and may include **wildcard** characters. e.g. C'A,B C' and C'a,b c'. are **not** equivalent.

- ◇ A **hexadecimal** string specified as a quoted string of hex digits prefixed with "X". e.g. x'81C2C340'.

- ◇ A **picture** string specified as a quoted string prefixed with "P".

Special characters represent generic groups of characters as described below. Any character in a picture string that is not one of these special characters is untranslated. e.g. P'A##-BC'.

String	Description
P'='	Any character.
P'-'	Any non-blank character.
P'.'	Any non-displayable character.
P'#'	Any numeric character. 0-9.
P'.'	Any non-numeric character.
P'@'	Any uppercase or lowercase alpha character.
P'<'	Any lowercase alpha character.
P'>'	Any uppercase alpha character.
P'\$'	Any non-alphanumeric special character.

- ◇ A **regular expression** string specified as a quoted string prefixed with "R".

Regular expressions enable powerful string pattern matching at the cost of rather complex syntax and potentially extended command processing time.

For syntax and usage see [Regular Expressions](#) in the Text Editor documentation. e.g. `R'A:d+x'` would match the upper case character "A" followed by 1 or more numeric digits followed by character "x".

◇ An **unquoted, quoted or character literal** string containing one or more **wildcard** characters.

Single-character wildcard '%' (percent) represents exactly one occurrence of any character. Multiple-character wildcard '*' (asterisk) represents zero or more occurrences of any character.

Beware of the following when using wildcard characters in a find string:

1. Alpha character matching becomes case-sensitive even in **unquoted** and **quoted** strings.
2. For find strings containing a multiple-character wildcard, once a match has been found on the characters in the find string that precede it, the characters in the find string that follow it may be matched at any subsequent location within the SMF record. e.g. For find string 'ABC*DEF', 'ABC' may be matched in the first three characters of the record and 'DEF' in the last three characters of the record.

The panel entry field for this option is 45 bytes in length. To specify values longer than this, position the cursor in the **Find String>** input field and press shift-F2 (**EXPAND**). A text edit window will be displayed allowing you to enter long find string values over multiple lines.

User Id>

User Id> is one of the "Content match" class fields and specifies one or more alternate, comma separated user id values to be matched in SMF record types known to contain a User Id field (**zUserId**) at a fixed location within the record data. This fixed position may be different for each of the SMF record types.

If a record contains any of the user id values then a true condition will be returned for the **User Id>** field. If no match is found or the SMF record is not of a type known to contain a User Id field at a fixed location, then a false condition will be returned.

A user id value may be specified as an **unquoted, quoted or character literal** string and may contain one or more **wildcard** characters as described for the **Find String>** input field. e.g. A user id search string '*1' will match a user id value of any length (maximum 8) that ends with 1. A user id search string 'ABC%DEF' will match a user id beginning with 'ABC' followed by any other single character followed by 'DEF'.

Unlike a find string, a user id search value does not imply a trailing "*" (asterisk) wildcard and must start at the fixed position within the SMF record at which the zUserId field is located, for length 8 characters. If no wildcard characters are specified, a User id search is padded with blanks or truncated to 8 characters. If no wildcards are specified and the search string is an **unquoted or quoted** string, then the alpha characters will be upper cased. e.g. A user id search string 'abc' will match user id 'ABC' but not 'ABC1', 'ABCXX' or 'XABC'. Search string '%abc' would match 'XABC' only and '*abc*' would match all of these user ids.

The following SMF Record-types are known to contain a User Id field.

004	014	018	026	035	042	062	065	068	110
005	015	020	030	036	060	063	066	069	118
006	017	025	034	040	061	064	067	080	119
010									

Job Name>

Job Name> is one of the "Content match" class fields and specifies one or more alternate, comma separated job name values to be matched in SMF record types known to contain a Job Name field (**zJobName**) at a fixed location within the record data. This fixed position may be different for each of the SMF record types.

If a record contains any of the job name values then a true condition will be returned for the **Job Name>** field. If no match is found or the SMF record is not of a type known to contain a Job Name field at a fixed location, then a false condition will be returned.

A job name value may be specified as an **unquoted, quoted or character literal** string and may contain one or more **wildcard** characters as described for the **Find String>** input field.

Differences between the **Job Name>** and **Find String>** specifications are as described for the **User Id>** input field.

The following SMF Record-types are known to contain a Job Name field.

004	010	017	025	034	040	061	064	067	080
005	014	018	026	035	042	062	065	068	110
006	015	020	030	036	060	063	066	069	118

System Id>

System Id> is one of the "Content match" class fields and specifies one or more alternate, comma separated system id values to be matched each SMF record.

System Id may be specified:

- Using an unquoted or quoted literal. e.g. ABC will exactly match System Id 'ABC'.

- Using single-character wildcard '%' (percent). e.g. 'AB%Z' will match any System Id beginning with 'AB' followed by any other single character followed by 'Z'
- Using multiple-character wildcard '*' (asterisk). e.g. '*Z' will match any System Id ending with 'Z'

All SMF Record-types contain a System Id field (zSID).

Logic: AND | OR

The **Logic**: field defines the logical operator to be applied between conditions returned by the 4 "Content match" class fields (**Type(s)**), **Find String**), **User Id**), **Job Name**) and **System Id**).

OR indicates that the "Content match" class will return a true condition when a true condition is returned from **ANY** of the "Content match" class fields.

AND indicates that the "Content match" class will only return a true condition if true conditions are returned for **ALL** "Content match" class fields for which values have been specified.

For both **OR** and **AND** logical operations, a true condition will be returned for the "Content match" class if no selection condition values are specified in any of the "Content match" class fields.

Options:

Format> ONLINE | OFFLINE

ONLINE indicates that the SMF dataset is in the format as written directly by SMF to the SMF log datasets (**SYS1.xxxx.MANx**). Note that SELCOPYi does not support a browse of SMF records directly from the System Logger.

Browse of online datasets should be undertaken with caution as SELCOPYi will keep a SYSDSN SHR enqueue on the file for the duration of the browse session, which may interfere with SMF's CLEAR processing.

ONLINE datasets have a **4-byte record descriptor word (RDW) prefix** at the start of each record, so record-type field mapping must be offset by this amount.

OFFLINE indicates that the SMF dataset is the format as written by the SMF DUMP tool (IFASMFDP) which does not include a 4-byte (RDW) record prefix.

Layout> F | B

The **Layout**> input field determines the record mapping layout to be used when displaying the SMF record data.

F (Full Layout)

F indicates that a comprehensive mapping for supported SMF record types will be used so that each record is split into structured segments and displayed over a number of lines in the Data Editor window view.

Each **supported SMF record type/sub-type** will be assigned a separate layout. The primary segment for an SMF record has a layout name in the format "**SMFnnn_xxx_yyyy_zzz**", where *nnn* represents the SMF record-type number and *xxx_yyyy_zzz* is a short description of the record contents. e.g. **SMF014_INPUT_or_RDBACK_Dataset**

SMF records that comprise potentially repeating groups will be mapped over several logical **Primary/Secondary Segments**.

Any selected records whose SMF record type is currently unsupported will be mapped using the **Basic Layout** record type **SMFNNN**.

B (Basic Layout)

B indicates that a common, simplified mapping (**SMFNNN**) will be used to display all SMF records of any type/sub-type. SMF records will **not** be split into segments and will each occupy a single line of the Data Editor window view.

The basic layout includes only common header fields (e.g. SMF record type, sub-type, timestamp), followed by the field named **Rest** which displays the tail end of the record as uninterpreted character data.

Basic layout browse is particularly useful when a cursory view of the data is required. For example, when determining the various SMF record types written during a particular time period.

Primary command **HEX ON** may be used to include the hexadecimal representation of the record data in the display.

Segment> SHOW | SHADOW

Applicable only when Full layout is selected and affects only SMF records that are mapped using **Primary/Secondary segments**.

SHOW indicates that data in secondary segments is to be displayed (not suppressed) when the Data Editor view is opened.

SHADOW indicates that data in secondary segments is to be suppressed and so displayed as shadow lines when the Data Editor view is opened.

Note that, while data in secondary segments is shadowed (and thereby occupying much less screen space), the detail for any single shadowed segment group may be displayed in a separate window by placing the cursor on the shadow line and pressing the "**ZoomW**" key (default on **Shift-F5**).

The shadow lines themselves may be hidden using the **SHADOW (SHAD) OFF** option and/or the **HIDE** primary command.

Regardless of your initial setting for this option, throughout the browse session the **VBASE** primary command may be used to switch between the 2 secondary segment display formats.

Extract Utility Panel (=13.2)

```

Figure 32. Extract Utility Panel (=13.2).

The SMF Extract Utility panel (ZZSGSMFX) is an **interactive panel window**, used to extract a selection of SMF records from one or more input files and copy them to a single output file.

The panel may be used to execute the extract utility directly in the SELCOPYi foreground or it can generate a JCL job stream that may be submitted to batch.

Primary command **SMFEXTRC** provides a Command Line Interface (CLI) to the SMF Extract Utility and the panel itself includes an option to generate CLI corresponding to the currently entered panel field values.

The panel may be opened via the following:

- Select option 2. 'Extract' from the SMF option menu (=13).
- Execute the primary command "SMFEXTRC" with no parameters from any command line.
- Execute the line-command "SMFEXTRC" from a file **list window**.

Menu Bar Items

- File** The File drop-down menu contains the single item "Exit" which simply closes the panel window. Note that, unlike CANCEL, CLOSE will save field values entered in the panel so that they may be redisplayed the next time the panel is opened.
- JCL** Generate the JCL job stream suitable for submission to batch, based on values set in the panel fields. This is equivalent to selecting "B" in the **Run Type**> panel field.
- Command** Generate the SMFEXTRC command syntax based on values set in the panel fields. This is equivalent to selecting "C" in the **Run Type**> panel field.
- Help** Display help for this panel view.

Commands

- Output** Browse the output (SMF extract) dataset using full (segmented) layout of the SMF records.
- BOutput** Browse the output (SMF extract) dataset using basic (non-segmented) layout of the SMF records.
- Input | I1** Browse the first entry in the SMF Source dataset list using full (segmented) layout of the SMF records.

I_n Browse the first *n*th entry in the SMF Source dataset list using full (segmented) layout of the SMF records.

BInput | **BI1** Browse the first entry in the SMF Source dataset list using basic (non-segmented) layout of the SMF records.

BI_n Browse the first *n*th entry in the SMF Source dataset list using basic (non-segmented) layout of the SMF records.

Panel Input Fields

By default, field entries are populated with arguments and options that were entered the last time the panel was used.

SMF Source Dataset(s) :

Input fields which together identify up to three existing, sequential or VSAM data sets, GDG groups or specific GDG generations, HFS files or PDS/PDSE library members from which SMF records are to be extracted.

Should more than three input datasets be required then select **Runtype> B** to generate a batch job or **Runtype> C** to generate a command line, both of which may be edited to include an unlimited number of input datasets.

If a **GDG base** is specified with no relative generation number (via the Member input field) then all generations will be input, starting with the oldest.

DSN/Path>

Identifies the fully qualified data set name or an absolute or relative HFS file path.

Dataset names beginning with "." (dot) will be treated as having the user's DSN prefix as defined by the User INI variable System.UserDSNPrefix.

A selectable list of data sets or HFS files will be presented if the entered value contains wildcards characters "*" (asterisk) or "%" (percent).

Member>

If the **DSN/Path>** field contains the DSN of a PDS/PDSE library, then this field may specify the name of an existing member within that library.

A selectable list of members will be presented if the entered value contains wildcards characters "*" (asterisk) or "%" (percent), or is blanked out.

Alternatively, this field may also be used to enter the **relative generation number** of a **GDG** (e.g. 0 or -10). If the **DSN/Path>** field contains the name of a GDG but no generation is specified in the **Member>** field, then all generations are read, starting with the oldest.

SMF Extract Dataset :

Input fields which together identify a single sequential or VSAM data set, GDG file generation, HFS file or PDS/PDSE library member that is to receive the extracted SMF records.

If the utility is executed in the SELCOPYi foreground and the specified SMF extract dataset name does not yet exist in the catalog, then the user will be prompted to allocate the new dataset. Having selected the required output dataset organisation, the appropriate dataset allocation or VSAM cluster definition dialog will be displayed.

DSN/Path>

Identifies the fully qualified data set name or an absolute or relative HFS file path.

If the dataset name begins with "." (dot), it will be treated as having the user's DSN prefix as defined by the User INI variable System.UserDSNPrefix.

A selectable list of data sets or HFS files will be presented if the entered value contains wildcards characters "*" (asterisk) or "%" (percent).

Member>

If the **DSN/Path>** field contains the DSN of a PDS/PDSE library, then this field may specify the name of an existing member within that library.

A selectable list of members will be presented if the entered value contains wildcards characters "*" (asterisk) or "%" (percent), or is blanked out.

Record Selection :

Fields which together specify values by which SMF records may be filtered. Only records that satisfy the specified selection criteria are selected for extraction.

A combination of record filtering input fields values may be specified, each relating to one of the following record filtering classes:

1. Input record limit (Input Limit>)
2. Output record limit (Output Limit>)
3. Earliest timestamp (Lo-Date/Time>)
4. Latest timestamp (Hi-Date/Time>)
5. Content match (Type(s)>, Find String>, User Id>, Job Name> and System Id>)

In order to be selected, a record must return a true condition for **all** the record filtering classes for which values have been specified. If no record filtering field values are specified, then all records are selected for display.

The "Content match" class encompasses filter criteria derived from values entered in any combination of the input fields **Type(s)>**, **Find String>**, **User Id>** and **Job Name>**. Each of these fields will return a true or false condition if it contains a test value.

The overall condition returned by the "Content match" class is based on the logical relationship between each of these fields. The value specified by the **Logic:** field determines this relationship as follows:

- ◇ For value "**OR**", a true condition will be returned for the "Content match" class if at least **one** of the "Content match" input fields for which a value has been entered returns a true condition.
- ◇ For value "**AND**", a true condition will be returned for the "Content match" class if **all** of the "Content match" input fields for which a value has been entered return a true condition.

Each of the "Content match" fields (Type(s)>, Find String>, User Id> and Job Name>) support specification of multiple, **alternate** values. If any of these alternate values match the data in the record, then a true condition will be returned for that field.

e.g. If "62,64" is specified in the **Type(s)>** field, "XJH23,XNZ14" is entered in the **User Id>** field and the value of the **Logic:** field is "AND", then the "Content match" class will return a true condition if the SMF record is identified as being either type 62 or 64 **AND** it contains a userid value of either "XJH23" or "XNZ14".

Type(s)>

Type(s)> is one of the "Content match" class fields and specifies the SMF record types and/or subtypes to be selected.

A list of alternate record type numbers may be provided, each separated by either a blank and/or comma.

If a record is of any of the specified SMF record types or SMF record subtypes then a true condition will be returned for the **Type(s)>** field. Otherwise a false condition is returned.

You may also specify a range of type numbers as **rr1:rr2** e.g. "60:69" is equivalent to "60,61,62,63,64,65,66,67,68,69".

To request a subtype (*ss*) of a record type (*rr*) you may specify either **rr-ss** or **rr#ss**. i.e. the record type number followed by either a hyphen "-" or a hash "#" followed by the record subtype number.

Where a subtype is not included on a type specification, a colon ":" may be inserted between 2 record type values to identify a range of record types. e.g. 60:69 may be used to identify all SMF record types between 60 and 69 inclusively.

Lo-Date/Time>

A timestamp in the format **yyyy/mm/dd hh:mm:ss.t** which identifies the earliest date and time at which an SMF record may have been written in order to be eligible for selection.

The timestamp may be abbreviated to specify a partial date and time as required. e.g. **2018/09/12** will be treated as **2018/09/12 00:00:00.0** so that any SMF record written on or after this date will satisfy the low date criterion.

A date relative to the current day may also be supplied as **+/-nnn**
e.g. If today were **2016/03/05** then **-5** will be treated as **2016/02/29** (leap year).

Hi-Date/Time>

A timestamp in the format **yyyy/mm/dd hh:mm:ss.t** which identifies the latest date and time at which an SMF record may have been written in order to be eligible for selection.

The timestamp may be abbreviated to specify a partial date and time as required. e.g. **2018/09** will be treated as **2018/09/99 99:99:99.9** so that any SMF record written on or before this date will satisfy the high date criterion.

A date relative to the current day may also be supplied as **+/-nnn**
e.g. If today were **2016/03/05** then **-5** will be treated as **2016/02/29** (leap year).

Input Limit>

The maximum number of records that may be read from the SMF Dataset for potential selection.

The input record count is incremented by 1 each time a record is read and then tested against the input limit value. If the count exceeds the input limit value, no further records are read. This processing occurs before all other record selection criteria is applied.

An input limit of "0" (zero) is not sensible and so is ignored.

See [Output Limit](#) for examples of input and output limit specification.

Output Limit>

The maximum number of records that may be selected for output. This value applies to SMF records that satisfy all other selection criteria have been applied.

Once the output limit has been reached, no more records will be read from the SMF input dataset. Similarly, no more records are read when the input limit has been reached (even if the output limit has not yet been reached).

If record selection is based on **multiple entries** specified in the **Type(s)>** field, then the output limit applies to each of the record type entries provided that either of the following is true:

1. No record selection criteria is specified in the **Find String>**, **User Id>** and **Job Name>** fields.
2. The **Logic:** option is set to **AND**.

An output limit of "0" (zero) is not sensible and so is ignored.

Examples ...

```
| DSN/Path> CBL.SMF.GDG
|
| Type(s)    > 14
|
| Input Limit> 5000
| Output Limit>
```

Only the first 5000 records will be read from "CBL.SMF.GDG" generation datasets from which any number of type 14 records may be selected for extraction.

```
| DSN/Path> CBL.SMF.GDG
|
| Type(s)    > 14
|
| Input Limit>
| Output Limit> 50
```

Records will be read from "CBL.SMF.GDG" generation data sets until 50 type 14 records have been selected.

If the first 50 records read are all type 14, then only 50 records will be read.

If there are less than 50 type 14 records in "CBL.SMF.GDG" generation datasets then all the datasets will be read to end-of-file regardless of how many records they contain.

```
| DSN/Path> CBL.SMF.GDG
|
| Type(s)    > 14
|
| Input Limit> 5000
| Output Limit> 50
```

No more than 5000 records will be read from "CBL.SMF.GDG" datasets.

If the first 100 records include 50 type 14 records, then only 100 records will be read.

```
| DSN/Path> CBL.SMF.GDG
|
| Type(s)    > 14 15 30
|
| Input Limit>
| Output Limit> 10
```

Records will be read from "CBL.SMF.GDG" data sets until up to 10 of each of the specified record types (14, 15 and 30) are found.

Therefore, a maximum of 30 records will be selected in total.

Find>

Find String> is one of the "Content match" class fields and specifies one or more alternate, comma separated strings to be located at any position within an SMF record.

If a record contains any of the search strings then a true condition will be returned for the **Find String>** field. e.g.

```
Find String> SYS1.MACLIB, SYS1.MIGLIB, SYS1.MODGEN, SYS1.MSGEN
```

Find strings may be specified as any of the following:

- ◇ An **unquoted** string.

Alpha character matching is case-insensitive unless **wildcard** characters are used. The string must not match a FIND command keyword and must not contain comma or blank characters. e.g. **ABC**.

- ◇ A **quoted** string (using either apostrophes or quotation marks).

Alpha character matching is case-insensitive unless **wildcard** characters are used. e.g. **'A,B C'** and **"a,b C"** are equivalent.

- ◇ A **character literal** string specified as a quoted string prefixed with "C".

Alpha character matching is case-sensitive and may include **wildcard** characters. e.g. **C'A,B C'** and **C'a,b C'** are **not** equivalent.

- ◇ A **hexadecimal** string specified as a quoted string of hex digits prefixed with "X". e.g. **x'81C2C340'**.

◇ A **picture** string specified as a quoted string prefixed with "P".

Special characters represent generic groups of characters as described below. Any character in a picture string that is not one of these special characters is untranslated. e.g. **P'A##-BC'**.

String	Description
P'='	Any character.
P'␣'	Any non-blank character.
P'␣'	Any non-displayable character.
P'#'	Any numeric character, 0-9.
P'.'	Any non-numeric character.
P'@'	Any uppercase or lowercase alpha character.
P'<'	Any lowercase alpha character.
P'>'	Any uppercase alpha character.
P'\$'	Any non-alphanumeric special character.

◇ A **regular expression** string specified as a quoted string prefixed with "R".

Regular expressions enable powerful string pattern matching at the cost of rather complex syntax and potentially extended command processing time.

For syntax and usage see [Regular Expressions](#) in the Text Editor documentation. e.g. **R'A:d+x'** would match the upper case character "A" followed by 1 or more numeric digits followed by character "x".

◇ An **unquoted, quoted or character literal** string containing one or more **wildcard** characters.

Single-character wildcard '%' (percent) represents exactly one occurrence of any character. Multiple-character wildcard '*' (asterisk) represents zero or more occurrences of any character.

Beware of the following when using wildcard characters in a find string:

1. Alpha character matching becomes case-sensitive even in **unquoted** and **quoted** strings.
2. For find strings containing a multiple-character wildcard, once a match has been found on the characters in the find string that precede it, the characters in the find string that follow it may be matched at any subsequent location within the SMF record. e.g. For find string 'ABC*DEF', 'ABC' may be matched in the first three characters of the record and 'DEF' in the last three characters of the record.

The panel entry field for this option is 45 bytes in length. To specify values longer than this, position the cursor in the **Find String>** input field and press shift-F2 (**EXPAND**). A text edit window will be displayed allowing you to enter long find string values over multiple lines.

User Id>

User Id> is one of the "Content match" class fields and specifies one or more alternate, comma separated user id values to be matched in SMF record types known to contain a User Id field (**zUserId**) at a fixed location within the record data. This fixed position may be different for each of the SMF record types.

If a record contains any of the user id values then a true condition will be returned for the **User Id>** field. If no match is found or the SMF record is not of a type known to contain a User Id field at a fixed location, then a false condition will be returned.

A user id value may be specified as an **unquoted, quoted or character literal** string and may contain one or more **wildcard** characters as described for the **Find String>** input field. e.g. A user id search string '*1' will match a user id value of any length (maximum 8) that ends with 1. A user id search string 'ABC%DEF' will match a user id beginning with 'ABC' followed by any other single character followed by 'DEF'.

Unlike a find string, a user id search value does not imply a trailing "*" (asterisk) wildcard and must start at the fixed position within the SMF record at which the zUserId field is located, for length 8 characters. If no wildcard characters are specified, a User id search is padded with blanks or truncated to 8 characters. If no wildcards are specified and the search string is an **unquoted or quoted** string, then the alpha characters will be upper cased. e.g. A user id search string 'abc' will match user id 'ABC' but not 'ABC1', 'ABCXX' or 'XABC'. Search string '%abc' would match 'XABC' only and '*abc*' would match all of these user ids.

The following SMF Record-types are known to contain a User Id field.

004	014	018	026	035	042	062	065	068	110
005	015	020	030	036	060	063	066	069	118
006	017	025	034	040	061	064	067	080	119
010									

Job Name>

Job Name> is one of the "Content match" class fields and specifies one or more alternate, comma separated job name values to be matched in SMF record types known to contain a Job Name field (**zJobName**) at a fixed location within the record data. This fixed position may be different for each of the SMF record types.

If a record contains any of the job name values then a true condition will be returned for the **Job Name>** field. If no match is found or the SMF record is not of a type known to contain a Job Name field at a fixed location, then a false condition will be returned.

A job name value may be specified as an **unquoted, quoted or character literal** string and may contain one or more **wildcard** characters as described for the **Find String>** input field.

Differences between the **Job Name>** and **Find String>** specifications are as described for the **User Id>** input field.

The following SMF Record-types are known to contain a Job Name field.

004	010	017	025	034	040	061	064	067	080
005	014	018	026	035	042	062	065	068	110
006	015	020	030	036	060	063	066	069	118

System Id>

System Id> is one of the "Content match" class fields and specifies one or more alternate, comma separated system id values to be matched each SMF record.

System Id may be specified:

- Using an unquoted or quoted literal. e.g. ABC will exactly match System Id 'ABC'.
- Using single-character wildcard '%' (percent). e.g. 'AB%Z' will match any System Id beginning with 'AB' followed by any other single character followed by 'Z'
- Using multiple-character wildcard '*' (asterisk). e.g. '*Z' will match any System Id ending with 'Z'

All SMF Record-types contain a System Id field (zSID).

Logic: AND | OR

The **Logic:** field defines the logical operator to be applied between conditions returned by the 4 "Content match" class fields (**Type(s)>**, **Find String>**, **User Id>**, **Job Name>** and **System Id>**).

OR indicates that the "Content match" class will return a true condition when a true condition is returned from **ANY** of the "Content match" class fields.

AND indicates that the "Content match" class will only return a true condition if true conditions are returned for **ALL** "Content match" class fields for which values have been specified.

For both **OR** and **AND** logical operations, a true condition will be returned for the "Content match" class if no selection condition values are specified in any of the "Content match" class fields.

Options:

Format> ONLINE | OFFLINE

ONLINE indicates that the SMF dataset is in the format as written directly by SMF to the SMF log datasets (**SYS1.xxxx.MANx**). Note that SELCOPYi does not support extraction of SMF records directly from the System Logger.

ONLINE datasets include a **4-byte record descriptor word (RDW) prefix** at the start of each record, so record-type field mapping must be offset by this amount.

OFFLINE indicates that the SMF dataset is the format as written by the SMF DUMP tool (IFASMFDP) which does not include a 4-byte (RDW) record prefix.

Run Type> F | B | C

"**F**" indicates that immediate foreground execution is required as soon as the <Enter> key is pressed.

"**B**" indicates that JCL should be produced for submission to batch.

"**C**" indicates that command line interface should be produced. The **SMFEXTRC** primary command is displayed in a Text Editor window view in a format suitable for execution using the **ACTION** key (default Shift-F4) ready to be copied into your **HOME** file (=4).

Append> APP | blank

APP indicates that the extracted records should be appended to the output dataset.

```

Figure 33. Report Utility Panel (=13.3).

The SMF Report Utility panel (ZZSGSMFR) is an **interactive panel window**, used to generate a printable report from a dataset containing SMF records.

The layout of your desired report should be specified using control statements saved in a **Report Definition** dataset.

The report produced will typically consist mainly of data extracted from a list of data fields from a single SMF Record-Type, but you can select fields from more than one record-type and even generate your own values based on meaningful calculations. The report can reference fields from both Primary (Base) and **Secondary segments**.

A user definable heading will be printed at the top of each page, followed by user definable column headings for each selected field.

Grand totals will automatically be printed for any selected field containing integer data, and sub-totals will also be printed if a sort/control-break has been requested.

The utility supports sourcing SMF data from either the **"SYS1.xxxx.MANn"** dataset format (VSAM ESDS with 4-byte "RDW" prefix) that is written to directly by SMF, or the dataset format written by the SMF DUMP utility (normally **RECFM=VBS** with no 4-byte "RDW" prefix).

Primary command **REPORT** provides a Command Line Interface (CLI) to the options on this panel.

The panel may be opened via the following:

- Select option 3. 'Report' from the SMF option menu (=13).
- Execute the primary command **SMFRPT** with no parameters from any command line.

Figure 33. Report Output.

Commands

- Edit** Open a Text Editor window to edit the Report Definition dataset or library member.
- Input** Browse the SMF Source dataset using full (segmented) layout of the SMF records.
- BInput** Browse the SMF Source dataset using basic (non-segmented) layout of the SMF records.
- JCL** Produce JCL for submission to batch.
- CLI / CMX** Produce command line interface. The **SMFEXTRC** primary command is displayed in a Text Editor window view in a format suitable for execution using the **ACTION** key (default Shift-F4) ready to be copied into your **HOME** file (=4).

Panel Input Fields

By default, field entries are populated with arguments and options that were entered the last time the panel was used.

Report Definition:

Input fields which together identify a single, sequential or VSAM data set, GDG file generation, HFS file or PDS/PDSE library member that contains (or will contain) the **SMF report definition control statements**.

Execute primary command **EDIT** (or **E**) to edit the report definition file.

DSN/Path>

Identifies the fully qualified data set name or an absolute or relative HFS file path.

Dataset names beginning with "." (dot) will be treated as having the user's DSN prefix as defined by the User INI variable System.UserDSNPrefix.

A selectable list of data sets or HFS files will be presented if the entered value contains wildcards characters "*" (asterisk) or "%" (percent).

Member>

If the **DSN/Path>** field contains the DSN of a PDS/PDSE library, then this field may specify the name of an existing member within that library.

A selectable list of members will be presented if the entered value contains wildcards characters "*" (asterisk) or "%" (percent), or is blanked out.

Alternatively, this field may also be used to enter the **relative generation number** of a **GDG** (e.g. 0 or -10). If the **DSN/Path>** field contains the name of a GDG but no generation is specified in the **Member>** field, then relative generation 0 is default.

SMF Dataset :

Input fields which together identify a single existing, sequential or VSAM data set, GDG file generation, HFS file or PDS/PDSE library member containing SMF records that are to be reported upon.

Type primary command **INPUT** (or **I**) to browse the SMF dataset using full layout.

Type primary command **BINPUT** (or **BI**) to browse the SMF dataset using basic layout.

DSN/Path>

Identifies the fully qualified data set name or an absolute or relative HFS file path.

Dataset names beginning with "." (dot) will be treated as though they actually begin with a high level qualifier equal to the user's own userid.

A selectable list of data sets or HFS files will be presented if the entered value contains wildcards characters "*" (asterisk) or "%" (percent).

Member>

If the **DSN/Path>** field contains the DSN of a PDS/PDSE library, then this field may specify the name of an existing member within that library.

A selectable list of members will be presented if the entered value contains wildcards characters "*" (asterisk) or "%" (percent), or is blanked out.

This field may also be used to enter the **relative generation number** of a **GDG**. e.g. 0 or -10.

Record Selection:

Fields which together specify values by which SMF records may be filtered. Only records that satisfy the specified selection criteria are selected for reporting.

A combination of record filtering input fields values may be specified, each relating to one of the following record filtering classes:

1. Input record limit (Input Limit>)
2. Output record limit (Output Limit>)
3. Earliest timestamp (Lo-Date/Time>)
4. Latest timestamp (Hi-Date/Time>)
5. Content match (Type(s)>, Find String>, User Id>, Job Name> and System Id>)

In order to be selected, a record must return a true condition for **all** the record filtering classes for which values have been specified. If no record filtering field values are specified, then all records are selected for display.

The "Content match" class encompasses filter criteria derived from values entered in any combination of the input fields **Type(s)>**, **Find String>**, **User Id>** and **Job Name>**. Each of these fields will return a true or false condition if it contains a test value.

The overall condition returned by the "Content match" class is based on the logical relationship between each of these fields. The value specified by the **Logic:** field determines this relationship as follows:

- ◊ For value "**OR**", a true condition will be returned for the "Content match" class if at least **one** of the "Content match" input fields for which a value has been entered returns a true condition.
- ◊ For value "**AND**", a true condition will be returned for the "Content match" class if **all** of the "Content match" input fields for which a value has been entered return a true condition.

Each of the "Content match" fields (Type(s)>, Find String>, User Id> and Job Name>) support specification of multiple, **alternate** values. If any of these alternate values match the data in the record, then a true condition will be returned for that field.

e.g. If "62,64" is specified in the **Type(s)>** field, "XJH23,XNZ14" is entered in the **User Id>** field and the value of the **Logic:** field is "AND", then the "Content match" class will return a true condition if the SMF record is identified as being either type 62 or 64 **AND** it contains a userid value of either "XJH23" or "XNZ14".

Type(s)>

Type(s)> is one of the "Content match" class fields and specifies the SMF record types and/or subtypes to be selected.

A list of alternate record type numbers may be provided, each separated by either blank and/or comma.

If a record is of any of the specified SMF record types or SMF record subtypes then a true condition will be returned for the **Type(s)**> field. Otherwise a false condition is returned.

You may also specify a range of type numbers as **rr1:rr2** e.g. "60:69" is equivalent to "60,61,62,63,64,65,66,67,68,69".

To request a subtype (*ss*) of a record type (*rr*) you may specify either **rr-ss** or **rr#ss**. i.e. the record type number followed by either a hyphen "-" or a hash "#" followed by the record subtype number.

Where a subtype is not included on a type specification, a colon ":" may be inserted between 2 record type values to identify a range of record types. e.g. 60:69 may be used to identify all SMF record types between 60 and 69 inclusively.

Lo-Date/Time>

A timestamp in the format **yyyy/mm/dd hh:mm:ss.t** which identifies the earliest date and time at which an SMF record may have been written in order to be eligible for selection.

The timestamp may be abbreviated to specify a partial date and time as required. e.g. **2018/09/12** will be treated as **2018/09/12 00:00:00.0** so that any SMF record written on or after this date will satisfy the low date criterion.

A date relative to the current day may also be supplied as **+/-nnn** e.g. If today were **2016/03/05** then **-5** will be treated as **2016/02/29** (leap year).

Hi-Date/Time>

A timestamp in the format **yyyy/mm/dd hh:mm:ss.t** which identifies the latest date and time at which an SMF record may have been written in order to be eligible for selection.

The timestamp may be abbreviated to specify a partial date and time as required. e.g. **2018/09** will be treated as **2018/09/99 99:99:99.9** so that any SMF record written on or before this date will satisfy the high date criterion.

A date relative to the current day may also be supplied as **+/-nnn** e.g. If today were **2016/03/05** then **-5** will be treated as **2016/02/29** (leap year).

Input Limit>

The maximum number of records that may be read from the SMF Dataset for potential selection.

The input record count is incremented by 1 each time a record is read and then tested against the input limit value. If the count exceeds the input limit value, no further records are read. This processing occurs before all other record selection criteria is applied.

An input limit of "0" (zero) is not sensible and so is ignored.

See [Output Limit](#) for examples of input and output limit specification.

Output Limit>

The maximum number of records that may be selected for reporting. This value applies to SMF records that satisfy all other selection criteria have been applied.

Once the output limit has been reached, no more records will be read from the SMF input dataset. Similarly, no more records are read when the input limit has been reached (even if the output limit has not yet been reached).

If record selection is based on **multiple entries** specified in the **Type(s)**> field, then the output limit applies to each of the record type entries provided that either of the following is true:

1. No record selection criteria is specified in the **Find String**>, **User Id**> and **Job Name**> fields.
2. The **Logic**: option is set to **AND**.

An output limit of "0" (zero) is not sensible and so is ignored.

Examples ...

```
| DSN/Path> CBL.SMF.GDG
|
| Type(s)      > 14
|
| Input Limit> 5000
| Output Limit>
```

Only the first 5000 records will be read from "CBL.SMF.GDG(0)" from which any number of type 14 records may be selected for reporting.

```
| DSN/Path> CBL.SMF.GDG
|
| Type(s)      > 14
|
| Input Limit>
| Output Limit> 50
```

Records will be read from "CBL.SMF.GDG(0)" until 50 type 14 records have been selected.

Therefore, if the first 50 records read are all type 14, then only 50 records will be read. However, if there are fewer than 50 type 14 records in "CBL.SMF.GDG(0)" then, ultimately, the whole file may be read regardless of the number of records it contains.

```

| DSN/Path> CBL.SMF.GDG
|
| Type(s)      > 14
|
| Input Limit> 5000
| Output Limit> 50

```

No more than 5000 records will be read from "CBL.SMF.GDG(0)" regardless of whether the output limit has been reached.

If the first 100 records include 50 type 14 records, then only 100 records will be read.

Find String>

Find String> is one of the "Content match" class fields and specifies one or more alternate, comma separated strings to be located at any position within an SMF record.

If a record contains any of the search strings then a true condition will be returned for the **Find String>** field. e.g.

```
Find String> SYS1.MACLIB, SYS1.MIGLIB, SYS1.MODGEN, SYS1.MSGEN
```

Find strings may be specified as any of the following:

◇ An **unquoted** string.

Alpha character matching is case-insensitive unless **wildcard** characters are used. The string must not match a FIND command keyword and must not contain comma or blank characters. e.g. **ABC**.

◇ A **quoted** string (using either apostrophes or quotation marks).

Alpha character matching is case-insensitive unless **wildcard** characters are used. e.g. 'A,B C' and "a,b C" are equivalent.

◇ A **character literal** string specified as a quoted string prefixed with "C".

Alpha character matching is case-sensitive and may include **wildcard** characters. e.g. C'A,B C' and C'a,b C'. are **not** equivalent.

◇ A **hexadecimal** string specified as a quoted string of hex digits prefixed with "X". e.g. X'81C2C340'.

◇ A **picture** string specified as a quoted string prefixed with "P".

Special characters represent generic groups of characters as described below. Any character in a picture string that is not one of these special characters is untranslated. e.g. P'A##-BC'.

String	Description
P'='	Any character.
P'-'	Any non-blank character.
P'.'	Any non-displayable character.
P'#'	Any numeric character. 0-9.
P'.'	Any non-numeric character.
P'@'	Any uppercase or lowercase alpha character.
P'<'	Any lowercase alpha character.
P'>'	Any uppercase alpha character.
P'\$'	Any non-alphanumeric special character.

◇ A **regular expression** string specified as a quoted string prefixed with "R".

Regular expressions enable powerful string pattern matching at the cost of rather complex syntax and potentially extended command processing time.

For syntax and usage see **Regular Expressions** in the Text Editor documentation. e.g. R'A:d+x' would match the upper case character "A" followed by 1 or more numeric digits followed by character "x".

◇ An **unquoted, quoted or character literal** string containing one or more **wildcard** characters.

Single-character wildcard '%' (percent) represents exactly one occurrence of any character. Multiple-character wildcard '*' (asterisk) represents zero or more occurrences of any character.

Beware of the following when using wildcard characters in a find string:

1. Alpha character matching becomes case-sensitive even in **unquoted** and **quoted** strings.
2. For find strings containing a multiple-character wildcard, once a match has been found on the characters in the find string that precede it, the characters in the find string that follow it may be matched at any subsequent location within the SMF record. e.g. For find string 'ABC*DEF', 'ABC' may be matched in the first three characters of the record and 'DEF' in the last three characters of the record.

The panel entry field for this option is 45 bytes in length. To specify values longer than this, position the cursor in the **Find String>** input field and press shift-F2 (**EXPAND**). A text edit window will be displayed allowing you to enter long find string values over multiple lines.

User Id>

User Id> is one of the "Content match" class fields and specifies one or more alternate, comma separated user id values to be matched in SMF record types known to contain a User Id field (**zUserid**) at a fixed location within the record data. This fixed position may be different for each of the SMF record types.

If a record contains any of the user id values then a true condition will be returned for the **User Id>** field. If no match is found or the SMF record is not of a type known to contain a User Id field at a fixed location, then a false condition will be returned.

A user id value may be specified as an **unquoted**, **quoted** or **character literal** string and may contain one or more **wildcard** characters as described for the **Find String>** input field. e.g. A user id search string '*1' will match a user id value of any length (maximum 8) that ends with 1. A user id search string 'ABC%DEF' will match a user id beginning with 'ABC' followed by any other single character followed by 'DEF'.

Unlike a find string, a user id search value does not imply a trailing "*" (asterisk) wildcard and must start at the fixed position within the SMF record at which the zUserid field is located, for length 8 characters. If no wildcard characters are specified, a User id search is padded with blanks or truncated to 8 characters. If no wildcards are specified and the search string is an **unquoted** or **quoted** string, then the alpha characters will be upper cased. e.g. A user id search string 'abc' will match user id 'ABC' but not 'ABC1', 'ABCXXX' or 'XABC'. Search string '%abc' would match 'XABC' only and '*abc*' would match all of these user ids.

The following SMF Record-types are known to contain a User Id field.

004	014	018	026	035	042	062	065	068	110
005	015	020	030	036	060	063	066	069	118
006	017	025	034	040	061	064	067	080	119
010									

Job Name>

Job Name> is one of the "Content match" class fields and specifies one or more alternate, comma separated job name values to be matched in SMF record types known to contain a Job Name field (**zJobName**) at a fixed location within the record data. This fixed position may be different for each of the SMF record types.

If a record contains any of the job name values then a true condition will be returned for the **Job Name>** field. If no match is found or the SMF record is not of a type known to contain a Job Name field at a fixed location, then a false condition will be returned.

A job name value may be specified as an **unquoted**, **quoted** or **character literal** string and may contain one or more **wildcard** characters as described for the **Find String>** input field.

Differences between the **Job Name>** and **Find String>** specifications are as described for the **User Id>** input field.

The following SMF Record-types are known to contain a Job Name field.

004	010	017	025	034	040	061	064	067	080
005	014	018	026	035	042	062	065	068	110
006	015	020	030	036	060	063	066	069	118

System Id>

System Id> is one of the "Content match" class fields and specifies one or more alternate, comma separated system id values to be matched each SMF record.

System Id may be specified:

- Using an unquoted or quoted literal. e.g. ABC will exactly match System Id 'ABC'.
- Using single-character wildcard '%' (percent). e.g. 'AB%Z' will match any System Id beginning with 'AB' followed by any other single character followed by 'Z'
- Using multiple-character wildcard '*' (asterisk). e.g. '*Z' will match any System Id ending with 'Z'

All SMF Record-types contain a System Id field (zSID).

Logic: AND | OR

The **Logic:** field defines the logical operator to be applied between conditions returned by the 4 "Content match" class fields (**Type(s)>**, **Find String>**, **User Id>**, **Job Name>** and **System Id>**).

OR indicates that the "Content match" class will return a true condition when a true condition is returned from **ANY** of the "Content match" class fields.

AND indicates that the "Content match" class will only return a true condition if true conditions are returned for **ALL** "Content match" class fields for which values have been specified.

For both **OR** and **AND** logical operations, a true condition will be returned for the "Content match" class if no selection condition values are specified in any of the "Content match" class fields.

Options:**Format> ONLINE | OFFLINE**

ONLINE indicates that the SMF dataset is in the format as written directly by SMF to the SMF log datasets (**SYS1.xxxx.MANx**). Note that SELCOPYi does not support reporting on SMF records directly from the System Logger.

ONLINE datasets include a **4-byte record descriptor word (RDW) prefix** at the start of each record, so record-type field mapping must be offset by this amount.

OFFLINE indicates that the SMF dataset is the format as written by the SMF DUMP tool (IFASMFDP) which does not include a 4-byte (RDW) record prefix.

Run Type> B | C | F

B indicates that JCL should be produced for submission to batch.

C indicates that command line interface should be produced. The **SMFRPT** primary command is displayed in a Text Editor window view in a format suitable for execution using the **ACTION** key (default Shift-F4) ready to be copied into your **HOME** file (=4).

F indicates that immediate foreground execution is required as soon as the <Enter> key is pressed.

In this case the report output will be collected in-storage and displayed in a Text Editor window view. The output will not be saved to disk but the user may enter the **CREATE** or **REPLACE** commands to do so.

If the expected report output is larger than your available foreground region then you should choose the **B** option to generate a batch job which will write the report to the DD name **SDEPRINT**.

Output Type> P=Print | C=CSV | J=JSON | X=XML | B=Browse

P requests standard **Print** output with page headings, optional sort, control breaks and totals/sub-totals.

C requests **Comma Separated Variable (CSV)** output suitable for loading into various external formats such as **DB2**. The first row will contain the column headings as defined by your report definition file. Defined control breaks and totals/sub-totals are all ignored for **CSV** output.

J requests **Java Script Object Notation (JSON)** output suitable for loading into various external formats such as a web page. Defined control breaks and totals/sub-totals are all ignored for **JSON** output.

X requests **eXtensible Markup Language (XML)** output suitable for loading into various external formats including directly into **Microsoft Excel**. Defined control breaks and totals/sub-totals are all ignored for **XML** output.

B requests an online **Browse** session is started with the format of the displayed data controlled by the report definition. i.e. fields selected from various primary/secondary segments will all appear on a single line.

The fields will be displayed grouped together by their source segment, so not strictly in accordance with your report definition.

This option will also define a permanent user default display format for the primary record type involved, meaning any future online browse will display only the selected fields. To revert to the default just type "SEL *" on the command line of the browse session.

Defined sort, control breaks and totals/sub-totals are all ignored for **BROWSE** output.

Page Depth>

Specifies the number of lines printed per page.

If left blank (or specified as zero) then the user's own prevailing Data Editor **PAGEDEPTH** option value will be used.

Type "**SD Q PAGEDEPTH**" to query your current Data Editor pagedepth value.

Type "**SD SET PAGEDEPTH nnn**" to set your current Data Editor pagedepth value.

Primary Commands

SELCOPYi SMF utility primary commands provide a command line interface to execution of the individual utilities.

A primary command may be executed from a SELCOPYi command prompt or via the **ACTION** key (default Shift-F4) when the command exists as text edited via the SELCOPYi Text Editor.

The SMF utility panels generate and execute relevant primary commands.

- SMFB
- SMFBB
- SMFCICSM
- SMFEXTRC
- REPORT
- SMFFLD
- VBASE

SMFB

Examples:

SmfB USER123.SMF.DATA Types(14 15 30-5) ILim(10000)
 Selecting from the first 10000 records, display SMF types 14, 15 along with type 30 records that are subtype 5.

SmfB USER123.SMF.DATA DateLo(2018/09/15 13:00) DateHi(2018/09/20) basic
 Display SMF records of any type using basic common header layout "SMFnnn" for all records, provided they fall within the DATELO/DATEHI timestamp range.

Syntax:

```

>>-- SmfB -- SmfFile -----+-----+-----+-----+----->
      |              |              |              |              |
      +- OFFLINE -+  |              |              |              |
      |              |              |              |              |
      +- ONLINE  -+  |              |              |              |
                          +------+ |              |

      +-AND-+

```

Description:

SMFB provides a command-line interface (CLI) to the SELCOPYi **SMF Browse Utility**.

Record Filtering

SMF records may be filtered so that only records that satisfy specified selection criteria are loaded and retained for subsequent browse.

A combination of record filtering parameters may be specified, each relating to one of the following record filtering classes:

1. Input record limit (ILIM)
2. Output record limit (OLIM)
3. Earliest timestamp (DATELO)
4. Latest timestamp (DATEHI)
5. Content match (TYPE, FIND, SID, USERID and JOBNAME)

In order to be selected, a record must return a true condition for **all** the record filtering classes for which parameters have been specified. If no record filtering parameters are specified, then all records are selected for display.

The "Content match" class encompasses filter criteria specified for any combination of parameters **TYPE, FIND, USERID** and **JOBNAME**, each parameter itself returning either a true or false condition. The overall condition returned by the "Content match" class is based on the logical relationship between each of these parameters. The value specified by the **LOGIC** parameter determines this relationship as follows:

- For **LOGIC(OR)**, a true condition will be returned for the "Content match" class if at least **one** of the specified content match parameters returns a true condition. This is the default if LOGIC is not specified.
- For **LOGIC(AND)**, a true condition will be returned for the "Content match" class if **all** of the specified content match parameters return a true condition.

Each of the "Content match" parameters (TYPE, FIND, USERID and JOBNAME) support specification of multiple, **alternate** values. If any of these alternate values match the data in the record, then a true condition will be returned for that parameter.

e.g. A "Content match" class specification of **TYPES(14,15) JOBNAME(SMF*,DCH*) LOGIC(AND)** will return a true condition if the SMF record is identified as being either type 14 or 15 **AND** it contains a value beginning "SMF" or "DCH" in the zJOBNAME field.

Storage Management

If none of the record filtering parameters TYPES, DATELO, DATEHI, USERID, JOBNAME, SID or FIND are specified, then only the first group of 100 records are loaded. Thereafter, additional groups of 100 records are loaded (and unloaded) as required (e.g. when scrolling vertically or on execution of a search or filter command). Beyond a few hundred records, SELCOPYi will attempt to minimise the amount of storage used by unloading as many groups of 100 records as possible.

If any of these record filtering parameters are specified, then the same technique applies except that the record group size starts at 1 and increments by 1 up to a maximum of 50 records. This is to minimize the amount of storage and I/O required in order to display each screen of selected records.

Parameters:

SmfFile

The name of a single existing, sequential or VSAM data set, GDG file generation, HFS file or PDS/PDSE library member containing SMF records that is to be browsed.

TYPES (*rr1, rr2 rr3-ss1 rr4#ss2 rr5:rr6*)

Specifies the SMF record types/subtypes to be selected.

A list of one or more record type (and optional subtype) numbers must be provided in brackets immediately following (no blank) the TYPES keyword, each separated by either blank or comma.

To request subtype *ss* of record type *rr* you may specify either *rr-ss* or *rr#ss*. e.g. 42-3 will specifically select SMF type 42 records of subtype 3.

Where a subtype is not included on a type specification, a colon ":" may be inserted between 2 record type values to identify a range of record types. e.g. 60:69 may be used to identify all SMF record types between 60 and 69 inclusively.

DATELO (*yyyy/mm/dd hh:mm:ss.tt*)

Specifies the minimum timestamp for record selection specified in **yyyy/mm/dd hh:mm:ss.t** format, which may be specified in as much detail as necessary. e.g. **2018/09/12** will be treated as **2018/09/12 00:00:00.0**

A date relative to the current day may also be supplied as **+/-nnn**
e.g. If today were **2016/03/05** then **-5** will be treated as **2016/02/29** (leap year).

DATEHI (*yyyy/mm/dd hh:mm:ss.tt*)

Specifies the maximum timestamp for record selection in **yyyy/mm/dd hh:mm:ss.t** format, which may be specified in as much detail as necessary. e.g. **2018/09** will be treated as **2018/09/99 99:99:99.9**

A date relative to the current day may also be supplied as **+/-nnn**
e.g. If today were **2016/03/05** then **-5** will be treated as **2016/02/29** (leap year).

ILIM(*nn*)

Specifies the maximum number of records that may be read from the SMF Dataset for potential selection.

See panel field **Output Limit** for further discussion.

OLIM(*nn*)

Specifies the maximum number of records that may be selected for browse.

See panel field **Output Limit** for further discussion.

FIND(*FindString1, FindString2, ...*)

FIND is one of the "Content match" class parameters and specifies one or more alternate, comma separated strings to be located at any position within an SMF record.

If a record contains any of the search strings then a true condition will be returned for the **FIND** parameter. e.g.

```
FIND( SYS1.MACLIB, SYS1.MIGLIB, SYS1.MODGEN, SYS1.MSGEN)
```

Find strings may be specified as any of the following:

- ◆ An **unquoted** string.

Alpha character matching is case-insensitive unless **wildcard** characters are used. The string must not match a FIND command keyword and must not contain comma or blank characters. e.g. **ABC**.

- ◆ A **quoted** string (using either apostrophes or quotation marks).

Alpha character matching is case-insensitive unless **wildcard** characters are used. e.g. 'A,B C' and "a,b C" are equivalent.

- ◆ A **character literal** string specified as a quoted string prefixed with "C".

Alpha character matching is case-sensitive and may include **wildcard** characters. e.g. C'A,B C' and C'a,b c'. are **not** equivalent.

- ◆ A **hexadecimal** string specified as a quoted string of hex digits prefixed with "X". e.g. X'81C2C340'.

- ◆ A **picture** string specified as a quoted string prefixed with "P".

Special characters represent generic groups of characters as described below. Any character in a picture string that is not one of these special characters is untranslated. e.g. P'A##-BC'.

String	Description
P'='	Any character.
P'-'	Any non-blank character.
P'.'	Any non-displayable character.
P'#'	Any numeric character, 0-9.
P'.'	Any non-numeric character.
P'@'	Any uppercase or lowercase alpha character.
P'<'	Any lowercase alpha character.
P'>'	Any uppercase alpha character.
P'\$'	Any non-alphanumeric special character.

- ◆ A **regular expression** string specified as a quoted string prefixed with "R".

Regular expressions enable powerful string pattern matching at the cost of rather complex syntax and potentially extended command processing time.

For syntax and usage see **Regular Expressions** in the Text Editor documentation. e.g. R'A:d+x' would match the upper case character "A" followed by 1 or more numeric digits followed by character "x".

- ◆ An **unquoted, quoted or character literal** string containing one or more **wildcard** characters.

Single-character wildcard '%' (percent) represents exactly one occurrence of any character. Multiple-character wildcard '*' (asterisk) represents zero or more occurrences of any character.

Beware of the following when using wildcard characters in a find string:

1. Alpha character matching becomes case-sensitive even in **unquoted** and **quoted** strings.
2. For find strings containing a multiple-character wildcard, once a match has been found on the characters in the find string that precede it, the characters in the find string that follow it may be matched at any subsequent location within the SMF record. e.g. For find string 'ABC*DEF', 'ABC' may be matched in the first three characters of the record and 'DEF' in the last three characters of the record.

USERID(*uid1, uid2 etc*)

USERID is one of the "Content match" class parameters and specifies one or more alternate, comma separated user id values to be matched in SMF record types known to contain a User Id field (**zUserId**) at a fixed location within the record data. This fixed position may be different for each of the SMF record types.

If a record contains any of the user id values then a true condition will be returned for the **USERID** parameter. If no match is found or the SMF record is not of a type known to contain a User Id field at a fixed location, then a false condition will be returned.

A user id value may be specified as an **unquoted, quoted or character literal** string and may contain one or more **wildcard** characters as described for the **FIND** parameter. e.g. A user id search string '*'1' will match a user id value of any length (maximum 8) that ends with 1. A user id search string 'ABC%DEF' will match a user id beginning with 'ABC' followed by any other single character followed by 'DEF'.

Unlike a find string, a user id search value does not imply a trailing "*" (asterisk) wildcard and must start at the fixed position within the SMF record at which the zUserId field is located, for length 8 characters. If no wildcard characters are specified, a User id search is padded with blanks or truncated to 8 characters. If no wildcards are specified and the search string is an **unquoted or quoted** string, then the alpha characters will be upper cased. e.g. A user id search string 'abc' will match user id 'ABC' but not 'ABC1', 'ABCXXX' or 'XABC'. Search string '%abc' would match 'XABC' only and '*abc*' would match all of these user ids.

The following SMF Record-types are known to contain a User Id field.

004	014	018	026	035	042	062	065	068	110
005	015	020	030	036	060	063	066	069	118
006	017	025	034	040	061	064	067	080	119
010									

JOBNAME (*job1, job2 etc*)

JOBNAME is one of the "Content match" class parameters and specifies one or more alternate, comma separated job name values to be matched in SMF record types known to contain a Job Name field (**zJobName**) at a fixed location within the record data. This fixed position may be different for each of the SMF record types.

If a record contains any of the job name values then a true condition will be returned for the **JobName** parameter. If no match is found or the SMF record is not of a type known to contain a Job Name field at a fixed location, then a false condition will be returned.

A job name value may be specified as an **unquoted, quoted or character literal** string and may contain one or more **wildcard** characters as described for the **FIND** parameter.

Differences between the **JOBNAME** and **FIND** parameter specifications are as described for the **USERID** parameter.

The following SMF Record-types are known to contain a Job Name field.

004	010	017	025	034	040	061	064	067	080
005	014	018	026	035	042	062	065	068	110
006	015	020	030	036	060	063	066	069	118

SID (*SystemId1, SystemId2 etc*)

SID is one of the "Content match" class options and specifies one or more alternate, comma separated system id values to be matched each SMF record.

System Id may be specified:

- ◇ Using an unquoted or quoted literal. e.g. ABC will exactly match System Id 'ABC'.
- ◇ Using single-character wildcard '%' (percent). e.g. 'AB%Z' will match any System Id beginning with 'AB' followed by any other single character followed by 'Z'
- ◇ Using multiple-character wildcard '*' (asterisk). e.g. '*Z' will match any System Id ending with 'Z'

All SMF Record-types contain a System Id field (zSID).

LOGIC (AND) / LOGIC (OR)

The **LOGIC** parameter defines the logical operator to be applied between conditions returned by the 4 "Content match" class parameters (**TYPES, FIND, USERID, JOBNAME** and **SID**).

OR indicates that the "Content match" class will return a true condition when a true condition is returned from **ANY** of the "Content match" class fields.

AND indicates that the "Content match" class will only return a true condition if true conditions are returned from **ALL** "Content match" class fields for which values have been specified.

For both **OR** and **AND** logical operations, a true condition will be returned for the "Content match" class if no selection condition values are specified in any of the "Content match" class fields.

ONLINE

ONLINE indicates that the SMF dataset is in the format as written directly by SMF to the SMF log datasets (**SYS1.xxxx.MANx**). Note that SELCOPYi does not support a browse of SMF records directly from the System Logger.

Browse of online datasets should be undertaken with caution as SELCOPYi will keep a SYSDSN SHR enqueue on the file for the duration of the browse session, which may interfere with SMF's CLEAR processing.

ONLINE datasets have a **4-byte record descriptor word (RDW) prefix** at the start of each record, so record-type field mapping must be offset by this amount.

OFFLINE

OFFLINE indicates that the SMF dataset is the format as written by the SMF DUMP tool (IFASMFDP) which does not include a 4-byte (RDW) record prefix. This is the default.

SHADOW

Applicable only when **BASIC** is not specified and affects only SMF records that are mapped using **Primary/Secondary segments**.

SHADOW indicates that secondary segments should initially display as shadow lines. This is the default.

Note that while secondary segments are shadowed (thereby occupying much less screen space) the detail for any single shadowed segment may be displayed in a separate window by placing the cursor on the shadow line and pressing the **"ZoomW"** key (**Shift-F5**).

The shadow lines themselves may be suppressed using the **SHADOW (SHAD)** set option and/or the **HIDE** primary command.

Regardless of your initial setting for this option, the **VBASE** primary command may be used to switch back and forth throughout your browse session.

SHOW

Applicable only when **BASIC** is not specified and affects only SMF records that are mapped using **Primary/Secondary segments**.

SHOW indicates that secondary segments should initially display in full detail

Regardless of your initial setting for this option, the **VBASE** primary command may be used to switch back and forth throughout your browse session.

BASIC

All records will be mapped using the basic layout **SMFnnn**.

Note that **"nnn"** here is a literal and does not represent the variable record-type number.

The basic layout includes the common header fields only (e.g. SMF record/sub-type, timestamp), followed by the field **"Rest"** which displays the tail end of the record as uninterpreted character data.

Use **HEX ON** to display hexadecimal representations.

If **BASIC** is not specified then SELCOPYi will use comprehensive mapping for supported record types.

Each supported SMF record type/sub-type will be assigned a separate layout **SMFnnn_xxx_yyyy_zzz**, where **"nnn"** represents the variable record-type number, and **"xxx_yyyy_zzz"** is the short description
e.g. **SMF014_INPUT_or_RDBACK_Dataset**

SMF records that comprise potentially repeating groups will be mapped over several logical **Primary/Secondary Segments**.

Any selected records whose SMF record type is currently unsupported will be mapped using the **"Basic Layout"** record type **SMFnnn**.

REGEN

Specify **REGEN** to reload full layout definitions, and should only be used if a refresh of the SELCOPYi SMF structure definitions is required (e.g. following a product or service upgrade).

Another implication of refreshing the structure definitions is that any user updates will be lost. These may include

- ◇ Any "permanent" alterations to the field display order/selection and/or column-widths made via the **SDE SELECT Columns** panel
- ◇ Any row colouring options specified via the **RCOLOUR** command
- ◇ Any column colouring options specified via the **CCOLOUR** command

See Also:

SMF Browse Utility panel

Parameters:**DIC** (*dictionary-dsn*)

Specifies *dictionary-dsn*, the DSN of the dataset containing the CICS monitoring dictionary record which describes the layout of the CICS performance monitoring record for a particular CICS system and APPLID.

This dataset is the output from the DFHMNDMP CICS utility and contains a reference to the 8-character CICS system id and global APPLID (product name).

If DIC(*dictionary-dsn*) is not specified, SMFCICSM uses the dataset allocated to DD **SDEDICT** otherwise error SDEX103E is returned.

NOSDO

NOSDO will suppress the automatic creation of the SELCOPYi SDO structure T110ST01 from the newly updated T110ST01 mapping member.

By default, SMFCICSM will create the SDO structure member.

SDEMAPI (*in-map-lib*)

Specifies *in-map-lib*, the DSN of the library containing the source T110ST01 mapping member from which the new mapping will be derived.

The T110ST01 source member contains a mapping of the CICS performance record that identifies all possible performance monitoring fields (the default mapping). SMFCICSM uses this mapping plus the dictionary record to select a subset of fields that are specific to the individual CICS system's performance records.

If **UPD** is specified without **SDEMAPO**, then source T110ST01 mapping member in *in-map-lib* will be updated with the additional performance monitoring record layout. All other contents of the member remain unchanged.

If SDEMAPI(*in-map-lib*) is not specified, SMFCICSM uses the library DSN allocated to DD **SDEMAPI** otherwise library "*distpfx.SZZSDIST.SMFMAP*" is used (where *distpfx* is the DSN HLQ of the SELCOPY distribution libraries).

SDEMAPO (*out-map-lib*)

Specifies *out-map-lib*, the DSN of the output library to which the new T110ST01 mapping member will be written.

The new T110ST01 mapping member will contain the contents of the source copy of the member plus the additional performance monitoring record layout.

If **UPD** is specified, then *out-map-lib* may be the same as *in-map-lib* otherwise error SDEX101E is returned.

If SDEMAPO(*out-map-lib*) is not specified, SMFCICSM resolves the output library DSN *out-map-lib* as follows:

1. Library DSN allocated to DD **SDEMAPO**.
2. If **UPD** is specified, then library DSN *in-map-lib*.
3. If set, the DSN defined by Data Edit option **SMFMAPLIB**.
4. Error SDEX105E is returned.

SDESDO (*sdo-lib*)

Specifies *sdo-lib*, the DSN of the output library in which the T110ST01 SELCOPYi SDO structure will be generated.

If **NOSDO** is specified, then SDESDO is ignored and no SDO structure is generated.

Library *sdo-lib* must not be the product SZZSDIST.SDO library distributed by CBL (error SDEX107E will be returned). The *sdo-lib* library should be common to all users (a site-wide SDO library) and its DSN set on option SDE.SITESDO in the System SELCOPYi INI dataset.

When the user executes menu item "Upd-Layouts" from the SMF Browse utility panel, the up-to-date T110ST01 SDO structure will be copied from the library assigned to variable SDE.SITESDO.

If SDESDO(*sdo-lib*) is not specified, SMFCICSM uses the library DSN allocated to DD **SDESDO** otherwise library "*userpfx.SELCOPYI.SMF.SDO*" is used (where *userpfx* is the DSN HLQ defined by variable System.UserDSNPrefix in the user's SELCOPYi INI dataset).

UPD

If **SDEMAPO** is not specified and DD **SDEMAPO** is not allocated, then **UPD** will allow the T110ST01 mapping member in *in-map-lib* to be updated with the new performance record layout, **provided** it is not the master copy found in the SELCOPY product distribution library SZZSDIST.SMFMAP (error SDEX105E will be returned).

SMF records may be filtered so that only records that satisfy specified selection criteria are selected for extraction.

A combination of record filtering parameters may be specified, each relating to one of the following record filtering classes:

1. Input record limit (ILIM)
2. Output record limit (OLIM)
3. Earliest timestamp (DATELO)
4. Latest timestamp (DATEHI)
5. Content match (TYPE, FIND, USERID, JOBNAME and SID)

In order to be selected, a record must return a true condition for **all** the record filtering classes for which parameters have been specified. If no record filtering parameters are specified, then all records are selected for display.

The "Content match" class encompasses filter criteria specified for any combination of parameters **TYPE**, **FIND**, **USERID** and **JOBNAME**, each parameter itself returning either a true or false condition. The overall condition returned by the "Content match" class is based on the logical relationship between each of these parameters. The value specified by the **LOGIC** parameter determines this relationship as follows:

- For **LOGIC(OR)**, a true condition will be returned for the "Content match" class if at least **one** of the specified content match parameters returns a true condition. This is the default if LOGIC is not specified.
- For **LOGIC(AND)**, a true condition will be returned for the "Content match" class if **all** of the specified content match parameters return a true condition.

Each of the "Content match" parameters (TYPE, FIND, USERID and JOBNAME) support specification of multiple, **alternate** values. If any of these alternate values match the data in the record, then a true condition will be returned for that parameter.

e.g. A "Content match" class specification of **TYPES(14,15) JOBNAME(SMF*,DCH*) LOGIC(AND)** will return a true condition if the SMF record is identified as being either type 14 or 15 **AND** it contains a value beginning "SMF" or "DCH" in the zJOBNAME field.

Parameters:

SmfInput

Provides the name(s) of existing, sequential or VSAM data sets, GDG bases, individual GDG generations, HFS files or PDS/PDSE library members from which SMF records are to be selected for extraction.

If a GDG base name is provided then all generations (oldest to newest) will be processed as input.

If more than one input dataset is required a blank separated list maybe supplied between a leading "(" (double open-parentheses) and a trailing ")" (double close-parentheses).

SmfOutput

The name of a sequential or VSAM data set, GDG file generation, HFS file or PDS/PDSE library member to which selected SMF records are to be written.

TYPES(rr1,rr2 rr3-ss1 rr4#ss2 rr5:rr6)

Specifies the SMF record types/subtypes to be selected.

A list of one or more record type (and optional subtype) numbers must be provided in brackets immediately following (no blank) the TYPES keyword, each separated by either blank or comma.

To request subtype *ss* of record type *rr* you may specify either *rr-ss* or *rr#ss*. e.g. 42-3 will specifically select SMF type 42 records of subtype 3.

Where a subtype is not included on a type specification, a colon ":" may be inserted between 2 record type values to identify a range of record types. e.g. 60:69 may be used to identify all SMF record types between 60 and 69 inclusively.

DATELO(yyyy/mm/dd hh:mm:ss.tt)

Specifies the minimum timestamp for record selection specified in **yyyy/mm/dd hh:mm:ss.t** format, which may be specified in as much detail as necessary. e.g. **2018/09/12** will be treated as **2018/09/12 00:00:00.0**

A date relative to the current day may also be supplied as **+/-nnn**
e.g. If today were **2016/03/05** then **-5** will be treated as **2016/02/29** (leap year).

DATEHI(yyyy/mm/dd hh:mm:ss.tt)

Specifies the maximum timestamp for record selection in **yyyy/mm/dd hh:mm:ss.t** format, which may be specified in as much detail as necessary. e.g. **2018/09** will be treated as **2018/09/99 99:99:99.9**

A date relative to the current day may also be supplied as **+/-nnn**
e.g. If today were **2016/03/05** then **-5** will be treated as **2016/02/29** (leap year).

ILIM(nn)

Specifies the maximum number of records that may be read from each SMF input dataset for potential selection.

See panel field **Output Limit** for further discussion.

OLIM(nn)

Specifies the maximum number of records that may be selected for output to the SMF output dataset.

See panel field **Output Limit** for further discussion.

FIND (*FindString1*, *FindString2*, ...)

FIND is one of the "Content match" class parameters and specifies one or more alternate, comma separated strings to be located at any position within an SMF record.

If a record contains any of the search strings then a true condition will be returned for the **FIND** parameter. e.g.

```
FIND( SYS1.MACLIB, SYS1.MIGLIB, SYS1.MODGEN, SYS1.MSGEN)
```

Find strings may be specified as any of the following:

◆ An **unquoted** string.

Alpha character matching is case-insensitive unless **wildcard** characters are used. The string must not match a **FIND** command keyword and must not contain comma or blank characters. e.g. **ABC**.

◆ A **quoted** string (using either apostrophes or quotation marks).

Alpha character matching is case-insensitive unless **wildcard** characters are used. e.g. **'A,B C'** and **"a,b C"** are equivalent.

◆ A **character literal** string specified as a quoted string prefixed with "C".

Alpha character matching is case-sensitive and may include **wildcard** characters. e.g. **C'A,B C'** and **C'a,b C'** are **not** equivalent.

◆ A **hexadecimal** string specified as a quoted string of hex digits prefixed with "X". e.g. **X'81C2C340'**.

◆ A **picture** string specified as a quoted string prefixed with "P".

Special characters represent generic groups of characters as described below. Any character in a picture string that is not one of these special characters is untranslated. e.g. **P'A##-BC'**.

String	Description
P'='	Any character.
P'-'	Any non-blank character.
P'.'	Any non-displayable character.
P'#'	Any numeric character, 0-9.
P'.'	Any non-numeric character.
P'@'	Any uppercase or lowercase alpha character.
P'<'	Any lowercase alpha character.
P'>'	Any uppercase alpha character.
P'\$'	Any non-alphanumeric special character.

◆ A **regular expression** string specified as a quoted string prefixed with "R".

Regular expressions enable powerful string pattern matching at the cost of rather complex syntax and potentially extended command processing time.

For syntax and usage see **Regular Expressions** in the Text Editor documentation. e.g. **R'A:d+x'** would match the upper case character "A" followed by 1 or more numeric digits followed by character "x".

◆ An **unquoted, quoted or character literal** string containing one or more **wildcard** characters.

Single-character wildcard '%' (percent) represents exactly one occurrence of any character. Multiple-character wildcard '*' (asterisk) represents zero or more occurrences of any character.

Beware of the following when using wildcard characters in a find string:

1. Alpha character matching becomes case-sensitive even in **unquoted** and **quoted** strings.
2. For find strings containing a multiple-character wildcard, once a match has been found on the characters in the find string that precede it, the characters in the find string that follow it may be matched at any subsequent location within the SMF record. e.g. For find string 'ABC*DEF', 'ABC' may be matched in the first three characters of the record and 'DEF' in the last three characters of the record.

USERID (*uid1*, *uid2* etc)

USERID is one of the "Content match" class parameters and specifies one or more alternate, comma separated user id values to be matched in SMF record types known to contain a User Id field (**zUserId**) at a fixed location within the record data. This fixed position may be different for each of the SMF record types.

If a record contains any of the user id values then a true condition will be returned for the **USERID** parameter. If no match is found or the SMF record is not of a type known to contain a User Id field at a fixed location, then a false condition will be returned.

A user id value may be specified as an **unquoted, quoted or character literal** string and may contain one or more **wildcard** characters as described for the **FIND** parameter. e.g. A user id search string '*1' will match a user id value of any length (maximum 8) that ends with 1. A user id search string 'ABC%DEF' will match a user id beginning with 'ABC'

followed by any other single character followed by 'DEF'.

Unlike a find string, a user id search value does not imply a trailing "*" (asterisk) wildcard and must start at the fixed position within the SMF record at which the zUserId field is located, for length 8 characters. If no wildcard characters are specified, a User id search is padded with blanks or truncated to 8 characters. If no wildcards are specified and the search string is an **unquoted** or **quoted** string, then the alpha characters will be upper cased. e.g. A user id search string 'abc' will match user id 'ABC' but not 'ABC1', 'ABCXXX' or 'XABC'. Search string '%abc' would match 'XABC' only and '*abc*' would match all of these user ids.

The following SMF Record-types are known to contain a User Id field.

004	014	018	026	035	042	062	065	068	110
005	015	020	030	036	060	063	066	069	118
006	017	025	034	040	061	064	067	080	119
010									

JOBNAME(*job1, job2 etc*)

JOBNAME is one of the "Content match" class parameters and specifies one or more alternate, comma separated job name values to be matched in SMF record types known to contain a Job Name field (**zJobName**) at a fixed location within the record data. This fixed position may be different for each of the SMF record types.

If a record contains any of the job name values then a true condition will be returned for the **JobName** parameter. If no match is found or the SMF record is not of a type known to contain a Job Name field at a fixed location, then a false condition will be returned.

A job name value may be specified as an **unquoted**, **quoted** or **character literal** string and may contain one or more **wildcard** characters as described for the **FIND** parameter.

Differences between the **JOBNAME** and **FIND** parameter specifications are as described for the **USERID** parameter.

The following SMF Record-types are known to contain a Job Name field.

004	010	017	025	034	040	061	064	067	080
005	014	018	026	035	042	062	065	068	110
006	015	020	030	036	060	063	066	069	118

SID(*SystemId1, SystemId2 etc*)

SID is one of the "Content match" class options and specifies one or more alternate, comma separated system id values to be matched each SMF record.

System Id may be specified:

- ◇ Using an unquoted or quoted literal. e.g. ABC will exactly match System Id 'ABC'.
- ◇ Using single-character wildcard '%' (percent). e.g. 'AB%Z' will match any System Id beginning with 'AB' followed by any other single character followed by 'Z'
- ◇ Using multiple-character wildcard '*' (asterisk). e.g. '*Z' will match any System Id ending with 'Z'

All SMF Record-types contain a System Id field (zSID).

LOGIC(AND) / LOGIC(OR)

The **LOGIC** parameter defines the logical operator to be applied between conditions returned by the 4 "Content match" class parameters (**TYPES**, **FIND**, **USERID**, **JOBNAME** and **SID**).

OR indicates that the "Content match" class will return a true condition when a true condition is returned from **ANY** of the "Content match" class fields.

AND indicates that the "Content match" class will only return a true condition if true conditions are returned from **ALL** "Content match" class fields for which values have been specified.

For both **OR** and **AND** logical operations, a true condition will be returned for the "Content match" class if no selection condition values are specified in any of the "Content match" class fields.

ONLINE

Indicates that the input SMF dataset(s) are in the format as written directly by SMF. These are typically **SYS1.xxxx.MAN1/2/3/etc** datasets (SELCOPYi does not support browse of SMF records directly from the System Logger).

ONLINE datasets include a **4-byte record descriptor word (RDW) prefix** at the start of each record, so record-type field mapping must be offset by this amount.

The output dataset will be created in the same format as the input.

OFFLINE

Indicates that the input SMF dataset(s) are the format as written by the SMF archiving tool (IFASMFDP) which does not include a 4-byte (RDW) record prefix. This is the default.

The output dataset will be created in the same format as the input.

- APP** Indicates that any selected input records should be appended to the output dataset.
- FGRND** Indicates that immediate foreground execution is required. This is the default.
- FGRND** Indicates that JCL should be produced for submission to batch.
- CMX** Indicates that command line interface should be produced. The **SMFEXTRC** primary command is displayed in a Text Editor window in a format suitable for execution using the **ACTION** key (default Shift-F4) ready to be copied into your **HOME** file (=4).

[SMF Extract Utility panel](#)

SMFFLD

Examples:

`Smffld 30`
Display a table of the name, data type, length and definition for each field defined in the SELCOPYi SDO structure for SMF type 30.

`Smffld 42-26`
Display a table of the name, data type, length and definition for each field defined in the SELCOPYi SDO structure for SMF type 42 subtype 26.

`Smffld`
If executed in an SMF record **Browse full layout display**, then a help window is opened which displays information for every field in all segments defined by the SDO structure for the focus SMF record.

Otherwise a library list window is opened displaying all SMF structure members in the user's **SELCOPYi structure library**.

Syntax:

```

      +--- SMF_RecType ---+
      |                     |
>>-- SMFFLD -----+-----+-----><

```

Description:

SMFFLD displays information on each field in the specified SMF record type or the structure mapping for the focus SMF record segment.

Alternatively, if no record-type is specified and SMFFLD is executed from anywhere other than an SMF browse display, then a **List Library Members** window is opened containing an entry for each SMF structure member in the user's **SELCOPYi structure library**. Entering SMFFLD in the command field against the required member entry will display the mapping information for that structure.

The help displayed for the specific SMF record starts with a list of hyper-links to the relevant field information for each segment structure definition in the SMF record type (or subtype).

Information for a segment structure is presented as a table containing the name, data type, length and definition of each field belonging to the segment. These tables are identical to those included in this manual under the heading "**SMF Record Layouts**".

The tables contain sub-headers that identify the structure name hierarchy for the fields that follow. The structure name hierarchy includes the name of every level of structure to which the field belongs and, when used as a prefix to the field name, constitutes the fully qualified field name that uniquely identifies the field.

A fully qualified field name begins with the segment structure name (level 1) and ends with the field name. Between these names are the names of each structure to which the field belongs in ascending order of level number. Each name is separated from the next by a dot/period (".") character. e.g.

```
SMF030_EXCP.zEXP.zBSZ.zBSZLarge
```

Use of fully qualified field names need only be specified in **report definition** control statements and only then if the field name is not unique within the segment structure. e.g. Because **zBSZLarge** is unique within the **SMF030_EXCP** segment, it may be referenced in a report definition **COLUMNS:** section simply as:

```
SMF030_EXCP.zBSZLarge
```

When an SMF full layout Browse window is opened, SMFFLD is temporarily assigned to the first unassigned PFKey if one is available. A message is displayed informing the user of the selected SMFFLD PFKey.

To display the description of an individual field in the browse display, simply execute the HELP command (default action on <F1>) with the cursor positioned in the field value or column headers.

Parameters:

SMF_RecType
Identifies the SMF record type number and optional subtype number.

To specify a record subtype, use either "**ttt-sss**" or "**ttt#sss**" notation, where "**ttt**" and "**sss**" represent the record type and subtype numbers respectively.

If executed in an SMF full layout browse display, the default is the structure member used to map the focus segment within the display area. Otherwise, the list of structure members is displayed.

REPORT

Examples:

The following examples are as they might appear in a plain text file (e.g. the user's HOME command centre file) suitable for execution using the **ACTION** key.

```
<REPORT RUN RPTDEF ( T030SUM ) \
    SMF-INPUT-BEG \
    USER123.SMF030 \
    TYPES (30-5) \
    DATELO( 2018/09/15 13:00 ) \
    DATEHI( 2018/09/20 ) \
    SMF-INPUT-END
```

Using the **report definition** saved in dataset "*userid*.SELCOPYI.RPT(T030SUM)", produce a report from all **SMF Record-Type 30 SubType 5** records contained in dataset **USER123.SMF030** provided they fall within the DATELO/DATEHI timestamp range.

The **T030SUM** member may contain the following report definition statements:

```
TITLE:
  Job/DD EXCPs Report (from SMF Type 30 Subtype 5)

COLUMNS:
  SMF030_Identification.zJOBNAME           'Job Name'
  SMF030_Identification.zSIT              'Job Start'
  SMF030_Common_Address_Space_Work.ZTME   'Job End'
  SMF030_EXCP.zDDN                        'DDName'
  SMF030_EXCP.zBLK                        'EXCP Blks'

REPEAT:
  SMF030_EXCP
```

Execution of the REPORT command would create a report output that looks something like the following:

12018/09/14 12:04 Job/DD EXCPs Report (from SMF Type 30 Subtype 5) PAGE 1					
Job Name	Job Start	Job End	DDName	EXCP	Blks

Description:

REPORT provides a command-line interface (CLI) to the **SMF Report Utility** panel.

The layout of your desired report should be specified using control statements saved in the **Report Definition** dataset.

The report produced will typically consist mainly of data extracted from a list of data fields from a single SMF Record-Type, but you can select fields from more than one record-type and even generate your own values based on meaningful calculations. The report can reference fields from both Primary (Base) and **Secondary segments**.

A user definable heading will be printed at the top of each page, followed by user definable column headings for each selected field.

Grand totals will automatically be printed for any selected field containing integer data, and sub-totals will also be printed if a sort/control-break has been requested.

See **REPORT Definition** for full details of supported report definition control statements.

The utility supports sourcing SMF data from either the **"SYS1.xxxx.MANn"** dataset format (VSAM ESDS with 4-byte "RDW" prefix) that is written to directly by SMF, or the dataset format written by the **SMF UNLOAD utility** (normally **RECFM=VBS** with no 4-byte "RDW" prefix).

Record Filtering

SMF records may be filtered so that only records that satisfy specified selection criteria are selected for reporting.

A combination of record filtering parameters may be specified, each relating to one of the following record filtering classes:

1. Input record limit (ILIM)
2. Output record limit (OLIM)
3. Earliest timestamp (DATELO)
4. Latest timestamp (DATEHI)
5. Content match (TYPE, FIND, USERID, JOBNAME and SID)

The "Content match" class encompasses filter criteria specified for any combination of parameters **TYPE**, **FIND**, **USERID**, **JOBNAME** and **SID**, each parameter itself returning either a true or false condition. The overall condition returned by the "Content match" class is based on the logical relationship between each of these parameters. The value specified by the **LOGIC** parameter determines this relationship as follows:

- For **LOGIC(OR)**, a true condition will be returned for the "Content match" class if at least **one** of the specified content match parameters returns a true condition. This is the default if LOGIC is not specified.
- For **LOGIC(AND)**, a true condition will be returned for the "Content match" class if **all** of the specified content match parameters return a true condition.

Each of the "Content match" parameters (TYPE, FIND, USERID, JOBNAME and SID) support specification of multiple, **alternate** values. If any of these alternate values match the data in the record, then a true condition will be returned for that parameter.

e.g. A "Content match" class specification of **TYPES(14,15) JOBNAME(SMF*,DCH*) LOGIC(AND)** will return a true condition if the SMF record is identified as being either type 14 or 15 **AND** it contains a value beginning "SMF" or "DCH" in the zJOBNAME field.

If your selection criteria requirements go beyond the scope of the "Content match" record filtering class then you will need to code a **FILTER**: expression in your [Report Definition File](#).

Parameters:

ReportDefinitionFile

The name of a data set or PDS/PDSE library member that contains the SMF report definition control statements.

See [REPORT Definition](#) for full details of supported report definition control statements.

If a member name only is supplied then it is assumed to be in library *userid.SELCOPYI.SMF.RPT*.

TYPES (*rr1,rr2 rr3-ss1 rr4#ss2 rr5:rr6*)

Specifies the SMF record types/subtypes to be selected.

A list of one or more record type (and optional subtype) numbers must be provided in brackets immediately following (no blank) the TYPES keyword, each separated by either blank or comma.

To request subtype *ss* of record type *rr* you may specify either *rr-ss* or *rr#ss*. e.g. 42-3 will specifically select SMF type 42 records of subtype 3.

Where a subtype is not included on a type specification, a colon ":" may be inserted between 2 record type values to identify a range of record types. e.g. 60:69 may be used to identify all SMF record types between 60 and 69 inclusively.

DATELO (*yyyy/mm/dd hh:mm:ss.tt*)

Specifies the minimum timestamp for record selection specified in **yyyy/mm/dd hh:mm:ss.tt** format, which may be specified in as much detail as necessary. e.g. **2018/09/12** will be treated as **2018/09/12 00:00:00.00**

A date relative to the current day may also be supplied as **+/-nnn**
e.g. If today were **2016/03/05** then **-5** will be treated as **2016/02/29** (leap year).

DATEHI (*yyyy/mm/dd hh:mm:ss.tt*)

Specifies the maximum timestamp for record selection in **yyyy/mm/dd hh:mm:ss.tt** format, which may be specified in as much detail as necessary. e.g. **2018/09** will be treated as **2018/09/99 99:99:99.99**

A date relative to the current day may also be supplied as **+/-nnn**
e.g. If today were **2016/03/05** then **-5** will be treated as **2016/02/29** (leap year).

ILIM (*nn*)

Specifies the maximum number of records that may be read from each SMF input dataset for potential selection.

See panel field [Output Limit](#) for further discussion.

OLIM (*nn*)

Specifies the maximum number of records that may be selected for output to the SMF output dataset.

See panel field [Output Limit](#) for further discussion.

FIND (*FindString1, FindString2, ...*)

FIND is one of the "Content match" class parameters and specifies one or more alternate, comma separated strings to be located at any position within an SMF record.

If a record contains any of the search strings then a true condition will be returned for the **FIND** parameter. e.g.

```
FIND( SYS1.MACLIB, SYS1.MIGLIB, SYS1.MODGEN, SYS1.MSGEN)
```

Find strings may be specified as any of the following:

◆ An **unquoted** string.

Alpha character matching is case-insensitive unless **wildcard** characters are used. The string must not match a FIND command keyword and must not contain comma or blank characters. e.g. **ABC**.

◆ A **quoted** string (using either apostrophes or quotation marks).

Alpha character matching is case-insensitive unless **wildcard** characters are used. e.g. **'A,B C'** and **"a,b C"** are equivalent.

◆ A **character literal** string specified as a quoted string prefixed with "C".

Alpha character matching is case-sensitive and may include **wildcard** characters. e.g. **C'A,B C'** and **C'a,b C'** are **not** equivalent.

◆ A **hexadecimal** string specified as a quoted string of hex digits prefixed with "X". e.g. **X'81C2C340'**.

◆ A **picture** string specified as a quoted string prefixed with "P".

Special characters represent generic groups of characters as described below. Any character in a picture string that is not one of these special characters is untranslated. e.g. **P'A##-BC'**.

String	Description
P'='	Any character.
P'-'	Any non-blank character.
P'.'	Any non-displayable character.
P'#'	Any numeric character. 0-9.
P'.'	Any non-numeric character.
P'@'	Any uppercase or lowercase alpha character.
P'<'	Any lowercase alpha character.
P'>'	Any uppercase alpha character.
P'\$'	Any non-alphanumeric special character.

◆ A **regular expression** string specified as a quoted string prefixed with "R".

Regular expressions enable powerful string pattern matching at the cost of rather complex syntax and potentially extended command processing time.

For syntax and usage see **Regular Expressions** in the Text Editor documentation. e.g. **R'A:d+x'** would match the upper case character "A" followed by 1 or more numeric digits followed by character "x".

◆ An **unquoted, quoted** or **character literal** string containing one or more **wildcard** characters.

Single-character wildcard '%' (percent) represents exactly one occurrence of any character. Multiple-character wildcard '*' (asterisk) represents zero or more occurrences of any character.

Beware of the following when using wildcard characters in a find string:

1. Alpha character matching becomes case-sensitive even in **unquoted** and **quoted** strings.
2. For find strings containing a multiple-character wildcard, once a match has been found on the characters in the find string that precede it, the characters in the find string that follow it may be matched at any subsequent location within the SMF record. e.g. For find string 'ABC*DEF', 'ABC' may be matched in the first three characters of the record and 'DEF' in the last three characters of the record.

```
USERID( uid1, uid2 etc )
```

USERID is one of the "Content match" class parameters and specifies one or more alternate, comma separated user id values to be matched in SMF record types known to contain a User Id field (**zUserId**) at a fixed location within the record data. This fixed position may be different for each of the SMF record types.

If a record contains any of the user id values then a true condition will be returned for the **USERID** parameter. If no match is found or the SMF record is not of a type known to contain a User Id field at a fixed location, then a false condition will be returned.

A user id value may be specified as an **unquoted, quoted** or **character literal** string and may contain one or more **wildcard** characters as described for the **FIND** parameter. e.g. A user id search string '*1' will match a user id value of any length (maximum 8) that ends with 1. A user id search string 'ABC%DEF' will match a user id beginning with 'ABC' followed by any other single character followed by 'DEF'.

Unlike a find string, a user id search value does not imply a trailing "*" (asterisk) wildcard and must start at the fixed position within the SMF record at which the zUserId field is located, for length 8 characters. If no wildcard characters are specified, a User id search is padded with blanks or truncated to 8 characters. If no wildcards are specified and the search string is an **unquoted** or **quoted** string, then the alpha characters will be upper cased. e.g. A user id search string 'abc' will

match user id 'ABC' but not 'ABC1', 'ABCXXX' or 'XABC'. Search string '%abc' would match 'XABC' only and '*abc*' would match all of these user ids.

The following SMF Record-types are known to contain a User Id field.

004	014	018	026	035	042	062	065	068	110
005	015	020	030	036	060	063	066	069	118
006	017	025	034	040	061	064	067	080	119
010									

JOBNAME(*job1, job2 etc*)

JOBNAME is one of the "Content match" class parameters and specifies one or more alternate, comma separated job name values to be matched in SMF record types known to contain a Job Name field (**zJobName**) at a fixed location within the record data. This fixed position may be different for each of the SMF record types.

If a record contains any of the job name values then a true condition will be returned for the **JobName** parameter. If no match is found or the SMF record is not of a type known to contain a Job Name field at a fixed location, then a false condition will be returned.

A job name value may be specified as an **unquoted, quoted** or **character literal** string and may contain one or more **wildcard** characters as described for the **FIND** parameter.

Differences between the **JOBNAME** and **FIND** parameter specifications are as described for the **USERID** parameter.

The following SMF Record-types are known to contain a Job Name field.

004	010	017	025	034	040	061	064	067	080
005	014	018	026	035	042	062	065	068	110
006	015	020	030	036	060	063	066	069	118

SID(*SystemId1, SystemId2 etc*)

SID is one of the "Content match" class options and specifies one or more alternate, comma separated system id values to be matched each SMF record.

System Id may be specified:

- ◇ Using an unquoted or quoted literal. e.g. ABC will exactly match System Id 'ABC'.
- ◇ Using single-character wildcard '%' (percent). e.g. 'AB%Z' will match any System Id beginning with 'AB' followed by any other single character followed by 'Z'
- ◇ Using multiple-character wildcard '*' (asterisk). e.g. '*Z' will match any System Id ending with 'Z'

All SMF Record-types contain a System Id field (zSID).

LOGIC(AND) / LOGIC(OR)

The **LOGIC** parameter defines the logical operator to be applied between conditions returned by the 4 "Content match" class parameters (**TYPES**, **FIND**, **USERID**, **JOBNAME** and **SID**).

OR indicates that the "Content match" class will return a true condition when a true condition is returned from **ANY** of the "Content match" class fields.

AND indicates that the "Content match" class will only return a true condition if true conditions are returned from **ALL** "Content match" class fields for which values have been specified.

For both **OR** and **AND** logical operations, a true condition will be returned for the "Content match" class if no selection condition values are specified in any of the "Content match" class fields.

ONLINE

ONLINE indicates that the SMF dataset is in the format as written directly by SMF to the SMF log datasets (**SYS1.xxxx.MANx**). Note that SELCOPYi does not support extraction of SMF records directly from the System Logger.

ONLINE datasets include a **4-byte record descriptor word (RDW) prefix** at the start of each record, so record-type field mapping must be offset by this amount.

OFFLINE

Indicates that the input SMF dataset(s) are the format as written by the SMF archiving tool (IFASMFDP) which does not include a 4-byte (RDW) record prefix. This is the default.

FGRND | RUN

Indicates that immediate execution is required. This is the default.

If running interactively under SELCOPYi (as apposed to running in batch using PGM=SDEAMAIN) then the report output will be collected in-storage and displayed in a Text Editor window. The output will not be saved to disk but the user may enter the **CREATE** or **REPLACE** commands to do so.

If the expected report output is larger than your available foreground region then you should choose the **JCL** option to generate a batch job which will write the report to the DD name **SDEPRINT**.

BATCH | JCL

Indicates that JCL should be produced for submission to batch.

CMX

Indicates that command line interface should be produced. The **REPORT** primary command is displayed in a Text Editor window in a format suitable for execution using the **ACTION** key (default Shift-F4) ready to be copied into your **HOME** file (=4).

L

Lists all members of report definition library *userid.SELCOPYI.RPT*.

ADD

This option is intended for execution via a function key (F1-F24) and assists the user creating a report definition by generating "COLUMNS:" section control statements for all "SELECTed" columns within the **focus record** during an **SMF Browse Session**.

The following demonstrates use of the REPORT ADD facility.

1. Start a formatted browse of an SMF dataset containing the type of record you wish to report on, then navigate to an instance of that record-type (e.g. **NEXT SMF014**).
2. Use the **KEYS dialog** or **SET PFKEY** command to temporary assign a function key definition to a "REPORT ADD" command (e.g. **PF 6 REPORT ADD T014RPT1**).
3. Type primary command **SEL** to open a dialog that will allow you to pick the columns you wish to see in your report (and the order in which they should appear). On exit from the dialog the browse view will have updated as per your selection.

Alternatively, if you know the names (or field reference numbers) of the fields you require just type "**SEL fieldname1,fieldname2,...,fieldname99**".

4. Press function key **F6** to add the columns to the report definition member.
5. Library member *userid.SELCOPYI.SMF.RPT(T014RPT1)* will be displayed with a new "COLUMNS:" style control statement added for each selected field.

For each field, a **column heading** is generated from the text of the first sentence of the field's description. The new line character "|" will be inserted into the heading, forcing it over multiple lines where necessary, in order to minimise the report column's width.

6. Repeat this process for any secondary segments if required.

[SMF Report Utility panel](#)

VBASE - SET/QUERY/EXTRACT Option

Syntax:

```
>>+-----+ VBASE -----+ ON +-----+<<
    | SET -----+          | OFF  --+
    +-----+          +-----+
```

```
>>--- Query ----- VBASE -----+<<
```

```
>>--- EXTRACT --- /VBASE/ -----+<<
```

Description:

VBASE controls whether or not record data assigned to a secondary segment record type mapping is displayed or suppressed. If suppressed, only primary (base) segments are displayed.

If secondary segments are suppressed (VBASE ON) and **SHADOW ON** (or **RESET HIDE**) is in effect, then groups of lines assigned the same secondary segment time are displayed as a single suppressed shadow line.

Compare with the **VIEW** primary command and prefix (line) command equivalents ("V", "V+" and "V-") which suppress or display segments on an individual segment record-type basis.

SET VBASE takes effect at the view level, so separate windows open on the same file may independently control this option.

SET Value:

ON | OFF

VBASE ON suppresses display of all secondary segment lines and displays all base (primary) segment lines only.

VBASE OFF resets the suppression of ALL secondary segments allowing the prevailing **VIEW** option to take full effect.

QUERY Response:

The current setting of the VBASE option, **ON** or **OFF**.

EXTRACT Rexx variables:

vbase.0	1
vbase.1	The current setting of the VBASE option, ON or OFF .

Creating your own "Commands"

You can, in a sense, create your own primary/line-commands that act as a short cut to perform any specific SMF (or other SELCOPYi) task.

This is achieved by creating a "macro" that will execute one or more of the previously described **Primary Commands**.

Example 1 - User command "SMFB30" to Browse SMF Type 30 records

1. Type "EM SMFB30".

This will edit a new member in your personal SELCOPYi REXX macro library.

2. Add the following lines and save the member.

```
-USER123.SELCOPYI.CBLE(SMFB30) G=1(0)      255 V PDSE   Size=6   Alt==+x
Command>                                     Scroll> Csr
<-----1-----2-----3-----4-----5-----6-----
00001 /* Execute SMFB to select Type 30 records only */
00002
00003   arg SmfDataset
00004   if SmfDataset = '' then SmfDataset = 'CBL.SMF.GDG(0)'
00005
00006   'smfb' SmfDataset 'types(30)'
00007 * * * End of File * * *
```

Figure 33. SMFB30 Sample REXX macro.

3. Type "LD my.smf.datasets" to bring up a list of your archived SMF datasets
4. Type "SMFB30" against any one the datasets to display its type 30 records only.

```
-Dataset List: CBL.SMF.GDG                                     2020/02/13 11:15  -+x

Figure 33. SMFB30 Sample REXX macro.

5. Type "SMFB30" from the main command prompt of any window to display type 30 records from your default SMF dataset (as defined in the SMFB30 macro).

The sample above specifies **CBL.SMF.GDG(0)** as the default SMF dataset if no parameter argument is supplied.

Example 2 - User command "SMFR14" to Report on SMF Type 14 records

1. Type "EM SMFR14".

This will edit a new member in your personal SELCOPYi REXX macro library.

2. Add the following lines and save the member.

The sample below assumes you have already created your **REPORT Definition** in member **USER123.SELCOPYI.RPT(SMF14@01)**.

```
-USER123.SELCOPYI.CBLE(SMFR14)  G=1(0)      255 V PDSE   Size=6   Alt=-+x
Command>                               Scroll> Csr
<---+----1-----2-----3-----4-----5-----6-----
00001 /* Execute REPORT for SMF 14 records */
00002
00003   arg SmfDataset
00004   if SmfDataset = '' then SmfDataset = 'CBL.SMF.GDG(0)'
00005

Figure 33. SMFR14 Sample REXX macro.

3. As for the previous example you can now bring up a list of your archived SMF datasets then type "SMFR14" against any one the datasets to report on its type 14 records, or type the command from main command prompt to report from your default SMF dataset.

4. Also, you can add a number of entries into to your **HOME (=4)** file, then execute any of them by placing your cursor on the command then pressing the "**ACTION**" key (Shift-F4).

REPORT Definition

Full details for all available Report Definition control statements may be found in the separate manual [SELCOPYi Report Utility](#). For convenience, information on the main features useful in creating basic SMF reports is duplicated here.

Report Definition control statements contains the following distinct sections:

- **BLANKIFZERO:**
- **BREAK:**
- **COLUMNS:**
- **COMPUTE:**
- **FILTER:**
- **OPTIONS:**
- **REPEAT:**
- **REQUIRED:**
- **RESET:**
- **SORT:**
- **TITLE:**
- **TOTALS:**

The SMF Report Utility is used to generate a printable report from a dataset containing SMF records.

The layout of desired report must be specified using control statements saved in a dataset which is split into sections e.g. **COLUMNS:**

Each section marker (xxxxx:) will be followed by one or more control statements.

The columns section for instance is followed by a line specifying each column to appear in the report. The order of the lines determines the order of the columns on the report page.

The report produced will typically consist mainly of data extracted from a list of data fields from a single SMF Record-Type, but you can select fields from more than one record-type and even generate your own values based on meaningful calculations. The report can reference fields from both Primary (Base) and **Secondary segments**.

A user definable heading will be printed at the top of each page, followed by user definable column headings for each selected field.

Grand totals will automatically be printed for any selected field containing valid numeric data, and **sub-totals** will also be printed if a sort/control-break has been requested.

Report definition lines starting with *asterisk* ("*") and any text enclosed by a *slash-asterisk* ("/*") and *asterisk-slash* ("*/") pair will be treated as **comment** data. However, comments are not supported in the **TITLE:** section.

Example report definition.

```

Figure 33. Report Definition.

TITLE: (Optional)
Data that follows "TITLE:" section header defines the title of the report which will appear centralised on the first line of each page.

The report title may span multiple lines in the report definition file, and immediately follow the section header (you don't need to start a new line).

The date/time in "**yyyy/mm/dd hh:mm**" format will automatically be added (left adjusted) on the report page heading line.

Right adjusted on this line will be **page number**.

Comments (lines beginning with asterisk) are not supported within the TITLE: section and will be treated as part of the report title.

COLUMNS: (Required)
Each line following defines a report columnn.

◇ **Token 1** on the line identifies the SMF **record-type** and **field name** in "**rectype.field**" notation. e.g.

```
SMF014_INPUT_or_RDBACK_Dataset.DSN
```

Where **SMF014_INPUT_or_RDBACK_Dataset** is the record-type and **DSN** is the field name.

It is also permissible to refer to fields within **Secondary segments** that belong to the **Primary** (or Base) segment. e.g.

```
SMF014#3_Step_Info.zPGN
```

Restrictions:

- Only one "Base" segment may be reported upon.
- At least one field must be selected from that "Base" segment.

◇ **Token 2** is optional. It defines a **column heading** which must be supplied in quotes. e.g. '**Dataset Name**' If no heading is supplied then the field name is used. e.g. "DSN"

To supply subsequent options (column width etc) without overriding the column heading just include a null heading by supply two simultaneous quotes. e.g.

```
SMF014_INPUT_or_RDBACK_Dataset.DSN '' 20
```

◇ **Token 3** is optional. It defines a **column width** override allowing you to truncate a long field or pad (with blanks) a short field.

◇ **Token 4** is optional. It specifies whether the significant bytes of the column value returned by the field extraction are on the **LEFT (L)** or the **RIGHT (R)**. When "LEFT" is used, values will be truncated on the right. When "RIGHT" is used, values will be truncated on the left. "LEFT" is default.

Note that numeric field values are always extracted as right adjusted character strings and so "RIGHT" (or "R") should be specified.

COMPUTE: (Optional)
The COMPUTE section identifies the start of REXX program statements that are executed immediately prior to writing an output record detail line. The values assigned to user-defined *compute-field* variables should be updated in the COMPUTE section using standard REXX operations and functions.

If a *compute-field* variable may be based on the current value contained in an input record field (*input-field*). If this is the case, *input-field* must have been defined in either the **COLUMNS** or **REQUIRED** section and referenced within the REXX statements without its first qualifier (i.e. the record mapping (record-type) structure name).

The value assigned to *input-field* will be the last one obtained from the input data before the COMPUTE REXX statements are called and the next output detail line is written. Similarly, the prevailing value assigned to a REPORT built-in field will be returned if a *built-in-field* is referenced.

If required, *input-field* and *built-in-field* values may also be updated within the REXX statements.

If *compute-field* needs to be assigned an initial value, then this may be done in the **BROWSE-EXIT** section. For example, a *compute-field* variable "XNUM" may be a counter value referenced in a BREAK line and so must be initialised to zero ("0") before the COMPUTE section containing the REXX statement "XNUM=XNUM+1" is executed.

The REPORT utility supports a number of built-in REXX functions that may be used in the COMPUTE section. See **Appendix B. Built-in functions** for descriptions of these.

Example:

```

REQUIRED:
  SMF030_Common_Address_Space_Work.zTME

COMPUTE:
  Duration = ''
  if zSIT<>' ' then
    do; if zTME<>' '
      then Duration = Secs2Time( Time2Secs(zTME) - Time2Secs(zSIT) )
    zSIT = translate(zSIT , "-:," , "/:." ) /* Date and Time chars. */
  end

COLUMNS:
  SMF030_Identification.zJOBNAME
  SMF030_Identification.zSIT
  :Duration

```

The above example calculates the time elapsed between a start and end timestamp and assigns the value to the REXX variable "Duration". It then updates the "zSIT" input record timestamp value so that it displays in the format "yyyy-mm-dd HH.MM.SS,tt".

This variable name is identified as :Duration (a *compute-field*) in the COLUMNS section. Each column detail line will contain a job name ("zJobName"), followed by the job execution start time ("zSIT"), followed by the job execution time (":Duration").

Note that the input record field containing the end time (zTME) is not included in the column detail line and so must be referenced in the REQUIRED section in order that its value is retrieved from the input records.

The Duration value is dependent upon non-null values for both zTME and zSIT otherwise a null Duration value will be returned. "Secs2Time" and "Time2Secs" are REPORT utility built-in functions to convert a number of seconds to an elapsed time and a timestamp to number of seconds respectively.

SORT: (Optional)

Each line following defines a report column on which sort is to be performed.

◇ **Token 1** on the line identifies the SMF **record-type** and **field name** in "**rectype.field**" notation as described for **COLUMNS:**.

In addition "**(A)**" or "**(D)**" may be supplied to define the **sort order** for that column as **ascending** or **descending**. "**(A)**" is the default.

TOTALS: (Optional)

This section is optional since the default action is to produce totals for all fields that contain at least one valid number.

Each line following defines a report column for which totals/sub-totals are to be reported.

◇ **Token 1** on the line identifies the SMF **record-type** and **field name** in "**rectype.field**" notation as described for **COLUMNS:**.

Column data that is not a valid number does not contribute to the reported total value.

BREAK: (Optional)

Each line following defines a column on which a report break will occur.

◇ **Token 1** on the line identifies the SMF **record-type** and **field name** in "**rectype.field**" notation as described for **COLUMNS:**.

A change in the value of any of the break columns will result in a **report gap** that will include **sub-totals** for any numeric columns.

Any break column must also appear as a "**SORT:**" column.

◇ **Token 2** is optional and may be used to supply a number which restricts the length of data (starting at the left of the field) used to detect a change in value.

A useful example of this would be where the break column is a timestamp field in *yyyy/mm/dd hh:mm:ss* format, but the break is required on the date portion only (i.e. change of day). e.g.

```

BREAK:
  SMF042#24_DFSMS.zTME 10

```

BLANKIFZERO: (Optional)

Each line following defines a column which will have a value of "0" translated to blank for **readability** i.e. making non-zero values stand out more clearly.

◊ **Token 1** on the line identifies the SMF **record-type** and **field name** in "**rectype.field**" notation as described for **COLUMNS:**.

"**BIZ:**", "**BLANKWHENZERO:**" and "**BWZ:**" are all valid synonyms.

FILTER: (Optional)

Use the **FILTER:** section to define an optional record selection criteria **expression**, which may include multiple (possibly parenthesised) terms and supports the standard Data-Edit **operators**.

e.g. Select SMF Record Type 14 only when the DDNAME does not begin with "SYS" and DSN begins with either "CBL", "JGE" or "NBJ".

```
FILTER:
      SMF014_INPUT_or_RDBACK_Dataset.SMFTIOE5 \>> 'SYS'
and (
  SMF014_INPUT_or_RDBACK_Dataset.DSN >> 'CBL'
  or SMF014_INPUT_or_RDBACK_Dataset.DSN >> 'JGE'
  or SMF014_INPUT_or_RDBACK_Dataset.DSN >> 'NBJ'
)
```

Note that explicit qualification of the field names by prefixing the record/segment name (followed by a dot) is not necessary, provided the field is within the "Primary" (Base) Segment. So the above example could equally be specified as follows.

```
FILTER:
      SMFTIOE5 \>> 'SYS'
and (
  DSN >> 'CBL'
  or DSN >> 'JGE'
  or DSN >> 'NBJ'
)
```

However, where the field referenced is part of a "Secondary" segment, the segment name prefix is required. e.g.

```
FILTER:
  SMF030_Completion.zSCC > 0
```

REPEAT: (Optional)

Each line following identifies a **secondary segment** name.

The default action for the report tool is that it outputs a report line for each **base** record (primary segment) having potentially gathered information from one or more of its attached **secondary** segments.

In fact it is currently a limitation that at least one field must be selected from the base segment and selection may be made from one base segment only.

Because many SMF record types contain repeating groups of secondary segments, the "REPEAT:" option may be used to identify the segment record-type on each of which you wish to generate a report line.

REQUIRED: (Optional)

Should be unnecessary.

Each line following identifies a **secondary segment** name that must be included in the temporarily generated structure required to produce the report.

It is intended that the report tool be sophisticated enough to automatically recognise (from the "COLUMNS:" definition and other information available in the supplied fully comprehensive SMF Record Type structures) the names of any secondary segments required to build the most basic structure capable of producing the desired report.

The fewer segments that are included, the faster the report will run.

This option is intended only for those occasions when the automatic process has failed to recognise a dependency and the SELCOPY support team should be notified in that event.

RESET: (Optional)

Each line following identifies a report column whose value should be reset to null following the output of a report line.

If a column is not identified in the **RESET:** section and is sourced from a secondary segment that does not appear again before the next report line is ready to be output, then the previous value will be repeated for that column.

So, as a general rule, if your report includes columns from segments that are not guaranteed to be present for every base segment, then a **RESET:** entry should be added to ensure a "blank" value is reported whenever the segment is missing.

OPTIONS: (Optional)

The **OPTIONS:** section currently supports only one keyword, that being **NOTOTALS** which prevents the tool's default action which is to report totals for any column containing at least one valid numeric value.

See also **TOTALS:**

Appendix A: Sample Reports

SMF 14 - Dataset Usage Statistics

Generate a report line for each dataset opened showing job information and EXCP count. Groups report lines by unique job name and insert a single blank line between jobs.

Figure 39. Appendix A: REPORT Output Example 3.

Appendix B: SMF Record Layouts

This appendix describes the layout of each SMF record type and sub-type supported by the latest version of SELCOPYi SMF Utilities.

In general, the field names used by SELCOPYi are shortened versions of those defined in the IBM documentation. Where possible, the name assigned to each field by the distributed SELCOPYi SDO structure is an abbreviated version of the field named by IBM DSECT macros and referenced in IBM publications. This chapter provides tables of the SELCOPYi defined field names and the data types used to interpret the contents of each field.

Users of the SMF Report utility are required to identify data fields to be displayed. Specification of each SMF field must also identify the name of record/segment to which it belongs.

e.g. **SMF042#02_Volume_StatusL.zDEVdup**, where "SMF042#02_Volume_Status" is the record segment name and *zDEVdup* is the name of the elementary field.

However, on occasion the record/segment involved may contain more than one elementary field of the same name. This can only be the case when at least one of the elementary fields is a member of a sub-structure.

e.g. Elementary field **zContTimeTOD** occurs twice in SMF Type 98 segment **SMF098#01_LockLocalCML**.

It is in sub-structure **zDet_AssocStat** and in sub-structure **zDet_All**. Therefore to unambiguously refer to each name the user must refer to them as **SMF098#01_LockLocalCML.zDet_AssocStat.zContTimeTOD** and **SMF098#01_LockLocalCML.zDet_All.zContTimeTOD** respectively.

To help determine a field's fully qualified name, each of the tables contain sub-headers. Each sub-header is the prefix that may be applied to the field names that immediately follow it in order to make them fully qualified. e.g.

SMF098#01_LockLocalCML.zDet_AssocStat<filename>, where "SMF098#01_LockLocalCML" is the record segment name, "zDet_AssocStat" is the name of the sub-structure to which the field belongs and *<filename>* is the name of the field.

The **Len** column contains the internal length of the field. If the length is variable, the minimum and maximum values are displayed. If the field has a precision (p) and scale (s) then it is displayed below the length as (p,s). e.g. For FIXED or DEC data types.

Record Type 0 - IPL

SMF Record 0 (IPL) is mapped by structure member "T000".

Primary Segment:

- **SMF000_IPL**

Secondary Segment(s): 0

Primary segment: **SMF000_IPL**

Field Name	Type	Len	Description
<i>SMF000_IPL.<fieldname></i>			
SMF000_IPL.Header_self_defining_section.<fieldname>			
zFLG	HEX	1	(IBM name: SMF0FLG) System indicator: Bit Meaning when set 0-2 Reserved 3-6 Version indicators* 7 RESERVED. *See 'Standard and Extended SMF record headers' on page 174 FOR a detailed description.
zRTY	INT	1	(IBM name: SMF0RTY) Record type 0 (X'00')
zTME	TSTMP	8	(IBM name: SMF0TME) Date/Time that the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF0SID) System identification (from the SID parameter).
zJWT	INT	4	(IBM name: SMF0JWT) Limit, in minutes, of continuous wait for the job (taken from JWT parameter). Continuous wait time is defined as time spent waiting while the application program is in control. For example, for data sets allocated dynamically (while the application program is running, for example) either or both of the following count toward a job's continuous wait time: v The time required to recall a data set from HSM Migration Levels 1 OR 2 V THE time required to mount a tape If a data set was allocated statically (for a DD statement, for example) these activities will not be counted towards the job's continuous wait time.
zBUF	INT	4	(IBM name: SMF0BUF) This field contains meaningless information.
zVST	INT	4	(IBM name: SMF0VST) Number of 1K bytes in virtual storage.

SMF000_IPL.Header_self_defining_section.zOPT.<fieldname>			
zDatasetAcc	BIT	1	Data set accounting. Record types selected. This bit is on when one of the following record types is selected: 14, 15, 17, 18, 62, 63, 64, 67 or 68.
zVolumeAcc	BIT	1	Volume accounting. Record types 10 OR 69 selected.
zTyp17	BIT	1	Type 17 records will be written for temporary data sets (REC(ALL)).

SMF000_IPL.Header_self_defining_section.<fieldname>			
zRST	INT	4	(IBM name: SMF0RST) Number of 1K bytes in central storage.
zRSV	CHAR	1	(IBM name: SMF0RSV) Reserved.
zOSL	CHAR	8	(IBM name: SMF0OSL) MVS product name.
zSYN	CHAR	8	(IBM name: SMF0SYN) System name (from the SYSNAME parameter in the IEASYSxx parmlib member).
zSYP	CHAR	8	(IBM name: SMF0SYP) Sysplex name (from the SYSPLEX parameter in the COUPLExx parmlib member).

zTZ	INT	4	(IBM name: SMF0TZ) Difference in time between local time and Greenwich mean time in binary units of 1.048576 seconds. The value of SMF0TZ is copied from the CVTTZ field. For more information about the CVTTZ field, see the CVT mapping macro in z/OS MVS Data Areas in the z/OS Internet library (www.ibm.com/systems/z/os/zos/library/bkserv).
zMSWT	INT	4	(IBM name: SMF0MSWT) Started task wait time limit (SMFPRMxx SWT(hhmm) value) converted to minutes.
zMTWT	INT	4	(IBM name: SMF0MTWT) TSO wait time limit (SMFPRMxx TWT(hhmm) value) converted to minutes.

Record Type 2 - Dump Header

SMF Record 2 (Dump Header) is mapped by structure member "T002".

Primary Segment:

- [SMF002_SMF_Dump_header](#)

Secondary Segment(s): 6 (in alphabetical order)

- [SMF002_01_ARECSIGN](#)
- [SMF002_01_Self_Def](#)
- [SMF002_01_Sig_Group](#)
- [SMF002_02_ARECSIGN](#)
- [SMF002_02_Self_Def](#)
- [SMF002_02_Sig_Interval](#)

Primary segment: [SMF002_SMF_Dump_header](#)

Field Name	Type	Len	Description
<i>SMF002_SMF_Dump_header.<fieldname></i>			
<i>SMF002_SMF_Dump_header.Header_self_defining_section.<fieldname></i>			
<i>SMF002_SMF_Dump_header.Header_self_defining_section.zFLG.<fieldname></i>			
zSubTypes	BIT	1	SMF2FLG bit 1 - Indicating this record has Subtypes
<i>SMF002_SMF_Dump_header.Header_self_defining_section.<fieldname></i>			
zRTY	INT	1	(IBM name: SMF2RTY) Record type 2 (X'02').
zTME	TSTMP	8	(IBM name: SMF2TME) Date/Time when the record was moved into the dump data set.
zSID	CHAR	4	(IBM name: SMF2SID) System identification (from the SID parameter).

Secondary segment: [SMF002_01_Sig_Group](#)

Field Name	Type	Len	Description
<i>SMF002_01_Sig_Group.<fieldname></i>			
<i>SMF002_01_Sig_Group.zFLG.<fieldname></i>			
zFirst	BIT	1	First group written.
zValid	BIT	1	Group's subtype is valid.
zOA55526	BIT	1	This record was generated on a system where the fix for APAR OA55526 was applied
zSelfDef	BIT	1	This record contains a self-defining section
<i>SMF002_01_Sig_Group.<fieldname></i>			
zGRTYPE	INT	1	(IBM name: SMF2GRTYPE) The record type for this group.
zGSTYPE	INT	2	(IBM name: SMF2GSTYPE) The record SubType for this group.
zGFTME	TSTMP	8	(IBM name: SMF2GFTME) Date/Time of the first record in the group.
zGCNT	INT	4	(IBM name: SMF2GCNT) The number of records in this signature group.

zGHASHMETHe	BINT (ENUM)	4	(IBM name: SMF2GHASHMETH) The hash method used for this group.
-------------	----------------	---	---

SMF002_01_Sig_Group.zFLG.zGHASHMETH.<fieldname>			
zSHA1	BIT	1	SHA1
zSHA256	BIT	1	SHA256
zSHA384	BIT	1	SHA384
zSHA512	BIT	1	SHA512
zGSIGTYPEe	BINT (ENUM)	2	(IBM name: SMF2GHASHMETH) The signature type used for this group.

SMF002_01_Sig_Group.zFLG.zGSIGTYPE.<fieldname>			
zRSA	BIT	1	RSA
zECDSA	BIT	1	ECDSA

SMF002_01_Sig_Group.zFLG.<fieldname>			
zGTOKENNAME	CHAR	32	(IBM name: SMF2GTOKENNAME) The saved CKA_ID of the PKCS#11 token name used to generate this signature.
zGSIGLEN	INT	4	(IBM name: SMF2GSIGLEN) The digital signature length for this signature group
zGSIG	XVCHAR	0 512	(IBM name: SMF2GSIG) The digital signature for this signature group. It is the result of the hash and sign operation (using the hash method and signature type specified in this record) on the concatenation of the following: 1. Running hashsum of all this group's records (hash each entire record padded out to a 128-byte boundary with zeros) 2. Running hashsum of all the previous group's records (hash each entire record padded out to a 128-byte boundary with zeros)

Secondary segment: SMF002_01_Self_Def

Field Name	Type	Len	Description
SMF002_01_Self_Def.<fieldname>			
zLEN	INT	2	(IBM name: SMF2GSDSLEN) Length of the self-defining section.
zASignOffset	INT	4	(IBM name: SMF2GSDSASignOffset) Offset to start of ARECSIGN section, including the record descriptor word (RDW).
zASignLen	INT	2	(IBM name: SMF2GSDSASignLen) Length of ARECSIGN section
zASignNum	INT	2	(IBM name: SMF2GSDSASignNum) Number of ARECSIGN sections

Secondary segment: SMF002_01_ARECSIGN

Field Name	Type	Len	Description
SMF002_01_ARECSIGN.<fieldname>			
SMF002_01_ARECSIGN.zHashMeth.<fieldname>			
zSHA512	BIT	1	SHA512

SMF002_01_ARECSIGN.zSigType.<fieldname>			
zLI2	BIT	1	LI2
SMF002_01_ARECSIGN.<fieldname>			
zTokenName	CHAR	32	(IBM name: SMF2GASignTokenName) The saved CKA ID of the PKCS#11 token name used to generate this signature.
zSigLen	INT	4	(IBM name: SMF2GASignSigLen) The length of the alternate digital signature for this signature group.
zSig	XVCHAR	0 1024	(IBM name: SMF2GASignSig) The digital signature for this signature group. The length of this field is in SMF2GASignSigLen.

Secondary segment: **SMF002_02_Sig_Interval**

Field Name	Type	Len	Description
SMF002_02_Sig_Interval.<fieldname>			
SMF002_02_Sig_Interval.zFLG.<fieldname>			
zFirst	BIT	1	First interval written.
zValid	BIT	1	Interval's subtype is valid.
zHalt	BIT	1	This interval is the result of a HALT.
zNewCrypt	BIT	1	This interval contains new cryptography options.
zOA55526	BIT	1	This record was generated on a system where the fix for APAR OA55526 was applied
zSelfDef	BIT	1	This record contains a self-defining section

SMF002_02_Sig_Interval.<fieldname>			
zIRTYPE	INT	1	(IBM name: SMF2IRTYPE) The record type for this interval.
zISTYPE	INT	2	(IBM name: SMF2ISTYPE) The record SubType for this interval.
zIFTME	TSTMP	8	(IBM name: SMF2IFTME) Date/Time of the first record in the interval.
zILTME	TSTMP	8	(IBM name: SMF2ILTME) Date/Time of the last record in the interval.
zINTME	TSTMP	8	(IBM name: SMF2INTME) Date/Time of the next interval.
zICNT	INT	4	(IBM name: SMF2ICNT) The number of records in this signature interval.
zHASHMETHe	BINT (ENUM)	4	(IBM name: SMF2IHASHMETH) The hash method used for this signature.

SMF002_02_Sig_Interval.zFLG.zHASHMETH.<fieldname>			
zSHA1	BIT	1	SHA1
zSHA256	BIT	1	SHA256
zSHA384	BIT	1	SHA384
zSHA512	BIT	1	SHA512
zISIGTYPEe	BINT (ENUM)	2	(IBM name: SMF2IHASHMETH) The signature type used for this signature.

SMF002_02_Sig_Interval.zFLG.zISIGTYPE.<fieldname>			
--	--	--	--

zRSA	BIT	1	RSA
zECDSA	BIT	1	ECDSA
SMF002_02_Sig_Interval.zFLG.<fieldname>			
zITOKENNAME	CHAR	32	(IBM name: SMF2ITOKENNAME) The saved CKA_ID of the PKCS#11 token name used to generate this signature.
zISIGLEN	INT	4	(IBM name: SMF2ISIGLEN) The digital signature length for this signature interval.
zISIG	XVCHAR	0 512	(IBM name: SMF2ISIG) The digital signature for this signature interval. It is the result of the hash and sign operation (using the hash method and signature type specified in this record) on the concatenation of the following: 1. Running hashsum of all this group's records (hash each entire record padded out to a 128-byte boundary with zeros) 2. Hash of the previous interval record's data, excluding the signature and signature length fields 3. Hash of this interval record's data, excluding the signature and signature length fields

Secondary segment: **SMF002_02_Self_Def**

Field Name	Type	Len	Description
SMF002_02_Self_Def.<fieldname>			
zLEN	INT	2	(IBM name: SMF2ISDSLEN) Length of the self-defining section.
zASignOffset	INT	4	(IBM name: SMF2ISDSASignOffset) Offset to start of ARECSIGN section, including the record descriptor word (RDW).
zASignLen	INT	2	(IBM name: SMF2ISDSASignLen) Length of ARECSIGN section.
zASignNum	INT	2	(IBM name: SMF2ISDSASignNum) Number of ARECSIGN sections.

Secondary segment: **SMF002_02_ARECSIGN**

Field Name	Type	Len	Description
SMF002_02_ARECSIGN.<fieldname>			
SMF002_02_ARECSIGN.zHashMeth.<fieldname>			
zSHA512	BIT	1	SHA512
SMF002_02_ARECSIGN.zSigType.<fieldname>			
zLI2	BIT	1	L12
SMF002_02_ARECSIGN.<fieldname>			
zTokenName	CHAR	32	(IBM name: SMF2IASignTokenName) The saved CKA ID of the PKCS#11 token name used to generate this signature.
SMF002_02_ARECSIGN.zFlgs.<fieldname>			
zNewCrypt	BIT	1	This interval contains new cryptography options.
SMF002_02_ARECSIGN.<fieldname>			
zSigLen	INT	4	

			(IBM name: SMF2IASignSigLen) The length of the alternate digital signature for this signature group.
zSig	XVCHAR	0 1024	(IBM name: SMF2IASignSig) The digital signature for this signature group. The length of this field is in SMF2IASignSigLen.

Record Type 3 - Dump Trailer

SMF Record 3 (Dump Trailer) is mapped by structure member "T003".

Primary Segment:

- [SMF003_SMF_Dump_Trailer](#)

Secondary Segment(s): 0

Primary segment: [SMF003_SMF_Dump_Trailer](#)

Field Name	Type	Len	Description
<i>SMF003_SMF_Dump_Trailer.<fieldname></i>			
<i>SMF003_SMF_Dump_Trailer.Header_Self_defining_Section.<fieldname></i>			
zFLG	HEX	1	(IBM name: SMF3FLG) System indicator: Bit Meaning when set 0-2 Reserved 3-6 Version indicators* 7 RESERVED. *See 'Standard and Extended SMF record headers' on page 174 FOR a detailed description.
zRTY	INT	1	(IBM name: SMF3RTY) Record type 3 (X'03').
zTME	TSTMP	8	(IBM name: SMF3TME) Date/Time when the record was moved into the dump data set.
zSID	CHAR	4	(IBM name: SMF3SID) System identification (from the SID parameter).

Record Type 4 - Step Termination

SMF Record 4 (Step Termination) is mapped by structure member "T004".

Primary Segment:

- SMF004_Step_Termination

Secondary Segment(s): 1

- SMF004_Relocate

Primary segment: SMF004_Step_Termination

Field Name	Type	Len	Description
<i>SMF004_Step_Termination.<fieldname></i>			
SMF004_Step_Termination.Header_Self_defining_Section.<fieldname>			
zFLG	HEX	1	(IBM name: SMF4FLG) System indicator: Bit Meaning when set 0-2 Reserved 3-6 Version indicators (see 'Standard and Extended SMF record headers' on page 174 FOR details.) 7 RESERVED.
zRTY	INT	1	(IBM name: SMF4RTY) Record type 4 (X'04').
zTME	TSTMP	8	(IBM name: SMF4TME) Date/Time that the record is passed to the SMF writer. This is the time when the step terminated.
zSID	CHAR	4	(IBM name: SMF4SID) System identification (from the SID parameter).
zJOBNAME	CHAR	8	(IBM name: SMF4JBN) Job name. The job name, time, and date that the reader recognized the JOB card (for this job) constitute the job log identification, or transaction name (for APCC output).
zRST	TSTMP	8	(IBM name: SMF4RST) Date/Time that the reader recognized the JOB card (for this job).
zUSERID	CHAR	8	(IBM name: SMF4UIF) User-defined identification field (taken from common exit parameter area, not from USER=parameter on job statement).
zSTN	INT	1	(IBM name: SMF4STN) Step number (first step=1, and so on).
zSIT	TSTMP	8	(IBM name: SMF4SIT) Date/Time that the initiator selected this step.
zNCI	INT	4	(IBM name: SMF4NCI) Number of card-image records in DD DATA and DD* data sets read by the reader for the step.
zSCC	INT	2	(IBM name: SMF4SCC) Step completion code: X'0ccc' indicates system ABEND in the job step where ccc is the system ABEND code. (See z/OS MVS System Codes.) X'8ccc' indicates user ABEND in the job step where ccc is the user ABEND code. X'nnnn' indicates normal completion where nnnn is the contents of the two low-order bytes in register 15 AT termination. X'0000' indicates either 1. The job step was flushed (not processed) because of an error during allocation or in a preceding job step, or 2. normal job completion with a return code of zero. Use this field in conjunction with the step termination indicator field (offset 87).
zPRTY	INT	1	(IBM name: SMF4PRTY) Address space dispatching priority (taken from DPRTY= parameter on EXEC card or the default APG value). For more information see z/OS MVS Initialization and Tuning Guide.
zPGMN	CHAR	8	(IBM name: SMF4PGMN) Program name (taken from PGM= parameter on EXEC card). If a backward reference was used, then this field contains *.DD.
zSTMN	CHAR	8	

			(IBM name: SMF4STMN) Step name (taken from name on EXEC card).
zRSV5	INT	2	(IBM name: SMF4RSV5) Reserved. SMF4RSH0, formerly a two-byte field at this offset, has been increased to four bytes and moved to offset 82.
zSYST	INT	2	(IBM name: SMF4SYST) Largest amount of storage used from top of private area, in 1K units. This storage area includes the LSQA and SWA (subpools 229, 230, 236, 237, 249, and 253-255). If ADDRSPC=REAL is specified, this field equals the amount of storage used that was not from the contiguous central storage reserved for the program. See offsets 82 AND 102. If storage was not allocated (job step was flushed), these fields equal zero.
zHOST	INT	2	(IBM name: SMF4HOST) Largest amount of storage from bottom of private area, in 1K units. This storage area includes subpools 0-127, 129-132, 244, 251 AND 252. If ADDRSPC=REAL is specified, this field equals the amount of contiguous central storage that was used. See offsets 82 AND 102.
zRV1	CHAR	2	(IBM name: SMF4RV1) Reserved.
zRSH0	INT	4	(IBM name: SMF4RSH0) Region size established, in 1K units taken from the REGION= parameter in the JCL, and rounded up to a 4K boundary. If ADDRSPC=REAL is specified, this field equals the amount of contiguous central storage reserved for the program. If the region requested was greater than 16 MEGABYTES, the region established resides above 16 MEGABYTES, and this field will contain a minimum value of 32 MEGABYTES.
zSPK	INT	1	(IBM name: SMF4SPK) Storage protect key, in the form xxxx0000 (where xxxx is the key).
zSTI	INT	1	(IBM name: SMF4STI) Step termination indicator Bit Meaning when set 0 RESERVED 1 CANCELED by exit IEFUJV 2 CANCELED by exit IEFUJI 3 CANCELED by exit IEFUSI 4 CANCELED by exit IEFACRT 5 STEP is to be restarted 6 IF 0, normal completion. If 1, ABEND. If step completion code (offset 55) equals 0322 OR 0522, IEFUTL allowed the abend to occur. If step completion code equals 0722, IEFUSO allowed the abend to occur. 7 IF 0, normal completion. If 1, step was flushed.
zRV2	CHAR	2	(IBM name: SMF4RV2) Reserved.
zAST	TIME	4	(IBM name: SMF4AST) Device allocation start time.
zPPST	TIME	4	(IBM name: SMF4PPST) Problem program start time.
zRV3	INT	1	(IBM name: SMF4RV3) Reserved.
zSRBT	INT	3	(IBM name: SMF4SRBT) Step CPU time under SRBs, in hundredths of a second. This field includes the CPU time for various supervisory routines that are dispatched from SRBs: locking routines, page resolution, swap control, cross-memory communications (WAIT, POST, I/O POST), and TQE scheduling.
zRIN	INT	2	(IBM name: SMF4RIN) Record indicator Bit Meaning when set 0-3 Reserved 4 FIELD SMF4SETM is not valid. An overflow condition occurs when the length of the value for the step CPU time under TCBs is greater than 3 BYTES. In this case, the step CPU time under TCBs is not recorded in the type 4 RECORD (SMF4SETM). The value is available in the type 30 RECORD (SMF30CPT). If your installation uses an accounting program that does not use the type 30 RECORD to gather step CPU time, you must update that program. Only the type 30 RECORD should be considered valid. 5 DEVICE data not recorded. When the TIOT size is greater than 32K (more than 1635 DD statements), device data is not collected for the type 4 RECORD. The data is available in the type 30 RECORD. 6 EXCP count might be wrong. For more information on EXCP count, see Chapter 10, 'EXCP count,' on page 137. 7 IF 0, storage is virtual. If 1, storage is central (real). 8-15 Reserved.
zRLCT	INT	2	(IBM name: SMF4RLCT) Offset from the beginning of the record (SMF4FLG) header to the relocate section. The displacement depends upon the size of the accounting fields

			and the number of devices.
zLENN	INT	2	(IBM name: SMF4LENN) Length of device entry portion of record. Equals: (8 times the number of devices) +

SMF004_Step_Termination.Device_Data.<fieldname>

zDEVC	INT	1	(IBM name: SMF4DEVC) Device class.
zUTYP	INT	1	(IBM name: SMF4UTYP) Unit type.
zCUAD	INT	2	(IBM name: SMF4CUAD) Device number.
zEXCP	INT	4	(IBM name: SMF4EXCP) EXCP count (see offset 102).

SMF004_Step_Termination.Accounting.<fieldname>

zLNTH	INT	1	(IBM name: SMF4LNTH) Length of accounting section, excluding this field.
zSETM	TIME	4	(IBM name: SMF4SETM) Step CPU time under TCBs. This field includes the CPU time for all tasks that are dispatched from TCBs below the level of RCT. CPU time is not expected to be constant between different runs of the same job step. For more information on CPU time, see Chapter 11, 'CPU time,' on page 139.
zNAF	INT	1	(IBM name: SMF4NAF) Number of accounting fields.
zACTF	VCHAR	1 257	(IBM name: SMF4ACTF) Accounting fields. Each entry for an accounting field contains the length of the field (one byte, binary) followed by the field (EBCDIC). A zero indicates an omitted field.

Secondary segment: SMF004_Relocate

Field Name	Type	Len	Description
<i>SMF004_Relocate.<fieldname></i>			
zPGIN	INT	4	(IBM name: SMF4PGIN) Number of non-VIO, non-swap page-ins for this step. This field includes page-ins that are required through page faults, specific page requests, and page fixes. It does not include page reclaims, page-ins for VIO data sets, pages that are swapped in, and page-ins for the common area.
zPGOT	INT	4	(IBM name: SMF4PGOT) Number of non-VIO, non-swap page-ins for this step. This field includes page-outs required through page requests, including those pages stolen by the paging supervisor through infrequent use. It does not include page-outs for VIO data sets, pages that are swapped out, and page-outs for the common area.
zNSW	INT	4	(IBM name: SMF4NSW) Number of address space swap sequences. (A swap sequence consists of an address space swap-out and swap-in.)
zPSI	INT	4	(IBM name: SMF4PSI) Number of pages swapped in. This field includes: LSQA, fixed pages, and those pages that the real storage manager determined to be active when the address space was swapped in. It does not include page reclaims nor pages found in storage during the swap-in process (such as pages brought in from SRBs started after completion of swap-in Stage 1 PROCESSING).
zPSO	INT	4	(IBM name: SMF4PSO) Number of pages swapped out. This field includes: LSQA, private area fixed pages, and private area non-fixed changed pages.
zVPI	INT	4	(IBM name: SMF4VPI) Number of VIO page-ins for this step. This field includes page-ins resulting

			from page faults or specific page requests on a VIO window. It does not include VIO swap-ins or page-ins for the common area.
zVPO	INT	4	(IBM name: SMF4VPO) Number of VIO page-outs for this step. This field includes page-outs resulting from specific page requests on a VIO window, and also those pages stolen by the paging supervisor through infrequent use. It does not include VIO swap-outs or page-outs for the common area.
zSST	INT	4	(IBM name: SMF4SST) Step service, in service units. This field equals: total job service minus the accumulated job service before this step's initialization.
zACT	TIME	4	(IBM name: SMF4ACT) Step transaction active time, in 1024-microsecond units equal: total job transaction active time minus the accumulated transaction active time before this step's initialization.
zPGNO	INT	2	(IBM name: SMF4PGNO) Step performance group number (taken from PERFORM= parameter on JOB or EXEC card or the RESET operator command).
zTRAN	TIME	4	(IBM name: SMF4TRAN) Step transaction residency time in 1024-microsecond units. That is the time the transaction was in central storage.
zCPM	INT	4	(IBM name: SMF4CPM) Number of attempts to read data from an ESO hiperspace that were not satisfied because the data has been deleted.
zRCLM	INT	4	(IBM name: SMF4RCLM) Number of VIO reclaims for this step.
zCPGN	INT	4	(IBM name: SMF4CPGN) Number of common area page-ins for this step (LPA+CSA).
zHSPI	INT	4	(IBM name: SMF4HSPI) Number of hiperspace page-ins from auxiliary to processor storage.
zPGST	INT	4	(IBM name: SMF4PGST) Number of pages stolen from the storage for this step.
zPSEC	INT	8	(IBM name: SMF4PSEC) Number of page seconds for this step, in page millisecond units. Equals: the number of pages used by this step times the processing time it held that number of pages.
zLPAI	INT	4	(IBM name: SMF4LPAI) Number of link pack area page-ins for the step.
zHSPO	INT	4	(IBM name: SMF4HSPO) Number of hiperspace page-outs from processor to auxiliary storage.
zCPUS	INT	4	(IBM name: SMF4CPUS) Step CPU service, in service units.
zIOCS	INT	4	(IBM name: SMF4IOCS) Step I/O service, in service units.
zMSOS	INT	4	(IBM name: SMF4MSOS) Step main storage service, in service units.
zSRBS	INT	4	(IBM name: SMF4SRBS) Step SRB service, in service units.
zRSV1	HEX	8	(IBM name: SMF4RSV1) Reserved.

Record Type 5 - Job Termination

SMF Record 5 (Job Termination) is mapped by structure member "T005".

Primary Segment:

- **SMF005_Job_Termination**

Secondary Segment(s): 0

Primary segment: **SMF005_Job_Termination**

Field Name	Type	Len	Description
<i>SMF005_Job_Termination.<fieldname></i>			
SMF005_Job_Termination.Header_Self_Defining_Section.<fieldname>			
zFLG	HEX	1	(IBM name: SMF5FLG) System indicator: Bit Meaning when set 0-2 Reserved 3-6 Version indicators 7 Reserved.
zRTY	INT	1	(IBM name: SMF5RTY) Record type 5 (X'05').
zTME	TSTMP	8	(IBM name: SMF5TME) Date/Time that the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF5SID) System identification (from the SID parameter).
zJOBNAME	CHAR	8	(IBM name: SMF5JBN) Job name. The job name, time, and date that the reader recognized the JOB card (for this job) constitute the job log identification, or transaction name (for APPC output).
zRST	TSTMP	8	(IBM name: SMF5RST) Date/Time that the reader recognized the JOB card (for this job).
zUSERID	CHAR	8	(IBM name: SMF5UIF) User-defined identification field (taken from common exit parameter area, not from USER=parameter on job statement).
zNST	INT	1	(IBM name: SMF5NST) Number of steps in the job.
zJIT	TSTMP	8	(IBM name: SMF5JIT) Date/Time that the initiator selected the job.
zNCI	INT	4	(IBM name: SMF5NCI) Number of card-image records in DD DATA and DD* data sets read by the reader for the job.
zJCC	INT	2	(IBM name: SMF5JCC) Job completion code: X'0ccc' indicates system ABEND in the last job step where ccc is the system ABEND code (see z/OS MVS System Codes). X'8ccc' indicates user ABEND in the last job step where ccc is the user ABEND code. X'nnnn' indicates normal completion where nnnn is the contents of the two low-order bytes in register 15 AT termination. X'0000' indicates either: (see note) 1. The last job step was flushed (not processed) because of an error during allocation or in a preceding job step, or 2. normal job completion with a return code of 0. Note: When a step in a multi-step job terminates abnormally, the subsequent steps, whether executed or flushed, do not propagate the step abend code for processing this record. The code appears in the job termination record (type 4). In this case, the field -SMF5JCC, can contain X'nnnn'. If an abend occurred in the job, the job termination indicator (bit 6 IN the SMF5JBTI field) is set to 1. Use this field in conjunction with the job termination indicator field, SMF5JBTI.
zJPTY	INT	1	(IBM name: SMF5JPTY) Job selection priority. This field normally equals the user-assigned priority of zero to 13, but if the job fails while being scheduled, this field equals 14 (TAKEN from the PRTY parameter on the JOB card). If no value is specified for the PRTY parameter on the JOB card, this field contains: v

			For JES3, the default priority specified on the JES3 STANDARDS initialization card v For JES2, a zero. Note that JES2 does not use the priority value reported in this field.
zRSTT	TSTMP	8	(IBM name: SMF5RSTT) Date/Time that the reader recognized the end of the job.

SMF005_Job_Termination.Header_Self_Defining_Section.zJBTI.<fieldname>			
zIEFUJV	BIT	1	CANCELED by exit IEFUJV.
zIEFUJI	BIT	1	CANCELED by exit IEFUJI.
zIEFUSI	BIT	1	CANCELED by exit IEFUSI.
zIEFACTRT	BIT	1	CANCELED by exit IEFACTRT (step exit only).
zABEND	BIT	1	IF 0, normal completion (if 1, then ABEND).

SMF005_Job_Termination.Header_Self_Defining_Section.<fieldname>			
zTRAN	TIME	4	(IBM name: SMF5TRAN) Job transaction residency time, in 1024-microsecond units. That is the total amount of time the transaction was in central storage.
zRDCL	INT	1	(IBM name: SMF5RDCL) Reader device class. (This field is not filled in for jobs submitted by way of an internal reader.)
zRUTY	INT	1	(IBM name: SMF5RUTY) Reader unit type. (This field is not filled in for jobs submitted by way of an internal reader.)
zJICL	CHAR	1	(IBM name: SMF5JICL) Job input class (taken from JOB card. default equals 'A').
zSPK	BIT	8	Storage protect key, in the form xxxx0000 where xxxx is the key.
zSRBT	INT	3	(IBM name: SMF5SRBT) Job CPU time under SRBs, in hundredths of a second. This field includes the CPU time for various supervisory routines that are dispatched from SRBs: locking routines, page resolution, swap control, cross-memory communications (WAIT, POST, I/O POST), and TQE scheduling.
zTJS	INT	4	(IBM name: SMF5TJS) Job service, in service units.
zTTAT	TIME	4	(IBM name: SMF5TTAT) Job transaction active time, in 1024-microsecond units.
zTLEN	INT	1	(IBM name: SMF5TLEN) Length of rest of the fixed portion of the record.
zPRGN	CHAR	20	(IBM name: SMF5PRGN) Programmer's name.
zACTF	INT	1	(IBM name: SMF5ACTF) Number of accounting fields.

SMF005_Job_Termination.Header_Self_Defining_Section.zJSAF.<fieldname>			
zACTL	INT	1	(IBM name: N/A) Accounting field length.
zACTN	XVCHAR	0 143	(IBM name: N/A) Accounting information.

SMF005_Job_Termination.Relocate_Section.<fieldname>			
zCPUS	INT	4	(IBM name: SMF5CPUS) Job CPU service, in service units.
zIOCS	INT	4	(IBM name: SMF5IOCS) Job I/O service in service units.
zMSOS	INT	4	(IBM name: SMF5MSOS) Job main storage service, in service units.
zSRBS	INT	4	(IBM name: SMF5SRBS) Job SRB service, in service units.

zRSV1	CHAR	8	(IBM name: SMF5RSV1) Reserved.
-------	------	---	-----------------------------------

Record Type 6 - External Writer

SMF Record 6 (External Writer) is mapped by structure member "T006".

Primary Segment:

- [SMF006_External_Writer](#)

Secondary Segment(s): 3 (in alphabetical order)

- [SMF006_External_Writer_Common](#)
- [SMF006_External_Writer_Enhanced_SYSOUT](#)
- [SMF006_External_Writer_IO_Data](#)

Primary segment: [SMF006_External_Writer](#)

Field Name	Type	Len	Description
<i>SMF006_External_Writer.<fieldname></i>			
zFLG	INT	1	(IBM Name: SMF6FLG) System indicator: Bit Meaning when set 0-2 Reserved. 3-6 Version indicators (See 'Standard and Extended SMF record headers' on page 174 FOR details.). 7 RESERVED.
zRTY	INT	1	(IBM Name: SMF6RTY) Record type 6 (X'06').
zTME	TSTMP	8	(IBM Name: SMF6TME) Date and time that the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM Name: SMF6SID) System identification (from the SID parameter).
zJBN	CHAR	8	(IBM Name: SMF6JBN) Job name (taken from job's RESQ). The job name, time, and date that the reader recognized the JOB card (for this job) log identification, or transaction name (for APPC output).
zRST	TSTMP	8	(IBM Name: SMF6RST) Date and time that the reader recognized the JOB card (for this job).
zUIF	CHAR	8	(IBM Name: SMF6UIF) User identification (taken from common exit parameter area not from USER= parameter on job statement).
zOWC	CHAR	1	(IBM Name: SMF6OWC) SYSOUT class (this field is blank for non-SYSOUT data sets).
zWST	TSTMP	8	(IBM Name: SMF6WST) Start date and time of print/punch processor including remote device working on the data in this record.
zNLR	INT	4	(IBM Name: SMF6NLR) Number of logical records written by the writer, by form number and class (this field includes JOBLOG information and data set copies). For an example, a data set of 1000 lines with two copies will show 2000 in this field.
zIOE	INT	1	(IBM Name: SMF6IOE) Zero or X'04' if the system detects an error while processing the input data set.
zNDS	INT	1	(IBM Name: SMF6NDS) Number of data sets processed by the writer and included in this record. If multiple copies are produced, each copy is counted (This field includes JOBLOG information.)
zFMN	CHAR	4	(IBM Name: SMF6FMN) Form number as defined in the FORM= parameter of the DD statement.

SMF006_External_Writer.zPAD1.<fieldname>

zCommon	BIT	1	Common section present.
zEnhanced	BIT	1	Enhanced SYSOUT support section present.

SMF006_External_Writer.<fieldname>			
zSBS	INT	2	(IBM Name: SMF6SBS) Subsystem identification - X'0000' indicates external writer.

Secondary segment: SMF006_External_Writer_Enhanced_SYSOUT

Field Name	Type	Len	Description
SMF006_External_Writer_Enhanced_SYSOUT.<fieldname>			
zLN5	INT	2	(IBM Name: SMF6LN5) Length of ESS section (including this field).
zSGID	INT	4	(IBM Name: SMF6SGID) Segment identifier. Contains 0 when the file is not segmented.

SMF006_External_Writer_Enhanced_SYSOUT.zIND.<fieldname>			
zError	BIT	1	Error obtaining scheduler JCL facility (SJF) information. Scheduler work block text unit (SWBTU) data area is not present.

SMF006_External_Writer_Enhanced_SYSOUT.<fieldname>			
zRSV	CHAR	1	(IBM Name: SMF6RSV) Reserved.
zJDVT	CHAR	8	(IBM Name: SMF6JDVT) JCL definition table (JDT) name in JCL definition vector table (JDTV).
zTUL	INT	2	(IBM Name: SMF6TUL) Text unit (SWBTU) data area length.
zTU	XVCHAR	0 1024	(IBM Name: SMF6TU) Text unit (SWBTU) data area. The data area can be processed using the SWBTUREQ macro and is mapped by MVS macro IEFSJPFX.

Secondary segment: SMF006_External_Writer_IO_Data

Field Name	Type	Len	Description
SMF006_External_Writer_IO_Data.<fieldname>			
zLN1	INT	2	(IBM Name: SMF6LN1) Length of this section, including this field.
zDCI	INT	1	(IBM Name: SMF6DCI) X'0000' indicates external writer.
zINDC	INT	1	(IBM Name: SMF6INDC) Record level indicator. 1 => MVS/XA SP2.2.0 and before - restructured SMF type 6 record. 3 => MVS/ESA SP3.1.0 - greater than 10K job support.
zJNM	CHAR	4	(IBM Name: SMF6JNM) When SMF6INDC contains an X'1', this field contains a four-digit EBCDIC job number. When SMF6INDC contains an X'3' or greater, the job number has more than four digits, and this field contains zeros. The correct job number is then found in SMF6JBID.
zOUT	CHAR	8	(IBM Name: SMF6OUT) X'0000' external writer.
zFCB	CHAR	4	(IBM Name: SMF6FCB) FCB image identification (printer only).
zUCS	CHAR	4	(IBM Name: SMF6UCS) UCS image identification (printer only).

Secondary segment: SMF006_External_Writer_Common

Field Name	Type	Len	Description
<i>SMF006_External_Writer_Common.<fieldname></i>			
zLN3	INT	2	(IBM Name: SMF6LN3) Length of the common section, including this field.
zROUT	INT	4	(IBM Name: SMF6ROUT) Output route code (this field is always set to zero). The route code is specified on the /*OUTPUT or DD statement.
zEFMN	CHAR	8	(IBM Name: SMF6EFMN) Output form number. This field is set regardless of the number of characters in the forms field (SMF6FMN). The form number is specified on the FORM= parameter of the DD statement.
zJBID	CHAR	8	(IBM Name: SMF6JBID) Job ID, or transaction ID (for APPC output).
zSTNM	CHAR	8	(IBM Name: SMF6STNM) This field is not filled in for an output writer.
zPRNM	CHAR	8	(IBM Name: SMF6PRNM) This field is not filled in for an output writer.
zDDNM	CHAR	8	(IBM Name: SMF6DDNM) This field is not filled in for an output writer.
zUSID	CHAR	8	(IBM Name: SMF6USID) The user ID associated with the job/session that created the data set, or the user ID associated with the transaction ID (for APPC output).
zSECS	CHAR	8	(IBM Name: SMF6SECS) The security label of the created data set, or data set level seclabel.
zPRMD	CHAR	8	(IBM Name: SMF6PRMD) The processing mode of the data set.
zDSNM	CHAR	53	(IBM Name: SMF6DSNM) The name of the data set being printed.

Record Type 6 - JES2 Output Writer

SMF Record 6 (JES2 Output Writer) is mapped by structure member "T006".

Primary Segment:

- SMF006_JES2_Output_Writer

Secondary Segment(s): 4 (in alphabetical order)

- SMF006_JES2_Output_Writer_Common
- SMF006_JES2_Output_Writer_Enhanced_SYSOUT
- SMF006_JES2_Output_Writer_IO_Data
- SMF006_JES2_Output_Writer_3800_NonImpact_Printing

Primary segment: SMF006_JES2_Output_Writer

Field Name	Type	Len	Description
<i>SMF006_JES2_Output_Writer.<fieldname></i>			
zFLG	INT	1	(IBM Name: SMF6FLG) System indicator: Bit Meaning when set 0-2 Reserved. 3-6 Version indicators (See 'Standard and Extended SMF record headers' on page 174 FOR details.). 7 RESERVED.
zRTY	INT	1	(IBM Name: SMF6RTY) Record type 6 (X'06').
zTME	TSTMP	8	(IBM Name: SMF6TME) Date and time that the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM Name: SMF6SID) System identification (from the SID parameter).
zJBN	CHAR	8	(IBM Name: SMF6JBN) Job name (taken from job's RESQ). The job name, time, and date that the reader recognized the JOB card (for this job) log identification, or transaction name (for APPC output).
zRST	TSTMP	8	(IBM Name: SMF6RST) Date and time that the reader recognized the JOB card (for this job).
zUIF	CHAR	8	(IBM Name: SMF6UIF) User identification (taken from common exit parameter area not from USER= parameter on job statement).
zOWC	CHAR	1	(IBM Name: SMF6OWC) *SYSOUT class (this field is blank for non-SYSOUT data sets).
zWST	TSTMP	8	(IBM Name: SMF6WST) Start date and time of print/punch processor including remote device working on the data in this record.
zNLR	INT	4	(IBM Name: SMF6NLR) Number of logical records written by the writer, by form number and class (this field includes JOBLOG information and data set copies). For an example, a data set of 1000 lines with two copies will show 2000 in this field.

SMF006_JES2_Output_Writer.zIOE.<fieldname>

zDBError	BIT	1	Data buffer read error. A change in this field will cause a new record type 6.
zCBError	BIT	1	Control buffer read error. A change in this field will cause a new record type 6.

SMF006_JES2_Output_Writer.<fieldname>

zNDS	INT	1	(IBM Name: SMF6NDS) Number of data sets processed by the writer and included in this record. If multiple copies are produced, each copy is counted (This field includes JOBLOG information.)
zFMN	CHAR	4	

			(IBM Name: SMF6FMN) Form number as defined in the FORM= parameter of the DD statement.
SMF006_JES2_Output_Writer.zPAD1.<fieldname>			
zNonImpact	BIT	1	3800 NonImpact printing subsystem section present
zCommon	BIT	1	Common section present.
zEnhanced	BIT	1	Enhanced SYSOUT support section present.
SMF006_JES2_Output_Writer.<fieldname>			
zSBS	INT	2	(IBM Name: SMF6SBS) Subsystem identification - X'0002' signifies JES2.

Secondary segment: SMF006_JES2_Output_Writer_IO_Data

Field Name	Type	Len	Description
SMF006_JES2_Output_Writer_IO_Data.<fieldname>			
zLN1	INT	2	(IBM Name: SMF6LN1) Length of this section, including this field.
SMF006_JES2_Output_Writer_IO_Data.zDCI.<fieldname>			
zSpin	BIT	1	Record represents spin data sets.
zOpEnd	BIT	1	Operator ended this data group. A change in this field will cause a new record type 6
zOpInt	BIT	1	Operator interrupted this data group. A change in this field will cause a new record type 6
zOpRestart	BIT	1	Operator restarted this data group. A change in this field will cause a new record type 6
zIntCont	BIT	1	Record represents continuation of interrupted data group. A change in this field will cause a new record type 6
zOpOver	BIT	1	Operator override programmed carriage control (printer only). A change in this field will cause a new record type 6
zPunchInt	BIT	1	Punch output was interpreted (3525 only). A change in this field will cause a new record type 6
SMF006_JES2_Output_Writer_IO_Data.<fieldname>			
zINDC	INT	1	(IBM Name: SMF6INDC) Record level indicator. 1 => MVS/XA JES2 SP2.2.0 and before - restructured SMF type 6 record. 3 => MVS/ESA JES2 SP3.1.1 - greater than 10K job support. 4 => MVS/ESA JES2 SP3.1.3 - security support. 5 => MVS/ESA JES2 SP4.1.0
zJNM	CHAR	4	(IBM Name: SMF6JNM) When SMF6INDC contains a X'1', this field contains a 4-digit EBCDIC job number. When SMF6INDC contains a X'3' or greater and the job number has more than 4 digits, this field contains zeroes. If the job number is greater than or equal to 999, this field contains the job number. For an APPC transaction, this field contains zeroes. The correct job number or APPC transaction is found in SMF6JBID.
zOUT	CHAR	8	(IBM Name: SMF6OUT) JES2 logical output device name defined in JESPARMS.
zFCB	CHAR	4	(IBM Name: SMF6FCB) FCB image identification (for printer only). A change in this field will cause a new record type 6.
zUCS	CHAR	4	(IBM Name: SMF6UCS) UCS image identification (for printer only). A change in this field will cause a new record type 6.

zPGE	INT	4	(IBM Name: SMF6PGE) Approximate page count (printer only). For a printer controlled by JES2, the count is updated: - On a new page definition, if LINECT=0 is specified on the JOBPARM JECL statement, in the accounting field of the JOB statement, on the OUTPUT JECL statement, or on the OUTPUT JCL statement. - After the number of lines specified in LINECT or on a new page definition. New page: The NEWPAGE parameter on the PRINTDEF or PRT(nnnn) JES2 Initialization statement determines the method of counting pages. If NEWPAGE=ALL or NEWPAGE=DEFAULT, then skip to any channel will be counted as a page. If NEWPAGE=1, then only skip to channel 1 will be counted as a page. For a printer controlled by an FSS, the count is affected by a PAGEDEF statement, a FORMDEF statement and/or the presence of page mode data.
zRTE	INT	2	(IBM Name: SMF6RTE) Output route code defined in JESPARMS. The route code is specified on the /*OUTPUT or DD statement. The form number is specified on the FORM parameter of the DD statement. This field is defined as follows: X'0100' indicates local routine. X'nnrr' (where nn is the node number and rr is the remote device within the node) indicates remote routing. X'00nn' indicates local routing. If more than 255 remotes are specified (in JESPARMS) for the system, this field is set to zero.

Secondary segment: SMF006_JES2_Output_Writer_3800_NonImpact_Printing

Field Name	Type	Len	Description
<i>SMF006_JES2_Output_Writer_3800_NonImpact_Printing.<fieldname></i>			
zLN2	INT	2	(IBM Name: SMF6LN2) Length of 3800 printing subsystem section including this field.
zCPS	INT	8	(IBM Name: SMF6CPS) Number of copies in each copy group. Each byte represents one copy group, and the sum of the 8 bytes is the total number of copies printed. A change in this field will cause a new record type 6 record.
zCHR	CHAR	16	(IBM Name: SMF6CHR) Names of the character arrangement tables that define the characters used in printing. Each name is 4 bytes long, with a maximum of 4 names. A change in this field will cause a new record type 6.
zMID	CHAR	4	(IBM Name: SMF6MID) Names of the copy modification module used to modify the data. A change in this field will cause a new record type 6.
zFLI	CHAR	4	(IBM Name: SMF6FLI) Name of the forms overlay printed on the copies. A change in this field will cause a new record type 6.
zFLC	INT	1	(IBM Name: SMF6FLC) Number of copies on which the forms overlay is printed A change in this field will cause a new record type 6.
<i>SMF006_JES2_Output_Writer_3800_NonImpact_Printing.zBID.<fieldname></i>			
zBurst	BIT	1	Output was burst into sheets by the Burster-Trimmed-Stacker. A change in this field will cause a new record type 6.
zOPTCDJ	BIT	1	DCB subparameter OPTCD=J was specified. Each output data line contained a table reference character that selected the character arrangement table used when printing that line. A change in this field will cause a new record type 6.

Secondary segment: SMF006_JES2_Output_Writer_Common

Field Name	Type	Len	Description
------------	------	-----	-------------

<i>SMF006_JES2_Output_Writer_Common.<fieldname></i>			
zLN3	INT	2	(IBM Name: SMF6LN3) Length of the common section, including this field.
zROUT	HEX	4	(IBM Name: SMF6ROUT) Output route code. This field is defined as follows: X'00010000' indicates local routing. X'nnnnrrrr' (where nnnn is the node number and rrrr is the remote device within that node) indicates remote routine. X'0000nnnn' indicates special local routing. This field is always set regardless of the number of remotes specified by the system. The node and remote devices are defined in JESPARMS.
zEFMN	CHAR	8	(IBM Name: SMF6EFMN) Output form number. This field is set regardless of the number of characters in the forms field (SMF6FMN).
zJBID	CHAR	8	(IBM Name: SMF6JBID) Job name, transaction ID (for APPC output), or TSO/E userid.
zSTNM	CHAR	8	(IBM Name: SMF6STNM) This field is not filled in for an output writer.
zPRNM	CHAR	8	(IBM Name: SMF6PRNM) This field is not filled in for an output writer.
zDDNM	CHAR	8	(IBM Name: SMF6DDNM) This field is not filled in for an output writer.
zUSID	CHAR	8	(IBM Name: SMF6USID) The user ID associated with the job/session that created the data set, or the user ID associated with the transaction ID (for APPC output).
zSECS	CHAR	8	(IBM Name: SMF6SECS) The security label of the created data set, or data set level seclabel.
zPRMD	CHAR	8	(IBM Name: SMF6PRMD) The processing mode of the data set.
zDSNM	CHAR	53	(IBM Name: SMF6DSNM) The name of the data set being printed.
zOTOK	CHAR	20	(IBM Name: SMF6OTOK) Output security token: The identifier JES assigns to those SYSOUT data sets that share common printing attributes and security information. Data sets thus grouped are then printed sequentially. If your installation also produces job header and trailer pages, these data sets appear between those job header and trailer pages as a job.

Secondary segment: SMF006_JES2_Output_Writer_Enhanced_SYSOUT

Field Name	Type	Len	Description
<i>SMF006_JES2_Output_Writer_Enhanced_SYSOUT.<fieldname></i>			
zLN5	INT	2	(IBM Name: SMF6LN5) Length of ESS section (including this field).
zSGID	INT	4	(IBM Name: SMF6SGID) Segment identifier. Contains 0 when the file is not segmented.
zBNOF	INT	2	(IBM Name: SMF6BNOF) Offset to bin section.
<i>SMF006_JES2_Output_Writer_Enhanced_SYSOUT.zIND.<fieldname></i>			
zError	BIT	1	Error obtaining scheduler JCL facility (SJF) information. Scheduler work block text unit (SWBTU) data area is not present.
<i>SMF006_JES2_Output_Writer_Enhanced_SYSOUT.<fieldname></i>			
zRSV	CHAR	1	(IBM Name: SMF6RSV) Reserved.
zJDVT	CHAR	8	

			(IBM Name: SMF6JDVT) JCL definition table (JDT) name in JCL definition vector table (JDTV).
zTUL	INT	2	(IBM Name: SMF6TUL) Text unit (SWBTU) data area length.
zTU	XVCHAR	0 1024	(IBM Name: SMF6TU) Text unit (SWBTU) data area. The data area can be processed using the SWBTUREQ macro and is mapped by MVS macro IEFSJPFx.

Record Type 6 - JES3 Output Writer

SMF Record 6 (JES3 Output Writer) is mapped by structure member "T006".

Primary Segment:

- SMF006_JES3_Output_Writer

Secondary Segment(s): 4 (in alphabetical order)

- SMF006_JES3_Output_Writer_Common
- SMF006_JES3_Output_Writer_Enhanced_SYSOUT
- SMF006_JES3_Output_Writer_IO_Data
- SMF006_JES3_Output_Writer_3800_NonImpact_Printing

Primary segment: SMF006_JES3_Output_Writer

Field Name	Type	Len	Description
<i>SMF006_JES3_Output_Writer.<fieldname></i>			
zFLG	INT	1	(IBM Name: SMF6FLG) System indicator: Bit Meaning when set 0-2 Reserved. 3-6 Version indicators (See 'Standard and Extended SMF record headers' on page 174 FOR details.). 7 RESERVED.
zRTY	INT	1	(IBM Name: SMF6RTY) Record type 6 (X'06').
zTME	TSTMP	8	(IBM Name: SMF6TME) Date and time that the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM Name: SMF6SID) System identification (from the SID parameter).
zJBN	CHAR	8	(IBM Name: SMF6JBN) Job name (taken from job's RESQ). The job name, time, and date that the reader recognized the JOB card (for this job) log identification, or transaction name (for APPC output).
zRST	TSTMP	8	(IBM Name: SMF6RST) Date and time that the reader recognized the JOB card (for this job).
zUIF	CHAR	8	(IBM Name: SMF6UIF) User identification (taken from common exit parameter area not from USER= parameter on job statement).
zOWC	CHAR	1	(IBM Name: SMF6OWC) *SYSOUT class (this field is blank for non-SYSOUT data sets).
zWST	TSTMP	8	(IBM Name: SMF6WST) Start date and time of print/punch processor including remote device working on the data in this record.
zNLR	INT	4	(IBM Name: SMF6NLR) Number of logical records written by the writer. This field is filled in when a data set is completed or restarted. The count is a cumulative count which includes repeats and restarts. It does not include records skipped due to forward repositioning of the writer.

<i>SMF006_JES3_Output_Writer.zIOE.<fieldname></i>			
zDBError	BIT	1	Data buffer read error. A change in this field will cause a new record type 6.
zCBError	BIT	1	Control buffer read error. A change in this field will cause a new record type 6.

<i>SMF006_JES3_Output_Writer.<fieldname></i>			
zNDS	INT	1	(IBM Name: SMF6NDS) Number of data sets processed by the writer and included in this record. If multiple copies are produced, each copy is counted (This field includes JOBLOG information.)
zFMN	CHAR	4	

			(IBM Name: SMF6FMN) Form number as defined in the FORM= parameter of the DD statement.
SMF006_JES3_Output_Writer.zPAD1.<fieldname>			
zNonImpact	BIT	1	3800 NonImpact printing subsystem section present
zCommon	BIT	1	Common section present.
zEnhanced	BIT	1	Enhanced SYSOUT support section present.
SMF006_JES3_Output_Writer.<fieldname>			
zSBS	INT	2	(IBM Name: SMF6SBS) Subsystem identification - X'0005' signifies JES3.

Secondary segment: **SMF006_JES3_Output_Writer_IO_Data**

Field Name	Type	Len	Description
SMF006_JES3_Output_Writer_IO_Data.<fieldname>			
zLN1	INT	2	(IBM Name: SMF6LN1) Length of this section, including this field.
SMF006_JES3_Output_Writer_IO_Data.zDCI.<fieldname>			
zSpin	BIT	1	Record represents spin data sets
zOpEnd	BIT	1	Operator ended this data group
zOpRestartD	BIT	1	Operator restarted data set with destination
zOpRestart	BIT	1	Operator restarted this data group
zOpRestartR	BIT	1	Received operator restarted data set
zOpSingle	BIT	1	Operator started with single space
zPunchInt	BIT	1	Punch output was interpreted.
SMF006_JES3_Output_Writer_IO_Data.<fieldname>			
zINDC	INT	1	(IBM Name: SMF6INDC) Record level indicator. 1 => MVS/XA JES3 SP2.2.1 and before - restructured SMF type 6 record. 3 => MVS/ESA JES3 SP3.1.1 - greater than 10K job support. 4 => MVS/ESA JES3 SP3.1.3 - security support.
zJNM	CHAR	4	(IBM Name: SMF6JNM) When SMF6INDC contains a X'1', this field contains a 4-digit EBCDIC job number. When SMF6INDC contains a X'3' or greater and the job number has more than 4 digits, this field contains zeroes. If the job number is greater than or equal to 999, this field contains the job number. For an APPC transaction, this field contains zeroes. The correct job number or APPC transaction is found in SMF6JBID.
zOUT	CHAR	8	(IBM Name: SMF6OUT) JES3 logical output device name defined in JESPARMS.
zFCB	CHAR	4	(IBM Name: SMF6FCB) FCB image identification (for printer only).
zUCS	CHAR	4	(IBM Name: SMF6UCS) UCS image identification (for printer only).
zPGE	INT	4	(IBM Name: SMF6PGE) For printer, approximate page count (A skip to carriage control channel one is counted as a page.) For punch, the number of cards punched. This field is filled in when a data set is completed or restarted. The count is a cumulative count which includes repeats and restarts. It does not include pages skipped due to forward repositioning of the writer.

SMF006_JES3_Output_Writer_IO_Data.zDFE.<fieldname>			
zBadCC	BIT	1	Some first character control data bad, default used
zBadLen	BIT	1	Bad record length (truncate or pad)

SMF006_JES3_Output_Writer_IO_Data.<fieldname>			
zOPR	INT	2	(IBM Name: SMF6OPR) Output priority.
zGRP	CHAR	8	(IBM Name: SMF6GRP) JES3 logical output device group name.
zRSVJ	CHAR	8	(IBM Name: SMF6RSVJ) Reserved for JES3.
zRSVU	CHAR	4	(IBM Name: SMF6RSVU) Reserved for user.

Secondary segment: SMF006_JES3_Output_Writer_3800_NonImpact_Printing

Field Name	Type	Len	Description
SMF006_JES3_Output_Writer_3800_NonImpact_Printing.<fieldname>			
zLN2	INT	2	(IBM Name: SMF6LN2) Length of 3800 printing subsystem section including this field.
zCPS	INT	8	(IBM Name: SMF6CPS) Number of copies in each copy group. Each byte represents one copy group, and the sum of the 8 bytes is the total number of copies printed.
zCHR	CHAR	16	(IBM Name: SMF6CHR) Names of the character arrangement tables that define the characters used in printing. Each name is 4 bytes long, with a maximum of 4 names.
zMID	CHAR	4	(IBM Name: SMF6MID) Names of the copy modification module used to modify the data.
zFLI	CHAR	4	(IBM Name: SMF6FLI) Name of the forms overlay printed on the copies.
zFLC	INT	1	(IBM Name: SMF6FLC) Number of copies on which the forms overlay is printed.

SMF006_JES3_Output_Writer_3800_NonImpact_Printing.zBID.<fieldname>			
zBurst	BIT	1	Output was burst into sheets by the Burster-Trimmer-Stacker.
zOPTCDJ	BIT	1	DCB subparameter OPTCD=J was specified. Each output data line contained a table reference character that selected the character arrangement table used when printing that line.

Secondary segment: SMF006_JES3_Output_Writer_Common

Field Name	Type	Len	Description
SMF006_JES3_Output_Writer_Common.<fieldname>			
zLN3	INT	2	(IBM Name: SMF6LN3) Length of the common section, including this field.
zEFMN	CHAR	8	(IBM Name: SMF6EFMN) Output form number. This field is set regardless of the number of characters in the forms field (SMF6FMN).
zJBID	CHAR	8	(IBM Name: SMF6JBID) Job name, transaction ID (for APPC output), or TSO/E userid.

zSTNM	CHAR	8	(IBM Name: SMF6STNM) This field is not filled in for an output writer.
zPRNM	CHAR	8	(IBM Name: SMF6PRNM) This field is not filled in for an output writer.
zDDNM	CHAR	8	(IBM Name: SMF6DDNM) This field is not filled in for an output writer.
zUSID	CHAR	8	(IBM Name: SMF6USID) The user ID associated with the job/session that created the data set, or the user ID associated with the transaction ID (for APPC output).
zSECS	CHAR	8	(IBM Name: SMF6SECS) The security label of the created data set, or data set level seclabel.
zPRMD	CHAR	8	(IBM Name: SMF6PRMD) The processing mode of the data set.
zDSNM	CHAR	53	(IBM Name: SMF6DSNM) The name of the data set being printed.

Secondary segment: SMF006_JES3_Output_Writer_Enhanced_SYSOUT

Field Name	Type	Len	Description
<i>SMF006_JES3_Output_Writer_Enhanced_SYSOUT.<fieldname></i>			
zLN5	INT	2	(IBM Name: SMF6LN5) Length of ESS section (including this field).
zSGID	INT	4	(IBM Name: SMF6SGID) Segment identifier. Contains 0 when the file is not segmented.

<i>SMF006_JES3_Output_Writer_Enhanced_SYSOUT.zIND.<fieldname></i>			
zError	BIT	1	Error obtaining scheduler JCL facility (SJF) information. Scheduler work block text unit (SWBTU) data area is not present.

<i>SMF006_JES3_Output_Writer_Enhanced_SYSOUT.<fieldname></i>			
zRSV	CHAR	1	(IBM Name: SMF6RSV) Reserved.
zJDVT	CHAR	8	(IBM Name: SMF6JDVT) JCL definition table (JDT) name in JCL definition vector table (JDTV).
zTUL	INT	2	(IBM Name: SMF6TUL) Text unit (SWBTU) data area length.
zTU	XVCHAR	0 1024	(IBM Name: SMF6TU) Text unit (SWBTU) data area. The data area can be processed using the SWBTUREQ macro and is mapped by MVS macro IEFSJPFY.

Record Type 6 - Print Services Facility

SMF Record 6 (Print Services Facility) is mapped by structure member "T006".

Primary Segment:

- [SMF006_Print_Services_Facility](#)

Secondary Segment(s): 8 (in alphabetical order)

Primary segment: [SMF006_Print_Services_Facility](#)

Field Name	Type	Len	Description
<i>SMF006_Print_Services_Facility.<fieldname></i>			
zFLG	INT	1	(IBM Name: SMF6FLG) System indicator: Bit Meaning when set 0-2 Reserved. 3-6 Version indicators (See 'Standard and Extended SMF record headers' on page 174 FOR details.). 7 RESERVED.
zRTY	INT	1	(IBM Name: SMF6RTY) Record type 6 (X'06').
zTME	TSTMP	8	(IBM Name: SMF6TME) Date and time that the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM Name: SMF6SID) System identification (from the SID parameter).
zJBN	CHAR	8	(IBM Name: SMF6JBN) Job name (taken from job's RESQ). The job name, time, and date that the reader recognized the JOB card (for this job) log identification, or transaction name (for APPC output).
zRST	TSTMP	8	(IBM Name: SMF6RST) Date and time that the reader recognized the JOB card (for this job).
zUIF	CHAR	8	(IBM Name: SMF6UIF) User identification (taken from common exit parameter area not from USER= parameter on job statement).
zOWC	CHAR	1	(IBM Name: SMF6OWC) SYSOUT class (this field is blank for non-SYSOUT data sets).
zWST	TSTMP	8	(IBM Name: SMF6WST) Start date and time of output service working on the data in this record. This field is filled in at JES3 LOGIN time for the writer job. Note: The timestamps should not be used to determine printer utilization.
zNLR	INT	4	(IBM Name: SMF6NLR) Number of logical records read by the writer. This field contains a value established like the byte count described in the introduction.

SMF006_Print_Services_Facility.zIOE.<fieldname>

zDBError	BIT	1	Data buffer read error.
zCBError	BIT	1	Control buffer read error.

SMF006_Print_Services_Facility.<fieldname>

zNDS	INT	1	(IBM Name: SMF6NDS) Number of copies of the data set requested.
zFMN	CHAR	4	(IBM Name: SMF6FMN) Form number - only the first four bytes appear in this field. This value is

			taken from the last SETUP message or from the FORMS parameter of the OUTPUT statement for the user data set.
--	--	--	--

SMF006_Print_Services_Facility.zPAD1.<fieldname>			
zNonImpact	BIT	1	Non-impact printing subsystem section present.
zCommon	BIT	1	Common section present.
zAllPoints	BIT	1	All-points-addressable (APA) printing subsystem section present.
zEnhanced	BIT	1	Enhanced SYSOUT support section present.
zXfer	BIT	1	File Transfer section present

SMF006_Print_Services_Facility.<fieldname>			
zSBS	INT	2	(IBM Name: SMF6SBS) Subsystem identification - X'0007' signifies PSF.

Secondary segment: SMF006_Print_Services_Facility_IO_Data

Field Name	Type	Len	Description
SMF006_Print_Services_Facility_IO_Data.<fieldname>			
zLN1	INT	2	(IBM Name: SMF6LN1) Length of this section, including this field.

SMF006_Print_Services_Facility_IO_Data.zDCI.<fieldname>			
zSpin	BIT	1	Record represents spin data sets
zOpEnd	BIT	1	Operator ended this data group
zOpRestartD	BIT	1	Operator restarted data set with destination
zOpRestart	BIT	1	Operator restarted this data group
zOpRestartR	BIT	1	Received operator restarted data set
zOpSingle	BIT	1	Operator started with single space

SMF006_Print_Services_Facility_IO_Data.<fieldname>			
zINDC	INT	1	(IBM Name: SMF6INDC) Record level indicator. Bits 0-3 are reserved. Bits 4-7 have a value as follows: 1 => PSF/MVS release 1.1 - restructured SMF type 6 record. 2 => Reserved. 3 => MVS/ESA JES2 SP3.1.1 - greater than 10K job support. 4 => MVS/ESA JES2 SP3.1.3 and above - security support. 5 => MVS/ESA JES2 SP4.1.0. 6 => PSF/MVS Release 3.1.0.
zJNM	CHAR	4	(IBM Name: SMF6JNM) When SMF6INDC contains a X'1', this field contains a 4-digit EBCDIC job number. When SMF6INDC contains a X'3' or greater and the job number has more than 4 digits, this field contains zeroes. If the job number is greater than or equal to 999, this field contains the job number. For an APPC transaction, this field contains zeroes. The correct job number or APPC transaction is found in SMF6JBID.
zOUT	CHAR	8	(IBM Name: SMF6OUT) For SNA-attached printers, the VTAM logical unit name. For channelattached printers, the printer device name.
zFCB	CHAR	4	Reserved.
zUCS	CHAR	4	Reserved.
zPGE	INT	4	(IBM Name: SMF6PGE) Approximate physical page count, including duplicates and separators. This field is not incremented when blank pages are sent through the printer

			after a job because of an NPRO request, or when a blank page is generated because PSF is not generating header and trailer pages, but mark forms is active.
--	--	--	---

Secondary segment: SMF006_Print_Services_Facility_NonImpact_Printing

Field Name	Type	Len	Description
<i>SMF006_Print_Services_Facility_NonImpact_Printing.<fieldname></i>			
zLN2	INT	2	(IBM Name: SMF6LN2) Length of non-impact printing subsystem section, including this field.
zCPS	INT	8	(IBM Name: SMF6CPS) Number of copies specified in the COPIES parameter of the OUTPUT statement for the user data set. Each byte represents one copy group. These values can be changed by operator commands.
zCHR	CHAR	16	(IBM Name: SMF6CHR) Names of the fonts that define the characters used in printing as specified in the JCL. Each name is 4 BYTES long, with a maximum of 4 NAMES.
zFLI	CHAR	4	(IBM Name: SMF6FLI) Name of the forms overlay printed on the copies, taken from the data set JCL.
zFLC	INT	1	(IBM Name: SMF6FLC) Number of copies on which the forms overlay is printed, taken from the data set JCL.

<i>SMF006_Print_Services_Facility_NonImpact_Printing.zBID.<fieldname></i>			
zBurst	BIT	1	Output was burst into sheets by the Burster-Trimmed-Stacker. A change in this field will cause a new record type 6.
zOPTCDJ	BIT	1	DCB subparameter OPTCD=J was specified. Each output data line contained a table reference character that selected the character arrangement table used when printing that line.
zCutSheet	BIT	1	Cut-sheet printer. This field is valid only when SMF6SBS equals X'0007', and SMFINDC is equal to or greater than X'02'.

Secondary segment: SMF006_Print_Services_Facility_Common

Field Name	Type	Len	Description
<i>SMF006_Print_Services_Facility_Common.<fieldname></i>			
zLN3	INT	2	(IBM Name: SMF6LN3) Length of the common section, including this field.
zROUT	HEX	4	(IBM Name: SMF6ROUT) Output route code. This field is defined as follows: X'00010000' indicates local routing. X'nnnnrrrr' (where nnnn is the node number and rrrr is the remote device within that node) indicates remote routine. X'0000nnnn' indicates special local routing. This field is always set regardless of the number of remote specified by this system. The node and remote devices are defined in JESPARMS.
zEFMN	CHAR	8	(IBM Name: SMF6EFMN) Output form number. SMF6EFMN is derived from the last setup message, the JES initialization statements, or from the FORMS parameter of the OUTPUT statement.
zJBID	CHAR	8	(IBM Name: SMF6JBID) Job ID, or Transaction ID (for APPC output).
zSTNM	CHAR	8	(IBM Name: SMF6STNM) This field is not filled in for an output writer.

zPRNM	CHAR	8	(IBM Name: SMF6PRNM) This field is not filled in for an output writer.
zDDNM	CHAR	8	(IBM Name: SMF6DDNM) This field is not filled in for an output writer.
zUSID	CHAR	8	(IBM Name: SMF6USID) The user ID associated with the job/session that created the data set, or the user ID associated with the transaction ID (for APPC output).
zSECS	CHAR	8	(IBM Name: SMF6SECS) The security label of the created data set, or data set level seclabel.
zPRMD	CHAR	8	(IBM Name: SMF6PRMD) The processing mode of the data set.
zDSNM	CHAR	53	(IBM Name: SMF6DSNM) The name of the data set being printed.
zOTOK	CHAR	20	(IBM Name: SMF6OTOK) Output security token: the identifier JES assigned to those SYSOUT data sets that share common printing attributes and security information. Data sets thus grouped are then printed sequentially. If your installation also produces job header and trailer pages, these data sets appear between those job header and trailer pages as a job.

Secondary segment: SMF006_Print_Services_Facility_AllPoints_Printing

Field Name	Type	Len	Description
<i>SMF006_Print_Services_Facility_AllPoints_Printing.<fieldname></i>			
zLN4	INT	2	(IBM Name: SMF6LN4) Length of the section (including this field).
zBNOF	INT	2	(IBM Name: SMF6BNOF) Offset to the Multi-Bins Header Section from start of APA section.
zFONT	INT	4	(IBM Name: SMF6FONT) Number of fonts mapped with an MCF.
zLFNT	INT	4	(IBM Name: SMF6LFNT) Number of fonts loaded.
zOVLY	INT	4	(IBM Name: SMF6OVLY) Number of overlays mapped with an MMO.
zLOLY	INT	4	(IBM Name: SMF6LOLY) Number of overlays loaded.
zPGSG	INT	4	(IBM Name: SMF6PGSG) Number of page segments mapped with an MPS.
zLPSG	INT	4	(IBM Name: SMF6LPSG) Number of page segments loaded.
zIMPS	INT	4	(IBM Name: SMF6IMPS) Number of sides of sheets of paper printed (number of logical impressions), including duplicates and separators. This field is noncumulative across interrupts and is valid only when SMFINDC is equal to or greater than X'02'. This field is not incremented when blank pages are sent through the printer after a job because of an NPRO request, or when a blank page is generated because PSF is not generating header and trailer pages, but mark forms is active.
zFEET	INT	4	(IBM Name: SMF6FEET) Number of feet of paper printed for the document (zero for printers that do not report paper size). This field is non-cumulative across interrupts. This field is not incremented when blank pages are sent through the printer after a job because of an NPRO request, or when a blank page is generated because PSF is not generating header and trailer pages, but mark forms is active.
zPGDF	INT	4	(IBM Name: SMF6PGDF) Number of PAGEDEFS used.
zFMDF	INT	4	

			(IBM Name: SMF6FMDF) Number of FORMDEFS used.
--	--	--	--

SMF006_Print_Services_Facility_AllPoints_Printing.zBIN.<fieldname>			
zBin1	BIT	1	Bin 1 used for any part of the data set.
zBin2	BIT	1	Bin 2 used for any part of the data set.
zBin3	BIT	1	Bin 3 used for any part of the data set.
zBin4	BIT	1	Bin 4 used for any part of the data set.

SMF006_Print_Services_Facility_AllPoints_Printing.zPGOP.<fieldname>			
zStdDup	BIT	1	Standard duplex was used for any part of the data set.
zTumDpx	BIT	1	Tumble duplex was used for any part of the data set. System security indicators. Valid only when SMF6INDC is equal to or greater than X'04'.
zSYSAREA	BIT	1	Keyword SYSAREA=YES
zDPAGELBL	BIT	1	Keyword DPAGELBL=YES
zSuccess	BIT	1	Print operation was successful
zSPAGELBL	BIT	1	Keyword SPAGELBL=YES
zError	BIT	1	Error occurred processing the security overlay
zOverrun	BIT	1	Image generator overrun error occurred.

SMF006_Print_Services_Facility_AllPoints_Printing.zFLG3.<fieldname>			
zSec	BIT	1	Security label integrity is guaranteed. Valid only when SMF6INDC is equal to or greater than X'04'
zHead	BIT	1	The job header page was printed
zTrail	BIT	1	The job trailer page was printed
zPageLabel	BIT	1	Data page labelling was suppressed
zUserArea	BIT	1	User printable area was suppressed.

SMF006_Print_Services_Facility_AllPoints_Printing.<fieldname>			
zNSOL	INT	4	(IBM Name: SMF6NSOL) Number of security overlays used while printing the data set. Valid only when SMF6INDC is equal to or greater than X'04'.
zNSFO	INT	4	(IBM Name: SMF6NSFO) Number of security fonts used while printing the data set. Valid only when SMF6INDC is equal to or greater than X'04'.
zNPS	INT	4	(IBM Name: SMF6NPS) Number of security page segments used while printing the data set. Valid only when SMF6INDC is equal to or greater than X'04'.
zFDNM	CHAR	8	(IBM Name: SMF6FDNM) FORMDEF name used to print the data set.
zPDNM	CHAR	8	(IBM Name: SMF6PDNM) PAGEDEF name used to print the data set.
zPTDV	CHAR	8	(IBM Name: SMF6PTDV) PRINTDEV name used to print the data set.
zSETU	CHAR	8	(IBM Name: SMF6SETU) COMSETUP name used to print the data set.
zLPGE	INT	4	(IBM Name: SMF6LPGE) Number of logical pages processed. (The accumulative number of logical pages per side.) This field is non-accumulative across interrupts. This field is not incremented when blank pages are sent through the printer after a job because of an NPRO request, or when a blank page is generated because PSF is not generating header and trailer pages, but forms marking is active.

Secondary segment: SMF006_Print_Services_Facility_MultiBins_Header

Field Name	Type	Len	Description
<i>SMF006_Print_Services_Facility_MultiBins_Header.<fieldname></i>			
zBNLN	INT	2	(IBM Name: SMF6LN4) Length of the section (including this field).
zBNUM	INT	2	(IBM Name: SMF6BNOF) Offset to the Multi-Bins Header Section from start of APA section.

Secondary segment: SMF006_Print_Services_Facility_MultiBins_Counter

Field Name	Type	Len	Description
<i>SMF006_Print_Services_Facility_MultiBins_Counter.<fieldname></i>			
zBNNO	INT	1	(IBM Name: SMF6BNNO) Bin number.
zBNCT	INT	3	(IBM Name: SMF6BNCT) Bin counter. This field is not incremented when blank pages are sent through the printer after a job because of an NPRO request, or when a blank page is generated because PSF is not generating header and trailer pages, but mark forms is active.
zBNLE	INT	2	(IBM Name: SMF6BNLE) Paper length in millimeters.
zBNWI	INT	2	(IBM Name: SMF6BNWI) Paper width in millimeters.

Secondary segment: SMF006_Print_Services_Facility_Enhanced_SYSOUT

Field Name	Type	Len	Description
<i>SMF006_Print_Services_Facility_Enhanced_SYSOUT.<fieldname></i>			
zLN5	INT	2	(IBM Name: SMF6LN5) Length of ESS section (including this field).
zSGID	INT	4	(IBM Name: SMF6SGID) Segment identifier. Contains 0 when the file is not segmented.

SMF006_Print_Services_Facility_Enhanced_SYSOUT.zIND.<fieldname>

zError	BIT	1	Error obtaining scheduler JCL facility (SJF) information. Scheduler work block text unit (SWBTU) data area is not present.
--------	-----	---	--

SMF006_Print_Services_Facility_Enhanced_SYSOUT.<fieldname>

zRSV	CHAR	1	(IBM Name: SMF6RSV) Reserved.
zJDVT	CHAR	8	(IBM Name: SMF6JDVT) JCL definition table (JDT) name in JCL definition vector table (JDVT).
zTUL	INT	2	(IBM Name: SMF6TUL) Text unit (SWBTU) data area length.
zTU	XVCHAR	0 1024	(IBM Name: SMF6TU) Text unit (SWBTU) data area. The data area can be processed using the SWBTUREQ macro and is mapped by MVS macro IEFSJPFx.

Secondary segment: SMF006_Print_Services_Facility_File_Transfer

Field Name	Type	Len	Description
<i>SMF006_Print_Services_Facility_File_Transfer.<fieldname></i>			
zLN6	INT	2	Length of File Transfer section (including this field).
zBYTE	INT	4	Total bytes sent.
zIPV4	IPADDRESS	4	Target IPv4 address.
zFTL	INT	1	Level indicator for file transfer section.
zPQLN	INT	2	Length of print queue name.
zPRTQ	XVCHAR	0 1024	Print queue name.
zBYTD	INT	8	Total bytes sent when > 4 Gigabytes.
zIPV6	IPADDRESS	16	Target IPv6 IP address.

Record Type 6 - IP PrintWay

SMF Record 6 (IP PrintWay) is mapped by structure member "T006".

Primary Segment:

- SMF006_IP_PrintWay

Secondary Segment(s): 4 (in alphabetical order)

- SMF006_IP_PrintWay_Common
- SMF006_IP_PrintWay_Enhanced_SYSOUT
- SMF006_IP_PrintWay_File_Transfer
- SMF006_IP_PrintWay_IO_Data

Primary segment: SMF006_IP_PrintWay

Field Name	Type	Len	Description
<i>SMF006_IP_PrintWay.<fieldname></i>			
zFLG	INT	1	(IBM Name: SMF6FLG) System indicator: Bit Meaning when set 0-2 Reserved. 3-6 Version indicators (See 'Standard and Extended SMF record headers' on page 174 FOR details.). 7 RESERVED.
zRTY	INT	1	(IBM Name: SMF6RTY) Record type 6 (X'06').
zTME	TSTMP	8	(IBM Name: SMF6TME) Date and time that the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM Name: SMF6SID) System identification (from the SID parameter).
zJBN	CHAR	8	(IBM Name: SMF6JBN) Job name (taken from job's RESQ). The job name, time, and date that the reader recognized the JOB card (for this job) log identification, or transaction name (for APPC output).
zRST	TSTMP	8	(IBM Name: SMF6RST) Date and time that the reader recognized the JOB card (for this job).
zUIF	CHAR	8	(IBM Name: SMF6UIF) User identification (taken from common exit parameter area not from USER= parameter on job statement).
zOWC	CHAR	1	(IBM Name: SMF6OWC) SYSOUT class (this field is blank for non-SYSOUT data sets).
zWST	TSTMP	8	(IBM Name: SMF6WST) Start date and time of output service working on the data in this record. This field is filled in at JES3 LOGIN time for the writer job. Note: The timestamps should not be used to determine printer utilization.
zNLR	INT	4	(IBM Name: SMF6NLR) Number of logical records read by the writer. This field contains a value established like the byte count described in the introduction.
<i>SMF006_IP_PrintWay.zIOE.<fieldname></i>			
zDBError	BIT	1	Data buffer read error.
zCBError	BIT	1	Control buffer read error.
<i>SMF006_IP_PrintWay.<fieldname></i>			
zNDS	INT	1	(IBM Name: SMF6NDS) Number of copies of the data set requested.
zFMN	CHAR	4	(IBM Name: SMF6FMN) Form number - only the first four bytes appear in this field. This value is taken from the last SETUP message or from the FORMS parameter of the OUTPUT statement for the user data set.

SMF006_IP_PrintWay.zPAD1.<fieldname>			
zCommon	BIT	1	Common section present.
zEnhanced	BIT	1	Enhanced SYSOUT support section present.
zXfer	BIT	1	File Transfer section present

SMF006_IP_PrintWay.<fieldname>			
zSBS	INT	2	(IBM Name: SMF6SBS) Subsystem identification - X'0009' signifies IP PrintWay.

Secondary segment: SMF006_IP_PrintWay_IO_Data

Field Name	Type	Len	Description
SMF006_IP_PrintWay_IO_Data.<fieldname>			
zLN1	INT	2	(IBM Name: SMF6LN1) Length of this section, including this field.

SMF006_IP_PrintWay_IO_Data.zDCI.<fieldname>			
zAttempt	BIT	1	Transmission attempted
zSuccess	BIT	1	Transmission successful
zReleaseCHKP	BIT	1	Data set released to the system with checkpoint
zRestartCHKP	BIT	1	Data set restarted using checkpoint information.

SMF006_IP_PrintWay_IO_Data.<fieldname>			
zINDC	INT	1	(IBM Name: SMF6INDC) Record level indicator. Bits 0-3 Reserved 4-7 Have a value as follows: 1 IP PrintWay basic mode 2-6 Reserved. 7 IP PrintWay extended mode - z/OS V1R5 and above.
zJNM	CHAR	4	(IBM Name: SMF6JNM) When SMF6INDC contains a X'1', this field contains a 4-digit EBCDIC job number. When SMF6INDC contains a X'3' or greater and the job number has more than 4 digits, this field contains zeroes. If the job number is greater than or equal to 999, this field contains the job number. For an APPC transaction, this field contains zeroes. The correct job number or APPC transaction is found in SMF6JBID.
zOUT	CHAR	8	(IBM Name: SMF6OUT) For SNA-attached printers, the VTAM logical unit name. For channelattached printers, the printer device name.
zFCB	CHAR	4	Reserved.
zUCS	CHAR	4	Reserved.
zPGE	INT	4	(IBM Name: SMF6PGE) For IP PrintWay extended mode, the total number of pages that printed successfully. When the printer prints on both sides of a sheet of paper (duplex printing), most printers count each side as one page. If no pages printed, or if no page count is available, this field contains X'00'. For IP PrintWay basic mode, this field contains X'00' Tips: 1. IP PrintWay fills in the page count only when it uses the direct sockets protocol to send data to the printer and the 'Record pages printed for accounting' option is selected in the Printer Inventory. 2. If the document did not finish printing, this field contains the number of pages that printed before the error. Field SMF6DCI contains X'00'.

Secondary segment: SMF006_IP_PrintWay_Common

Field Name	Type	Len	Description
<i>SMF006_IP_PrintWay_Common.<fieldname></i>			
zLN3	INT	2	(IBM Name: SMF6LN3) Length of the common section, including this field.
zROUT	HEX	4	(IBM Name: SMF6ROUT) Reserved.
zEFMN	CHAR	8	(IBM Name: SMF6EFMN) Output form number. SMF6EFMN is derived from the last setup message, the JES initialization statements, or from the FORMS parameter of the OUTPUT statement.
zJBID	CHAR	8	(IBM Name: SMF6JBID) Job ID.
zSTNM	CHAR	8	(IBM Name: SMF6STNM) Step name.
zPRNM	CHAR	8	(IBM Name: SMF6PRNM) Proc step name.
zDDNM	CHAR	8	(IBM Name: SMF6DDNM) DD name.
zUSID	CHAR	8	(IBM Name: SMF6USID) The user ID associated with the job/session that created the data set.
zSECS	CHAR	8	(IBM Name: SMF6SECS) Reserved.
zPRMD	CHAR	8	(IBM Name: SMF6PRMD) The processing mode of the data set.
zDSNM	CHAR	53	(IBM Name: SMF6DSNM) The name of the data set being printed.
zOTOK	CHAR	20	(IBM Name: SMF6OTOK) Output security token: assigns to those SYSOUT data sets that share common printing attributes and security information. Data sets thus grouped are then printed sequentially. If your installation also produces job header and trailer pages, these data sets appear between those job header and trailer pages as a job.

Secondary segment: SMF006_IP_PrintWay_Enhanced_SYSOUT

Field Name	Type	Len	Description
<i>SMF006_IP_PrintWay_Enhanced_SYSOUT.<fieldname></i>			
zLN5	INT	2	(IBM Name: SMF6LN5) Length of ESS section (including this field).
zSGID	INT	4	(IBM Name: SMF6SGID) Segment identifier.
<i>SMF006_IP_PrintWay_Enhanced_SYSOUT.zIND.<fieldname></i>			
zError	BIT	1	Error obtaining scheduler JCL facility (SJF) information. Scheduler work block text unit (SWBTU) data area is not present.
<i>SMF006_IP_PrintWay_Enhanced_SYSOUT.<fieldname></i>			
zRSV	CHAR	1	(IBM Name: SMF6RSV) Reserved.
zJDVT	CHAR	8	(IBM Name: SMF6JDVT) JCL definition table (JDT) name in JCL definition vector table (JDTV).
zTUL	INT	2	(IBM Name: SMF6TUL) Text unit (SWBTU) data area length.

zTU	XVCHAR	0 1024	(IBM Name: SMF6TU) Text unit (SWBTU) data area. The data area can be processed using the SWBTUREQ macro and is mapped by MVS macro IEFSJPFx.
-----	--------	-----------	---

Secondary segment: SMF006_IP_PrintWay_File_Transfer

Field Name	Type	Len	Description
<i>SMF006_IP_PrintWay_File_Transfer.<fieldname></i>			
zLN6	INT	2	Length of File Transfer section (including this field).
zBYTE	INT	4	Total number of bytes transmitted, described in the section introduction.
zIP	IPADDRESS	4	IP address of target address. If these records are written in IP PrintWay extended mode, this field contains 0. IP PrintWay basic mode fills in the IP address only when it uses the LPR or direct sockets protocols to send data to the printer.
zFTL	INT (ENUM)	1	File transfer level indicator 'Basic' => IP PrintWay basic mode wrote the record. 'XNoInf' => IP PrintWay extended mode wrote the record. Fields SMF6ACTL and SMF6ACCT are not present. 'XInf' => IP PrintWay extended mode wrote the record. Fields SMF6ACTL and SMF6ACCT are present.
zPQLN	INT	2	Length of the Print Queue Name field. When IP PrintWay basic mode writes the record, SMF6PQLN contains the length of the SMF6PRTQ field. When IP PrintWay extended mode writes the record, SMF6PQLN contains the length of the meaningful portion of SMF6PRTQ.
zPRTQ	CHAR	24	Print Queue Name. If IP PrintWay basic mode writes the record, SMF6PRTQ is variable in length, with the length as specified in SMF6PQLN. If IP PrintWay extended mode writes the record, SMF6PRTQ is always 24 BYTES in length and the print queue name is padded to the right with blanks. SMF6PQLN can be used to extract the print queue name from SMF6PRTQ.
zBYTD	INT	8	For IP PrintWay extended mode, the total bytes transmitted (64-bit integer), described in the section introduction. For IP PrintWay basic mode, the SMF6BYTD field is not present.
zURIL	INT	2	For IP PrintWay extended mode, the length of the target device universal resource indicator (URI). For IP PrintWay basic mode, the SMF6URIL field is not present.
zURI	XVCHAR	0 1024	For IP PrintWay extended mode, the target device universal resource indicator (URI). For IP PrintWay basic mode, the SMF6URI field is not present.
zACTL	INT	2	For IP PrintWay extended mode, the length of the accounting information in the SMF6ACCT field. If this field contains 0, there is no accounting information in SMF6ACCT. This situation can occur if Print Interface or NetSpool dynamically allocated the print job on the JES spool. For IP PrintWay basic mode, this field is not present.
zACCT	CHAR	143	For IP PrintWay extended mode, accounting information from the JOB JCL statement. The first byte contains the number (in binary) of accounting pairs that follow. Each accounting pair has this format: - 1 byte with the length (in binary) of accounting information that follows. If the length is zero, there is no string of accounting information in this accounting pair. - A variable length string that contains the accounting information (in EBCDIC). For example, if the JOB JCL statement contains: (TSS40000,JROMXB,1234,5,4321,.,3,N,254) The SMF SMF6ACCT field contains: '0908e3e2e2f4f0f0f006d1d9d6d4e7c204f1f2f3f401f504f4f3f2f10001f301d503f2f5f4'x For IP PrintWay basic mode, this field is not present.

Record Type 7 - Data Lost

SMF Record 7 (Data Lost) is mapped by structure member "T007".

Primary Segment:

- SMF007_SMF_Data_Lost

Secondary Segment(s): 0

Primary segment: SMF007_SMF_Data_Lost

Field Name	Type	Len	Description
<i>SMF007_SMF_Data_Lost.<fieldname></i>			
SMF007_SMF_Data_Lost.Header_Self_defining_Section.<fieldname>			
zFLG	HEX	1	(IBM name: SMF7FLG) System indicator: Bit Meaning when set 0-2 Reserved 3-6 Version indicators (see 'Standard and Extended SMF record headers' on page 174 FOR details) 7 RESERVED.
zRTY	INT	1	(IBM name: SMF7RTY) Record type 7 (X'07').
zTME	TSTMP	8	(IBM name: SMF7TME) Date/Time when the record was built into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF7SID) System identification (from the SID parameter).
zNRO	INT	2	(IBM name: SMF7NRO) Number of SMF records lost because no SMF data sets were available for recording. Unsigned, count up to 65,535. This field is marked as invalid, and is set to zero when SMF7NRF is ON. SMF7NROX is the 4 BYTE equivalent of this field.
zSTM	TSTMP	8	(IBM name: SMF7STM) When SMF7DRP is off, this is the time when the buffers condition began. When SMF7DRP is on, this is the time when the DROP record filter became active. This field is in hundredths of a second.

SMF007_SMF_Data_Lost.Header_Self_defining_Section.zFL1.<fieldname>			
zNRF	BIT	1	indicates that field zNRO has exceeded its 2 byte capacity and is therefore invalid. Use SMF7NROX, which is the 4 byte equivalent of zNRO.
zLSD	BIT	1	indicates that this record is the result of a log stream becoming full.
zDRP	BIT	1	Indicates that this record is the result of the SMF record flood facility dropping records.

SMF007_SMF_Data_Lost.Header_Self_defining_Section.<fieldname>			
zRSV1	CHAR	2	(IBM name: SMF7RSV1) Reserved.
zDTYP	INT	1	(IBM name: SMF7DTYP) The type of record that was dropped by the filter. This field is zero unless SMF7DRP is ON.
zNROX	INT	4	(IBM name: SMF7NROX) Number of SMF records lost because no SMF data sets were available for recording. Unsigned, 4 BYTE equivalent of SMF7NRO.
zLSN	CHAR	26	(IBM name: SMF7LSN) The name of the log stream associated with the data space that experiences the loss. Only filled in when SMF7LSD is ON.

Record Type 8 - I/O Configuration

SMF Record 8 (I/O Configuration) is mapped by structure member "T008".

Primary Segment:

- SMF008_IO_Configuration

Secondary Segment(s): 1

- SMF008_Device

Primary segment: SMF008_IO_Configuration

Field Name	Type	Len	Description
<i>SMF008_IO_Configuration.<fieldname></i>			
SMF008_IO_Configuration.Header_Self_defining_Section.<fieldname>			
zFLG	HEX	1	(IBM name: SMF8FLG) System indicator: Bit Meaning when set 0-2 Reserved 3-6 Version indicators* 7 RESERVED. *See 'Standard and Extended SMF record headers' on page 174 FOR a detailed description.
zRTY	INT	1	(IBM name: SMF8RTY) Record type 08 (X'08').
zTME	TSTMP	8	(IBM name: SMF8TME) Date/Time when the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF8SID) System identification (from the SID parameter).
zLENN	INT	2	(IBM name: SMF8LENN) Length of rest of record including this field.

Secondary segment: SMF008_Device

Field Name	Type	Len	Description
<i>SMF008_Device.<fieldname></i>			
zDUT	INT	2	(IBM name: SMF8DUT) Device class and unit type.
zCHA	INT	2	(IBM name: SMF8CHA) Device number.

Record Type 9 - VARY Device ONLINE

SMF Record 9 (VARY Device ONLINE) is mapped by structure member "T009".

Primary Segment:

- SMF009_VARY_Device_ONLINE

Secondary Segment(s): 1

- SMF009_Device

Primary segment: SMF009_VARY_Device_ONLINE

Field Name	Type	Len	Description
<i>SMF009_VARY_Device_ONLINE.<fieldname></i>			
SMF009_VARY_Device_ONLINE.Header_Self_defining_Section.<fieldname>			
zFLG	HEX	1	(IBM name: SMF9FLG) System indicator: Bit Meaning when set 0-2 Reserved 3-6 Version indicators* 7 RESERVED. *See 'Standard and Extended SMF record headers' on page 174 FOR a detailed description.
zRTY	INT	1	(IBM name: SMF9RTY) Record type 9 (X'09').
zTME	TSTMP	8	(IBM name: SMF9TME) Date/Time when the record was built into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF9SID) System identification (from the SID parameter).
zLENN	INT	2	(IBM name: SMF9LENN) Length of rest of record including this field.

Secondary segment: SMF009_Device

Field Name	Type	Len	Description
<i>SMF009_Device.<fieldname></i>			
zDUT	INT	2	(IBM name: SMF9DUT) Device class and unit type.
zCUA	INT	2	(IBM name: SMF9CUA) Device number.
zVPC	INT (ENUM)	1	(IBM name: SMF9VPC) Identifies the issuer of the vary path command that causes the specified device to change states
zRSV	CHAR	3	(IBM name: SMF9RSV) Reserved.

Record Type 10 - Allocation Recovery

SMF Record 10 (Allocation Recovery) is mapped by structure member "T010".

Primary Segment:

- SMF010_Allocation_Recovery

Secondary Segment(s): 1

- SMF010_Device

Primary segment: SMF010_Allocation_Recovery

Field Name	Type	Len	Description
<i>SMF010_Allocation_Recovery.<fieldname></i>			
SMF010_Allocation_Recovery.Header_Self_defining_Section.<fieldname>			
zFLG	HEX	1	(IBM name: SMF10FLG) System indicator: Bit Meaning when set 0-2 Reserved 3-6 Version indicators* 7 RESERVED. *See 'Standard and Extended SMF record headers' on page 174 FOR a detailed description.
zRTY	INT	1	(IBM name: SMF10RTY) Record type 10 (X'0A').
zTME	TSTMP	8	(IBM name: SMF10TME) Date/Time that the record was built into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF10SID) System identification (from the SID parameter).
zJBN	CHAR	8	(IBM name: SMF10JBN) Job name The job name, time, and date that the reader recognized the JOB card (for this job) constitute the job log identification, or transaction name (for APPC output). Note: This field contains blanks if allocation recovery is for a system task.
zRST	TSTMP	8	(IBM name: SMF10RST) Date/Time that the reader recognized the JOB card (for this job). This field equals zero if allocation recovery is for a system task.
zUIF	CHAR	8	(IBM name: SMF10UIF) User-defined identification field (taken from common exit parameter area, not from USER=parameter on job statement).
zLN	INT	2	(IBM name: SMF10LN) Length of rest of record including this field.

Secondary segment: SMF010_Device

Field Name	Type	Len	Description
<i>SMF010_Device.<fieldname></i>			
zDUT	INT	2	(IBM name: SMF10DUT) Device class and unit type.
zCUA	INT	2	(IBM name: SMF10CUA) Device number.

Record Type 11 - VARY Device OFFLINE

SMF Record 11 (VARY Device OFFLINE) is mapped by structure member "T011".

Primary Segment:

- SMF011_VARY_Device_OFFLINE

Secondary Segment(s): 1

- SMF011_Device

Primary segment: SMF011_VARY_Device_OFFLINE

Field Name	Type	Len	Description
<i>SMF011_VARY_Device_OFFLINE.<fieldname></i>			
SMF011_VARY_Device_OFFLINE.Header_Self_defining_Section.<fieldname>			
zFLG	HEX	1	(IBM name: SMF11FLG) System indicator: Bit Meaning when set 0-2 Reserved 3-6 Version indicators* 7 RESERVED. *See 'Standard and Extended SMF record headers' on page 174 FOR a detailed description.
zRTY	INT	1	(IBM name: SMF11RTY) Record type 11 (X'0B').
zTME	TSTMP	8	(IBM name: SMF11TME) Date/Time that the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF11SID) System identification (from the SID parameter).
zLN	INT	2	(IBM name: SMF11LN) Length of the rest of the record (including this field).

Secondary segment: SMF011_Device

Field Name	Type	Len	Description
<i>SMF011_Device.<fieldname></i>			
zDUT	INT	2	(IBM name: SMF11DUT) Device class and unit type.
zCUA	INT	2	(IBM name: SMF11CUA) Device number.
zVPC	INT (ENUM)	1	(IBM name: SMF11VPC) Identifies the issuer of the vary path command that causes the specified device to change states
zRSV	CHAR	3	(IBM name: SMF11RSV) Reserved.

Record Type 14 - INPUT or RDBACK Dataset

SMF Record 14 (INPUT or RDBACK Dataset) is mapped by structure member "T014".

Primary Segment:

- [SMF014_INPUT_or_RDBACK_Dataset](#)

Secondary Segment(s): 9 (in alphabetical order)

- [SMF014#1_Compressed_format_Dataset](#)
- [SMF014#2_SMS_Class](#)
- [SMF014#3_Step_Info](#)
- [SMF014#4_ISO_ANSI_V4_CCSID_Info](#)
- [SMF014#5_Additional_Dataset_Char](#)
- [SMF014#6_PDSE_Statistics](#)
- [SMF014#7_Tape_Encryption](#)
- [SMF014#8_RAS](#)
- [SMF014#9_Dataset_Encryption](#)

Primary segment: [SMF014_INPUT_or_RDBACK_Dataset](#)

Field Name	Type	Len	Description
<i>SMF014_INPUT_or_RDBACK_Dataset.<fieldname></i>			
<i>SMF014_INPUT_or_RDBACK_Dataset.Header_Self_Defining_Section.<fieldname></i>			
zFLG	HEX	1	(IBM name: SMF14FLG) System indicator: Bit Meaning when set 0-2 Reserved 3-6 Version indicators 7 Reserved.
zRTY	INT	1	(IBM name: SMF14RTY) Record type 14 (X'0E').
zTME	TSTMP	8	(IBM name: SMF14TME) Date/Time that the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF14SID) System identification (from the SID parameter).
zJOBNAME	CHAR	8	(IBM name: SMF14JBN) Job name. The job name, time, and date that the reader recognized the JOB card (for this job) constitute the job log identification, or transaction name (for APPC output).
zRST	TSTMP	8	(IBM name: SMF14RST) Date/Time that the reader recognized the JOB card (for this job).
zUSERID	CHAR	8	(IBM name: SMF14UID) User-defined identification field (taken from common exit parameter area, not from USER=parameter on job statement).

<i>SMF014_INPUT_or_RDBACK_Dataset.Header_Self_Defining_Section.zRIN.<fieldname></i>			
zEOV	BIT	1	Record written by end of volume (EOV).
zDAD	BIT	1	DASD.
zTDS	BIT	1	Temporary data set.
zDDA	BIT	1	DCBDSORG=DA (the data set organization being used is direct access-BDAM).
zIS	BIT	1	DCBDSORG=IS and DCBMACRF not EXCP (the data set organization being used is indexed sequential and the EXCP access method is not being used).
zJIS	BIT	1	JFCDSORG=IS (the data set organization being used is indexed sequential).
zVIO	BIT	1	Virtual input output (VIO) data set access.
zIPD	BIT	1	Partitioned data set directory entries (PDSE) data set.

zTRC	BIT	1	The QSAM TRUNC macro has been issued against a PDSE.
zNSG	BIT	1	Null segment encountered in a PDSE.
zSTR	BIT	1	Extended format sequential data set indicator.
zHBT	BINT	1	Hiperbatch section present.
zXSG	BIT	1	Extended information segment present.
zTCL	BIT	1	Task termination closed the DCB.
zABD	BIT	1	Task is terminating (TCBFA is on).

SMF014_INPUT_or_RDBACK_Dataset.Section_Sizes.<fieldname>

zSDC	INT	1	(IBM name: SMF14SDC) Size of DCB/DEB section.
zNUC	INT	1	(IBM name: SMF14NUC) Number of UCB sections. There is always one UCB section for each UCB currently processing except for BPAM-concatenated data sets. For BPAM there is one UCB section for each data set in the concatenation except that any z/OS UNIX directories are omitted. For extended format data sets, there is one UCB section for each volume.
zSUC	INT	1	(IBM name: SMF14SUC) Size of each UCB section.
zSET	INT	1	(IBM name: SMF14SET) Size of ISAM extension section. This field always contains X'0'.
zOPE	TIME	4	(IBM name: SMF14OPE) Time when the data set was opened.

SMF014_INPUT_or_RDBACK_Dataset.TIOT.<fieldname>

SMFTIOE1	INT	1	Length, in bytes, of the DD entry (including all device entries). This field is mapped by TIOELNGH in the TIOT mapping.
SMFTIOE2	HEX	1	Status indicator. This field indicates the tape label processing to be performed. whether unallocating, rewinding, or unloading tape data sets is required. This field is mapped by TIOESSTA in the TIOT mapping.
SMFTIOE3	INT	1	Number of devices requested for this data set during allocation. For PDSE data sets, this field will always contain X'1'. This field is mapped by TIOEWTCT in the TIOT mapping.
SMFTIOE4	HEX	1	A data set and device indicator. This field is mapped by TIOELINK in the TIOT mapping.
SMFTIOE5	CHAR	8	Data definition name (DDname). This field is mapped by TIOEDDNM in the TIOT mapping.
SMFTIOE6	HEX	3	Scheduler Work Area (SWA) address of the job file control block (JFCB). This field is mapped by TIOEJFCB in the TIOT mapping.
SMFTIOE7	HEX	1	This field is mapped by TIOESTTC in the TIOT mapping.

SMF014_INPUT_or_RDBACK_Dataset.JFCB.<fieldname>

DSN	CHAR	44	DATA SET NAME (DSNAME=). For TCAM this is the 8 byte PROCESS QUEUE NAME (QNAME=)
ELNM	CHAR	8	DSNAME= ELEMENT (MEMBER) NAME (DSNAME=x(member)). MEMBER NAME OR RELATIVE GENERATION NUMBER. TYPE OF AREA (INDEX, PRIME OR OVERFLOW) FOR AN INDEXED SEQUENTIAL DATA SET ONLY.
FCIPLTX	CHAR	7	MODULE NAME OF NETWORK CONTROL PROGRAM (DCB=IPLTXID=) (TCAM)
LSRD	CHAR	8	Target DDNAME for Batch LSR when JFCBLSR indicator is ON

SMF014_INPUT_or_RDBACK_Dataset.JFCB.TDSM.<fieldname>

CAT	BIT	1	DATA SET IS CATALOGED
VSL	BIT	1	VOLUME SERIAL LIST HAS BEEN CHANGED

SDS	BIT	1	SUBSYSTEM DATA SET - This dataset is either a SYSIN/SYSOUT dataset, or SUBSYS= was specified on the DD statement
TTR	BIT	1	A JOB STEP IS TO BE RESTARTED. USE JFCBOTTR INSTEAD OF DS1LSTAR FIELD TO REPOSITION DATA SET IF AUTOMATIC STEP RESTART OCCURS. (THIS JOB HAD ABEND PROCESSING FOR A DATA SET OPENED FOR MOD.)
NWRIT	BIT	1	DO NOT WRITE BACK THE JFCB DURING OPEN PROCESSING
NDSCB	BIT	1	DO NOT MERGE DSCB OR LABEL FIELDS INTO THIS JFCB
NDCB	BIT	1	DO NOT MERGE DCB FIELDS INTO THIS JFCB
PAT	BIT	1	THE PATTERNING DSCB IS COMPLETE

SMF014_INPUT_or_RDBACK_Dataset.JFCB.<fieldname>

DSCB	HEX	3	TTR OF THE FORMAT 1 DSCB FOR DATA SET PART ON THE FIRST VOLUME OF THE DATA SET
FCBID	HEX	4	FORMS CONTROL BUFFER IMAGE ID (FCB=name)

SMF014_INPUT_or_RDBACK_Dataset.JFCB.TDSM.AM.<fieldname>

AMCRO	HEX	2	CHECKPOINT/RESTART OPTION INDICATORS
AMSTR	INT	2	NUMBER OF STRINGS (AMP=('STRNO=num'))

SMF014_INPUT_or_RDBACK_Dataset.JFCB.TDSM.<fieldname>

ADBF	INT	2	NUMBER OF DATA BUFFERS AMP=('BUFND=NNN') (VSAM)
NLREC	INT	2	LOGICAL RECORD LENGTH - VSAM

SMF014_INPUT_or_RDBACK_Dataset.JFCB.TDSI.<fieldname>

TrackRecordingTechnique	BINT (ENUM)	4	
Media	BINT (ENUM)	4	
Compaction	BINT (ENUM)	4	
SpecialAttr	BINT (ENUM)	4	

SMF014_INPUT_or_RDBACK_Dataset.JFCB.<fieldname>

LabelType	INT (ENUM)	1	
BUFOF	INT	1	TAPE DATA SET - THIS FIELD CONTAINS THE BUFFER
FLSQ	INT	2	LABEL= FILE (DATA SET) SEQUENCE NUMBER (LABEL=(ds-seq#,))
VLSQ	INT	2	VOLUME= VOLUME SEQUENCE NUMBER (VOL=(,vol-seq#,))
DMMASK	HEX	8	DATA MANAGEMENT MASK
CRDT	DATE	3	DATA SET CREATION DATE in the format: 'YYDDDD' in which the year is an offset from 1900, i.e. 1989 is 1900 + 89. The 89 in hex is 59, in this case January 8, 1989 would be 590008. This date is the date of the Allocation of the data set and is not valid until the Allocation is processing.
XPDT	DATE	3	DATA SET EXPIRATION DATE (LABEL=EXPDT=) Stored in the same format as the Creation Date This field may alternately contain the date that is calculated by adding the Retention Period (LABEL=RETPD=) to the Creation Date (JFCBCRDT). NOTE: JFCBXPDT is not valid until the data set is actually allocated.
IND1	INT (ENUM)	1	

SMF014_INPUT_or_RDBACK_Dataset.JFCB.Ind2.<fieldname>			
Disp	BINT (ENUM)	2	Disposition - NEW/MOD/OLD
Security	BINT (ENUM)	2	Indicates when a password is required
Shr	BINT (ENUM)	1	Shared Dataset
ENT	BIT	1	Delete this JFCB before alloc for a restarted GDG
REQ	BIT	1	Storage Volume Requested
Temp	BIT	1	Dataset will be deleted when job completes with a normal condition code

SMF014_INPUT_or_RDBACK_Dataset.JFCB.<fieldname>			
BUFIN	BINT	4	INPUT Buffers (DCB=BUFIN=) BITS 0-3 CONTAIN THE NUMBER OF BUFFERS ASSIGNED INITIALLY FOR RECEIVING OPERATIONS FOR EACH LINE IN A LINE GROUP (TCAM)
BUFOUT	BINT	4	OUTPUT Buffers (DCB=BUFOUT=) BITS 4-7 CONTAIN THE NUMBER OF BUFFERS ASSIGNED INITIALLY FOR SENDING OPERATIONS FOR EACH LINE IN A LINE GROUP (TCAM)
BUFL	INT	2	BUFFER LENGTH (DCB=BUFL=)
EROPT	INT (ENUM)	1	
TRTCH	INT (ENUM)	1	TAPE RECORDING TECHNIQUE (DCB=TRTCH=)
KEYLE	HEX	1	DIRECT ACCESS KEY LENGTH (DCB=KEYLEN=)
MODE	INT (ENUM)	1	MODE OF OPERATION (CARD READER, CARD PUNCH) (DCB=MODE=)
STACK	HEX	1	STACKER SELECTION (CARD READER, CARD PUNCH) (DCB=STACK=)
PRTSP	INT (ENUM)	1	NORMAL PRINTER SPACING (DCB=PRTSP=)
DEN	INT (ENUM)	1	TAPE DENSITY - 2400/3400 SERIES MAGNETIC TAPE UNITS (DCB=DEN=)
ABFS	INT	3	TOTAL BUFFER SIZE FOR ALL VSAM BUFFERS (AMP=('BUFSP=num')) (VSAM)

SMF014_INPUT_or_RDBACK_Dataset.JFCB.DSORG.<fieldname>			
DSRG1	INT (ENUM)	1	DATA SET ORGANIZATION - BYTE1
DSRG2	INT (ENUM)	1	DATA SET ORGANIZATION - BYTE2

SMF014_INPUT_or_RDBACK_Dataset.JFCB.<fieldname>			
RECFM	INT (ENUM)	1	RECORD FORMAT (DCB=RECFM=) (AMP=('RECFM=')). 'Unk' => No RECFM recorded. 'F' => Fixed length. 'FA' => Fixed length (ANSI format). 'FB' => Fixed length (blocked). 'FBA' => Fixed length (blocked, ANSI format). 'FBM' => Fixed length (blocked, machine code format). 'FBS' => Fixed length (blocked, standard blocks). 'FBSA' => Fixed length (blocked, standard blocks, ANSI format). 'FBSM' => Fixed length (blocked, standard blocks, machine code format). 'FBT' => Fixed length (blocked, track overflow). 'FBTA' => Fixed length (blocked, track overflow, ANSI format). 'FBTM' => Fixed length (blocked, track overflow, machine code format). 'FM' => Fixed length (machine code format). 'FS' => Fixed length (standard blocks). 'FSA' => Fixed length (standard blocks, ANSI format).

			'FSM' => Fixed length (standard blocks, machine code format). 'FT' => Fixed length (track overflow). 'FTA' => Fixed length (track overflow, ANSI format). 'FTM' => Fixed length (track overflow, machine code format). 'U' => Undefined-length. 'UA' => Undefined-length (ANSI format). 'UM' => Undefined-length (machine code format). 'UT' => Undefined-length (track overflow). 'UTA' => Undefined-length (track overflow, ANSI format). 'UTM' => Undefined-length (track overflow, machine code format). 'V' => Variable length. 'VA' => Variable length (ANSI format). 'VB' => Variable length (blocked). 'VBA' => Variable length (blocked, ANSI format). 'VBM' => Variable length (blocked, machine code format). 'VBST' => Variable length (blocked, spanned, track overflow). 'VBSTA' => Variable length (blocked, spanned, track overflow, ANSI format). 'VBSTM' => Variable length (blocked, spanned, track overflow, machine code format). 'VBT' => Variable length (blocked, track overflow). 'VBTA' => Variable length (blocked, track overflow, ANSI format). 'VBTM' => Variable length (blocked, track overflow, machine code format). 'VM' => Variable length (machine code format). 'VS' => Variable length (spanned). 'VSA' => Variable length (spanned, ANSI format). 'VSM' => Variable length (spanned, machine code format). 'VT' => Variable length (track overflow). 'VTA' => Variable length (track overflow, ANSI format). 'VTM' => Variable length (track overflow, machine code format).
OPTCD	INT	1	OPTION CODES (DCB=OPTCD=)
BLKSZ	INT	2	MAXIMUM BLOCK SIZE (DCB=BLKSIZE=)
BUFSZ	INT	2	MAXIMUM BUFFER SIZE (DCB=BUFSIZE=)
IXBUF	INT	2	NUMBER OF INDEX BUFFERS (AMP=('BUFNI=num')) (VSAM)
RECL	INT	2	LOGICAL RECORD LENGTH (DCB=LRECL=)
BUFMX	INT	1	MAXIMUM NUMBER OF BUFFERS (DCB=BUFMAX=). THE MAXIMUM NUMBER OF BUFFERS TO BE USED FOR DATA TRANSFER FOR EACH LINE IN THIS LINE GROUP (TCAM)
NVOL	INT	1	NUMBER OF VOLUME SERIAL NUMBERS
VOLS	CHAR	30	VOLUME SERIAL NUMBERS - 1 to 5
PQTY	INT	3	SPACE= Primary quantity (SPACE=(, (prim-qty))) PRIMARY QUANTITY OF DIRECT ACCESS STORAGE REQUIRED
RUNIT	CHAR	3	UNIT TYPE (EBCDIC) OF A DEVICE AT A REMOTE TERMINAL. THE FIRST TWO CHARACTERS ARE RD (READER), PR (PRINTER) OR PU (PUNCH). THE THIRD CHARACTER IS A NUMBER FROM 1 TO 9

SMF014_INPUT_or_RDBACK_Dataset.JFCB.Space.<fieldname>

SpaceTyp	BINT (ENUM)	2	Request type - CYL/TRK/BLK
SpaceReq1	BINT (ENUM)	3	Request type - CONTIG/MXIG/ALX
SpaceReq2	BINT (ENUM)	1	Request type - ROUND/ABSTR

SMF014_INPUT_or_RDBACK_Dataset.JFCB.<fieldname>

SQTY	INT	3	SPACE= Secondary quantity (SPACE=(, (, sec-qty))) SECONDARY QUANTITY OF DIRECT ACCESS STORAGE REQUIRED
DQTY	INT	3	SPACE= Directory quantity (SPACE=(, (, dir-qty))) QUANTITY OF DIRECT ACCESS STORAGE REQUIRED FOR A DIRECTORY OR AN EMBEDDED INDEX AREA

ABST	INT	2	SPACE= Absolute track (ABSTR) request address
DRLH	CHAR	3	SPACE= AVERAGE DATA BLOCK LENGTH (blklgth)
VLCT	INT	1	VOLUME COUNT (volct) (VOL=(,,volct)
VLDQ	HEX	1	Volser dequeue indicators

SMF014_INPUT_or_RDBACK_Dataset.DCB_DEB.<fieldname>

SMFDCBOR	INT	2	Data set organization being used. This field is mapped by DCBDSORG in the DCB mapping.
SMFDCBRF	INT	1	Record format. This field is mapped by DCBREGFM in the DCB mapping.
SMFDCBMF	INT	2	Type of I/O macro instruction and options. This field is mapped by DCBMACRF in the DCB mapping.
SMFDCBFL	INT	1	Indicator used by the OPEN, CLOSE, EOVS routines such as the type of the last I/O operation. This field is mapped by DCBOFLGS in the DCB mapping.
SMFDCBOP	INT	1	Option codes used by access-method interfaces. This field is mapped by DCBOPTCD in the DCB mapping.
zRV2	INT	1	(IBM name: SMF14RV2) Reserved.
SMFDEBFL	INT	1	Data set and device status indicator. This field indicates whether a data set is modified, new or old, and shows the status of DASD. This field is mapped by DEBOFLGS in the DEB mapping. For information about DEBOFLGS.
SMFDEBOP	INT	1	Indicator showing both the method of I/O processing and the disposition that is to be performed when an end-of-volume (EOV) condition occurs. This field is mapped by DEBOPATB in the DEB mapping.
SMFDEBVL	INT	2	Volume sequence number. For direct access, the sequence number is relative to the first volume of the data set. For tape, the sequence number is relative to the first volume processed. This field is valid only for sequential data sets. This field is mapped by DEBVOLSQ in the DEB mapping.

SMF014_INPUT_or_RDBACK_Dataset.DCB_DEB.Space.DCB_DEB_Tape_Ext.<fieldname>

SMFDCBBL	INT	4	Block count for each volume. For PDSE data sets, this field will always contain X'0'. This field is mapped by DCBBLKCT in the DCB mapping.
SMFDSSNO	CHAR	6	Data set serial number. For PDSE data sets, this field will always contain X'0'. This field is mapped by UCBFSER in the UCB mapping.
zRV3	CHAR	1	(IBM name: SMF14RV3) Reserved.
zTDA	INT	1	(IBM name: SMF14TDA) Tape DS authorization flags.
zOPD	DATE	4	(IBM name: SMF14OPD) Date when the data set was opened, in the form 0ccyyddF.

SMF014_INPUT_or_RDBACK_Dataset.DCB_DEB.Space.DCB_DEB_DASD_Ext.<fieldname>

zNTU	INT	4	(IBM name: SMF14NTU) Relative track and record of the last user block in the form of TTR0, if a basic format data set. Relative track and record of the last user block in the form of TTTR, if a large format data set. For extended data sets, this field will accumulate the number of tracks used across all the volumes (TTTT).
zNTR	INT	4	(IBM name: SMF14NTR) Number of tracks released by the DADSM routine. For PDSE data sets, this field will always contain X'0'.
zNER	INT	1	(IBM name: SMF14NER) Number of extents released by the DADSM routine. For PDSE data sets, this field will always contain X'0'.
zEDI	INT	1	

			(IBM name: SMF14EDI) Enhanced Data Integrity (EDI) flag indicator. Bit Meaning when set 0 DATA set name found in EDI exclusion table. 1 DATA set being opened for output but is currently open for output. 2 DATA set being opened for input but is currently open for output and the data set is not excluded from EDI processing.. 3 APPLICATION requested EDI processing be bypassed and the data set is not excluded from EDI processing.. 4-7 Reserved.
zFG1	BIT	8	byte. Bit Meaning when set 0 LARGE format data set. zNTU is in TTRT format. 1 EAV BAM detected one or more EXCP or XDAP issuances-DEB2XEXCP flag is on. 2-7 Reserved.
zRV4	CHAR	1	(IBM name: SMF14RV4) Reserved.
zOPD	DATE	4	(IBM name: SMF14OPD) Date when the data set was opened, in the form 0ccyyddF.

SMF014_INPUT_or_RDBACK_Dataset.UCB.<fieldname>

SMFUCBDV	INT	2	Device number. If this field contains X'7FFF', this could be a virtual I/O (VIO) data set. If bit 7 0F field zRIN is set to one, this is a VIO data set. Virtual I/O devices are identified by the following: Device Class 0 UNIT Type 0 DEVICE Number X'7FFF' It is important to understand the following: v Allocation messages for VIO data sets will show VIO ALLOCATED TO ddname. v SMF records will show VIO unit addresses as X'7FFF'. v The actual in-storage UCB built for VIO will show address X'3FFF'. For example, the following messages indicate that ddname is not allocated to a Virtual I/O device, but is instead allocated to a real device whose unit address is X'3FFF' or X'7FFF' respectively: v IEF237I X'3FFF' ALLOCATED TO ddname v IEF237I X'7FFF' ALLOCATED TO ddname
SMFSRTEV	CHAR	6	Volume serial number.
SMFUCBTY	INT	4	Unit type. This field is mapped by UCBTYP in the UCB mapping.
SMFSRTES	INT	1	DASD volume status indicator. This field indicates whether this DASD volume is a private, public, storage, or control volume. For PDSE data sets, this field will always contain X'0'. This field is mapped by UCBSTAB in the UCB mapping.
zNEX	INT	1	(IBM name: SMF14NEX) Number of extents.
zRV5	CHAR	2	(IBM name: SMF14RV5) Reserved.
SMFEXCP	INT	4	EXCP count for entire step. Note that if a data set is opened and closed twice during a single step, the count in the second type 14 RECORD is the sum of all EXCPs for both uses of the data set. (The EXCP count in the last type 14 RECORD for the step is equal to the corresponding entry for the data set in record type 4). For more information about EXCP count. For PDSE data sets, the number of pages that were read or written. For compressed data sets the number of physical blocks that were read or written.

SMF014_INPUT_or_RDBACK_Dataset.UCB.Space.SMF014_UCB_TapeExt.<fieldname>

SMFSRTEF	INT	2	Data set sequence count.
SMFSRTEQ	INT	2	Data set sequence number.

SMF014_INPUT_or_RDBACK_Dataset.UCB.Space.SMF014_UCB_DASDExt.<fieldname>

zNTA	INT	4	Number of tracks allocated on the device. For PDSE data sets, this field will always contain X'0'.
------	-----	---	--

SMF014_INPUT_or_RDBACK_Dataset.HiperBatch.<fieldname>

SMFIOREQ	INT	4	(IBM name: SMF14NUC) Number of requests for I/O issued by the access method for this data set for which Hiperbatch attempted to find the requested data in its buffers (see SMFCHITS and SMFPHIOS).
SMFCHITS	INT	4	Number of requests for I/O issued by the access method for this data set satisfied by moving data from Hiperbatch buffers.

SMFNMWTS	INT	4	Number of times Hiperbatch temporarily suspended this requester because another user was already reading some or all of the requested data.
SMFPHIOS	INT	4	Number of requests for I/O issued by the access method for this data set satisfied by performing DASD I/O. Note that the sum of SMFPHIOS and SMFCHITS should equal SMFIOREQ.
SMFCIOS	INT	4	Number of DASD I/Os (as recorded in SMFPHIOS) for which Hiperbatch copied the data into its buffers.

SMF014_INPUT_or_RDBACK_Dataset.ISAM_Extension.<fieldname>

zRV6	CHAR	2	(IBM name: SMF14RV6) Reserved.
SMFDCBMA	INT	1	Extension of I/O macro instruction (DCBMACRF) for ISAM. This field is mapped by DCBMACCT in the DCB mapping.
SMFDCBNL	INT	1	Number of index levels. This field is mapped by DCBNLVET in the DCB mapping.
SMFDCBR3	INT	4	For each use of the data set, number of read or write accesses to an overflow record which is not first in a chain of such records. This field is mapped by DCBRORG3 in the DCB mapping.
SMFDCBNR	INT	4	Number of logical records in prime data area. This field is mapped by DCBNRECT in the DCB mapping.
SMFDCBR2	INT	2	Number of tracks (whole or partial remaining in overflow area). This field is mapped by DCBRORG2 in the DCB mapping.
SMFDCBNO	INT	2	Number of logical records in overflow area. This field is mapped by DCBNOREC in the DCB mapping.
SMFDCBR1	INT	2	Number of cylinder overflow areas that are full. This field is mapped by DCBRORG1 in the DCB mapping.
zRV7	CHAR	1	(IBM name: SMF14RV7) Reserved.
SMFDEBNI	INT	1	Number of extents in independent index area. This field is mapped by DEBNIEEQ in the DEB mapping.
SMFDEBNP	INT	1	Number of extents in prime data area. This field is mapped by DEBNPEEQ in the DEB mapping.
SMFDEBNO	INT	1	Number of extents in independent overflow area. This field is mapped by DEBNOEEQ in the DEB mapping.
SMFNPCYL	INT	2	Number of cylinders in independent index area.
SMFNPCYL	INT	2	Number of cylinders in prime data area.
SMFNOCYL	INT	2	Number of cylinders in independent overflow area.

SMF014_INPUT_or_RDBACK_Dataset.Ext_Info_Seg_Desc.<fieldname>

zSXS	INT	2	(IBM name: SMF14SXS) Size of extended information segment (size of all sections including this length field).
------	-----	---	--

Secondary segment: SMF014#1_Companded_format_Dataset

Field Name	Type	Len	Description
SMF014#1_Companded_format_Dataset.<fieldname>			
zESL1	INT	2	(IBM name: N/A) Size of this extended information section (size of variable length fields including this 4 BYTE section descriptor word).
zSTY	INT	1	(IBM name: SMF14STY) Section type code. Type Meaning when set 1 COMPRESSED format data set section 2 SMS class information section 3 STEP Information section 4 ISO/ANSI Version 4 CCSID (coded character set ID) information section 5

			ADDITIONAL data set characteristics section 6 PDSE data set caching statistics 7 TAPE encryption data section 8 RAS section 9 DASD data set encryption section
SMF014#1_Compressed_format_Dataset.zXF1.<fieldname>			
zLBD	BIT	1	Compressed format data set size values (SMF14CDS and SMF14UDS) are invalid.
zCRJ	BIT	1	Compression of the data set has been rejected.
zZEDCNAC	BIT	1	During output processing, the system determined that the zEDC feature was not available. In this case, some or all data was written non-compressed due to unavailability of the zEDC feature. (If 0, then zEDC used on all compression.) Valid only when SMF14CMPTYPE is SMF14CMPTYPEZEDC.
zZEDCNAD	BIT	1	During input processing, the system determined that the zEDC feature was not available. In this case, it used software decompression to decompress the data. (If 0, then zEDC used on decompression.) Valid only when SMF14CMPTYPE is SMF14CMPTYPEZEDC.
SMF014#1_Compressed_format_Dataset.<fieldname>			
zXF2	HEX	1	(IBM name: SMF14XF2) Indicators: Bit Meaning when set 0-7 Reserved.
zCDL	INT	8	(IBM name: SMF14CDL) Number of bytes of compressed data read or written since this open.
zUDL	INT	8	(IBM name: SMF14UDL) Number of bytes of data read or written since this open (data length prior to compression).
zCDS	INT	8	(IBM name: SMF14CDS) Size of the compressed format data set (number of compressed user data bytes).
zUDS	INT	8	(IBM name: SMF14UDS) Size of the compressed format data set (number of uncompressed user data bytes).
zCIS	INT	4	(IBM name: SMF14CIS) Physical block size of extended format data set.
zTKL	INT	2	(IBM name: SMF14TKL) Length of dictionary token, SMF14TKN field (not including the length of this field). Currently equals 36.
zTKN	HEX	36	(IBM name: SMF14TKN) Dictionary token for compressed format data set.
zCMPTYPE	INT	1	(IBM name: SMF14CMPTYPE) Indicators: Value Name and meaning when set 0 SMF14CMPTYPEPENA. Not compressed format, or unknown. 1 SMF14CMPTYPEGEN. Generic compression. 2 MF14CMPTYPEPLRD. Tailored compression. 3 SMF14CMPTYPEZEDC. zEDC compression.

Secondary segment: **SMF014#2_SMS_Class**

Field Name	Type	Len	Description
SMF014#2_SMS_Class.<fieldname>			
zESL2	INT	2	(IBM name: N/A) Size of this extended information section (size of variable length fields including this 4 BYTE section descriptor word).
zSTY	INT	1	(IBM name: SMF14STY) Section type code. Type Meaning when set 1 COMPRESSED format data set section 2 SMS class information section 3 STEP Information section 4 ISO/ANSI Version 4 CCSID (coded character set ID) information section 5 ADDITIONAL data set characteristics section 6 PDSE data set caching statistics 7 TAPE encryption data section 8 RAS section 9 DASD data set encryption section

zMCN	CHAR	8	(IBM name: SMF14MCN) SMS Management class name.
zDCN	CHAR	8	(IBM name: SMF14DCN) SMS Data class name.
zSCN	CHAR	8	(IBM name: SMF14SCN) SMS Storage class name (first 8 CHARACTERS).

Secondary segment: SMF014#3_Step_Info

Field Name	Type	Len	Description
<i>SMF014#3_Step_Info.<fieldname></i>			
zESL3	INT	2	(IBM name: N/A) Size of this extended information section (size of variable length fields including this 4 BYTE section descriptor word).
zSTY	INT	1	(IBM name: SMF14STY) Section type code. Type Meaning when set 1 COMPRESSED format data set section 2 SMS class information section 3 STEP Information section 4 ISO/ANSI Version 4 CCSID (coded character set ID) information section 5 ADDITIONAL data set characteristics section 6 PDSE data set caching statistics 7 TAPE encryption data section 8 RAS section 9 DASD data set encryption section
zSPN	CHAR	8	(IBM name: SMF14SPN) Job step name.
zPGN	CHAR	8	(IBM name: SMF14PGN) Job step program name.
SMFJOBID	CHAR	8	Job ID.
SMFPLXID	CHAR	8	Sysplex name.

Secondary segment: SMF014#4_ISO_ANSI_V4_CCSID_Info

Field Name	Type	Len	Description
<i>SMF014#4_ISO_ANSI_V4_CCSID_Info.<fieldname></i>			
zESL4	INT	2	(IBM name: N/A) Size of this extended information section (size of variable length fields including this 4 BYTE section descriptor word).
zSTY	INT	1	(IBM name: SMF14STY) Section type code. Type Meaning when set 1 COMPRESSED format data set section 2 SMS class information section 3 STEP Information section 4 ISO/ANSI Version 4 CCSID (coded character set ID) information section 5 ADDITIONAL data set characteristics section 6 PDSE data set caching statistics 7 TAPE encryption data section 8 RAS section 9 DASD data set encryption section

SMF014#4_ISO_ANSI_V4_CCSID_Info.zCFG.<fieldname>

zIBM	BIT	1	IBM format Version 4 tape
zOUT	BIT	1	Opened for OUTPUT not DISP=MOD
zMOD	BIT	1	Opened for OUTPUT DISP=MOD
zUDF	BIT	1	User CCSID value is defaulted to CCSID=500
zTDF	BIT	1	Tape CCSID value is defaulted to CCSID=367
zIGN	BIT	1	CCSID value specified on DD statement was ignored

SMF014#4_ISO_ANSI_V4_CCSID_Info.<fieldname>

zUSR	INT	4	(IBM name: SMF14USR) CCSID user application expects data records to be in (specified on JOB/EXEC statement or defaulted).
zTPE	INT	4	(IBM name: SMF14TPE) CCSID of data records on tape (specified on DD statement or in tape label).
zLBL	INT	4	(IBM name: SMF14LBL) CCSID specified in the tape label of an existing tape when opened for input processing. Note: 1. If opened for input processing, then bit 1 AND 2 WILL both be off. 2. If no CCSID information is specified (in other words SMF14USR and SMF14TPE are 0), then the IBM standard ASCII/EBCDIC (XLATE) was used to process this Version 4 TAPE.

Secondary segment: SMF014#5_Additional_Dataset_Char

Field Name	Type	Len	Description
<i>SMF014#5_Additional_Dataset_Char.<fieldname></i>			
zESL5	INT	2	(IBM name: N/A) Size of this extended information section (size of variable length fields including this 4 BYTE section descriptor word).
zSTY	INT	1	(IBM name: SMF14STY) Section type code. Type Meaning when set 1 COMPRESSED format data set section 2 SMS class information section 3 STEP Information section 4 ISO/ANSI Version 4 CCSID (coded character set ID) information section 5 ADDITIONAL data set characteristics section 6 PDSE data set caching statistics 7 TAPE encryption data section 8 RAS section 9 DASD data set encryption section

SMF014#5_Additional_Dataset_Char.zBFG0.<fieldname>

zBLK	BIT	1	Block size is present in zLBS
zFLGP	BIT	1	Flag field is present in zFLG1/2
zDST	BIT	1	Dataset version is present in zDSVER
zALS	BIT	1	Alias name is present in zALI

SMF014#5_Additional_Dataset_Char.<fieldname>

zBFG1	HEX	1	(IBM name: SMF14BFG1) Flag byte 2.
zLBS	INT	8	(IBM name: SMF14LBS) Block size value.

SMF014#5_Additional_Dataset_Char.zBFG0.zFLG1.<fieldname>

zUPF	BIT	1	BSAM user PGFIX option flag (DEB2XUPF)
zEADSCB1	BIT	1	DCBEADSCBOK flag (If on, then EADSCB=OK specified in DCBE. If off, then either there is no DCBE or EADSCB=OK is not specified in the DCBE)
zEADSCB2	BIT	1	DCBEADSCBOK flag (If on, then EADSCB=OK specified in DCBE. If off, then either there is no DCBE or EADSCB=OK is not specified in the DCBE)
zXTIO	BIT	1	DD has XTIO, not TIOT entry
zDSENCRYPTOK	BIT	1	If on, the application program is enabled for basic and large format data set encryption with EXCP. The application coded DSENCRYPT=OK on the DCBE macro.

SMF014#5_Additional_Dataset_Char.zBFG0.<fieldname>

zFLG2	HEX	1	(IBM name: SMF14FLG2) Flag byte 2.
-------	-----	---	---------------------------------------

zDSVER	HEX	1	(IBM name: SMF14DSVER) Indicates the version of the data set or, in the case of a partitioned concatenation, the first data set in the concatenation, as follows: Value Meaning m'00' The data set is neither a PDSE nor an extended-format data set. X'01' The data set is either a PDSE V1 or an extended-format V1. X'02' The data set is either a PDSE V2 or an extended-format V2.
zALI	CHAR	44	(IBM name: SMF14ALI) Alias data set name.

Secondary segment: **SMF014#6_PDSE_Statistics**

Field Name	Type	Len	Description
<i>SMF014#6_PDSE_Statistics.<fieldname></i>			
zESL6	INT	2	(IBM name: N/A) Size of this extended information section (size of variable length fields including this 4 BYTE section descriptor word).
zSTY	INT	1	(IBM name: SMF14STY) Section type code. Type Meaning when set 1 COMPRESSED format data set section 2 SMS class information section 3 STEP Information section 4 ISO/ANSI Version 4 CCSID (coded character set ID) information section 5 ADDITIONAL data set characteristics section 6 PDSE data set caching statistics 7 TAPE encryption data section 8 RAS section 9 DASD data set encryption section
zDRD	INT	4	(IBM name: SMF14DRD) Directory read request count.
zDRDH	INT	4	(IBM name: SMF14DRDH) Directory read hit count.
zMRD	INT	4	(IBM name: SMF14MRD) Member read request count.
zMRDH	INT	4	(IBM name: SMF14MRDH) Member read hit count.
zMCE	INT	4	(IBM name: SMF14MCE) Member cache eligible count.
zMST	INT	4	(IBM name: SMF14MST) Member cache stolen count.
zMNC	INT	4	(IBM name: SMF14MNC) Member cache eligible but not cached count.
zMCF	INT	4	(IBM name: SMF14MCF) Member cache eligible but cache full count. Note: If concatenation is involved, the counts reflect the total count for all concatenated PDSE data sets.

Secondary segment: **SMF014#7_Tape_Encryption**

Field Name	Type	Len	Description
<i>SMF014#7_Tape_Encryption.<fieldname></i>			
zESL7	INT	2	(IBM name: N/A) Size of this extended information section (size of variable length fields including this 4 BYTE section descriptor word).
zSTY	INT	1	(IBM name: SMF14STY) Section type code. Type Meaning when set 1 COMPRESSED format data set section 2 SMS class information section 3 STEP Information section 4 ISO/ANSI Version 4 CCSID (coded character set ID) information section 5 ADDITIONAL data set characteristics section 6 PDSE data set caching statistics 7 TAPE encryption data section 8 RAS section 9 DASD data set encryption section

zKL1	CHAR	64	(IBM name: SMF14KL1) Key label 1
SMF12CD1	CHAR	1	Encoding mechanism for key label 1. This field can be 'L' for Label or 'H' for Hash.
zKL2	CHAR	64	(IBM name: SMF14KL2) Key label 2
zCD2	CHAR	1	(IBM name: SMF14CD2) Encoding mechanism for key label 2. This field can be 'L' for Label or 'H' for Hash.
zKET	INT	4	(IBM name: SMF14KET) Key exchange time in hundredths seconds. The key exchange (encryption overhead) time is only applicable for SMF record type 15 AND only for non-parallel OPEN processing writing file sequence 1 FROM loadpoint. In all other cases, this field is set to zero.

Secondary segment: **SMF014#8_RAS**

Field Name	Type	Len	Description
SMF014#8_RAS.<fieldname>			
zESL8	INT	2	(IBM name: N/A) Size of this extended information section (size of variable length fields including this 4 BYTE section descriptor word).
zSTY	INT	1	(IBM name: SMF14STY) Section type code. Type Meaning when set 1 COMPRESSED format data set section 2 SMS class information section 3 STEP Information section 4 ISO/ANSI Version 4 CCSID (coded character set ID) information section 5 ADDITIONAL data set characteristics section 6 PDSE data set caching statistics 7 TAPE encryption data section 8 RAS section 9 DASD data set encryption section

SMF014#8_RAS.zRFG0.<fieldname>			
zDCBEREJ	BIT	1	DCBE reject flags present.
zPREL	BIT	1	PARTREL flags present.

SMF014#8_RAS.zRFG1.<fieldname>			
zRFG1DBYP	BIT	1	OPEN with DCBE BYPASS_AUTH=YES was specified to bypass authorization checking. When zRFG1JBYP is also ON, bypass authorization checking because JSCBPASS is in effect.
zRFG1JBYP	BIT	1	JSCBPASS was specified to bypass authorization checking.
zRFG1AUTH	BIT	1	The caller of OPEN was either in supervisor state, in a system key, or APF-authorized.
zRFG1BYP	BIT	1	OPEN bypassed SAF authority checking. Refer to zRFG1DBYP and zRFG1JBYP to determine the method that was used to request bypass of SAF authority checking.

SMF014#8_RAS.<fieldname>			
zRFG2	HEX	1	(IBM name: SMF14RFG2) Reserved
zRFG3	HEX	1	(IBM name: SMF14RFG3) Reserved

SMF014#8_RAS.zRASDATA0.<fieldname>			
zDCBEEXCP	BIT	1	DCBE invalidated because EXCP and no foundation extension present.
zDCBEDS0RG	BIT	1	DCBE invalidated because DSORG is not PS, PO OR DA.
zDCBEFREE	BIT	1	DCBE invalidated because storage is not addressable.

zDCBEKEY	BIT	1	DCBE invalidated because DCBE storage is not in key of caller.
zDCBEID	BIT	1	DCBE invalidated because the DCBEID is not 'DCBE'.
zDCBEMIN	BIT	1	DCBE invalidated because it is not at least the minimum length required (56 bytes)
zN0DCBE	BIT	1	DCBEHIARC flags set but DCBDCBE is zeros.

SMF014#8_RAS.zRASDATA1.<fieldname>

zPRELVIO	BIT	1	Partial release not called by CLOSE because VIO data set.
zPRELABD	BIT	1	Partial release not called by CLOSE because task is abending.
zPRELINP	BIT	1	Partial release not called by CLOSE because not opened for output
zPRELEXCP	BIT	1	Partial release not called by CLOSE because EXCP DCB but no direct access device section present.
zPRELNOUT	BIT	1	Partial release not called by CLOSE because even though opened for output, last I/O was not output.
zPRELIO	BIT	1	Partial release had an I/O error.

Secondary segment: SMF014#9_Dataset_Encryption

Field Name	Type	Len	Description
SMF014#9_Dataset_Encryption.<fieldname>			
zESL9	INT	2	(IBM name: N/A) Size of this extended information section (size of variable length fields including this 4 BYTE section descriptor word).
zSTY	INT	1	(IBM name: SMF14STY) Section type code. Type Meaning when set 1 COMPRESSED format data set section 2 SMS class information section 3 STEP Information section 4 ISO/ANSI Version 4 CCSID (coded character set ID) information section 5 ADDITIONAL data set characteristics section 6 PDSE data set caching statistics 7 TAPE encryption data section 8 RAS section 9 DASD data set encryption section

SMF014#9_Dataset_Encryption.zDEF.<fieldname>

zDSENC	BIT	1	Data set encrypted
zDSEB	BIT	1	User requested access method to bypass decryption on reads and the system honored the request
zDSENCNP	BIT	1	Blocks do not have prefixes. Set only for basic and large format.

SMF014#9_Dataset_Encryption.<fieldname>

zDET	HEX	2	(IBM name: SMF14DET) Encryption type. The first byte is X'01' to signify AES. The second byte is X'00' to signify 256 bits.
zDKL	CHAR	64	(IBM name: SMF14DKL) DASD data set key labels

Record Type 15 - OUTPUT UPDAT INOUT or OUTIN

SMF Record 15 (OUTPUT UPDAT INOUT or OUTIN) is mapped by structure member "T015".

Primary Segment:

- SMF015_OUTPUT_UPDAT_INOUT_or_OUTIN

Secondary Segment(s): 9 (in alphabetical order)

- SMF015#1_Compressed_format_Dataset
- SMF015#2_SMS_Class
- SMF015#3_Step_Info
- SMF015#4_ISO_ANSI_V4_CCSDID_Info
- SMF015#5_Additional_Dataset_Char
- SMF015#6_PDSE_Statistics
- SMF015#7_Tape_Encryption
- SMF015#8_RAS
- SMF015#9_Dataset_Encryption

Primary segment: SMF015_OUTPUT_UPDAT_INOUT_or_OUTIN

Field Name	Type	Len	Description
<i>SMF015_OUTPUT_UPDAT_INOUT_or_OUTIN.<fieldname></i>			
<i>SMF015_OUTPUT_UPDAT_INOUT_or_OUTIN.Header_Self_Defining_Section.<fieldname></i>			
zFLG	HEX	1	(IBM name: SMF15FLG) System indicator: Bit Meaning when set 0-2 Reserved 3-6 Version indicators 7 Reserved.
zRTY	INT	1	(IBM name: SMF15RTY) Record type 15 (X'0F').
zTME	TSTMP	8	(IBM name: SMF15TME) Date/Time that the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF15SID) System identification (from the SID parameter).
zJOBNAME	CHAR	8	(IBM name: SMF15JBN) Job name. The job name, time, and date that the reader recognized the JOB card (for this job) constitute the job log identification, or transaction name (for APPC output).
zRST	TSTMP	8	(IBM name: SMF15RST) Date/Time that the reader recognized the JOB card (for this job).
zUSERID	CHAR	8	(IBM name: SMF15UID) User-defined identification field (taken from common exit parameter area, not from USER=parameter on job statement).
<i>SMF015_OUTPUT_UPDAT_INOUT_or_OUTIN.Header_Self_Defining_Section.zRIN.<fieldname></i>			
zEOV	BIT	1	Record written by end of volume (EOV).
zDAD	BIT	1	DASD.
zTDS	BIT	1	Temporary data set.
zDDA	BIT	1	DCBDSORG=DA (the data set organization being used is direct access-BDAM).
zIS	BIT	1	DCBDSORG=IS and DCBMACRF not EXCP (the data set organization being used is indexed sequential and the EXCP access method is not being used).
zJIS	BIT	1	JFCDSORG=IS (the data set organization being used is indexed sequential).
zVIO	BIT	1	Virtual input output (VIO) data set access.
zIPD	BIT	1	Partitioned data set directory entries (PDSE) data set.

zTRC	BIT	1	The QSAM TRUNC macro has been issued against a PDSE.
zNSG	BIT	1	Null segment encountered in a PDSE.
zSTR	BIT	1	Extended format sequential data set indicator.
zHBT	BINT	1	Hiperbatch section present.
zXSG	BIT	1	Extended information segment present.
zTCL	BIT	1	Task termination closed the DCB.
zABD	BIT	1	Task is terminating (TCBFA is on).

SMF015_OUTPUT_UPDAT_INOUT_or_OUTIN.Section_Sizes.<fieldname>

zSDC	INT	1	(IBM name: SMF15SDC) Size of DCB/DEB section.
zNUC	INT	1	(IBM name: SMF15NUC) Number of UCB sections. There is always one UCB section for each UCB currently processing except for BPAM-concatenated data sets. For BPAM there is one UCB section for each data set in the concatenation except that any z/OS UNIX directories are omitted. For extended format data sets, there is one UCB section for each volume.
zSUC	INT	1	(IBM name: SMF15SUC) Size of each UCB section.
zSET	INT	1	(IBM name: SMF15SET) Size of ISAM extension section. This field always contains X'0'.
zOPE	TIME	4	(IBM name: SMF15OPE) Time when the data set was opened.

SMF015_OUTPUT_UPDAT_INOUT_or_OUTIN.TIOT.<fieldname>

SMFTIOE1	INT	1	Length, in bytes, of the DD entry (including all device entries). This field is mapped by TIOELNGH in the TIOT mapping.
SMFTIOE2	HEX	1	Status indicator. This field indicates the tape label processing to be performed. whether unallocating, rewinding, or unloading tape data sets is required. This field is mapped by TIOESSTA in the TIOT mapping.
SMFTIOE3	INT	1	Number of devices requested for this data set during allocation. For PDSE data sets, this field will always contain X'1'. This field is mapped by TIOEWTCT in the TIOT mapping.
SMFTIOE4	HEX	1	A data set and device indicator. This field is mapped by TIOELINK in the TIOT mapping.
SMFTIOE5	CHAR	8	Data definition name (DDname). This field is mapped by TIOEDDNM in the TIOT mapping.
SMFTIOE6	HEX	3	Scheduler Work Area (SWA) address of the job file control block (JFCB). This field is mapped by TIOEJFCB in the TIOT mapping.
SMFTIOE7	HEX	1	This field is mapped by TIOESTTC in the TIOT mapping.

SMF015_OUTPUT_UPDAT_INOUT_or_OUTIN.JFCB.<fieldname>

DSN	CHAR	44	DATA SET NAME (DSNAME=). For TCAM this is the 8 byte PROCESS QUEUE NAME (QNAME=)
ELNM	CHAR	8	DSNAME= ELEMENT (MEMBER) NAME (DSNAME=x(member)). MEMBER NAME OR RELATIVE GENERATION NUMBER. TYPE OF AREA (INDEX, PRIME OR OVERFLOW) FOR AN INDEXED SEQUENTIAL DATA SET ONLY.
FCIPLTX	CHAR	7	MODULE NAME OF NETWORK CONTROL PROGRAM (DCB=IPLTXID=) (TCAM)
LSRD	CHAR	8	Target DDNAME for Batch LSR when JFCBLSR indicator is ON

SMF015_OUTPUT_UPDAT_INOUT_or_OUTIN.JFCB.TDSM.<fieldname>

CAT	BIT	1	DATA SET IS CATALOGED
VSL	BIT	1	VOLUME SERIAL LIST HAS BEEN CHANGED

SDS	BIT	1	SUBSYSTEM DATA SET - This dataset is either a SYSIN/SYSOUT dataset, or SUBSYS= was specified on the DD statement
TTR	BIT	1	A JOB STEP IS TO BE RESTARTED. USE JFCBOTTR INSTEAD OF DS1LSTAR FIELD TO REPOSITION DATA SET IF AUTOMATIC STEP RESTART OCCURS. (THIS JOB HAD ABEND PROCESSING FOR A DATA SET OPENED FOR MOD.)
NWRIT	BIT	1	DO NOT WRITE BACK THE JFCB DURING OPEN PROCESSING
NDSCB	BIT	1	DO NOT MERGE DSCB OR LABEL FIELDS INTO THIS JFCB
NDCB	BIT	1	DO NOT MERGE DCB FIELDS INTO THIS JFCB
PAT	BIT	1	THE PATTERNING DSCB IS COMPLETE

SMF015_OUTPUT_UPDAT_INOUT_or_OUTIN.JFCB.<fieldname>

DSCB	HEX	3	TTR OF THE FORMAT 1 DSCB FOR DATA SET PART ON THE FIRST VOLUME OF THE DATA SET
FCBID	HEX	4	FORMS CONTROL BUFFER IMAGE ID (FCB=name)

SMF015_OUTPUT_UPDAT_INOUT_or_OUTIN.JFCB.TDSM.AM.<fieldname>

AMCRO	HEX	2	CHECKPOINT/RESTART OPTION INDICATORS
AMSTR	INT	2	NUMBER OF STRINGS (AMP=('STRNO=num'))

SMF015_OUTPUT_UPDAT_INOUT_or_OUTIN.JFCB.TDSM.<fieldname>

ADBF	INT	2	NUMBER OF DATA BUFFERS AMP=('BUFND=NNN') (VSAM)
NLREC	INT	2	LOGICAL RECORD LENGTH - VSAM

SMF015_OUTPUT_UPDAT_INOUT_or_OUTIN.JFCB.TDSI.<fieldname>

TrackRecordingTechnique	BINT (ENUM)	4	
Media	BINT (ENUM)	4	
Compaction	BINT (ENUM)	4	
SpecialAttr	BINT (ENUM)	4	

SMF015_OUTPUT_UPDAT_INOUT_or_OUTIN.JFCB.<fieldname>

LabelType	INT (ENUM)	1	
BUFOF	INT	1	TAPE DATA SET - THIS FIELD CONTAINS THE BUFFER
FLSQ	INT	2	LABEL= FILE (DATA SET) SEQUENCE NUMBER (LABEL=(ds-seq#,))
VLSQ	INT	2	VOLUME= VOLUME SEQUENCE NUMBER (VOL=(,vol-seq#,))
DMMASK	HEX	8	DATA MANAGEMENT MASK
CRDT	DATE	3	DATA SET CREATION DATE in the format: 'YYDDDD' in which the year is an offset from 1900, i.e. 1989 is 1900 + 89. The 89 in hex is 59, in this case January 8, 1989 would be 590008. This date is the date of the Allocation of the data set and is not valid until the Allocation is processing.
XPDT	DATE	3	DATA SET EXPIRATION DATE (LABEL=EXPDT=) Stored in the same format as the Creation Date This field may alternately contain the date that is calculated by adding the Retention Period (LABEL=RETPD=) to the Creation Date (JFCBCRDT). NOTE: JFCBXPDT is not valid until the data set is actually allocated.
IND1	INT (ENUM)	1	

SMF015_OUTPUT_UPDAT_INOUT_or_OUTIN.JFCB.<fieldname>			
Disp	BINT (ENUM)	2	Disposition - NEW/MOD/OLD
Security	BINT (ENUM)	2	Indicates when a password is required
Shr	BINT (ENUM)	1	Shared Dataset
ENT	BIT	1	Delete this JFCB before alloc for a restarted GDG
REQ	BIT	1	Storage Volume Requested
Temp	BIT	1	Dataset will be deleted when job completes with a normal condition code

SMF015_OUTPUT_UPDAT_INOUT_or_OUTIN.JFCB.<fieldname>			
BUFIN	BINT	4	INPUT Buffers (DCB=BUFIN=) BITS 0-3 CONTAIN THE NUMBER OF BUFFERS ASSIGNED INITIALLY FOR RECEIVING OPERATIONS FOR EACH LINE IN A LINE GROUP (TCAM)
BUFOUT	BINT	4	OUTPUT Buffers (DCB=BUFOUT=) BITS 4-7 CONTAIN THE NUMBER OF BUFFERS ASSIGNED INITIALLY FOR SENDING OPERATIONS FOR EACH LINE IN A LINE GROUP (TCAM)
BUFL	INT	2	BUFFER LENGTH (DCB=BUFL=)
EROPT	INT (ENUM)	1	
TRTCH	INT (ENUM)	1	TAPE RECORDING TECHNIQUE (DCB=TRTCH=)
KEYLE	HEX	1	DIRECT ACCESS KEY LENGTH (DCB=KEYLEN=)
MODE	INT (ENUM)	1	MODE OF OPERATION (CARD READER, CARD PUNCH) (DCB=MODE=)
STACK	HEX	1	STACKER SELECTION (CARD READER, CARD PUNCH) (DCB=STACK=)
PRTSP	INT (ENUM)	1	NORMAL PRINTER SPACING (DCB=PRTSP=)
DEN	INT (ENUM)	1	TAPE DENSITY - 2400/3400 SERIES MAGNETIC TAPE UNITS (DCB=DEN=)
ABFS	INT	3	TOTAL BUFFER SIZE FOR ALL VSAM BUFFERS (AMP=('BUFSP=num')) (VSAM)

SMF015_OUTPUT_UPDAT_INOUT_or_OUTIN.JFCB.DSORG.<fieldname>			
DSRG1	INT (ENUM)	1	DATA SET ORGANIZATION - BYTE1
DSRG2	INT (ENUM)	1	DATA SET ORGANIZATION - BYTE2

SMF015_OUTPUT_UPDAT_INOUT_or_OUTIN.JFCB.<fieldname>			
RECFM	INT (ENUM)	1	RECORD FORMAT (DCB=RECFM=) (AMP=('RECFM=')). 'Unk' => No RECFM recorded. 'F' => Fixed length. 'FA' => Fixed length (ANSI format). 'FB' => Fixed length (blocked). 'FBA' => Fixed length (blocked, ANSI format). 'FBM' => Fixed length (blocked, machine code format). 'FBS' => Fixed length (blocked, standard blocks). 'FBSA' => Fixed length (blocked, standard blocks, ANSI format). 'FBSM' => Fixed length (blocked, standard blocks, machine code format). 'FBT' => Fixed length (blocked, track overflow). 'FBTA' => Fixed length (blocked, track overflow, ANSI format). 'FBTM' => Fixed length (blocked, track overflow, machine code format). 'FM' => Fixed length (machine code format). 'FS' => Fixed length (standard blocks). 'FSA' => Fixed length (standard blocks, ANSI format).

			<p>'FSM' => Fixed length (standard blocks, machine code format). 'FT' => Fixed length (track overflow). 'FTA' => Fixed length (track overflow, ANSI format). 'FTM' => Fixed length (track overflow, machine code format). 'U' => Undefined-length. 'UA' => Undefined-length (ANSI format). 'UM' => Undefined-length (machine code format). 'UT' => Undefined-length (track overflow). 'UTA' => Undefined-length (track overflow, ANSI format). 'UTM' => Undefined-length (track overflow, machine code format). 'V' => Variable length. 'VA' => Variable length (ANSI format). 'VB' => Variable length (blocked). 'VBA' => Variable length (blocked, ANSI format). 'VBM' => Variable length (blocked, machine code format). 'VBS' => Variable length (blocked, spanned). 'VBSA' => Variable length (blocked, spanned, ANSI format). 'VBSM' => Variable length (blocked, spanned, machine code format). 'VBST' => Variable length (blocked, spanned, track overflow). 'VBSTA' => Variable length (blocked, spanned, track overflow, ANSI format). 'VBSTM' => Variable length (blocked, spanned, track overflow, machine code format). 'VBT' => Variable length (blocked, track overflow). 'VBTA' => Variable length (blocked, track overflow, ANSI format). 'VBTM' => Variable length (blocked, track overflow, machine code format). 'VM' => Variable length (machine code format). 'VS' => Variable length (spanned). 'VSA' => Variable length (spanned, ANSI format). 'VSM' => Variable length (spanned, machine code format). 'VT' => Variable length (track overflow). 'VTA' => Variable length (track overflow, ANSI format). 'VTM' => Variable length (track overflow, machine code format).</p>
OPTCD	INT	1	OPTION CODES (DCB=OPTCD=)
BLKSZ	INT	2	MAXIMUM BLOCK SIZE (DCB=BLKSIZE=)
BUFSZ	INT	2	MAXIMUM BUFFER SIZE (DCB=BUFSIZE=)
IXBUF	INT	2	NUMBER OF INDEX BUFFERS (AMP=('BUFNI=num')) (VSAM)
RECL	INT	2	LOGICAL RECORD LENGTH (DCB=LRECL=)
BUFMX	INT	1	MAXIMUM NUMBER OF BUFFERS (DCB=BUFMAX=). THE MAXIMUM NUMBER OF BUFFERS TO BE USED FOR DATA TRANSFER FOR EACH LINE IN THIS LINE GROUP (TCAM)
NVOL	INT	1	NUMBER OF VOLUME SERIAL NUMBERS
VOLS	CHAR	30	VOLUME SERIAL NUMBERS - 1 to 5
PQTY	INT	3	SPACE= Primary quantity (SPACE=(, (prim-qty))) PRIMARY QUANTITY OF DIRECT ACCESS STORAGE REQUIRED
RUNIT	CHAR	3	UNIT TYPE (EBCDIC) OF A DEVICE AT A REMOTE TERMINAL. THE FIRST TWO CHARACTERS ARE RD (READER), PR (PRINTER) OR PU (PUNCH). THE THIRD CHARACTER IS A NUMBER FROM 1 TO 9

SMF015_OUTPUT_UPDAT_INOUT_or_OUTIN.JFCB.Space.<fieldname>			
SpaceTyp	BINT (ENUM)	2	Request type - CYL/TRK/BLK
SpaceReq1	BINT (ENUM)	3	Request type - CONTIG/MXIG/ALX
SpaceReq2	BINT (ENUM)	1	Request type - ROUND/ABSTR

SMF015_OUTPUT_UPDAT_INOUT_or_OUTIN.JFCB.<fieldname>			
SQTY	INT	3	SPACE= Secondary quantity (SPACE=(, (, sec-qty))) SECONDARY QUANTITY OF DIRECT ACCESS STORAGE REQUIRED
DQTY	INT	3	SPACE= Directory quantity (SPACE=(, (, dir-qty))) QUANTITY OF DIRECT ACCESS STORAGE REQUIRED FOR A DIRECTORY OR AN EMBEDDED INDEX AREA

ABST	INT	2	SPACE= Absolute track (ABSTR) request address
DRLH	CHAR	3	SPACE= AVERAGE DATA BLOCK LENGTH (blklgth)
VLCT	INT	1	VOLUME COUNT (volct) (VOL=(,,volct)
VLDQ	HEX	1	Volser dequeue indicators

SMF015_OUTPUT_UPDAT_INOUT_or_OUTIN.DCB_DEB.<fieldname>

SMFDCBOR	INT	2	Data set organization being used. This field is mapped by DCBDSORG in the DCB mapping.
SMFDCBRF	INT	1	Record format. This field is mapped by DCBREGFM in the DCB mapping.
SMFDCBMF	INT	2	Type of I/O macro instruction and options. This field is mapped by DCBMACRF in the DCB mapping.
SMFDCBFL	INT	1	Indicator used by the OPEN, CLOSE, EOVS routines such as the type of the last I/O operation. This field is mapped by DCBOFLGS in the DCB mapping.
SMFDCBOP	INT	1	Option codes used by access-method interfaces. This field is mapped by DCBOPTCD in the DCB mapping.
zRV2	INT	1	(IBM name: SMF15RV2) Reserved.
SMFDEBFL	INT	1	Data set and device status indicator. This field indicates whether a data set is modified, new or old, and shows the status of DASD. This field is mapped by DEBOFLGS in the DEB mapping. For information about DEBOFLGS, see z/OS DFSMSdfp Diagnosis.
SMFDEBOP	INT	1	Indicator showing both the method of I/O processing and the disposition that is to be performed when an end-of-volume (EOV) condition occurs. This field is mapped by DEBOPATB in the DEB mapping.
SMFDEBVL	INT	2	Volume sequence number. For direct access, the sequence number is relative to the first volume of the data set. For tape, the sequence number is relative to the first volume processed. This field is valid only for sequential data sets. This field is mapped by DEBVOLSQ in the DEB mapping.

SMF015_OUTPUT_UPDAT_INOUT_or_OUTIN.DCB_DEB.Space.DCB_DEB_Tape_Ext.<fieldname>

SMFDCBBL	INT	4	Block count for each volume. For PDSE data sets, this field will always contain X'0'. This field is mapped by DCBBLKCT in the DCB mapping.
SMFDSSNO	CHAR	6	Data set serial number. For PDSE data sets, this field will always contain X'0'. This field is mapped by UCBFSER in the UCB mapping.
zRV3	CHAR	1	(IBM name: SMF15RV3) Reserved.
zTDA	INT	1	(IBM name: SMF15TDA) Tape DS authorization flags.
zOPD	DATE	4	(IBM name: SMF15OPD) Date when the data set was opened, in the form 0ccyyddF.

SMF015_OUTPUT_UPDAT_INOUT_or_OUTIN.DCB_DEB.Space.DCB_DEB_DASD_Ext.<fieldname>

zNTU	INT	4	(IBM name: SMF15NTU) Relative track and record of the last user block in the form of TTR0, if a basic format data set. Relative track and record of the last user block in the form of TTTR, if a large format data set. For extended data sets, this field will accumulate the number of tracks used across all the volumes (TTTT).
zNTR	INT	4	(IBM name: SMF15NTR) Number of tracks released by the DADSM routine. For PDSE data sets, this field will always contain X'0'.
zNER	INT	1	(IBM name: SMF15NER) Number of extents released by the DADSM routine. For PDSE data sets, this field will always contain X'0'.
zEDI	INT	1	

			(IBM name: SMF15EDI) Enhanced Data Integrity (EDI) flag indicator. Bit Meaning when set 0 DATA set name found in EDI exclusion table. 1 DATA set being opened for output but is currently open for output. 2 DATA set being opened for input but is currently open for output and the data set is not excluded from EDI processing.. 3 APPLICATION requested EDI processing be bypassed and the data set is not excluded from EDI processing.. 4-7 Reserved.
zFG1	BIT	8	byte. Bit Meaning when set 0 LARGE format data set. zNTU is in TTRT format. 1 EAV BAM detected one or more EXCP or XDAP issuances-DEB2XEXCP flag is on. 2-7 Reserved.
zRV4	CHAR	1	(IBM name: SMF15RV4) Reserved.
zOPD	DATE	4	(IBM name: SMF15OPD) Date when the data set was opened, in the form 0ccyyddF.

SMF015_OUTPUT_UPDAT_INOUT_or_OUTIN.UCB.<fieldname>

SMFUCBDV	INT	2	Device number. If this field contains X'7FFF', this could be a virtual I/O (VIO) data set. If bit 7 0F field zRIN is set to one, this is a VIO data set. Virtual I/O devices are identified by the following: Device Class 0 UNIT Type 0 DEVICE Number X'7FFF' It is important to understand the following: v Allocation messages for VIO data sets will show VIO ALLOCATED TO ddname. v SMF records will show VIO unit addresses as X'7FFF'. v The actual in-storage UCB built for VIO will show address X'3FFF'. For example, the following messages indicate that ddname is not allocated to a Virtual I/O device, but is instead allocated to a real device whose unit address is X'3FFF' or X'7FFF' respectively: v IEF237I X'3FFF' ALLOCATED TO ddname v IEF237I X'7FFF' ALLOCATED TO ddname
SMFSRTEV	CHAR	6	Volume serial number.
SMFUCBTY	INT	4	Unit type. This field is mapped by UCBTYP in the UCB mapping.
SMFSRTEs	INT	1	DASD volume status indicator. This field indicates whether this DASD volume is a private, public, storage, or control volume. For PDSE data sets, this field will always contain X'0'. This field is mapped by UCBSTAB in the UCB mapping.
zNEX	INT	1	(IBM name: SMF15NEX) Number of extents.
zRV5	CHAR	2	(IBM name: SMF15RV5) Reserved.
SMFEXCP	INT	4	EXCP count for entire step. Note that if a data set is opened and closed twice during a single step, the count in the second type 14 RECORD is the sum of all EXCPs for both uses of the data set. (The EXCP count in the last type 14 RECORD for the step is equal to the corresponding entry for the data set in record type 4). For more information about EXCP count. For PDSE data sets, the number of pages that were read or written. For compressed data sets the number of physical blocks that were read or written.

SMF015_OUTPUT_UPDAT_INOUT_or_OUTIN.UCB.Space.SMF014_UCB_TapeExt.<fieldname>

SMFSRTEF	INT	2	Data set sequence count.
SMFSRTEQ	INT	2	Data set sequence number.

SMF015_OUTPUT_UPDAT_INOUT_or_OUTIN.UCB.Space.SMF014_UCB_DASDExt.<fieldname>

zNTA	INT	4	Number of tracks allocated on the device. For PDSE data sets, this field will always contain X'0'.
------	-----	---	--

SMF015_OUTPUT_UPDAT_INOUT_or_OUTIN.HiperBatch.<fieldname>

SMFIOREQ	INT	4	(IBM name: SMF15NUC) Number of requests for I/O issued by the access method for this data set for which Hiperbatch attempted to find the requested data in its buffers (see SMFCHITS and SMFPHIOS).
SMFCHITS	INT	4	Number of requests for I/O issued by the access method for this data set satisfied by moving data from Hiperbatch buffers.

SMFNMWTS	INT	4	Number of times Hiperbatch temporarily suspended this requester because another user was already reading some or all of the requested data.
SMFPHIOS	INT	4	Number of requests for I/O issued by the access method for this data set satisfied by performing DASD I/O. Note that the sum of SMFPHIOS and SMFCHITS should equal SMFIOREQ.
SMFCIOS	INT	4	Number of DASD I/Os (as recorded in SMFPHIOS) for which Hiperbatch copied the data into its buffers.

SMF015_OUTPUT_UPDAT_INOUT_or_OUTIN.ISAM_Extension.<fieldname>			
zRV6	CHAR	2	(IBM name: SMF15RV6) Reserved.
SMFDCBMA	INT	1	Extension of I/O macro instruction (DCBMACRF) for ISAM. This field is mapped by DCBMACCT in the DCB mapping.
SMFDCBNL	INT	1	Number of index levels. This field is mapped by DCBNLVET in the DCB mapping.
SMFDCBR3	INT	4	For each use of the data set, number of read or write accesses to an overflow record which is not first in a chain of such records. This field is mapped by DCBRORG3 in the DCB mapping.
SMFDCBNR	INT	4	Number of logical records in prime data area. This field is mapped by DCBNRECT in the DCB mapping.
SMFDCBR2	INT	2	Number of tracks (whole or partial remaining in overflow area). This field is mapped by DCBRORG2 in the DCB mapping.
SMFDCBNO	INT	2	Number of logical records in overflow area. This field is mapped by DCBNOREC in the DCB mapping.
SMFDCBR1	INT	2	Number of cylinder overflow areas that are full. This field is mapped by DCBRORG1 in the DCB mapping.
zRV7	CHAR	1	(IBM name: SMF15RV7) Reserved.
SMFDEBNI	INT	1	Number of extents in independent index area. This field is mapped by DEBNIEEQ in the DEB mapping.
SMFDEBNP	INT	1	Number of extents in prime data area. This field is mapped by DEBNPEEQ in the DEB mapping.
SMFDEBNO	INT	1	Number of extents in independent overflow area. This field is mapped by DEBNOEEQ in the DEB mapping.
SMFNPCYL	INT	2	Number of cylinders in independent index area.
SMFNPCYL	INT	2	Number of cylinders in prime data area.
SMFNOCYL	INT	2	Number of cylinders in independent overflow area.

SMF015_OUTPUT_UPDAT_INOUT_or_OUTIN.Ext_Info_Seg_Desc.<fieldname>			
zSXS	INT	2	(IBM name: SMF15SXS) Size of extended information segment (size of all sections including this length field).

Secondary segment: SMF015#1_Companded_format_Dataset

Field Name	Type	Len	Description
SMF015#1_Companded_format_Dataset.<fieldname>			
zESL1	INT	2	(IBM name: N/A) Size of this extended information section (size of variable length fields including this 4 BYTE section descriptor word).
zSTY	INT	1	(IBM name: SMF15STY) Section type code. Type Meaning when set 1 COMPRESSED format data set section 2 SMS class information section 3 STEP Information section 4 ISO/ANSI Version 4 CCSID (coded character set ID) information section 5

			ADDITIONAL data set characteristics section 6 PDSE data set caching statistics 7 TAPE encryption data section 8 RAS section 9 DASD data set encryption section
SMF015#1_Compressed_format_Dataset.zXF1.<fieldname>			
zLBD	BIT	1	Compressed format data set size values (SMF14CDS and SMF14UDS) are invalid.
zCRJ	BIT	1	Compression of the data set has been rejected.
zZEDCNAC	BIT	1	During output processing, the system determined that the zEDC feature was not available. In this case, some or all data was written non-compressed due to unavailability of the zEDC feature. (If 0, then zEDC used on all compression.) Valid only when SMF14CMPTYPE is SMF14CMPTYPEZEDC.
zZEDCNAD	BIT	1	During input processing, the system determined that the zEDC feature was not available. In this case, it used software decompression to decompress the data. (If 0, then zEDC used on decompression.) Valid only when SMF14CMPTYPE is SMF14CMPTYPEZEDC.
SMF015#1_Compressed_format_Dataset.<fieldname>			
zXF2	HEX	1	(IBM name: SMF15XF2) Indicators: Bit Meaning when set 0-7 Reserved.
zCDL	INT	8	(IBM name: SMF15CDL) Number of bytes of compressed data read or written since this open.
zUDL	INT	8	(IBM name: SMF15UDL) Number of bytes of data read or written since this open (data length prior to compression).
zCDS	INT	8	(IBM name: SMF15CDS) Size of the compressed format data set (number of compressed user data bytes).
zUDS	INT	8	(IBM name: SMF15UDS) Size of the compressed format data set (number of uncompressed user data bytes).
zCIS	INT	4	(IBM name: SMF15CIS) Physical block size of extended format data set.
zTKL	INT	2	(IBM name: SMF15TKL) Length of dictionary token, SMF14TKN field (not including the length of this field). Currently equals 36.
zTKN	HEX	36	(IBM name: SMF15TKN) Dictionary token for compressed format data set.
zCMPTYPE	INT	1	(IBM name: SMF15CMPTYPE) Indicators: Value Name and meaning when set 0 SMF14CMPTYPEPENA. Not compressed format, or unknown. 1 SMF14CMPTYPEGEN. Generic compression. 2 MF14CMPTYPETLRD. Tailored compression. 3 SMF14CMPTYPEZEDC. zEDC compression.

Secondary segment: **SMF015#2_SMS_Class**

Field Name	Type	Len	Description
SMF015#2_SMS_Class.<fieldname>			
zESL2	INT	2	(IBM name: N/A) Size of this extended information section (size of variable length fields including this 4 BYTE section descriptor word).
zSTY	INT	1	(IBM name: SMF15STY) Section type code. Type Meaning when set 1 COMPRESSED format data set section 2 SMS class information section 3 STEP Information section 4 ISO/ANSI Version 4 CCSID (coded character set ID) information section 5 ADDITIONAL data set characteristics section 6 PDSE data set caching statistics 7 TAPE encryption data section 8 RAS section 9 DASD data set encryption section

zMCN	CHAR	8	(IBM name: SMF15MCN) SMS Management class name.
zDCN	CHAR	8	(IBM name: SMF15DCN) SMS Data class name.
zSCN	CHAR	8	(IBM name: SMF15SCN) SMS Storage class name (first 8 CHARACTERS).

Secondary segment: SMF015#3_Step_Info

Field Name	Type	Len	Description
<i>SMF015#3_Step_Info.<fieldname></i>			
zESL3	INT	2	(IBM name: N/A) Size of this extended information section (size of variable length fields including this 4 BYTE section descriptor word).
zSTY	INT	1	(IBM name: SMF15STY) Section type code. Type Meaning when set 1 COMPRESSED format data set section 2 SMS class information section 3 STEP Information section 4 ISO/ANSI Version 4 CCSID (coded character set ID) information section 5 ADDITIONAL data set characteristics section 6 PDSE data set caching statistics 7 TAPE encryption data section 8 RAS section 9 DASD data set encryption section
zSPN	CHAR	8	(IBM name: SMF15SPN) Job step name.
zPGN	CHAR	8	(IBM name: SMF15PGN) Job step program name.
SMFJOBID	CHAR	8	Job ID.
SMFPLXID	CHAR	8	Sysplex name.

Secondary segment: SMF015#4_ISO_ANSI_V4_CCSID_Info

Field Name	Type	Len	Description
<i>SMF015#4_ISO_ANSI_V4_CCSID_Info.<fieldname></i>			
zESL4	INT	2	(IBM name: N/A) Size of this extended information section (size of variable length fields including this 4 BYTE section descriptor word).
zSTY	INT	1	(IBM name: SMF15STY) Section type code. Type Meaning when set 1 COMPRESSED format data set section 2 SMS class information section 3 STEP Information section 4 ISO/ANSI Version 4 CCSID (coded character set ID) information section 5 ADDITIONAL data set characteristics section 6 PDSE data set caching statistics 7 TAPE encryption data section 8 RAS section 9 DASD data set encryption section
<i>SMF015#4_ISO_ANSI_V4_CCSID_Info.zCFG.<fieldname></i>			
zIBM	BIT	1	IBM format Version 4 tape
zOUT	BIT	1	Opened for OUTPUT not DISP=MOD
zMOD	BIT	1	Opened for OUTPUT DISP=MOD
zUDF	BIT	1	User CCSID value is defaulted to CCSID=500
zTDF	BIT	1	Tape CCSID value is defaulted to CCSID=367
zIGN	BIT	1	CCSID value specified on DD statement was ignored
<i>SMF015#4_ISO_ANSI_V4_CCSID_Info.<fieldname></i>			

zUSR	INT	4	(IBM name: SMF15USR) CCSID user application expects data records to be in (specified on JOB/EXEC statement or defaulted).
zTPE	INT	4	(IBM name: SMF15TPE) CCSID of data records on tape (specified on DD statement or in tape label).
zLBL	INT	4	(IBM name: SMF15LBL) CCSID specified in the tape label of an existing tape when opened for input processing. Note: 1. If opened for input processing, then bit 1 AND 2 WILL both be off. 2. If no CCSID information is specified (in other words SMF14USR and SMF14TPE are 0), then the IBM standard ASCII/EBCDIC (XLATE) was used to process this Version 4 TAPE.

Secondary segment: SMF015#5_Additional_Dataset_Char

Field Name	Type	Len	Description
<i>SMF015#5_Additional_Dataset_Char.<fieldname></i>			
zESL5	INT	2	(IBM name: N/A) Size of this extended information section (size of variable length fields including this 4 BYTE section descriptor word).
zSTY	INT	1	(IBM name: SMF15STY) Section type code. Type Meaning when set 1 COMPRESSED format data set section 2 SMS class information section 3 STEP Information section 4 ISO/ANSI Version 4 CCSID (coded character set ID) information section 5 ADDITIONAL data set characteristics section 6 PDSE data set caching statistics 7 TAPE encryption data section 8 RAS section 9 DASD data set encryption section

<i>SMF015#5_Additional_Dataset_Char.zBFG0.<fieldname></i>			
zBLK	BIT	1	Block size is present in zLBS
zFLGP	BIT	1	Flag field is present in zFLG1/2
zDST	BIT	1	Dataset version is present in zDSVER
zALS	BIT	1	Alias name is present in zALI

<i>SMF015#5_Additional_Dataset_Char.<fieldname></i>			
zBFG1	HEX	1	(IBM name: SMF15BFG1) Flag byte 2.
zLBS	INT	8	(IBM name: SMF15LBS) Block size value.

<i>SMF015#5_Additional_Dataset_Char.zBFG0.zFLG1.<fieldname></i>			
zUPF	BIT	1	BSAM user PGFIX option flag (DEB2XUPF)
zEADSCB1	BIT	1	DCBEADSCBOK flag (If on, then EADSCB=OK specified in DCBE. If off, then either there is no DCBE or EADSCB=OK is not specified in the DCBE)
zEADSCB2	BIT	1	DCBEADSCBOK flag (If on, then EADSCB=OK specified in DCBE. If off, then either there is no DCBE or EADSCB=OK is not specified in the DCBE)
zXTIO	BIT	1	DD has XTIO, not TIOT entry
zDSENCRYPTOK	BIT	1	If on, the application program is enabled for basic and large format data set encryption with EXCP. The application coded DSENCRYPT=OK on the DCBE macro.

<i>SMF015#5_Additional_Dataset_Char.zBFG0.<fieldname></i>			
zFLG2	HEX	1	(IBM name: SMF15FLG2) Flag byte 2.

zDSVER	HEX	1	(IBM name: SMF15DSVER) Indicates the version of the data set or, in the case of a partitioned concatenation, the first data set in the concatenation, as follows: Value Meaning m'00' The data set is neither a PDSE nor an extended-format data set. X'01' The data set is either a PDSE V1 or an extended-format V1. X'02' The data set is either a PDSE V2 or an extended-format V2.
zALI	CHAR	44	(IBM name: SMF15ALI) Alias data set name.

Secondary segment: SMF015#6_PDSE_Statistics

Field Name	Type	Len	Description
<i>SMF015#6_PDSE_Statistics.<fieldname></i>			
zESL6	INT	2	(IBM name: N/A) Size of this extended information section (size of variable length fields including this 4 BYTE section descriptor word).
zSTY	INT	1	(IBM name: SMF15STY) Section type code. Type Meaning when set 1 COMPRESSED format data set section 2 SMS class information section 3 STEP Information section 4 ISO/ANSI Version 4 CCSID (coded character set ID) information section 5 ADDITIONAL data set characteristics section 6 PDSE data set caching statistics 7 TAPE encryption data section 8 RAS section 9 DASD data set encryption section
zDRD	INT	4	(IBM name: SMF15DRD) Directory read request count.
zDRDH	INT	4	(IBM name: SMF15DRDH) Directory read hit count.
zMRD	INT	4	(IBM name: SMF15MRD) Member read request count.
zMRDH	INT	4	(IBM name: SMF15MRDH) Member read hit count.
zMCE	INT	4	(IBM name: SMF15MCE) Member cache eligible count.
zMST	INT	4	(IBM name: SMF15MST) Member cache stolen count.
zMNC	INT	4	(IBM name: SMF15MNC) Member cache eligible but not cached count.
zMCF	INT	4	(IBM name: SMF15MCF) Member cache eligible but cache full count. Note: If concatenation is involved, the counts reflect the total count for all concatenated PDSE data sets.

Secondary segment: SMF015#7_Tape_Encryption

Field Name	Type	Len	Description
<i>SMF015#7_Tape_Encryption.<fieldname></i>			
zESL7	INT	2	(IBM name: N/A) Size of this extended information section (size of variable length fields including this 4 BYTE section descriptor word).
zSTY	INT	1	(IBM name: SMF15STY) Section type code. Type Meaning when set 1 COMPRESSED format data set section 2 SMS class information section 3 STEP Information section 4 ISO/ANSI Version 4 CCSID (coded character set ID) information section 5 ADDITIONAL data set characteristics section 6 PDSE data set caching statistics 7 TAPE encryption data section 8 RAS section 9 DASD data set encryption section

zKL1	CHAR	64	(IBM name: SMF15KL1) Key label 1
SMF12CD1	CHAR	1	Encoding mechanism for key label 1. This field can be 'L' for Label or 'H' for Hash.
zKL2	CHAR	64	(IBM name: SMF15KL2) Key label 2
zCD2	CHAR	1	(IBM name: SMF15CD2) Encoding mechanism for key label 2. This field can be 'L' for Label or 'H' for Hash.
zKET	INT	4	(IBM name: SMF15KET) Key exchange time in hundredths seconds. The key exchange (encryption overhead) time is only applicable for SMF record type 15 AND only for non-parallel OPEN processing writing file sequence 1 FROM loadpoint. In all other cases, this field is set to zero.

Secondary segment: **SMF015#8_RAS**

Field Name	Type	Len	Description
SMF015#8_RAS.<fieldname>			
zESL8	INT	2	(IBM name: N/A) Size of this extended information section (size of variable length fields including this 4 BYTE section descriptor word).
zSTY	INT	1	(IBM name: SMF15STY) Section type code. Type Meaning when set 1 COMPRESSED format data set section 2 SMS class information section 3 STEP Information section 4 ISO/ANSI Version 4 CCSID (coded character set ID) information section 5 ADDITIONAL data set characteristics section 6 PDSE data set caching statistics 7 TAPE encryption data section 8 RAS section 9 DASD data set encryption section

SMF015#8_RAS.zRFG0.<fieldname>			
zDCBEREJ	BIT	1	DCBE reject flags present.
zPREL	BIT	1	PARTREL flags present.

SMF015#8_RAS.zRFG1.<fieldname>			
zRFG1DBYP	BIT	1	OPEN with DCBE BYPASS_AUTH=YES was specified to bypass authorization checking. When zRFG1JBYP is also ON, bypass authorization checking because JSCBPASS is in effect.
zRFG1JBYP	BIT	1	JSCBPASS was specified to bypass authorization checking.
zRFG1AUTH	BIT	1	The caller of OPEN was either in supervisor state, in a system key, or APF-authorized.
zRFG1BYP	BIT	1	OPEN bypassed SAF authority checking. Refer to zRFG1DBYP and zRFG1JBYP to determine the method that was used to request bypass of SAF authority checking.

SMF015#8_RAS.<fieldname>			
zRFG2	HEX	1	(IBM name: SMF15RFG2) Reserved
zRFG3	HEX	1	(IBM name: SMF15RFG3) Reserved

SMF015#8_RAS.zRASDATA0.<fieldname>			
zDCBEEXCP	BIT	1	DCBE invalidated because EXCP and no foundation extension present.
zDCBEDS0RG	BIT	1	DCBE invalidated because DSORG is not PS, PO OR DA.
zDCBEFREE	BIT	1	DCBE invalidated because storage is not addressable.

zDCBEKEY	BIT	1	DCBE invalidated because DCBE storage is not in key of caller.
zDCBEID	BIT	1	DCBE invalidated because the DCBEID is not 'DCBE'.
zDCBEMIN	BIT	1	DCBE invalidated because it is not at least the minimum length required (56 bytes)
zN0DCBE	BIT	1	DCBEHIARC flags set but DCBDCBE is zeros.

SMF015#8_RAS.zRASDATA1.<fieldname>

zPRELVIO	BIT	1	Partial release not called by CLOSE because VIO data set.
zPRELABD	BIT	1	Partial release not called by CLOSE because task is abending.
zPRELINP	BIT	1	Partial release not called by CLOSE because not opened for output
zPRELEXCP	BIT	1	Partial release not called by CLOSE because EXCP DCB but no direct access device section present.
zPRELNOUT	BIT	1	Partial release not called by CLOSE because even though opened for output, last I/O was not output.
zPRELIO	BIT	1	Partial release had an I/O error.

Secondary segment: SMF015#9_Dataset_Encryption

Field Name	Type	Len	Description
SMF015#9_Dataset_Encryption.<fieldname>			
zESL9	INT	2	(IBM name: N/A) Size of this extended information section (size of variable length fields including this 4 BYTE section descriptor word).
zSTY	INT	1	(IBM name: SMF15STY) Section type code. Type Meaning when set 1 COMPRESSED format data set section 2 SMS class information section 3 STEP Information section 4 ISO/ANSI Version 4 CCSID (coded character set ID) information section 5 ADDITIONAL data set characteristics section 6 PDSE data set caching statistics 7 TAPE encryption data section 8 RAS section 9 DASD data set encryption section

SMF015#9_Dataset_Encryption.zDEF.<fieldname>

zDSENC	BIT	1	Data set encrypted
zDSEB	BIT	1	User requested access method to bypass decryption on reads and the system honored the request
zDSENCNP	BIT	1	Blocks do not have prefixes. Set only for basic and large format.

SMF015#9_Dataset_Encryption.<fieldname>

zDET	INT	2	(IBM name: SMF15DET) Encryption type
zDKL	CHAR	64	(IBM name: SMF15DKL) DASD data set key labels

Record Type 16 - DFSORT

SMF Record 16 (DFSORT) is mapped by structure member "T016".

Primary Segment:

- SMF016_DFSORT

Secondary Segment(s): 6 (in alphabetical order)

- SMF016_Data_Section
- SMF016_OUTFIL_Dataset
- SMF016_Product_Section
- SMF016_Record_Length
- SMF016_SORTIN_Dataset
- SMF016_SORTOUT_Dataset

Primary segment: SMF016_DFSORT

Field Name	Type	Len	Description
<i>SMF016_DFSORT.<fieldname></i>			
SMF016_DFSORT.Header_Self_Defining_Section.<fieldname>			
zFLG	HEX	1	(IBM name: N/A) System indicator.
zRTY	INT	1	(IBM name: N/A) Record type 16 (x'10').
zTME	TSTMP	8	(IBM name: N/A) Time when record was moved to SMF buffer.
zSID	CHAR	4	(IBM name: ICESID) System identification (taken from SID parameter).
zJOBNAME	CHAR	8	(IBM name: ICEJOBNM) Job name.
zRST	TSTMP	8	(IBM name: ICERST) Time reader recognized job card.
zUIF	CHAR	8	(IBM name: ICEUIF) Installation dependent information.
zSTN	INT	1	(IBM name: ICESTN) Step number.
zTRN	INT	2	(IBM name: ICETRN) Number of triplets supported by DFSORT.
zSUBID	CHAR	4	(IBM name: ICESUBID) Subsystem identification.
zRSUB	INT	2	(IBM name: ICERSUB) Record subtype: v 1: Short record, successful execution. v 2: Full record, successful execution. v 3: Short record, unsuccessful execution.
zPROD	INT	4	(IBM name: ICEPROD) Offset to product section.
zPRODL	INT	2	(IBM name: ICEPRODL) Product section length.
zPRODN	INT	2	(IBM name: ICEPRODN) Number of product sections. This field will be zero if no product section is provided.
zDATA	INT	4	(IBM name: ICEDATA) Offset to common data section.
zDATAL	INT	2	(IBM name: ICEDATAL) Common data section length.
zDATAN	INT	2	(IBM name: ICEDATAN) Number of data sections. This field will be zero if no data section is provided.

zSTAT	INT	4	(IBM name: ICESTAT) Offset to record-length distribution section.
zSTATL	INT	2	(IBM name: ICESTATL) Record-length distribution section length.
zSTATN	INT	2	(IBM name: ICESTATN) Number of record-length distribution sections. This field will be zero if no record-length distribution section is provided.
zINDS	INT	4	(IBM name: ICEINDS) Offset to first input data set section.
zINDSL	INT	2	(IBM name: ICEINDSL) Input data set section length.
zINDSN	INT	2	(IBM name: ICEINDSN) Number of input data set sections. This field will be zero if no input data set sections are provided.
zOTDS	INT	4	(IBM name: ICEOTDS) Offset to SORTOUT data set section.
zOTDSL	INT	2	(IBM name: ICEOTDSL) SORTOUT data set section length.
zOTDSN	INT	2	(IBM name: ICEOTDSN) Number of SORTOUT data set sections. This field will be zero if no SORTOUT data set section is provided.
zOFDS	INT	4	(IBM name: ICEOFDS) Offset to first OUTFIL data set section.
zOFDSL	INT	2	(IBM name: ICEOFDSL) OUTFIL data set section length.
zOFDSN	INT	2	(IBM name: ICEOFDSN) Number of OUTFIL data set sections. This field will be zero if no OUTFIL data set sections are provided.
zSPGN	INT	2	(IBM name: ICESPGN) Performance group. This information is collected from OUCB field OUCBSPG.
zUSER	CHAR	8	(IBM name: ICEUSER) User ID for which the job or session is being executed. This field is provided only when RACF is active.
zGROUP	CHAR	8	(IBM name: ICEGROUP) Group ID for which the job or session is being executed. This field is provided only when RACF is active.

Secondary segment: SMF016_Product_Section

Field Name	Type	Len	Description
<i>SMF016_Product_Section.<fieldname></i>			
zRECV	CHAR	2	(IBM name: ICERECV) Record version: '01'
zPRDCT	CHAR	8	(IBM name: ICEPRDCT) Product name: '5650ZOS '
zRELMN	CHAR	4	(IBM name: ICERELNM) DFSORT release level, such as '2.03'.

Secondary segment: SMF016_Data_Section

Field Name	Type	Len	Description
<i>SMF016_Data_Section.<fieldname></i>			

zSTPNM	CHAR	8	(IBM name: ICESTPNM) Step name. blank if no step name.
zRCDS5	INT	4	(IBM name: ICERCDS5) Number of records sorted. A 64-bit integer version of this field is defined as zEXRCS.
zBYTES5	INT	4	(IBM name: ICEBYTES5) Number of bytes sorted. A 64-bit integer version of this field is defined as zEXBYS.
zCPUT5	FIXED	4 (10,2)	(IBM name: ICECPUT5) Processor time (TCB time), in hundredths of a second.
zLEN	INT	2	(IBM name: ICELEN) Specified record length.
zIBLK	INT	2	(IBM name: ICEIBLK) Maximum input block size or control interval size (15-bit). A 31-bit version of this field is defined as zIBLKF.
zOBLK	INT	2	(IBM name: ICEOBLK) Maximum output block size or control interval size (15-bit). A 31-bit version of this field is defined as zOBLKF.
zKEYLN	INT	2	(IBM name: ICEKEYLN) Total control field length (number of bytes actually compared by DFSORT).
zWBLK5	INT	4	(IBM name: ICEWBLK5) Number of work data set tracks used.

SMF016_Data_Section.zFLBYT.<fieldname>

zRFMT	BINT (ENUM)	2	(IBM name: N/A) Record Format. F => Fixed-length records, V => Variable-length records, VS => Variable-length spanned records.
zTECH	BINT (ENUM)	2	BLCK => Blockset technique, PEER => Peerage technique, VALE => Vale technique, CONV => Conventional technique.
zPROG	BIT	1	DFSORT was invoked through a program.
zMEM	BIT	1	Sorting was completed in memory (work space was not needed).

SMF016_Data_Section.<fieldname>

zNDYNA	INT	1	(IBM name: ICENDYNA) Number of allocated work data sets.
--------	-----	---	---

SMF016_Data_Section.zFLBY2.<fieldname>

zSORT	BIT	1	A sort was specified.
zMERGE	BIT	1	A merge was specified.
zCOPY	BIT	1	A copy was specified.
zTOOL	BIT	1	DFSORT was called by zTOOL.
zAPF	BIT	1	DFSORT running APF authorized.
zMOBJ	BIT	1	Memory objects used as work storage.
zJKS1	BIT	1	Invoked by JOINKEYS Subtask 1.
zJKS2	BIT	1	Invoked by JOINKEYS Subtask 2.

SMF016_Data_Section.zIOTYP.<fieldname>

zE15	BIT	1	E15 exit was used.
zE32	BIT	1	E32 exit was used.
zE35	BIT	1	E35 exit was used.
zSIN	BIT	1	SORTIN data sets were used.
zSINN	BIT	1	SORTINnn data sets were used.
zSOUT	BIT	1	SORTOUT data set was used.

zOUTF	BIT	1	OUTFIL data sets were used.
-------	-----	---	-----------------------------

SMF016_Data_Section.zCSFLG.<fieldname>

zALTS	BIT	1	ALTSEQ was specified.
zIREC	BIT	1	INREC was specified.
zINCL	BIT	1	INCLUDE was specified.
zOMIT	BIT	1	OMIT was specified.
zOREC	BIT	1	OUTREC was specified.
zSUM	BIT	1	SUM was specified.
zOFIL	BIT	1	OUTFIL was specified.
zJOIN	BIT	1	JOINKEYS Main task was specified.

SMF016_Data_Section.<fieldname>

zTIMES	TSTMP	8	(IBM name: ICETIMES) Time DFSORT started processing (local time).
zTIMEE	TSTMP	8	(IBM name: ICETIMEE) Time DFSORT terminated processing (local time).

SMF016_Data_Section.zRCBYT.<fieldname>

zSABD	BIT	1	System abend detected.
zUABD	BIT	1	User abend detected.
zUABR	BIT	1	User requested ABEND issued by DFSORT.
zRC16	BIT	1	RC=16 returned to caller.
zRC20	BIT	1	RC=20 returned to caller.

SMF016_Data_Section.<fieldname>

zRC	INT	1	(IBM name: ICERC) Return code of DFSORT to its invoker. This field will contain X'FF' if a user-requested or system ABEND is issued.
zRESN	INT	2	(IBM name: N/A) Reason code. If zRC is not 0 or 4, then this field will contain the system or user ABEND code, or the number of the DFSORT message describing the reason for an unsuccessful execution.
zAVLR	INT	4	(IBM name: ICEAVLR) Average record length of sorted variable length records.
zDSA	INT	2	(IBM name: ICEDSA) DSA value in effect (in megabytes).

SMF016_Data_Section.zFLBY3.<fieldname>

zHIPER	BIT	1	Hipersorting was used.
zDSPAC	BIT	1	Data space was used.
zWRKDS	BIT	1	Work data sets were used.
zLOCSM	BIT	1	Locale processing was used for a SORT or MERGE control field.
zLOCIO	BIT	1	Locale processing was used for an INCLUDE or OMIT compare field.
zEQUAL	BIT	1	EQUALS was used for a sort or merge application.
zBLK31	BIT	1	31-bit block size fields are available.
zMEMOB	BIT	1	A memory object was used.

SMF016_Data_Section.zWKFLG.<fieldname>

zWRKTD	BIT	1	Work data set tracks were allocated dynamically.
--------	-----	---	--

zWRKCF	BIT	1	Cache fast write was used for one or more work data sets.
--------	-----	---	---

SMF016_Data_Section.<fieldname>

zWEXS	INT	2	(IBM name: ICEWEXS) Number of extents initially allocated for all work data sets.
zWEXE	INT	2	(IBM name: ICEWEXE) Number of extents allocated for all work data sets when sorting terminated.
zWALLS	INT	4	(IBM name: ICEWALLS) Number of tracks initially allocated for work data sets.
zWALLE	INT	4	(IBM name: ICEWALLE) Number of tracks allocated to work data sets when sorting terminated.

SMF016_Data_Section.zFLBY4.<fieldname>

zSMUNI	BIT	1	SORT or MERGE control field was specified with a Unicode data format.
--------	-----	---	---

SMF016_Data_Section.zIAMB.<fieldname>

zSIAM	BINT (ENUM)	3	(IBM name: ICEIAMB) SORTIN access method.
-------	----------------	---	--

SMF016_Data_Section.<fieldname>

zINIO	INT	4	(IBM name: ICEINIO) Number of calls to the access method used for SORTIN. A 64-bit integer version of this field is defined as zEXINN.
-------	-----	---	---

SMF016_Data_Section.zOAMB.<fieldname>

zSOAM	BINT (ENUM)	3	(IBM name: ICEOAMB) SORTOUT access method.
-------	----------------	---	---

SMF016_Data_Section.<fieldname>

zOUTIO	INT	4	(IBM name: ICEOUTIO) Number of calls to the access method used for SORTOUT. A 64-bit version of this field is defined as zEXOUT.
zIBLKF	INT	4	(IBM name: ICEIBLKF) Maximum input block size or control interval size (31-bit). A 15-bit version of this field is defined as zIBLK.
zWKIO	INT	4	(IBM name: ICEWKIO) Number of EXCPs for all work data sets.
zSRBTS	INT	4	(IBM name: ICESRBTS) Cumulative value of the SRB time for the region when DFSORT started processing, in hundredths of a second.
zSRBTE	INT	4	(IBM name: ICESRBTE) Cumulative value of the SRB time charged to the address space when DFSORT terminated processing. This field is obtained from the ASCBSRBT field in the ASCB control block. The difference between this value and the zSRBTS value will be the SRB time charged to this DFSORT application, provided there is no other activity in the address space.
zTCBS	INT	2	(IBM name: ICETCBS) Number of TCBS defined in the region while DFSORT is processing. If the number is different at the end of processing from the number at the start of processing, this field will contain the larger number.
zKEYNM	INT	2	(IBM name: ICEKEYNM) Number of Sort or Merge control fields.
zHSPMX	INT	2	(IBM name: ICEHSPMX) HIPRMAX value in effect.
zDSPSZ	INT	2	(IBM name: ICEDSPSZ) DSPSIZE value in effect.
zEXRCS	INT	8	(IBM name: ICEEXRCS) Number of records sorted (64-bit integer). A 32-bit integer version of this field is defined as zRCDS.

zEXBYS	INT	8	(IBM name: ICEEXBYS) Number of bytes sorted (64-bit integer). A 32-bit integer version of this field is defined as zBYTES.
zEXINN	INT	8	(IBM name: ICEEXINN) Number of calls to the access method used for SORTIN (64-bit integer). A 32-bit integer version of this field is defined as zINIO.
zEXOUT	INT	8	(IBM name: ICEEXOUT) Number of calls to the access method used for SORTOUT (64-bit integer). A 32-bit integer version of this field is defined as zOUTIO.
zHSPN	INT	2	(IBM name: ICEHSPN) Number of Hiperspaces created.
zHSPU	INT	4	(IBM name: ICEHSPU) Number of Hiperspace pages used.
zDSPN	INT	2	(IBM name: ICEDSPN) Number of data spaces created.
zDSPU	INT	4	(IBM name: ICEDSPU) Number of data space pages used.
zPRCNM	CHAR	8	(IBM name: ICEPRCNM) Proc step name. Blank if no proc step name.
zIDSNM	CHAR	44	(IBM name: ICEIDSNM) SORTIN data set name.
zIVOLS	CHAR	6	(IBM name: ICEIVOLS) SORTIN volume serial.
zODSNM	CHAR	44	(IBM name: ICEODSNM) SORTOUT data set name.
zOVOLS	CHAR	6	(IBM name: ICEOVOLS) SORTOUT volume serial.
zINPDS	INT	2	(IBM name: ICEINPDS) Number of SORTIN data sets, including concatenated data sets.
zINNDS	INT	2	(IBM name: ICEINNDS) Number of SORTINnn data sets.
zOUTDS	INT	2	(IBM name: ICEOUTDS) Number of SORTOUT data sets.
zOFLDS	INT	2	(IBM name: ICEOFLDS) Number of OUTFIL data sets.
zRCINP	INT	8	(IBM name: ICERCINP) Number of input records (64-bit integer).
zRCOUT	INT	8	(IBM name: ICERCOUT) Number of output records (64-bit integer).
zRCINS	INT	8	(IBM name: ICERCINS) Number of inserted records (64-bit integer).
zRCDEL	INT	8	(IBM name: ICERCDEL) Number of deleted records (64-bit integer).
zMD15N	CHAR	8	(IBM name: ICEMD15N) Routine name specified for MODS E15 exit.
zMD15M	INT	4	(IBM name: ICEMD15M) Storage specified for MODS E15 exit.
zMD15S	CHAR	8	(IBM name: ICEMD15S) Library ddname specified for MODS E15 exit.
zMD15E	CHAR	1	(IBM name: ICEMD15E) Requirements specified for MODS E15 exit.
zMD35N	CHAR	8	(IBM name: ICEMD35N) Routine name specified for MODS E35 exit.
zMD35M	INT	4	(IBM name: ICEMD35M) Storage specified for MODS E35 exit.
zMD35S	CHAR	8	(IBM name: ICEMD35S) Library ddname specified for MODS E35 exit.

zMD35E	CHAR	1	(IBM name: ICEMD35E) Requirements specified for MODS E35 exit.
zLCALE	CHAR	32	(IBM name: ICELCALE) Active locale name or NONE.
zESMAX	INT	4	(IBM name: ICEESMAX) EXPMAX value in effect.
zESOLD	INT	4	(IBM name: ICEESOLD) EXPOLD value in effect.
zESRES	INT	4	(IBM name: ICEESRES) EXPRES value in effect.
zOBLKF	INT	4	(IBM name: ICEOBLKF) Maximum output block size of control interval size (31-bit). A 15-bit version of this field is defined as zOBLK.
zFILSZ	INT	8	(IBM name: ICEFILSZ) Value specified for FILSZ/SIZE (64-bit integer).
zAVGRL	INT	4	(IBM name: ICEAVGRL) Value specified for AVGRLEN.

SMF016_Data_Section.zFSZFL.<fieldname>

zSFSZFL	BINT (ENUM)	4	(IBM name: ICEFSZFL) FILSZ/SIZE value units. FILSZ/SIZE value is specified as n, En, Un or is not specified and file size could not be determined.
---------	----------------	---	---

SMF016_Data_Section.<fieldname>

zMOSIZ	INT	4	(IBM name: ICEMOSIZ) MOSIZE value in effect.
zMON	INT	2	(IBM name: ICEMON) Number of memory objects allocated.
zMOUSE	INT	8	(IBM name: ICEMOUSE) Number of megabytes used for memory objects (64-bit integer).
zMNVLX	INT	4	(IBM name: ICEMNVLX) The main storage value specified in kilobytes (subject to the SIZE/MAINSIZE limit), or supplied by default.
zMNVLY	INT	4	(IBM name: ICEMNVLY) The main storage theoretically available to DFSORT in kilobytes, considering the MINLIM value specified when the program was installed.
zMNVLZ	INT	4	(IBM name: ICEMNVLZ) The main storage actually available to DFSORT in kilobytes, after any other program took what it needed from the region (invoking program or exit routines).

SMF016_Data_Section.zMNFLG.<fieldname>

zSZMAX	BIT	1	SIZE=MAX in effect.
--------	-----	---	---------------------

SMF016_Data_Section.<fieldname>

zINMRG	INT	2	(IBM name: ICEINMRG) Number of intermediate merges performed for a Sort application. This field is zero if no intermediate merges were required to complete the Sort application. This field is always zero for a Copy or Merge application.
zCPUZE	INT	4	(IBM name: ICECPUZE) Subset of the processor time reported in field zCPUT that was eligible to be dispatched on a zIIP, in hundredths of a second.
zCPUZP	INT	4	(IBM name: ICECPUZP) Subset of the processor time reported in field zCPUZE that was actually dispatched on a zIIP, in hundredths of a second.
zTUNE	INT (ENUM)	1	(IBM name: ICETUNE) TUNE value in effect.
zDYINC	INT	4	(IBM name: ICEDYINC) Initial increment dynamically calculated for Hiperspace or Memory Object

			work files.
zDYMAX	INT	4	(IBM name: ICEDYMAX) Final EXPMAX value dynamically calculated.
zDYOLD	INT	4	(IBM name: ICEDYOLD) Final EXPOLD value dynamically calculated.
zDYRES	INT	4	(IBM name: ICEDYRES) Final EXPRES value dynamically calculated.
zCOLLK	CHAR	64	(IBM name: ICECOLLK) Active COLLKEY Value.

Secondary segment: SMF016_Record_Length

Field Name	Type	Len	Description
<i>SMF016_Record_Length.<fieldname></i>			
zCTR01	INT	4	(IBM name: ICECTR01) Records with length 5-15.
zCTR02	INT	4	(IBM name: ICECTR02) Records with length 16-31.
zCTR03	INT	4	(IBM name: ICECTR03) Records with length 32-63.
zCTR04	INT	4	(IBM name: ICECTR04) Records with length 64-127.
zCTR05	INT	4	(IBM name: ICECTR05) Records with lengths 128-191.
zCTR06	INT	4	(IBM name: ICECTR06) Records with lengths 192-255.
zCTR07	INT	4	(IBM name: ICECTR07) Records with lengths 256-511.
zCTR08	INT	4	(IBM name: ICECTR08) Records with lengths 512-1023.
zCTR09	INT	4	(IBM name: ICECTR09) Records with lengths 1024-2047.
zCTR10	INT	4	(IBM name: ICECTR10) Records with lengths 2048-4095.
zCTR11	INT	4	(IBM name: ICECTR11) Records with lengths 4096-7167.
zCTR12	INT	4	(IBM name: ICECTR12) Records with lengths 7168-10751.
zCTR13	INT	4	(IBM name: ICECTR13) Records with lengths 10752-15359.
zCTR14	INT	4	(IBM name: ICECTR14) Records with lengths 15360-20991.
zCTR15	INT	4	(IBM name: ICECTR15) Records with lengths 20992-26623.
zCTR16	INT	4	(IBM name: ICECTR16) Records with lengths 26624-32756.

Secondary segment: SMF016_SORTIN_Dataset

Field Name	Type	Len	Description
------------	------	-----	-------------

SMF016_SORTIN_Dataset.<fieldname>			
SMF016_SORTIN_Dataset.zINFL1.<fieldname>			
zINDD	BINT (ENUM)	2	(IBM name: ICEINFL1) SORTIN dataset DD type.

SMF016_SORTIN_Dataset.zINFL2.<fieldname>			
zPIPE	BIT	1	Pipe data set.
zSTRIPE	BIT	1	Striped data set.
zCOMP	BIT	1	Compressed data set.
zVSAMEA	BIT	1	VSAM extended addressability data set.
zHFS	BIT	1	HFS file.

SMF016_SORTIN_Dataset.zINAMB.<fieldname>			
zINAM	BINT (ENUM)	3	(IBM name: ICEINAMB) SORTIN dataset access method.

SMF016_SORTIN_Dataset.zINTYP.<fieldname>			
zINDEV	BINT (ENUM)	3	(IBM name: ICEINTYP) SORTIN dataset physical device type. TAPE => Tape data set, DISK => Disk data set, OTHER => Spool, dummy or pipe data set, or HFS file.

SMF016_SORTIN_Dataset.<fieldname>			
zINRCF	INT (ENUM)	1	(IBM name: ICEINRCF) Record Format. 'Unk' => No RECFM recorded. 'F' => Fixed length. 'FA' => Fixed length (ANSI format). 'FB' => Fixed length (blocked). 'FBA' => Fixed length (blocked, ANSI format). 'FBM' => Fixed length (blocked, machine code format). 'FBS' => Fixed length (blocked, standard blocks). 'FBSA' => Fixed length (blocked, standard blocks, ANSI format). 'FBSM' => Fixed length (blocked, standard blocks, machine code format). 'FBT' => Fixed length (blocked, track overflow). 'FBTA' => Fixed length (blocked, track overflow, ANSI format). 'FBTM' => Fixed length (blocked, track overflow, machine code format). 'FM' => Fixed length (machine code format). 'FS' => Fixed length (standard blocks). 'FSA' => Fixed length (standard blocks, ANSI format). 'FSM' => Fixed length (standard blocks, machine code format). 'FT' => Fixed length (track overflow). 'FTA' => Fixed length (track overflow, ANSI format). 'FTM' => Fixed length (track overflow, machine code format). 'U' => Undefined-length. 'UA' => Undefined-length (ANSI format). 'UM' => Undefined-length (machine code format). 'UT' => Undefined-length (track overflow). 'UTA' => Undefined-length (track overflow, ANSI format). zVolser	CHAR	6	(IBM name: N/A) Volume serial number.

Record Type 18 - Rename NonVSAM Dataset Status

SMF Record 18 (Rename NonVSAM Dataset Status) is mapped by structure member "T018".

Primary Segment:

- [SMF018_Rename_NonVSAM_Dataset_Status](#)

Secondary Segment(s): 0

Primary segment: [SMF018_Rename_NonVSAM_Dataset_Status](#)

Field Name	Type	Len	Description
<i>SMF018_Rename_NonVSAM_Dataset_Status.<fieldname></i>			
SMF018_Rename_NonVSAM_Dataset_Status.Header_Self_Defining_Section.<fieldname>			
zFLG	HEX	1	(IBM name: SMF18FLG) System indicator: Bit Meaning when set 0-2 Reserved 3-6 Version indicators 7 Reserved.
zRTY	INT	1	(IBM name: SMF18RTY) Record type 18 (X'12').
zTME	TSTMP	8	(IBM name: SMF18TME) Date/Time when the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF18SID) System identification (from the SID parameter).
zJOBNAME	CHAR	8	(IBM name: SMF18JBN) Job name. The job name, time, and date that the reader recognized the JOB card (for this job) constitute the job log identification, or transaction name (for APPC output).
zRST	TSTMP	8	(IBM name: SMF18RST) Date/Time that the reader recognized the JOB card (for this job).
zUSERID	CHAR	8	(IBM name: SMF18UID) User-defined identification field (taken from common exit parameter area, not from USER=parameter on job statement).
SMF018_Rename_NonVSAM_Dataset_Status.Header_Self_Defining_Section.zIN1.<fieldname>			
Continuation	BIT	1	Continuation record indicator for a multi-volume data set rename request whereby the volume being processed by rename is not the first volume. This flag is set when the volume serial number in this record is one that had a volume sequence number of more than one and rename is processing each volume individually. Field name zCON.
SMF018_Rename_NonVSAM_Dataset_Status.Header_Self_Defining_Section.<fieldname>			
zIN2	INT	1	(IBM name: SMF18IN2) Record indicator byte 2.
zOldDSN	CHAR	44	(IBM name: N/A) Old data set name.
zNewDSN	CHAR	44	(IBM name: N/A) New data set name.
zRV1	CHAR	3	(IBM name: SMF18RV1) Reserved.
zNVols	INT	1	(IBM name: N/A) When rename is called one volume at a time, the value will be one for each SMF 18 RECORD. When rename is called with a list, the value will reflect the total number of volumes processed in the list that are recorded in one SMF 18 RECORD. This value designates the number of volume entries that follow.

SMF018_Rename_NonVSAM_Dataset_Status.VolInfo.<fieldname>			
zRV2	CHAR	2	(IBM name: SMF18RV2) Reserved.
zVolser	CHAR	6	(IBM name: N/A) Volume serial number.

Record Type 19 - Direct Access Volume

SMF Record 19 (Direct Access Volume) is mapped by structure member "T019".

Primary Segment:

- [SMF019_Direct_Access_Volume](#)

Secondary Segment(s): 0

Primary segment: [SMF019_Direct_Access_Volume](#)

Field Name	Type	Len	Description
<i>SMF019_Direct_Access_Volume.<fieldname></i>			
zFLG	HEX	1	(IBM name: SMF19FLG) System indicator: Bit Meaning when set 0-2 Reserved 3-6 Version indicators* 7 RESERVED. *See 'Standard and Extended SMF record headers' on page 174 FOR a detailed description.
zRTY	INT	1	(IBM name: SMF19RTY) Record type 19 (X'13').
zTME	TSTMP	8	(IBM name: SMF19TME) Date/Time when the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF19SID) System identification (from the SID parameter).
zRV1	CHAR	2	(IBM name: SMF19RV1) Reserved.
zVOL	CHAR	6	(IBM name: SMF19VOL) Volume serial number.
zOID	CHAR	10	(IBM name: SMF19OID) Owner identification from the VTOC.
zDEV	INT	4	(IBM name: SMF19DEV) Device type.
zVTC	HEX	5	(IBM name: SMF19VTC) Volume table of contents (VTOC) address (format of CCHHR).

<i>SMF019_Direct_Access_Volume.zVTI.<fieldname></i>			
zF5Err	BIT	1	Format 5 data set control blocks (DSCB) missing or erroneous
zVtocNotRec1	BIT	1	VTOC does not begin on record 1
zF5Good	BIT	1	Accurate format 5 and 6 data set control blocks (DSCB). bit 0 set to zero
zVtocErr	BIT	1	Possible VTOC or VTOC index error
zVtocFix	BIT	1	VTOC error has been fixed. bit 0 set to zero.
zVtoclx	BIT	1	Indexed VTOC.

<i>SMF019_Direct_Access_Volume.<fieldname></i>			
zNDS	INT	2	(IBM name: SMF19NDS) Number of data set control blocks (DSCB) calculated as: number of DSCBs per track times number of tracks in VTOC.
zDSR	INT	2	(IBM name: SMF19DSR) Number of data set control blocks (DSCB) - format 0 DSCBS, that is, number of available DSCBs.
zNAT	INT	2	(IBM name: SMF19NAT) Number of unused alternate tracks.
zSPC	INT	2	(IBM name: SMF19SPC) Number of unallocated cylinders.
zLEX	INT	2	(IBM name: SMF19LEX) Number of cylinders in the largest unallocated extent.

zNUE	INT	2	(IBM name: SMF19NUE) Number of unallocated extents.

zFL2	INT	1	(IBM name: SMF19FL2) Reserved.
zCUU	INT	2	(IBM name: SMF19CUU) Device Number.
zIND	INT	2	(IBM name: SMF19IND) Module identification or drive number indicating physical identity of devices having moveable address plugs. This field is taken from bits 2-7 of sense byte 4 FOR these devices. (See the component descriptions of these devices for the meaning of sense byte 4.) Beginning of expanded SMF statistics
zRV3	CHAR	4	(IBM name: SMF19RV3) Reserved.
zSDS	INT	4	(IBM name: SMF19SDS) Number of DSCBs.
zSL0	INT	4	(IBM name: SMF19SL0) Number of format 0 DSCBs.
zRV4	CHAR	4	(IBM name: SMF19RV4) Reserved

SMF019_Direct_Access_Volume.zEVF.<fieldname>

zSUC	INT	4	(IBM name: SMF19SUC) Number of free cylinders.
zSUT	INT	4	(IBM name: SMF19SUT) Number of addl free tracks.
zSNC	INT	4	(IBM name: SMF19SNC) Number of free cylinders in largest free extent.
zSNT	INT	4	(IBM name: SMF19SNT) Number of addl free tracks in largest free extent.
zSNE	INT	4	(IBM name: SMF19SNE) Number of free extents.

SMF019_Direct_Access_Volume.zTMF.<fieldname>

zBUC	INT	4	(IBM name: SMF19BUC) Number of free cylinders.
zBUT	INT	4	(IBM name: SMF19BUT) Number of addl free tracks.
zBNC	INT	4	(IBM name: SMF19BNC) Number of free cylinders in largest free extent
zBNT	INT	4	(IBM name: SMF19BNT) Number of addl free tracks in largest free extent.
zBNE	INT	4	(IBM name: SMF19BNE) Number of free extents.

SMF019_Direct_Access_Volume.zVLI.<fieldname>

zTRK	INT	4	(IBM name: SMF19TRK) Total number of tracks on the volume
zTRM	INT	4	(IBM name: SMF19TRM) Total number of tracks in the track-managed space when SMF19CYM = '1'. Set to the value of SMF19TRK otherwise. When SMF19CYM = '1' this value is also the first track address where cylinder-managed space begins. End of expanded SMF statistics

Record Type 20 - Job Initiation

SMF Record 20 (Job Initiation) is mapped by structure member "T020".

Primary Segment:

- SMF020_Job_Initiation

Secondary Segment(s): 1

- SMF020_Relocate_Section

Primary segment: SMF020_Job_Initiation

Field Name	Type	Len	Description
<i>SMF020_Job_Initiation.<fieldname></i>			
SMF020_Job_Initiation.Header_Self_defining_Section.<fieldname>			
zFLG	HEX	1	(IBM name: SMF20FLG) System indicator: Bit Meaning when set 0-2 Reserved 3-6 Version indicators 7 Reserved.
zRTY	INT	1	(IBM name: SMF20RTY) Record type 20 (X'14').
zTME	TSTMP	8	(IBM name: SMF20TME) Date/Time when the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF20SID) System identification (from the SID parameter).
zJOBNAME	CHAR	8	(IBM name: SMF20JBN) Job name. The job name, time, and date that the reader recognized the JOB card (for this job) constitute the job log identification, or transaction name (for APPC output).
zRST	TSTMP	8	(IBM name: SMF20RST) Date/Time that the reader recognized the JOB card (for this job).
zUserID	CHAR	8	(IBM name: N/A) User-defined identification field (taken from common exit parameter area, not from USER=parameter on job statement).
zRLO	INT	2	(IBM name: SMF20RLO) Offset to relocatable area. See z/OS Security Server RACF Macros and Interfaces for more information about relocatable areas for RACF-owned records.
zPGM	CHAR	20	(IBM name: SMF20PGM) Programmer's name.
zNAF	INT	1	(IBM name: SMF20NAF) Number of accounting fields.
SMF020_Job_Initiation.Header_Self_defining_Section.zACT.<fieldname>			
zACTL	INT	1	(IBM name: N/A) Accounting field length.
zACTN	XVCHAR	0 143	(IBM name: N/A) Accounting information.

Secondary segment: SMF020_Relocate_Section

Field Name	Type	Len	Description
<i>SMF020_Relocate_Section.<fieldname></i>			

zFLS	INT	2	(IBM name: SMF20FLS) Size of relocate section (including this field).
zGRP	CHAR	8	(IBM name: SMF20GRP) RACF Group ID. If RACF is not active, this field is set to zero.
zRUD	CHAR	8	(IBM name: SMF20RUD) RACF User ID. If RACF is not active, this field is set to zero.
zTID	CHAR	8	(IBM name: SMF20TID) RACF terminal ID. If RACF is not active, or if RACF is active and the user is not a terminal user, then this field is set to zero.

Record Type 21 - Tape Error

SMF Record 21 (Tape Error) is mapped by structure member "T021".

Primary Segment:

- SMF021_Tape_Error

Secondary Segment(s): 0

Primary segment: SMF021_Tape_Error

Field Name	Type	Len	Description
<i>SMF021_Tape_Error.<fieldname></i>			
zFLG	HEX	1	(IBM name: SMF21FLG) System indicator: Bit Meaning when set 0-2 Reserved 3-6 Version indicators* 7 RESERVED. *See 'Standard and Extended SMF record headers' on page 174 F0R a detailed description.
zRTY	INT	1	(IBM name: SMF21RTY) Record type 21 (X'15').
zTME	TSTMP	8	(IBM name: SMF21TME) Date/Time when the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF21SID) System identification (from the SID parameter).
zLGH	INT	2	(IBM name: SMF21LGH) Length of rest of record.
zVOL	CHAR	6	(IBM name: SMF21VOL) Volume serial number.
zCA	HEX	2	(IBM name: SMF21CA) Device number or device address.
zUCB	HEX	4	(IBM name: SMF21UCB) UCBTYP value.
zDEV	HEX	1	(IBM name: SMF21DEV) Low order byte of UCB device type. Values less than X'80' represent reel tapes. Values of X'80' or greater represent cartridge tapes.
zTapeStyle	BINT (ENUM)	1	(IBM name: N/A) Reel Tape or Cartridge.
zTR	INT	1	(IBM name: SMF21TR) Number of temporary read errors (non-buffered log).
zTW	INT	1	(IBM name: SMF21TW) Number of temporary write errors (non-buffered log).
zSIO	INT	2	(IBM name: SMF21SIO) Number of start sub-channel (SSCH) instructions.
zPR	INT	1	(IBM name: SMF21PR) Number of permanent read errors.
zPW	INT	1	(IBM name: SMF21PW) Number of permanent write errors.
zNB	INT	1	(IBM name: SMF21NB) Number of noise blocks (non-buffered log).
zERG	INT	2	(IBM name: SMF21ERG) Number of erase gaps.
zCLN	INT	2	(IBM name: SMF21CLN) Number of cleaner actions.
zBLS	INT	2	(IBM name: SMF21BLS) Block size of the last data set closed on the tape if the tape was demounted during CLOSE processing, not at a different time. Some programs that use EXCP do not provide a block size. This field is valid only (but still might contain zero) when bit SMF21LB is off.

SMF021_Tape_Error.zOFL.<fieldname>			
zOutput	BIT	1	Output tape
zInput	BIT	1	Input tape (READ BACKWARD)

SMF021_Tape_Error.<fieldname>			
zTUS	INT	3	(IBM name: SMF21TUS) Tape unit serial.
zTRF	INT	2	(IBM name: SMF21TRF) Temporary read forward errors.
zTRB	INT	2	(IBM name: SMF21TRB) Temporary read backward errors.
zTWF	INT	2	(IBM name: SMF21TWF) Temporary write errors.
zBR	INT	3	(IBM name: SMF21BR) Number of bytes read, in units of 4096. The length of each block is rounded up to a multiple of 4096 BEFORE being counted. This count includes volume mount and verify, in addition to task I/O. Provided only for cartridge tape devices. Maximum value is X'FFFFFF'.
zBW	INT	3	(IBM name: SMF21BW) Number of bytes written, in units of 4096. The length of each block is rounded up to a multiple of 4096 BEFORE being counted. Provided only for cartridge tape devices. Maximum value is X'FFFFFF'.

SMF021_Tape_Error.zFL1.<fieldname>			
zNCT	BIT	1	zBRN and zBWN at 64 and 68 contain valid values. Currently this bit is on only for 3590.
zLS	BIT	1	Field zLST has a valid value.
zLB	BIT	1	zLBS has a valid value.
zDBV	BIT	1	zDBR and zDBW at 80 and 84 contain valid values.
zMFV	BIT	1	zMCR, zMCW, zMDR, and zMDW contain valid values.

SMF021_Tape_Error.<fieldname>			
zFL2	HEX	1	(IBM name: SMF21FL2) Reserved.
zBRN	INT	4	(IBM name: SMF21BRN) Number of bytes read, in units of 4096. The length of each block is rounded up to a multiple of 4096 BEFORE being counted. Valid only if SMF21NCT is on. If the value is less than X'FFFFFF', it is also in SMF21BR.
zBWN	INT	4	(IBM name: SMF21BWN) Number of bytes written, in units of 4096. The length of each block is rounded up to a multiple of 4096 BEFORE being counted. Valid only if SMF21NCT is on. If the value is less than X'FFFFFF', it is also in SMF21BW.
zLST	INT	4	(IBM name: SMF21LST) Number of I/Os initiated on current volume. Valid only if SMF21LS is on.
zLBS	INT	4	(IBM name: SMF21LBS) Block size. Valid only if SMF21LB is on.
zDBR	INT	4	(IBM name: SMF21DBR) Number of bytes read by the device, in units of 4096. Valid only if SMF21DBV is on.
zDBW	INT	4	(IBM name: SMF21DBW) Number of bytes written by the device, in units of 4096. Valid only if SMF21DBV is on.
zMCR	INT	4	(IBM name: SMF21MCR) Number of bytes read by the channel, in units of 1M. Valid only if SMF21MFV is on.

zMCW	INT	4	(IBM name: SMF21MCW) Number of bytes written by the channel, in units of 1M. Valid only if SMF21MFV is on.
zMDR	INT	4	(IBM name: SMF21MDR) Number of bytes read by the device, in units of 1M. Valid only if SMF21MFV is on.
zMDW	INT	4	(IBM name: SMF21MDW) Number of bytes written by the device, in units of 1M. Valid only if SMF21MFV is on.

Record Type 22 - Configuration

SMF Record 22 (Configuration) is mapped by structure member "T022".

Primary Segment:

- [SMF022_Configuration](#)

Secondary Segment(s): 17 (in alphabetical order)

- [SMF022_Continuation](#)
- [SMF022_CHP](#)
- [SMF022_CHPID](#)
- [SMF022_CPU](#)
- [SMF022_Device_Entry](#)
- [SMF022_Device_Expansion](#)
- [SMF022_Expanded_Storage](#)
- [SMF022_IO_Config_Change](#)
- [SMF022_IO_Config_Change_Hdr](#)
- [SMF022_Log_Partn](#)
- [SMF022_Phys_Control_Unit](#)
- [SMF022_PCI_Func](#)
- [SMF022_Reconfig_CHP](#)
- [SMF022_Reconfig_PCIE](#)
- [SMF022_Storage](#)
- [SMF022_Storage_Control](#)
- [SMF022_Storage_Element](#)

Primary segment: [SMF022_Configuration](#)

Field Name	Type	Len	Description
<i>SMF022_Configuration.<fieldname></i>			
<i>SMF022_Configuration.Header_Self_defining_Section.<fieldname></i>			
zFLG	HEX	1	(IBM name: SMF22FLG) System indicator: Bit Meaning when set 0-2 Reserved 3-6 Version indicators (see 'Standard and Extended SMF record headers' on page 174 FOR details) 7 RESERVED.
zRTY	INT	1	(IBM name: SMF22RTY) Record type 22 (X'16').
zTME	TSTMP	8	(IBM name: SMF22TME) Date/Time when the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF22SID) System identification (from the SID parameter).
zIND	INT (ENUM)	2	(IBM name: SMF22IND) Record creator indicator
zECT	INT	2	(IBM name: SMF22ECT) Number of sections that are to follow.

Secondary segment: [SMF022_CPU](#)

Field Name	Type	Len	Description
<i>SMF022_CPU.<fieldname></i>			
<i>SMF022_CPU.zCFG.<fieldname></i>			
zVector	BIT	1	Vector feature indicator
zCpuReconfig	BIT	1	CPU reconfiguration indicator
<i>SMF022_CPU.<fieldname></i>			
zPID	INT	1	

			(IBM name: SMF22PID) CPU section identification (this field is always 1).
zCPN	INT	2	(IBM name: SMF22CPN) CPU model number (taken from CONFIG CPU command).
zCpuld	INT	2	(IBM name: SMF22Cpuld) CPU identifier (taken from CONFIG CPU command or default in PSACPUPA).
zCPA	INT	1	(IBM name: SMF22CPA) CPU identifier (Should not be used. Use SMF22Cpuld.)

Secondary segment: **SMF022_Storage**

Field Name	Type	Len	Description
<i>SMF022_Storage.<fieldname></i>			
SMF022_Storage.zMFL.<fieldname>			
zInterleaved	BIT	1	Central storage frames are interleaved
zNotObtained	BIT	1	Real storage status could not be obtained.

SMF022_Storage.<fieldname>			
zTID	INT	1	(IBM name: SMF22TID) Storage section identification (this field is always 3).
zPGL	INT	4	(IBM name: SMF22PGL) Block number of the first online frame reported in this storage element. When the block number exceeds X'FFFFFFFF', it is reported in the SMF22 Storage Element Extension (ID=X'0C')
zNPG	INT	4	(IBM name: SMF22NPG) The number of online frames reported in this storage element

Secondary segment: **SMF022_CHP**

Field Name	Type	Len	Description
<i>SMF022_CHP.<fieldname></i>			
zRV7	CHAR	1	(IBM name: SMF22RV7) Reserved.
zUID	INT	1	(IBM name: SMF22UID) Channel Path section Identification (this field is always 7).

SMF022_CHP.zPAR.<fieldname>			
zPFG	BIT	1	(IBM name: SMF22PFG) If 1=CHP, CHP is valid for this installation. If 0, zPOW=0 and zPON=0
zPOW	BIT	1	(IBM name: SMF22POW) If 1=CHP, CHP is owned by this system, and zPFG=1. if 0, zPON=0
zPON	BIT	1	(IBM name: SMF22PON) If 1=CHP, CHP is ONLINE, zPFG=1, and zPOW=1

Secondary segment: **SMF022_Reconfig_CHP**

Field Name	Type	Len	Description
------------	------	-----	-------------

SMF022_Reconfig_CHP.<fieldname>			
zRV8	CHAR	1	(IBM name: SMF22RV8) Reserved.
zRID	INT	1	(IBM name: SMF22RID) Reconfigured Channel Path section identification (this field is always 8).
zCNT	INT	1	(IBM name: SMF22CNT) Count of channel path IDs (CHPIDs) in this section.
zCHI	CHAR	1	(IBM name: SMF22CHI) Array of channel path identifiers.

Secondary segment: SMF022_Reconfig_PCIE

Field Name	Type	Len	Description
SMF022_Reconfig_PCIE.<fieldname>			
zPCIID	INT	1	(IBM name: SMF22PCIID) Reconfigured PCIE function identifier section identification (this field is always X'0B').
zPCICNT	INT	2	(IBM name: SMF22PCICNT) Count of PCIE function identifiers (PFIDs) in this section.
zPFID	INT	4	(IBM name: SMF22PFID) Array of PCIE function identifiers (PFIDs).

Secondary segment: SMF022_Expanded_Storage

Field Name	Type	Len	Description
SMF022_Expanded_Storage.<fieldname>			
zXID	INT	1	(IBM name: SMF22XID) Expanded storage identification (this field is always 9).
zXAD	INT	4	(IBM name: SMF22XAD) Beginning expanded storage frame (E-frame) address in this contiguous block (taken from the CONFIG command). Note: Expanded storage is always addressed in frames.
zXNP	INT	4	(IBM name: SMF22XNP) Number of 4K expanded storage frames in this contiguous block (taken from the CONFIG command).

Secondary segment: SMF022_Storage_Control

Field Name	Type	Len	Description
SMF022_Storage_Control.<fieldname>			
zGID	INT	1	(IBM name: SMF22GID) Storage control section identification (this field is always 10, X'0A').
zSSI	INT	2	(IBM name: SMF22SSI) 3990 SUBSYSTEM identifier.
zMDL	INT	1	(IBM name: SMF22MDL) 3990 Model identifier.
zVOL	CHAR	6	(IBM name: SMF22VOL) Originating device volume serial (this field is blank if device is offline).
zCUA	INT	2	

			(IBM name: SMF22CUA) Originating device identification.
zCCA	INT	1	(IBM name: SMF22CCA) Originating device channel connection address (CCA).
zDDC	INT	1	(IBM name: SMF22DDC) Originating device director-to-device connection (DDC).
zPDC	INT	1	(IBM name: SMF22PDC) Originating device previous DDC.

SMF022_Storage_Control.zSCS.<fieldname>

zStatus	BINT (ENUM)	3	(IBM name: SMF22SCS) 3990 subsystem caching status:
zMaint	BIT	1	Subsystem storage is disabled for maintenance.
zImINotAvail	BIT	1	IML device is not available.
zNoFastWrite	BIT	1	Cache fast write is disabled.

SMF022_Storage_Control.zPCS.<fieldname>

zStatus	BINT (ENUM)	3	(IBM name: SMF22PCS) Previous subsystem caching status:
zMaint	BIT	1	Subsystem storage is disabled for maintenance.
zImINotAvail	BIT	1	IML device is not available.
zNoFastWrite	BIT	1	Cache fast write is disabled.

SMF022_Storage_Control.zSNV.<fieldname>

zStatus	BINT (ENUM)	2	(IBM name: SMF22SNV) 3990 subsystem NVS status:
zMaint	BIT	1	Disabled for maintenance.
zPendErr	BIT	1	Pending due to error.

SMF022_Storage_Control.zPNV.<fieldname>

zStatus	BINT (ENUM)	2	(IBM name: SMF22PNV) Previous subsystem NVS status:
zMaint	BIT	1	Disabled for maintenance.
zPendErr	BIT	1	Pending due to error.

SMF022_Storage_Control.zSDS.<fieldname>

zStatus	BINT (ENUM)	2	Caching status
zFastWrite	BINT (ENUM)	2	Fast write status
zPrimary	BIT	1	Primary of duplex pair.
zSecondary	BIT	1	Secondary of duplex pair.
zDuplexPair	BINT (ENUM)	2	Duplex pair status. for Multi-target PPRC, PPRC pair status for relationship 1 if primary
zPinned	BINT (ENUM)	2	Pinned data
zCCALow6	BIT	6	Low-order 6 bits of CCA value of other device in duplex.

SMF022_Storage_Control.zPDS.<fieldname>

zStatus	BINT (ENUM)	2	Caching status
zFastWrite	BINT (ENUM)	2	Fast write status

zPrimary	BIT	1	Primary of duplex pair.
zSecondary	BIT	1	Secondary of duplex pair.
zDuplexPair	BINT (ENUM)	2	Duplex pair status. for Multi-target PPRC, PPRC pair status for relationship 1 if primary
zPinned	BINT (ENUM)	2	Pinned data
zCCALow6	BIT	6	Low-order 6 bits of CCA value of other device in duplex.

SMF022_Storage_Control.zADS.<fieldname>

zFailedMVS	BIT	1	Data exists in failed MVS for the devices.
------------	-----	---	--

SMF022_Storage_Control.zSMT.<fieldname>

zPPRC1	BINT (ENUM)	2	PPRC pair status rel 1
zPPRC2	BINT (ENUM)	2	PPRC pair status rel 2
zPPRC3	BINT (ENUM)	2	PPRC pair status rel 3

SMF022_Storage_Control.zPAD.<fieldname>

zFailedMVS	BIT	1	Data exists in failed MVS for the devices.
------------	-----	---	--

SMF022_Storage_Control.zPMT.<fieldname>

zPPRC1	BINT (ENUM)	2	PPRC pair status rel 1
zPPRC2	BINT (ENUM)	2	PPRC pair status rel 2
zPPRC3	BINT (ENUM)	2	PPRC pair status rel 3

SMF022_Storage_Control.zCYS.<fieldname>

zXRC	BIT	1	XRC active for the device.
zPPRC	BIT	1	PPRC active for the device.
zPPRCVol	BINT (ENUM)	1	PPRC primary or secondary volume:
zXrcSusp	BIT	1	Volume in XRC suspended or quiesced state.
zStChg	BIT	1	PPRC volume is State Change pending.
zConcurCopy	BIT	1	Concurrent Copy is active.
zFlashCopy	BIT	1	Flash Copy is active.

SMF022_Storage_Control.zPCY.<fieldname>

zXRC	BIT	1	XRC active for the device.
zPPRC	BIT	1	PPRC active for the device.
zPPRCVol	BINT (ENUM)	1	PPRC primary or secondary volume:
zXrcSusp	BIT	1	Volume in XRC suspended or quiesced state.
zStChg	BIT	1	PPRC volume is State Change pending.
zConcurCopy	BIT	1	Concurrent Copy is active.
zFlashCopy	BIT	1	Flash Copy is active.

SMF022_Storage_Control.<fieldname>

zCYL	INT	4	(IBM name: SMF22CYL) Device high cylinders.
zCYP	INT	4	(IBM name: SMF22CYP) Previous device high cylinders.

Secondary segment: SMF022_Storage_Element

Field Name	Type	Len	Description
<i>SMF022_Storage_Element.<fieldname></i>			
SMF022_Storage_Element.zXFL.<fieldname>			
zInterleaved	BIT	1	Central storage frames are interleaved
zNotObtained	BIT	1	Real storage status could not be obtained.

SMF022_Storage_Element.<fieldname>			
zTXD	INT	1	(IBM name: SMF22TXD) Storage section identification (this field is always 12).
zXGL	HEX	8	(IBM name: SMF22XGL) Block number of the first online frame reported in this storage element.
zXPG	INT	4	(IBM name: SMF22XPG) The number of online frames reported in this storage element.

Secondary segment: SMF022_IO_Config_Change_Hdr

Field Name	Type	Len	Description
<i>SMF022_IO_Config_Change_Hdr.<fieldname></i>			
zOID	INT	1	(IBM name: SMF22OID) I/O configuration change element ID (this field is always 11).
zR#	INT	1	(IBM name: SMF22R#) Record number of this record.
zTR	INT	1	(IBM name: SMF22TR) Total number of records for this I/O configuration change. For example, if there are 3 RECORDS total, and this record is the first, SMF22R# would contain 1, and SMF22TR would contain 3 (INDICATING record 1 OF 3).
zOFF	INT	2	(IBM name: SMF22OFF) Offset of first entry in this record.
zELN	INT	2	(IBM name: SMF22ELN) Length of each entry in the array of I/O configuration change elements.
zT#E	INT	4	(IBM name: SMF22T#E) Total number of entries for this I/O configuration change.
z#E	INT	4	(IBM name: SMF22#E) Number of entries in this record.

SMF022_IO_Config_Change_Hdr.zFLS.<fieldname>			
zSOFT	BIT	1	Requestor of the ACTIVATE specified the SOFT option. This indicates that only software configuration changes are to be made.
zFORCE	BIT	1	Requestor of the ACTIVATE specified the FORCE option.

SMF022_IO_Config_Change_Hdr.<fieldname>			
zIDN	CHAR	44	(IBM name: SMF22IDN) Name of IODF data set that contains the new I/O configuration definition.

zEDT	CHAR	2	(IBM name: SMF22EDT) ID of the eligible device table (EDT) or '***' if the new EDT could not be rebuilt during dynamic activation of the I/O configuration.
zCFI	CHAR	8	(IBM name: SMF22CFI) Operating system configuration ID for new configuration.
zHCT	HEX	64	(IBM name: SMF22HCT) Hardware configuration token that represents the new I/O configuration.
z#UA	INT	4	(IBM name: SMF22#UA) Number of unit control blocks (UCB) added for this I/O configuration change.
z#UD	INT	4	(IBM name: SMF22#UD) Number of unit control blocks (UCB) deleted for this I/O configuration change.
zFNC	INT	1	(IBM name: SMF22FNC) Activate function requested. See Note 1 ON page 263 FOR possible values of this field.

Secondary segment: SMF022_IO_Config_Change

Field Name	Type	Len	Description
<i>SMF022_IO_Config_Change.<fieldname></i>			
zETY	INT (ENUM)	1	(IBM name: SMF22ETY) Entry type.
zERQ	INT	1	(IBM name: SMF22ERQ) Entry request. For the possible values of this field, see Note 3 ON page 263, 4 ON page 263, 5 ON page 264, 6 ON page 264, and 7 ON page 264.

<i>SMF022_IO_Config_Change.zEFL.<fieldname></i>			
zHardware	BIT	1	Hardware change
zSoftware	BIT	1	Software change
zDynamic	BIT	1	Indicates that this entry was created because an installation-static device is being changed to a dynamic device. This entry represents the delete request (SMF22ERQ=SMF22DDD). There will be another entry that represents the add request.
zSubChan	BIT	1	Indicates whether the UCB for the device is connected to a subchannel. Valid only when the entry type is 'device' (SMFETY=SMF22DEV) and entry request is 'add device' (SMFERQ=SMF22DAD).
zLCSS	BIT	1	Indicates that this entry represents a change affecting the current logical channel subsystem (LCSS).
zLoseAcc	BIT	1	Indicates that the activating partition will lose access to the device because either the device is deleted from the configuration or the activating partition is to be removed from the candidate list of the device.
zCandChg	BIT	1	Indicates that this entry was created because the candidate list of the device was changed. When SMF22ETY=SMF22DEV, SMF22ERQ=SMF22DDD and SMF22ECC is on, one or more partitions were deleted from the device candidate list. When SMF22ETY=SMF22DEV, SMF22ERQ=SMF22DAD and SMF22ECC is on, one or more partitions were added to the device candidate list.

<i>SMF022_IO_Config_Change.<fieldname></i>			
zECSS	INT	1	(IBM name: SMF22ECSS) Logical channel subsystem (LCSS) ID
zESI	CHAR	28	(IBM name: SMF22ESI) Entry type specific information follows.

Secondary segment: SMF022_Device_Entry

Field Name	Type	Len	Description
<i>SMF022_Device_Entry.<fieldname></i>			
zDVN	INT	2	(IBM name: SMF22DVN) Device number.
zDCM	INT	1	(IBM name: SMF22DCM) Mask of channel path IDs (CHPID) contained in SMF22DCH that were added to or deleted from this device. Valid only under one of the following conditions (zero otherwise): Entry request SMF22ERQ value Modify to add CHPIDs SMF22DAH Modify to remove CHPIDs SMF22DDH
zDPM	INT	1	(IBM name: SMF22DPM) Mask of physical control unit numbers in SMF22DPC that were added to or deleted from this device. Valid only under one of the following conditions (zero otherwise): Entry request SMF22ERQ value Modify to add CUs SMF22DAP Modify to remove CUs SMF22DDP
zDCH	CHAR	8	(IBM name: SMF22DCH) Array of one-byte elements that represent channel path IDs (CHPID) that were added to or deleted from this device. Valid only under one of the following conditions (zero otherwise): Entry request SMF22ERQ value Modify to add CHPIDs SMF22DAH Modify to remove CHPIDs SMF22DDH
zDPC	CHAR	16	(IBM name: SMF22DPC) Array of two-byte elements that represent physical control unit numbers that were added to or deleted from this device. Valid only under one of the following conditions (zero otherwise): Entry request SMF22ERQ value Modify to add CUs SMF22DAP Modify to remove CUs SMF22DDP

Secondary segment: SMF022_Device_Expansion

Field Name	Type	Len	Description
<i>SMF022_Device_Expansion.<fieldname></i>			
zSSID	INT	1	(IBM name: SMF22SSID) Subchannel set ID
zDCM	CHAR	27	(IBM name: SMF22DCM) Reserved.

Secondary segment: SMF022_Phys_Control_Unit

Field Name	Type	Len	Description
<i>SMF022_Phys_Control_Unit.<fieldname></i>			
zPCN	INT	2	(IBM name: SMF22PCN) Physical control unit number.
zPCM	INT	1	(IBM name: SMF22PCM) Mask of channel path IDs in SMF22PCH that were added to or deleted from this control unit. Valid only under one of the following conditions (zero otherwise): Entry request SMF22ERQ value Modify to add CHPIDs SMF22PAH Modify to remove CHPIDs SMF22PDH
zPCH	CHAR	8	(IBM name: SMF22PCH) Array of 1-byte elements that represent channel path IDs (CHPID) that were added to or deleted from this control unit. Valid only under one of the following conditions (zero otherwise): Entry request SMF22ERQ value Modify to add CHPIDs SMF22PAH Modify to remove CHPIDs SMF22PDH
zPUA	CHAR	4	(IBM name: SMF22PUA) Range of unit addresses that were added to or deleted from this control unit. Valid only under one of the following conditions (zero otherwise): Entry request SMF22ERQ value Modify to add unit address SMF22PAU range Modify to remove unit address SMF22PDU range

zPUC	INT	1	(IBM name: SMF22PUC) Count of unit addresses.
zPSU	INT	1	(IBM name: SMF22PSU) Starting unit address.

Secondary segment: SMF022_CHPID

Field Name	Type	Len	Description
<i>SMF022_CHPID.<fieldname></i>			
zCCH	INT	1	(IBM name: SMF22CCH) Channel path ID (CHPID).

Secondary segment: SMF022_Log_Partn

Field Name	Type	Len	Description
<i>SMF022_Log_Partn.<fieldname></i>			
zLP_Name	CHAR	8	(IBM name: SMF22LP_Name) Logical partition name.
zLP_MIFID	HEX	8	(IBM name: SMF22LP_MIFID) Multiple Image Facility (MIF) identifier.

Secondary segment: SMF022_PCI_Func

Field Name	Type	Len	Description
<i>SMF022_PCI_Func.<fieldname></i>			
zPF_PPID	INT	4	(IBM name: SMF22PF_PPID) PCIe function ID.

Secondary segment: SMF022_Continuation

Field Name	Type	Len	Description
<i>SMF022_Continuation.<fieldname></i>			
zL99	INT	1	(IBM name: SMF22L99) Length of this section.
zCON	INT	1	(IBM name: SMF22CON) Identifies next record as a continuation (this field is always 99).

Record Type 23 - SMF Status

SMF Record 23 (SMF Status) is mapped by structure member "T023".

Primary Segment:

- SMF023_SMF_Status

Secondary Segment(s): 6 (in alphabetical order)

- SMF023_BindBreak
- SMF023_LogStream
- SMF023_Product
- SMF023_SpinLock
- SMF023_Stats
- SMF023_System

Primary segment: SMF023_SMF_Status

Field Name	Type	Len	Description
<i>SMF023_SMF_Status.<fieldname></i>			
SMF023_SMF_Status.Header_self_defining_section.<fieldname>			
zFLG	HEX	1	(IBM name: SMF23FLG) System indicator: Bit Meaning when set 0-2 Reserved 3-6 Version indicators (See 'Standard and Extended SMF record headers' on page 174 FOR details.) 7 RESERVED.
zRTY	INT	1	(IBM name: SMF23RTY) Record type 23 (X'17').
zTME	TSTMP	8	(IBM name: SMF23TME) Date/Time when the record was moved to the SMF buffer.
zSID	CHAR	4	(IBM name: SMF23SID) System identification (from the SID parameter).
zPOF	INT	4	(IBM name: SMF23POF) Offset to product section from start of record, including the record descriptor word (RDW).
zPLN	INT	2	(IBM name: SMF23PLN) Length of product section.
zPON	INT	2	(IBM name: SMF23PON) Number of product sections.
zSOF	INT	4	(IBM name: SMF23SOF) Offset to system section from start of record, including the record descriptor word (RDW).
zSLN	INT	2	(IBM name: SMF23SLN) Length of system section.
zSON	INT	2	(IBM name: SMF23SON) Number of system sections.
zROF	INT	4	(IBM name: SMF23ROF) Offset to SMF statistics section from start of record, including the record descriptor word (RDW).
zRLN	INT	2	(IBM name: SMF23RLN) Length of SMF statistics section.
zRON	INT	2	(IBM name: SMF23RON) Number of SMF statistics sections.
zLOF	INT	4	(IBM name: SMF23LOF) Offset to SMF logstream statistics section.
zLLN	INT	2	(IBM name: SMF23LLN) Length of SMF logstream statistics section.
zLON	INT	2	(IBM name: SMF23LON) Number of SMF logstream statistics sections.

zNOF	INT	4	(IBM name: SMF23NOF) Offset to spin lock instrumentation data section from start of record, including the record descriptor word (RDW).
zNLN	INT	2	(IBM name: SMF23NLN) Length of spin lock instrumentation data section.
zNON	INT	2	(IBM name: SMF23NON) Number of spin lock instrumentation data sections.
zBOF	INT	4	(IBM name: SMF23BOF) Offset to bind break instrumentation data section from start of record, including the record descriptor word (RDW).
zBLN	INT	2	(IBM name: SMF23BLN) Length of bind break instrumentation data section.
zBON	INT	2	(IBM name: SMF23BON) Number of bind break instrumentation data sections.

Secondary segment: SMF023_Product

Field Name	Type	Len	Description
<i>SMF023_Product.<fieldname></i>			
zTID	INT	2	(IBM name: SMF23TID) SubType identification - '0'.
zRVN	CHAR	2	(IBM name: SMF23RVN) Record version number - '02'.
zPNM	CHAR	8	(IBM name: SMF23PNM) Product name - 'SMF'.

Secondary segment: SMF023_System

Field Name	Type	Len	Description
<i>SMF023_System.<fieldname></i>			
zINT	CHAR	6	(IBM name: SMF23INT) Length of measurement interval.
zFLS	CHAR	4	(IBM name: SMF23FLS) Operating system release level.
zOSL	CHAR	8	(IBM name: SMF23OSL) MVS product name (taken from CVTPRODN).
zTOD	TSTMP	8	(IBM name: SMF23TOD) Time and date that the interval ended for the STATUS function, in time-of-day (TOD) format, an unsigned 64-bit fixed-point number where bit 51 IS equivalent to 1 MICROSECOND. If you requested synchronized interval recording for SMF statistics, a field in other records, similar to this field, contains the same time so you can compare this record with other records generated at the end of the same interval.
zSYN	CHAR	8	(IBM name: SMF23SYN) System name (from the SYSNAME parameter in the IEASYSxx parmlib member).
zSYP	CHAR	8	(IBM name: SMF23SYP) Sysplex name (from the SYSPLEX parameter in the COUPLExx parmlib member).

Secondary segment: SMF023_Stats

Field Name	Type	Len	Description
<i>SMF023_Stats.<fieldname></i>			
zBFW	INT	4	(IBM name: SMF23BFW) Number of buffers written.
zBFQ	INT	4	(IBM name: SMF23BFQ) Maximum number of buffers used at one time.
zSUS	CHAR	4	(IBM name: SMF23SUS) Reserved.
zRCW	INT	4	(IBM name: SMF23RCW) Number of records written.
zBFA	INT	4	(IBM name: SMF23BFA) Amount of each buffer allocation request.
zBFT	INT	4	(IBM name: SMF23BFT) Total amount of buffer storage currently allocated (and recently used).
zBFH	INT	4	(IBM name: SMF23BFH) 'High water mark' of buffer storage allocation.
zBFM	INT	4	(IBM name: SMF23BFM) Buffer storage maximum in effect (BUFSIZMAX binary value).
zBFL	INT	4	(IBM name: SMF23BFL) Buffer storage usage warning level in effect (BUFUSEWARN binary value).

<i>SMF023_Stats.zSFG.<fieldname></i>			
z4NGR	BIT	1	zNGR count ON=4 bytes, OFF=8 bytes
z4PBG	BIT	1	zPBG count ON=4 bytes, OFF=8 bytes
z4NFR	BIT	1	zNFR count ON=4 bytes, OFF=8 bytes
z4PFX	BIT	1	zPFX count ON=4 bytes, OFF=8 bytes
z41RF	BIT	1	z1RF count ON=4 bytes, OFF=8 bytes
z4NRF	BIT	1	zNRF count ON=4 bytes, OFF=8 bytes
z4NIO	BIT	1	zNIO count ON=4 bytes, OFF=8 bytes
z4TCB	BIT	1	zTCB count ON=4 bytes, OFF=8 bytes
z4SRB	BIT	1	zSRB count ON=4 bytes, OFF=8 bytes

<i>SMF023_Stats.<fieldname></i>			
zNGR	INT	8	(IBM name: SMF23NGR) Total number of getmain requests that have been issued. For more details, see the explanation of SMF23SFG bit 0.
zPBG	INT	8	(IBM name: SMF23PBG) Total number of pages backed during getmain requests that have been issued. For more details, see the explanation of SMF23SFG bit 1.
zNFR	INT	8	(IBM name: SMF23NFR) Total number of fix requests that have been issued for the storage whose address space is below two gigabytes. For more details, see the explanation of SMF23SFG bit 2.
zPFX	INT	8	(IBM name: SMF23PFX) Total number of frames that were requested to be fixed for the storage whose address space is below two gigabytes. For more details, see the explanation of SMF23SFG bit 3.
z1RF	INT	8	(IBM name: SMF231RF) Total number of first reference faults. For more details, see the explanation of SMF23SFG bit 4.
zNRF	INT	8	(IBM name: SMF23NRF) Total number of non-first reference faults. For more details, see the explanation of SMF23SFG bit 5.

zNIO	INT	8	(IBM name: SMF23NIO) Total number of I/Os for this interval. For more details, see the explanation of SMF23SFG bit 6.
zTCB	INT	8	(IBM name: SMF23TCB) Total number of unlocked TCB dispatches. For more details, see the explanation of SMF23SFG bit 7.
zSRB	INT	8	(IBM name: SMF23SRB) Total number of SRB dispatches. For more details, see the explanation of SMF23SFG bit 8.
zNGD	INT	4	(IBM name: SMF23NGD) Total number of getmain requests that have been issued for this interval. For the cumulative total, see the explanation of SMF23NGR.
zPBD	INT	4	(IBM name: SMF23PBD) Total number of pages backed during GETMAIN requests that have been issued for this interval. For the cumulative total, see the explanation of SMF23PBG.
zNFD	INT	4	(IBM name: SMF23NFD) Total number of fix requests that have been issued for storage (address space only) below two gigabytes for this interval. For the cumulative total, see the explanation of SMF23NFR.
zPFD	INT	4	(IBM name: SMF23PFD) Total number of frames that were requested to be fixed for storage (address space only) below two gigabytes for this interval. For the cumulative total, see the explanation of SMF23PFX.
z1RD	INT	4	(IBM name: SMF231RD) Total number of first reference faults taken for this interval. For the cumulative total, see the explanation of SMF231RF.
zNRD	INT	4	(IBM name: SMF23NRD) Total number of non-first reference faults taken for this interval. For the cumulative total, see the explanation of SMF23NRF.
zNID	INT	8	(IBM name: SMF23NID) Total number of I/Os for this interval. For the cumulative total, see the explanation of SMF23NIO.
zTCD	INT	8	(IBM name: SMF23TCD) Total number of unlocked TCB dispatches for this interval. For the cumulative total, see the explanation of SMF23TCB.
zSRD	INT	8	(IBM name: SMF23SRD) Total number of SRB dispatches for this interval. For the cumulative total, see the explanation of SMF23SRB.

Secondary segment: SMF023_LogStream

Field Name	Type	Len	Description
<i>SMF023_LogStream.<fieldname></i>			
zLSL	INT	2	(IBM name: SMF23LSL) Length of the logstream name in SMF23LSN.
zLSN	CHAR	26	(IBM name: SMF23LSN) Logstream name.
zLFA	INT	4	(IBM name: SMF23LFA) Amount of each buffer allocation.
zLFT	INT	4	(IBM name: SMF23LFT) Total amount of buffer storage currently used (in bytes).
zLFH	INT	4	(IBM name: SMF23LFH) Binary high water mark of the buffer allocation (in bytes).
zLFM	INT	4	(IBM name: SMF23LFM) Buffer storage maximum in effect (DSPSIZMAX value in bytes).
zLFL	INT	4	(IBM name: SMF23LFL) Binary buffer warning level in effect (BUFUSEWARN binary value).

SMF023_LogStream.zLFG.<fieldname>			
zGlobBufWrn	BIT	1	The buffer warning level in effect was from the global option.
zGlobBufSiz	BIT	1	The buffer size (DSPSIZMAX) in effect was from the global option.
zCompReq	BIT	1	Compression is requested for records written to this log stream by SMF configuration. When off, compression is not requested.
zCompPrep	BIT	1	Compression is prepared. This log stream is ready to compress records, or in other words, hardware is capable of using zEDC, and all setup for compression succeeded. When off, hardware is not capable of using zEDC or compression setup failed. See message IFA730I.
zCompAvail	BIT	1	Compression is available. The last use of zEDC was successful, and it indicated zEDC Express features were available to satisfy compression requests. When off, at the last request, zEDC Express features were not available to satisfy compression requests.
zGlobPermfix	BIT	1	The current PERMFIK value for this log stream is the global PERMFIK value. In the SMF configuration, a log stream PERMFIK value was not specified.

SMF023_LogStream.<fieldname>			
zPFT	INT	4	(IBM name: SMF23PFT) Total storage SMF is currently using for zEDC for this log stream. Value does not account for 1MB needed by each log stream using zEDC. Value may be up to 2MB greater than the defined PERMFIK value depending on usage.
zPFM	INT	4	(IBM name: SMF23PFM) Max storage SMF can use for zEDC for this log stream. Configuration-defined PERMFIK value.
zPFH	INT	4	(IBM name: SMF23PFH) High water mark of storage SMF has used for zEDC for this log stream connection.
zCWN	INT	4	(IBM name: SMF23CWN) Number of log blocks written containing compressed records during this interval.
zNCN	INT	4	(IBM name: SMF23NCN) Number of log blocks written containing non-compressed records during this interval.
zBBC	INT	8	(IBM name: SMF23BBC) zEDC uncompressed bytes total. For logstreams with compressed data, this field contains the total number of uncompressed bytes that zEDC successfully compressed during the interval. For logstreams with no compressed data, this field contains zeros.
zBAC	INT	8	(IBM name: SMF23BAC) zEDC compressed bytes total. For logstreams with compressed data, this field contains the total number of compressed bytes that were written to the logstream during the interval. For logstreams with no compressed data, this field contains zeros.
zLHP	INT	4	(IBM name: SMF23LHP) High water mark of the percentage of the buffer that is in use.
zLCP	INT	4	(IBM name: SMF23LCP) Current percentage of the buffer that is in use.

Secondary segment: **SMF023_SpinLock**

Field Name	Type	Len	Description
SMF023_SpinLock.<fieldname>			
zSPN	VCHAR	2 1002	(IBM name: SMF23SPN) For internal use only.

Secondary segment: SMF023_BindBreak

Field Name	Type	Len	Description
<i>SMF023_BindBreak.<fieldname></i>			
zBND	VCHAR	2 1002	(IBM name: SMF23BND) For internal use only.

Record Type 24 - JES2 Spool Offload

SMF Record 24 (JES2 Spool Offload) is mapped by structure member "T024".

Primary Segment:

- [SMF024_JES2_Spool_Offload](#)

Secondary Segment(s): 7 (in alphabetical order)

- [SMF024_Affinity](#)
- [SMF024_Affinity_SysName](#)
- [SMF024_Enhanced_SYSOULT](#)
- [SMF024_General](#)
- [SMF024_Job_Sel_Crit](#)

- [SMF024_SYSOULT_Sel_Crit](#)

Primary segment: [SMF024_JES2_Spool_Offload](#)

Field Name	Type	Len	Description
<i>SMF024_JES2_Spool_Offload.<fieldname></i>			
<i>SMF024_JES2_Spool_Offload.Header_Self_defining_Section.<fieldname></i>			
zFLG	HEX	1	(IBM name: SMF24FLG) System indicator: Bit Meaning when set 0-2 Reserved 3-6 Version indicators* 7 RESERVED. *See 'Standard and Extended SMF record headers' on page 174 FOR a detailed description.
zRTY	INT	1	(IBM name: SMF24RTY) Record type 24 (X'18').
zTME	TSTMP	8	(IBM name: SMF24TME) Date/Time that the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF24SID) System identification (from the SID parameter).
zSSI	CHAR	4	(IBM name: SMF24SSI) Subsystem identification.
zSUB	INT (ENUM)	2	(IBM name: SMF24SUB) Record SubType
zNTR	INT	2	(IBM name: SMF24NTR) Number of triplets. A triplet is a set of offsets/length/numbers values that define a section of the record.
zRSV	CHAR	2	(IBM name: SMF24RSV) Reserved.
zOPS	INT	4	(IBM name: SMF24OPS) Offset to product section.
zLPS	INT	2	(IBM name: SMF24LPS) Length of product section.
zNPS	INT	2	(IBM name: SMF24NPS) Number of product sections.
zOGN	INT	4	(IBM name: SMF24OGN) Offset to general sections.
zLGN	INT	2	(IBM name: SMF24LGN) Length of general section.
zNGN	INT	2	(IBM name: SMF24NGN) Number of general sections.
zOSP	INT	4	(IBM name: SMF24OSP) Offset to job or SYSOUT selection criteria section.
zLSP	INT	2	(IBM name: SMF24LSP) Length of job or SYSOUT selection criteria section.
zNSP	INT	2	

			(IBM name: SMF24NSP) Number of job or SYSOUT selection criteria sections.
zOSW	INT	4	(IBM name: SMF24OSW) Offset to enhanced SYSOUT support (ESS) section.
zLSW	INT	2	(IBM name: SMF24LSW) Length of enhanced SYSOUT support (ESS) section.
zNSW	INT	2	(IBM name: SMF24NSW) Number of enhanced SYSOUT support (ESS) section.
zOSA	INT	4	(IBM name: SMF24OSA) Offset to system affinity section.
zLSA	INT	2	(IBM name: SMF24LSA) Length of system affinity section.
zNSA	INT	2	(IBM name: SMF24LSA) Number of system affinity sections.

Secondary segment: SMF024_Product

Field Name	Type	Len	Description
<i>SMF024_Product.<fieldname></i>			
zPVR	CHAR	2	(IBM name: SMF24PVR) Record version number.
zPNM	CHAR	8	(IBM name: SMF24PNM) Product name 'JES2'.
zRS2	CHAR	2	(IBM name: SMF24RS2) Reserved.

Secondary segment: SMF024_General

Field Name	Type	Len	Description
<i>SMF024_General.<fieldname></i>			
zGLN	INT	2	(IBM name: SMF24GLN) Length of general section.
<i>SMF024_General.zBCF.<fieldname></i>			
zFirstBuff	BIT	1	First SMF buffer for job
zContBuff	BIT	1	C0ntinuation of SMF buffer
zLastBuff	BIT	1	Last SMF buffer for job
<i>SMF024_General.zEOJ.<fieldname></i>			
zCompleted	BIT	1	Completed job offloaded
zSkipped	BIT	1	Job completed with skipped data sets
zUncompleted	BIT	1	Uncompleted job offloaded
zCancelled	BIT	1	Job cancelled by operator
<i>SMF024_General.<fieldname></i>			
zJBN	CHAR	8	(IBM name: SMF24JBN) Job name.
zJID	CHAR	8	(IBM name: SMF24JID) Original job identification.

zCJD	CHAR	8	(IBM name: SMF24CJD) Current identification.
zSYS	CHAR	4	(IBM name: SMF24SYS) System identification.
zDSN	CHAR	44	(IBM name: SMF24DSN) Offload data set name.
zCNT	INT	4	(IBM name: SMF24CNT) Number of records transmitted or received.
zTDS	TSTMP	8	(IBM name: SMF24TDS) Date/Time that offload data set was allocated.
zORG	CHAR	8	(IBM name: SMF24ORG) Node of origin.
zTRD	TSTMP	8	(IBM name: SMF24TRD) Date/Time.

Secondary segment: SMF024_Job_Sel_Crit

Field Name	Type	Len	Description
<i>SMF024_Job_Sel_Crit.<fieldname></i>			
zLN1	INT	2	(IBM name: SMF24LN1) Length of job section.
<i>SMF024_Job_Sel_Crit.zJFG.<fieldname></i>			
zHeld	BIT	1	Held job
zAffAny	BIT	1	AFFINITY=ANY
<i>SMF024_Job_Sel_Crit.<fieldname></i>			
zJCL	CHAR	1	(IBM name: SMF24JCL) Job class.
zJND	CHAR	8	(IBM name: SMF24JND) Node name.
zJAF	CHAR	28	(IBM name: SMF24JAF) Affinity system identification.

Secondary segment: SMF024_SYSOUT_Sel_Crit

Field Name	Type	Len	Description
<i>SMF024_SYSOUT_Sel_Crit.<fieldname></i>			
zLN2	INT	2	(IBM name: SMF24LN2) Length of SYSOUT section.
<i>SMF024_SYSOUT_Sel_Crit.zSFG.<fieldname></i>			
zSysoutHelp	BIT	1	Held SYSOUT
zSysoutBurst	BIT	1	Bursting SYSOUT
zJobHeld	BIT	1	Held job
zIncomplete	BIT	1	Incomplete data set
zMultiDest	BIT	1	Multi-destination data set
<i>SMF024_SYSOUT_Sel_Crit.<fieldname></i>			

zSCL	CHAR	1	(IBM name: SMF24SCL) SYSOUT class.
zSND	CHAR	8	(IBM name: SMF24SND) Node name.
zSRN	CHAR	8	(IBM name: SMF24SRN) Remote name.
zFCB	CHAR	4	(IBM name: SMF24FCB) Forms control buffer (FCB).
zFOR	CHAR	8	(IBM name: SMF24FOR) Forms overlay name.
zFLS	CHAR	4	(IBM name: SMF24FLS) Flash cartridge name.
zPRM	CHAR	8	(IBM name: SMF24PRM) Print data set (PR) mode.
zUCS	CHAR	4	(IBM name: SMF24UCS) Universal character set (UCS).
zWID	CHAR	8	(IBM name: SMF24WID) Writer.
zREC	INT	4	(IBM name: SMF24REC) Data set record count. 60 3A SMF24PRY 1 BINARY Output selection priority.

Secondary segment: SMF024_Affinity

Field Name	Type	Len	Description
<i>SMF024_Affinity.<fieldname></i>			
zLSA	INT	2	(IBM name: SMF24LSA) Length of system affinity section.
zSAN	INT	4	(IBM name: SMF24SAN) Number of system affinities.
zLN4	INT	4	(IBM name: SMF24LN4) Length of system name.

Secondary segment: SMF024_Affinity_SysName

Field Name	Type	Len	Description
<i>SMF024_Affinity_SysName.<fieldname></i>			
zSCA	XVCHAR	0 80	(IBM name: SMF24SCA) System affinity name.

Secondary segment: SMF024_Enhanced_SYSOUS

Field Name	Type	Len	Description
<i>SMF024_Enhanced_SYSOUS.<fieldname></i>			
zLN3	INT	2	(IBM name: SMF24LN3) Length of ESS section (including this field).
zSGT	INT	4	(IBM name: SMF24SGT) Segment identifier.

SMF024_Enhanced_SYSOUT.zIND.<fieldname>			
zSJFerr	BIT	1	Error obtaining scheduler JCL facility (SJF) information. Scheduler work block text unit (SWBTU) data area is not present

SMF024_Enhanced_SYSOUT.<fieldname>			
zJDT	CHAR	8	(IBM name: SMF24JDT) JCL definition table (JDT) name in JCL definition vector table (JDTV).
zTUL	INT	2	(IBM name: SMF24TUL) Text unit (SWBTU) data area length.
zTU	XVCHAR	0 1000	(IBM name: SMF24TU) Text unit (SWBTU) data area. The data area can be processed using the SWBTUREQ macro.

Record Type 25 - JES3 Device Allocation

SMF Record 25 (JES3 Device Allocation) is mapped by structure member "T025".

Primary Segment:

- [SMF025_JES3_Device_Allocation](#)

Secondary Segment(s): 0

Primary segment: [SMF025_JES3_Device_Allocation](#)

Field Name	Type	Len	Description
<i>SMF025_JES3_Device_Allocation.<fieldname></i>			
<i>SMF025_JES3_Device_Allocation.Header_Self_defining_Section.<fieldname></i>			
zFLG	HEX	1	(IBM name: SMF25FLG) System indicator: Bit Meaning when set 0-2 Reserved 3-6 Version indicators* 7 RESERVED. *See 'Standard and Extended SMF record headers' on page 174 FOR a detailed description.
zRTY	INT	1	(IBM name: SMF25RTY) Record type 25 (X'19').
zTME	TSTMP	8	(IBM name: SMF25TME) Date/Time that the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF25SID) System identification (from the SID parameter).
zJBN	CHAR	8	(IBM name: SMF25JBN) Job name. The job name, time, and date that the reader recognized the JOB card (for this job) constitute the job log identification, or transaction name (for APPC output).
zRST	TSTMP	8	(IBM name: SMF25RST) Date/Time that the reader recognized the JOB card (for this job).
zUIF	CHAR	8	(IBM name: SMF25UIF) User-defined identification field (taken from common exit parameter area, not from USER=parameter on job statement).

<i>SMF025_JES3_Device_Allocation.Header_Self_defining_Section.zIND.<fieldname></i>			
zDynAlloc	BIT	1	If zero, allocation by user's DD statements. If 1, dynamic allocation.
zCatAlloc	BIT	1	If zero, non-catalog allocation by JES3. If 1, catalog allocation by JES3.
zAutoAlloc	BIT	1	If zero, manual allocation by operator. If 1, automatic allocation by JES3 (see the ALLOCATE= keyword on the JES3 SETPARAM initialization statement in z/OS JES3 Initialization and Tuning Reference).

<i>SMF025_JES3_Device_Allocation.Header_Self_defining_Section.<fieldname></i>			
zNTF	INT	4	(IBM name: SMF25NTF) Number of IAT5110 GET messages for tape volumes issued for the job.
zNDF	INT	4	(IBM name: SMF25NDF) Number of IAT5110 GET messages for disk volumes issued for the job.
zFST	TSTMP	8	(IBM name: SMF25FST) Date/Time that the fetch processing ended. That is, the time that the first phase of MDS ended. (During this phase, messages are issued to inform the operator of the volumes required for the job to run.)
zSST	INT	4	(IBM name: SMF25SST) If manual allocation, the time when the *START SETUP operator command was issued. If automatic allocation, this field contains zeroes.
zSSD	DEC	4 (7,0)	(IBM name: SMF25SSD) If manual allocation, the date when the *START SETUP operator command was issued. If automatic allocation, this field contains zeroes.
zNTM	INT	4	

			(IBM name: SMF25NTM) Number of tape volumes mounted by MDS.
zNDM	INT	4	(IBM name: SMF25NDM) Number of disk volumes mounted by MDS.
zMST	TSTMP	8	(IBM name: SMF25MST) Date/Time when all JES3 volume mount messages have been issued. If not mounts were required, this field equals the time of JES3 allocation.
zVVT	TSTMP	8	(IBM name: SMF25VVT) Date/Time of JES3 device verification.
zNMV	INT	4	(IBM name: SMF25NMV) Number of Mass Storage Volume requests allocated by MDS for the job. Note: As of MVS/SP4.1, this field is no longer valid.

Record Type 26 - JES2 Job Purge

SMF Record 26 (JES2 Job Purge) is mapped by structure member "T026".

Primary Segment:

- SMF026_JES2_Job_Purge

Secondary Segment(s): 11 (in alphabetical order)

- SMF026_Accounting
- SMF026_Actuals
- SMF026_Descriptor
- SMF026_Encryption_Compression
- SMF026_Events
- SMF026_Job_Correlator
- SMF026_Network
- SMF026_Print
- SMF026_Routing
- SMF026_Triplet
- SMF026_Workload_Management

Primary segment: SMF026_JES2_Job_Purge

Field Name	Type	Len	Description
SMF026_JES2_Job_Purge.<fieldname>			
SMF026_JES2_Job_Purge.Header_Self_defining_Section.<fieldname>			
zFLG	HEX	1	(IBM name: SMF26FLG) System indicator: Bit Meaning when set 0-2 Reserved 3-6 Version indicators* 7 RESERVED. *See 'Standard and Extended SMF record headers' on page 174 FOR a detailed description.
zRTY	INT	1	(IBM name: SMF26RTY) Record type 26 (X'1A').
zTME	TSTMP	8	(IBM name: SMF26TME) Date/Time that the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF26SID) System identification (from the SID parameter).
zJOBNAME	CHAR	8	(IBM name: SMF26JBN) Job name.
zRST	TSTMP	8	(IBM name: SMF26RST) Date/Time that the reader recognized the JOB statement (for this job).
zUIF	CHAR	8	(IBM name: SMF26UIF) User-defined identification field (taken from common exit parameter area, not from USER=parameter on job statement).
zRSV	CHAR	4	(IBM name: SMF26RSV) Reserved.
zSBS	INT	2	(IBM name: SMF26SBS) Subsystem identification - X'0002' signifies JES2.

SMF026_JES2_Job_Purge.Header_Self_defining_Section.zIND.<fieldname>			
zDescriptor	BINT	1	Descriptor section present
zEvents	BINT	1	Events section present
zActuals	BINT	1	Actuals section present
zNetwork	BINT	1	JES2 network section present
zRouting	BINT	1	JES2 routing section present
zPrint	BINT	1	Print section present
zReserved	BINT	1	Reserved
zTriplet	BINT	1	Triplet section present

Secondary segment: **SMF026_Descriptor**

Field Name	Type	Len	Description
<i>SMF026_Descriptor.<fieldname></i>			
zLN1	INT	2	(IBM name: SMF26LN1) Length of descriptor section, including this field.
zRV1	CHAR	2	(IBM name: SMF26RV1) Reserved.
zIN2	INT	1	(IBM name: SMF26IN2) Job information indicator Bit Meaning when set 0 BACKGROUND batch job 1 FOREGROUND TSO/E user 2 SYSTEM task 3 NO journal option 4 NO output option 5 TYPRUN=SCAN was specified 6 TYPRUN=COPY was specified 7 RESTART = Y was specified.
zINF	INT	1	(IBM name: SMF26INF) Job information indicator Bit Meaning when set 0 /*PRIORITY statement present or keyword 'PRTY =' was specified on JOB statement 1 /*SETUP statement(s) present 2 TYPRUN=HOLD was specified 3 NO job log option 4 EXECUTION batching 5 JOB was entered on internal reader 6 JOB was rerun by JES2 7 JOB was canceled by the operator.
zJNM	CHAR	4	(IBM name: SMF26JNM) JES2-assigned job number if less than 10,000. If the job number is greater or equal to 10,000, this field is zeroes and the job number is in the SMF26JID field.
zJID	CHAR	8	(IBM name: SMF26JID) 8-character job identifier
zNAM	CHAR	20	(IBM name: SMF26NAM) Programmer's name (taken from JOB statement).
zMSG	CHAR	1	(IBM name: SMF26MSG) Message class (taken from JOB statement).
zCLS	CHAR	1	(IBM name: SMF26CLS) Job class (taken from JOB statement).
zXPI	INT	1	(IBM name: SMF26XPI) JES2 job selection priority when the job was initially read.
zXPS	INT	1	(IBM name: SMF26XPS) JES2 job selection priority when the job was selected.
zIX2	INT	1	(IBM name: SMF26IX2) Job information indicator Bit Meaning when set 0 JOB delayed due to duplicate job name 1 JOB purged as a result of spool offload 2 JOB went through unspun in its lifetime 3 JOB had at least one JOE purged due to PSO/SAPI
zOPS	CHAR	1	(IBM name: SMF26OPS) Reserved.
zLOC	INT	2	(IBM name: SMF26LOC) Input route code. These fields are defined as follows: X'0100' indicates local routing. X'nnrr' is remote routing. and X'00nn' indicates special local routing. If more than 255 REMOTES are specified for the system, this field is set to zero. See the Routing Section described later in this record.
zDEV	CHAR	8	(IBM name: SMF26DEV) JES2 logical input device name as defined in JESPARMS.
zACT	CHAR	4	(IBM name: SMF26ACT) Programmer's accounting number. JES2-defined sub-field from the accounting information field in the JOB statement or default values assigned for this job or from /*JOBPARM, JES2 control statement.
zROM	CHAR	4	(IBM name: SMF26ROM) Programmer's room number. JES2-defined sub-field from the accounting information field in the JOB statement or default values assigned for this job or from /*JOBPARM, JES2 control statement.
zXTM	INT	4	

			(IBM name: SMF26XTM) Estimated processing time, in seconds. JES2-defined sub-field from the accounting information field in the JOB statement or default values assigned for this job or from /*JOBPARM, JES2 control statement.
zELN	INT	4	(IBM name: SMF26ELN) Estimated output lines. JES2-defined sub-field from the accounting information field in the JOB statement or default values assigned for this job or from /*JOBPARM, JES2 control statement.
zEPU	INT	4	(IBM name: SMF26EPU) Estimated output punched cards. JES2-defined sub-field from the accounting information field in the JOB statement or default values assigned for this job or from /*JOBPARM, JES2 control statement.
zFRM	CHAR	4	(IBM name: SMF26FRM) Output form number. If the source field contain four or fewer characters, SMF26FRM is set. Otherwise, this field is set to blanks, and the contents of the source field appear only in SMF26EFM, described under the Routing Section later in this record.
zCYP	INT	2	(IBM name: SMF26CYP) Job print copy count. JES2-defined sub-field from the accounting information field in the JOB statement or default values assigned for this job or from /*JOBPARM, JES2 control statement.
zLIN	INT	2	(IBM name: SMF26LIN) Lines per page. JES2-defined sub-field from the accounting information field in the JOB statement or default values assigned for this job or from /*JOBPARM, JES2 control statement.
zPRR	INT	2	(IBM name: SMF26PRR) Job print route code. These fields are defined as follows: X'0100' indicates local routing. X'nnrr' is remote routing. and X'00nn' indicates special local routing. If more than 255 REMOTES are specified for the system, this field is set to zero. See the Routing Section described later in this record.
zPUR	INT	2	(IBM name: SMF26PUR) Job punch route code. These fields are defined as follows: X'0100' indicates local routing. X'nnrr' is remote routing. and X'00nn' indicates special local routing. If more than 255 REMOTES are specified for the system, this field is set to zero. See the Routing Section described later in this record.
zPDD	CHAR	8	(IBM name: SMF26PDD) Procedure data definition name (DDNAME) used for JCL conversion.

Secondary segment: SMF026_Events

Field Name	Type	Len	Description
<i>SMF026_Events.<fieldname></i>			
zLN2	INT	2	(IBM name: SMF26LN2) Length of events section, including this field.
zRV2	CHAR	2	(IBM name: SMF26RV2) Reserved.
zRPT	TSTMP	8	(IBM name: SMF26RPT) Reader stop Date/Time.
zCST	TSTMP	8	(IBM name: SMF26CST) Converter start Date/Time
zCPT	TSTMP	8	(IBM name: SMF26CPT) Converter stop Date/Time
zXST	TSTMP	8	(IBM name: SMF26XST) Execution processor start Date/Time
zXPT	TSTMP	8	(IBM name: SMF26XPT) Execution processor stop Date/Time
zOST	TSTMP	8	(IBM name: SMF26OST) Output processor start Date/Time

zOPT	TSTMP	8	(IBM name: SMF26OPT) Output processor stop Date/Time
------	-------	---	---

Secondary segment: SMF026_Actuals

Field Name	Type	Len	Description
<i>SMF026_Actuals.<fieldname></i>			
zLN3	INT	2	(IBM name: SMF26LN3) Length of actuals section, including this field.
zRV4	CHAR	2	(IBM name: SMF26RV4) Reserved.
zICD	INT	4	(IBM name: SMF26ICD) Number of input statements for job. This field includes JCL and SYSIN statements.
zXLN	INT	4	(IBM name: SMF26XLN) Number of output lines generated to spool.
zXPU	INT	4	(IBM name: SMF26XPU) Number of punched cards generated to spool.
zRID	CHAR	4	(IBM name: SMF26RID) Input processor system (CPU) identification.
zCID	CHAR	4	(IBM name: SMF26CID) Conversion processor system (CPU) identification.
zXID	CHAR	4	(IBM name: SMF26XID) Execution processor system (CPU) identification.
zOID	CHAR	4	(IBM name: SMF26OID) Output processor system (CPU) identification.

Secondary segment: SMF026_Network

Field Name	Type	Len	Description
<i>SMF026_Network.<fieldname></i>			
zLN4	INT	2	(IBM name: SMF26LN4) Length of network section including this field.
zRV5	CHAR	2	(IBM name: SMF26RV5) Reserved.
zNID	CHAR	4	(IBM name: SMF26NID) Job transmitter system identifier.
zNST	TSTMP	8	(IBM name: SMF26NST) Job transmitter start Date/Time
zNPT	TSTMP	8	(IBM name: SMF26NPT) Job transmitter stop Date/Time
zNAC	CHAR	8	(IBM name: SMF26NAC) Network accounting number.
zNJB	CHAR	8	(IBM name: SMF26NJB) Original job identification.
zNDV	CHAR	8	(IBM name: SMF26NDV) Job transmitter device name.
zNON	CHAR	8	(IBM name: SMF26NON) Original node name.
zNXN	CHAR	8	(IBM name: SMF26NXN) Processing node name.

zNNM	CHAR	8	(IBM name: SMF26NNM) Next node name.
zNLN	CHAR	8	(IBM name: SMF26NLN) Last node name.
zUSERID	CHAR	8	(IBM name: SMF26SUI) Submitting userid.
zNN	CHAR	8	(IBM name: SMF26NN) Job end execution notify node.
zNU	CHAR	8	(IBM name: SMF26NU) Job end execution notify userid.

Secondary segment: SMF026_Routing

Field Name	Type	Len	Description
<i>SMF026_Routing.<fieldname></i>			
zLN5	INT	2	(IBM name: SMF26LN5) Length of routing section (including this field).
zINR	HEX	4	(IBM name: SMF26INR) Input route code. These fields are defined as follows: X'00010000' indicated local routing. X'nnrrnnnn' indicates remote routing, and X'0000nnnn' indicates special local routing. This field is always set regardless of the number of remotes specified for the system.
zPRD	HEX	4	(IBM name: SMF26PRD) Default print route code. These fields are defined as follows: X'00010000' indicated local routing. X'nnrrnnnn' indicates remote routing, and X'0000nnnn' indicates special local routing. This field is always set regardless of the number of remotes specified for the system.
zPUD	HEX	4	(IBM name: SMF26PUD) Default punch route code. These fields are defined as follows: X'00010000' indicated local routing. X'nnrrnnnn' indicates remote routing, and X'0000nnnn' indicates special local routing. This field is always set regardless of the number of remotes specified for the system.

Secondary segment: SMF026_Print

Field Name	Type	Len	Description
<i>SMF026_Print.<fieldname></i>			
zLN6	INT	2	(IBM name: SMF26LN6) Length of print section including this field.
zEBT	INT	4	(IBM name: SMF26EBT) Estimated SYSOUT byte count.
zXBT	INT	4	(IBM name: SMF26XBT) Actual SYSOUT byte count.
zEPG	INT	4	(IBM name: SMF26EPG) Estimated page count.
zXPG	INT	4	(IBM name: SMF26XPG) Actual page count. For page mode data sets, JES2 updates the page count when it encounters a 'begin page' indicator in the data stream header.
zEFM	CHAR	8	(IBM name: SMF26EFM) Output form number. This field is set regardless of the number of characters in the forms field.

Secondary segment: SMF026_Triplet

Field Name	Type	Len	Description
<i>SMF026_Triplet.<fieldname></i>			
zLN7	INT	2	(IBM name: SMF26LN7) Length of triplet section.
zOAG	INT	4	(IBM name: SMF26OAG) Offset of accounting section.
zLAG	INT	2	(IBM name: SMF26LAG) Length of accounting section (including length of field SMF26LN8).
zNAG	INT	2	(IBM name: SMF26NAG) Number of accounting sections.
zOWL	INT	4	(IBM name: SMF26OWL) Offset of Workload Management section.
zLWL	INT	2	(IBM name: SMF26LWL) Length of Workload Management section.
zNWL	INT	2	(IBM name: SMF26NWL) Number of Workload Management sections.
zOJC	INT	4	(IBM name: SMF26OJC) Offset of Job Correlator section.
zLJC	INT	2	(IBM name: SMF26LJC) Length of Job Correlator section.
zNJC	INT	2	(IBM name: SMF26NJC) Number of Job Correlator sections.
zOEC	INT	4	(IBM name: SMF26OEC) Offset of Encryption/Compression section.
zLEC	INT	2	(IBM name: SMF26LEC) Length of Encryption/Compression section.
zNEC	INT	2	(IBM name: SMF26NEC) Number of Encryption/Compression sections.

Secondary segment: SMF026_Accounting

Field Name	Type	Len	Description
<i>SMF026_Accounting.<fieldname></i>			
zLN8	INT	2	(IBM name: SMF26LN8) Length of accounting section.
zNRA	INT	1	(IBM name: SMF26NRA) Number of accounting pairs.
zAC1	VCHAR	1 1001	(IBM name: SMF26AC1) An accounting pair consists of a 1-byte length field, which contains the length of the following string. The string contains accounting data. If the length field is zero, there is no following string.

Secondary segment: SMF026_Workload_Management

Field Name	Type	Len	Description
<i>SMF026_Workload_Management.<fieldname></i>			
zWCL	CHAR	8	(IBM name: SMF26WCL) Service class name at the time of execution.

zWOC	CHAR	8	(IBM name: SMF26WOC) Original service class (assigned by WLM classification when the job finished conversion).
SMF026_Workload_Management.zWIN.<fieldname>			
zWLM	BIT	1	Job ran in MODE=WLM
zSJ	BIT	1	Job ran because of \$\$ J
SMF026_Workload_Management.<fieldname>			
zWJC	CHAR	8	(IBM name: SMF26WJC) Eight character job class (padded on right with blanks).
zWSE	CHAR	16	(IBM name: SMF26WSE) Sixteen character scheduling environment (padded on right with blanks).

Secondary segment: **SMF026_Job_Correlator**

Field Name	Type	Len	Description
SMF026_Job_Correlator.<fieldname>			
zJCR	CHAR	64	(IBM name: SMF26JCR) Job correlator of the job being purged.

Secondary segment: **SMF026_Encryption_Compression**

Field Name	Type	Len	Description
SMF026_Encryption_Compression.<fieldname>			
zBYU	INT	8	(IBM name: SMF26BYU) Total job uncompressed byte count.
zBYC	INT	8	(IBM name: SMF26BYC) Total job compressed byte count.
zCCT	INT	4	(IBM name: SMF26CCT) Compressed data set count.
zECT	INT	4	(IBM name: SMF26ECT) Encrypted data set count.

Record Type 30 - Common Address Space Work

SMF Record 30 (Common Address Space Work) is mapped by structure member "T030".

Primary Segment:

- [SMF030_Common_Address_Space_Work](#)

Secondary Segment(s): 18 (in alphabetical order)

- [SMF030_z_OS_UNIX_Process](#)
- [SMF030_zEDC_Usage_Statistics](#)
- [SMF030_Accounting](#)
- [SMF030_Automatic_Restart_Management](#)
- [SMF030_APPC_MVS_Cumulative_Resource](#)
- [SMF030_APPC_MVS_Resource](#)
- [SMF030_Completion](#)
- [SMF030_Counter_Data](#)
- [SMF030_EXCP](#)
- [SMF030_Identification](#)
- [SMF030_IO_Activity](#)
- [SMF030_Multisystem_Enclave_Remote_System_Data](#)
- [SMF030_Operator](#)
- [SMF030_Performance](#)
- [SMF030_Processor_Accounting](#)
- [SMF030_Storage_and_Paging](#)
- [SMF030_Subsystem](#)
- [SMF030_Usage_Data](#)

Primary segment: [SMF030_Common_Address_Space_Work](#)

Field Name	Type	Len	Description
<i>SMF030_Common_Address_Space_Work.<fieldname></i>			
SMF030_Common_Address_Space_Work.Header_Self_Defining_Section.<fieldname>			
zFLG	HEX	1	(IBM name: SMF30FLG) System indicator: Bit Meaning when set 0 Subsystem identification follows system identification 1 Subtypes used 2 Reserved 3-6 Version indicators 7 Reserved.
zRTY	INT	1	(IBM name: SMF30RTY) Record type 30 (X'1E').
zTME	TSTMP	8	(IBM name: SMF30TME) Date/Time that the record was moved to the SMF buffer.
zSID	CHAR	4	(IBM name: SMF30SID) System identification (from the SID parameter).
zWID	CHAR	4	(IBM name: SMF30WID) Work type indicator for the address space. The value identifies the type of address space that is being reported on (for example: 'STC' for started tasks and system address spaces, 'TSO' for TSO/E users, etc).
zSTY	INT	2	(IBM name: SMF30STP) Record subtype. 1=Job start or start of other work unit. The subtype 1 record identifies the work unit but contains no resource data. 2=Activity since previous interval ended. 3=Activity for the last interval before step termination. 4=Step total. 5=Job termination or termination of other work unit. 6=System address space. Contains the total resources used since the start of the address space. Note that the data in the subtype 6 record is cumulative, unlike the subtype 2 record.
zSTYe	INT (ENUM)	2	(IBM name: N/A) Record subtype - short expansion. 'Job Start' = Job start or start of other work unit. The subtype 1 record identifies the work unit but contains no resource data. 'Activity(2)' = Activity since previous interval ended. 'Activity(3)' = Activity for the last interval before step termination. 'Step Total' = Step total. 'Job Term' = Job termination or termination of other work unit. 'SysAddr Space' = System address space. Contains the total resources used since the start of the address space. Note that the data in the subtype 6 record is cumulative, unlike the subtype 2 record.

zSOF	INT	4	(IBM name: SMF30SOF) Offset to subsystem section from start of record, including the record descriptor word (RDW).
zSLN	INT	2	(IBM name: SMF30SLN) Length of subsystem section.
zSON	INT	2	(IBM name: SMF30SON) Number of subsystem sections.
zIOF	INT	4	(IBM name: SMF30IOF) Offset to identification section from start of record, including the record descriptor word (RDW).
zILN	INT	2	(IBM name: SMF30ILN) Length of identification section.
zION	INT	2	(IBM name: SMF30ION) Number of identification sections.
zUOF	INT	4	(IBM name: SMF30UOF) Offset to I/O activity section from start of record, including the record descriptor word (RDW).
zULN	INT	2	(IBM name: SMF30ULN) Length of I/O activity section.
zUON	INT	2	(IBM name: SMF30UON) Number of I/O activity sections.
zTOF	INT	4	(IBM name: SMF30TOF) Offset to completion section from start of record, including the record descriptor word (RDW).
zTLN	INT	2	(IBM name: SMF30TLN) Length of completion section.
zTON	INT	2	(IBM name: SMF30TON) Number of completion sections.
zCOF	INT	4	(IBM name: SMF30COF) Offset to processor section from start of record, including the record descriptor word (RDW).
zCLN	INT	2	(IBM name: SMF30CLN) Length of processor section.
zCON	INT	2	(IBM name: SMF30CON) Number of processor sections.
zAOF	INT	4	(IBM name: SMF30AOF) Offset to accounting section from start of record, including the record descriptor word (RDW).
zALN	INT	2	(IBM name: SMF30ALN) Total length of the single accounting section.
zAON	INT	2	(IBM name: SMF30AON) Number of variable length text segments.
zROF	INT	4	(IBM name: SMF30ROF) Offset to storage section from start of record, including the record descriptor word (RDW).
zRLN	INT	2	(IBM name: SMF30RLN) Length of storage section.
zRON	INT	2	(IBM name: SMF30RON) Number of storage sections.
zPOF	INT	4	(IBM name: SMF30POF) Offset to performance section from start of record, including the record descriptor word (RDW).
zPLN	INT	2	(IBM name: SMF30PLN) Length of the performance section.
zPON	INT	2	(IBM name: SMF30PON) Number of performance sections.
zOOF	INT	4	(IBM name: SMF30OOF) Offset to operator section from start of record, including the record descriptor word (RDW).

zOLN	INT	2	(IBM name: SMF30OLN) Length of the operator section.
zOON	INT	2	(IBM name: SMF30OON) Number of operator sections.
zEOF	INT	4	(IBM name: SMF30EOF) Offset to the execute channel program (EXCP) section from start of record, including the record descriptor word (RDW).
zELN	INT	2	(IBM name: SMF30ELN) Length of the execute channel program (EXCP) section, in this record.
zEON	INT	2	(IBM name: SMF30EON) Number of execute channel program (EXCP) sections in this record.
zEOR	INT	2	(IBM name: SMF30EOR) Number of execute channel program (EXCP) sections in subsequent records. When this number exceeds two bytes, it is not valid. See zEOS for the correct value.
zRVD	CHAR	2	(IBM name: SMF30RVD) Reserved.
zEOS	INT	4	(IBM name: SMF30EOS) Number of execute channel program (EXCP) sections in subsequent records.
zDRO	INT	4	(IBM name: SMF30DRO) Offset to APPC/MVS resource section from start of record, including the record descriptor word (RDW).
zDRL	INT	2	(IBM name: SMF30DRL) Length of APPC/MVS resource section.
zDRN	INT	2	(IBM name: SMF30DRN) Number of APPC/MVS resource sections in this record (this number is 0 OR 1).
zARO	INT	4	(IBM name: SMF30ARO) Offset to APPC/MVS cumulative resource section from start of record, including the record descriptor word (RDW).
zARL	INT	2	(IBM name: SMF30ARL) Length of APPC/MVS cumulative resource section.
zARN	INT	2	(IBM name: SMF30ARN) Number of APPC/MVS cumulative resource sections in this record (this number is 0 OR 1).
zOPO	INT	4	(IBM name: SMF30OPO) Offset to OpenMVS process section.
zOPL	INT	2	(IBM name: SMF30OPL) Length of z/OS UNIX process section.
zOPN	INT	2	(IBM name: SMF30OPN) Number of z/OS UNIX process sections on current record.
zOPM	INT	4	(IBM name: SMF30OPM) Number of z/OS UNIX process sections on subsequent records.
zUDO	INT	4	(IBM name: SMF30UDO) Offset to first usage data section from the start of the record, including the record descriptor word (RDW).
zUDL	INT	2	(IBM name: SMF30UDL) Length of each usage data section - '76'.
zUDN	INT	2	(IBM name: SMF30UDN) Number of usage data sections in this record.
zUDS	INT	4	(IBM name: SMF30UDS) Number of usage data sections in subsequent records.
zRMO	INT	4	(IBM name: SMF30RMO) Offset to first automatic restart management section.
zRML	INT	2	(IBM name: SMF30RML) Length of automatic restart management section.
zRMN	INT	2	(IBM name: SMF30RMN) Number of automatic restart management sections.

zRMS	INT	4	(IBM name: SMF30RMS) Number of automatic restart management sections in subsequent records.
zMOF	INT	4	(IBM name: SMF30MOF) Offset to the Multisystem Enclave Remote Data section.
zMLN	INT	2	(IBM name: SMF30MLN) Length of MultiSystem Enclave Remote System Data section.
zMNO	INT	2	(IBM name: SMF30MNO) Number of MultiSystem Enclave Remote System Data sections in this record.
zMOS	INT	4	(IBM name: SMF30MOS) Number of MultiSystem Enclave Remote System Data sections in subsequent records.
zCDO	INT	4	(IBM name: SMF30CDO) Offset to the Counter Data Section.
zCDL	INT	2	(IBM name: SMF30CDL) Length of a Counter Data Section.
zCDN	INT	2	(IBM name: SMF30CDN) Number of Counter Data Sections.
zUSO	INT	4	(IBM name: SMF30USO) Offset to the zEDC usage statistics section.
zUSL	INT	2	(IBM name: SMF30USL) Length of the zEDC usage statistics section.
zUSN	INT	2	(IBM name: SMF30USN) Number of zEDC usage statistics sections.

Secondary segment: SMF030_Subsystem

Field Name	Type	Len	Description
<i>SMF030_Subsystem.<fieldname></i>			
zTYP	INT	2	(IBM name: SMF30TYP) Record subtype. 1=Job start or start of other work unit. The subtype 1 record identifies the work unit but contains no resource data. 2=Activity since previous interval ended. 3=Activity for the last interval before step termination. 4=Step total. 5=Job termination or termination of other work unit. 6=System address space. Contains the total resources used since the start of the address space. Note that the data in the subtype 6 record is cumulative, unlike the subtype 2 record.
zTYPe	INT (ENUM)	2	(IBM name: N/A) Record subtype - short expansion. 'Job Start' = Job start or start of other work unit. The subtype 1 record identifies the work unit but contains no resource data. 'Activity(2)' = Activity since previous interval ended. 'Activity(3)' = Activity for the last interval before step termination. 'Step Total' = Step total. 'Job Term' = Job termination or termination of other work unit. 'SysAddr Space' = System address space. Contains the total resources used since the start of the address space. Note that the data in the subtype 6 record is cumulative, unlike the subtype 2 record.
zRS1	CHAR	2	(IBM name: SMF30RS1) Reserved.
zRVN	CHAR	2	(IBM name: SMF30RVN) Record version number Value Meaning '05' MVS/SP Version 5 '04' MVS/SP Version 4 '03' MVS/SP Version 3 '02' MVS/SP Version 2 '01' VS2
zPNM	CHAR	8	(IBM name: SMF30PNM) Subsystem or product name, for example SMF.
zOSL	CHAR	8	(IBM name: SMF30OSL) Code string for the operating system level to represent the version, release, and modification level as described for CVTPROD. Guaranteed to be larger in each release.
zSYN	CHAR	8	(IBM name: SMF30SYN) System name (from the SYSNAME parameter in the IEASYSxx parmlib

			member).
zSYP	CHAR	8	(IBM name: SMF30SYP) Sysplex name (from the SYSPLEX parameter in the COUPLExx parmlib member).

Secondary segment: SMF030_Identification

Field Name	Type	Len	Description
<i>SMF030_Identification.<fieldname></i>			
zJOBNAME	CHAR	8	(IBM name: SMF30JBN) Job or session name. The job name, time, and date that the reader recognized the JOB card (for this job) constitute the job log identification.
zPGM	CHAR	8	(IBM name: SMF30PGM) Program name (taken from PGM= parameter on EXEC card). If a backward reference was used, this field contains PGM=*.DD.
zSTM	CHAR	8	(IBM name: SMF30STM) Step name (taken from name on EXEC card).
zUSERID	CHAR	8	(IBM name: SMF30UIF) User-defined identification field (taken from common exit parameter area, not from USER=parameter on job statement).
zJESJOB	CHAR	8	(IBM name: SMF30JNM) JES job identifier. Jobs scheduled by the APPC/MVS transaction scheduler (ASCH) start with an 'A' followed by a seven-digit number.
zSTN	INT	2	(IBM name: SMF30STN) Step number (first step = 1, and so on).
zCLS	CHAR	1	(IBM name: SMF30CLS) Job class (blank for TSO/E session or started tasks).

SMF030_Identification.zJF1.<fieldname>

zJobID	BIT	1	Job/Session id section flag.
--------	-----	---	------------------------------

SMF030_Identification.<fieldname>

zPGN	INT	2	(IBM name: SMF30PGN) Beginning with z/OS V1R3, this field is always zero.
zJPT	INT	2	(IBM name: SMF30JPT) JES input priority. If no value is specified for the PRTY parameter (on the JOB card), this field contains: v For JES3, the default priority specified on the JES3 STANDARDS initialization card v For JES2, a zero. Note that JES2 does not use the priority value reported in the field. (The JES2 job selection priority is requested using the JES2 PRIORITY control statement.)
zAST	TIME	4	(IBM name: SMF30AST) Device allocation start time.
zPPS	TIME	4	(IBM name: SMF30PPS) Problem program start time.
zSIT	TSTMP	8	(IBM name: SMF30SIT) Date/Time that the initiator selected this step or job.
zRST	TSTMP	8	(IBM name: SMF30RST) Date/Time that the reader recognized the JOB card (for this job).
zRET	TIME	4	(IBM name: SMF30RET) Time that the reader recognized the end of the JCL being read for the job or started task (reader stop time). For TSO/E this is the logon enqueue time.
zRED	DATE	4	(IBM name: SMF30RED) Date that the reader recognized the end of the JCL being read for the job or started task (reader stop date), in the form 0 CYYDDDF.

zUSR	CHAR	20	(IBM name: SMF30USR) Programmer's name.
zGRP	CHAR	8	(IBM name: SMF30GRP) RACF group ID. 0 = RACF is not active.
zRUD	CHAR	8	(IBM name: SMF30RUD) RACF user ID. 0 = RACF is not active.
zTID	CHAR	8	(IBM name: SMF30TID) RACF terminal ID. This field is zero if RACF is not active (or the user is not a terminal user).
zTSN	CHAR	8	(IBM name: SMF30TSN) Terminal symbolic name.
zPSN	CHAR	8	(IBM name: SMF30PSN) The name of the step that invoked the procedure. This field contains blanks if not part of a procedure.
zCL8	CHAR	8	(IBM name: SMF30CL8) 8-character job class (left justified, padded with blanks). For JES2, taken from the zCLS field (if not specified), 'TSU' for TSO sessions, or 'STC' for started tasks. For JES3, taken from the CLASS parameter on the // * MAIN card (if valid), or the default (JS3BATCH).
zISS	TSTMP	8	(IBM name: SMF30ISS) Time and date that the interval started for SubType 2 AND 3 RECORDS, in time-of-day (TOD) format, an unsigned 64-bit fixed-point number where bit 51 IS equivalent to 1 MICROSECOND. The representation of this value in local time is stored in zIST and zIDT. Variations in setting the local time can make the times appear to be out of synchronization.
zIET	TSTMP	8	(IBM name: SMF30IET) Time and date that the interval ended for SubType 2 AND 3 RECORDS, in time-of-day (TOD) format, an unsigned 64-bit fixed-point number where bit 51 IS equivalent to 1 MICROSECOND. If you requested synchronized interval recording, you can use this field to compare this record with other records generated at the end of the same interval. If the address space being reported was not swapped in when the interval ended, then the time contained in this field might be earlier than the time that the record was generated.
zSSN	INT	4	(IBM name: SMF30SSN) Substep number. This field is set to zero for non-z/OS UNIX steps. When the z/OS UNIX exec function is requested, a new substep is begun and this value is incremented.
zEXN	CHARZ	16	(IBM name: SMF30EXN) Program name. For a z/OS UNIX program, this contains the name, for up to 16 BYTES, starting after the last slash in the file name, of the program that was run. The z/OS UNIX name ends with the null character X'00'. For an MVS program, it is an unqualified name of up to 8 CHARACTERS of the program that was executed. The MVS program name is padded with blanks to a length of 16 CHARACTERS. For example, for a z/OS UNIX name of /usr/joe/somepgm, the field in SMF record type 30 IS somepgm ended by X'00'. For a z/OS UNIX name of /usr/joe/someverylongprogramname, the field is truncated to someverylongprog.
zASI	INT	2	(IBM name: SMF30ASI) Address space identifier.
zCOR	CHAR	64	(IBM name: SMF30COR) JES job correlator.

Secondary segment: SMF030_IO_Activity

Field Name	Type	Len	Description
<i>SMF030_IO_Activity.<fieldname></i>			
zINP	INT	4	(IBM name: SMF30INP) Number of card-image records in DD DATA and DD* data sets read by the reader for the map. This field is not set for SubTypes 2 OR 3.
zTEP	INT	4	

			(IBM name: SMF30TEP) Total blocks transferred (accumulated execute channel program (EXCP) counts - valid up to 'X'FFFFFFF', zero and invalid when zTEF is set)
zTPT	INT	4	(IBM name: SMF30TPT) Number of TPUTS (terminal writes) for a TSO/E session. If a batch job or a started task successfully processes TPUTs, this field might be non-zero for batch jobs or started tasks.
zTGT	INT	4	(IBM name: SMF30TGT) Number of TGETS (terminal reads) for a TSO/E session.
zRDR	INT	1	(IBM name: SMF30RDR) Reader device class as defined in JESPARMS. 0 - for TSO/E sessions or started tasks.
zRDT	INT	1	(IBM name: SMF30RDT) Reader device type as defined in JESPARMS. 0 - for TSO/E sessions or started tasks.
zTCN	INT	4	(IBM name: SMF30TCN) Total device connect time (in 128 MICRO-SECOND units) for this address space. For a DIV object, this field contains total device connect time for reads, writes, and re-reads.

SMF030_IO_Activity.zDCF.<fieldname>

zDevConWrong	BIT	1	DEVICE connect time may be incorrect. If this flag is set, the system resources manager (SRM) disabled the channel measurement while the job was running. If channel measurement is disabled, device connect time is not recorded. Thus, if this bit is set, zTCN and zDCT reflect less than the actual total connect time.
zIncomplete	BIT	1	Fields zAIC, zEIC, zAID, zEID, zAIW, zEIW, zAIS, zEIS contain incomplete data. (SRM could not deliver deltas or values for this interval.)
zTEPInvalid	BIT	1	zTEP Field value is invalid

SMF030_IO_Activity.<fieldname>

zRSB	CHAR	2	(IBM name: SMF30RSB) Reserved.
zTRR	INT	4	(IBM name: SMF30TRR) Total address space REREAD count.
zAIC	TIME	4	(IBM name: SMF30AIC) DASD I/O connect time, in 128-microsecond units, for address space plus dependent enclaves. Note that the value of RqsvAIC for FICON® channel utilization cannot be calculated. For more information.
zAID	TIME	4	(IBM name: SMF30AID) DASD I/O disconnect time, in 128-microsecond units, for address space plus dependent enclaves.
zAIW	TIME	4	(IBM name: SMF30AIW) DASD I/O pending plus control unit queue time, in 128-microsecond units, for address space plus dependent enclaves.
zAIS	INT	4	(IBM name: SMF30AIS) DASD I/O start subchannel count for address space plus dependent enclaves.
zEIC	TIME	4	(IBM name: SMF30EIC) DASD I/O connect time, in 128-microsecond units, for independent enclaves owned by the address space. Note that the value of RqsvEIC for FICON channel utilization cannot be calculated. For more information.
zEID	TIME	4	(IBM name: SMF30EID) DASD I/O disconnect time, in 128-microsecond units, for independent enclaves owned by the address space.
zEIW	TIME	4	(IBM name: SMF30EIW) DASD I/O pending plus control unit queue time, in 128-microsecond units, for independent enclaves owned by the address space.
zEIS	INT	4	(IBM name: SMF30EIS) DASD I/O start subchannel count for independent enclaves.
zTEX	INT	8	

			(IBM name: SMF30TEX) Total blocks transferred - accumulated EXCP counts. This field is the 8-byte equivalent of zTEP, but this field remains valid after zTEP is invalid.
zDAS	INT	4	(IBM name: SMF30DAS) Number of DDs that had their DD accounting information suppressed.

Secondary segment: SMF030_Completion

Field Name	Type	Len	Description
<i>SMF030_Completion.<fieldname></i>			
zSCC	HEX	2	<p>(IBM name: SMF30SCC) Step completion code: X'0ccc' indicates system abnormal endof task (abend) in the job step where ccc is the system abend code. (See z/OS MVS System Codes.) X'8ccc' indicates user abend in the job step where ccc is the user abend code. X'nnnn' indicates normal completion where nnnn is the contents of the two low-order bytes in register 15 at termination. X'0000' indicates one of the following: - The job step was flushed (not processed) because of an error during allocation or in a preceding job step. - The job step terminated with an abend code ending in X'0D'. In this case, zSCC contains the value from the low-order two bytes of the TCBCMPC field, which may contain zeros. - Normal job step completion with a return code of 0. Use this field in conjunction with the job/step termination indicator field, zSTI.</p> <p>Job completion code: X'0ccc' indicates system ABEND in the last job step where ccc is the system abend code. (See z/OS MVS System Codes.) X'8ccc' indicates user abend in the job step where ccc is the user abend code. X'nnnn' indicates normal completion where nnnn is the contents of the two low-order bytes in register 15 at termination. X'0000' indicates one of the following (see note): - The last job step was flushed (not processed) because of an error during allocation or in a preceding job step. - The job step terminated with an abend code ending in X'0D'. In this case, zSCC contains the value from the low-order two bytes of the TCBCMPC field, which may contain zeros. - Normal job completion with a return code of 0. Use this field in conjunction with the job/step termination indicator field, zSTI.</p> <p>Note: When a step in a multi-step job terminates abnormally, the subsequent steps, whether executed or flushed, do not propagate the step abend code for processing this record. The code appears in the step termination record (SubType 4). In this case, the field, zSCC, can contain X'nnnn' or X'0000'. If an abend occurred in the job, the job termination indicator (bit zFlushed in the zSTI field) indicates a user abend if the value is 0 (zero).</p>

<i>SMF030_Completion.zSTI.<fieldname></i>			
zReserved	BIT	1	RESERVED
zIEFUJV	BIT	1	CANCELED by exit IEFUJV.
zIEFUJI	BIT	1	CANCELED by exit IEFUJI.
zIEFUSI	BIT	1	CANCELED by exit IEFUSI.
zIEFACTRT	BIT	1	CANCELED by exit IEFACRT.
zRestart	BIT	1	Step is to be restarted.
zAbended	BIT	1	If zero, then normal completion. If 1, then abnormal end of task (abend). If step completion code equals 0322 or 0522, then IEFUTL caused the abend. If step completion code equals 0722, then IEFUSO caused the abend.
zFlushed	BIT	1	If zero, then normal completion. If 1, then step was flushed.

zEXCPCount	BIT	1	EXCP counts might be incorrect because the record did not include all the DD statements.
zNoWrite	BIT	1	Previous interval record was not written because an error occurred. The cumulative count might be incorrect because the counters were cleared.
zEXCPMerge	BIT	1	EXCP sections were not merged from the interval to the step record or from the step to the job record.
zPostExecute	BIT	1	Step completed with a 'post execution' error. Post-execution errors include a failure that occurred because the ALLOCxx parmlib member specified CATLG_ERR FAILJOB(YES).
zUnixExec	BIT	1	Step completed due to z/OS UNIX exec function request.
zCOND	BIT	1	Job abnormally ended because of COND= condition on the JOB card. This flag will be set on in the SubType 5 Job termination record only.
zEvict	BIT	1	Job was evicted via the \$EJnn,STEP,HOLD or equivalent command. This bit is set for SubType 4 (step end) records only.

SMF030_Completion.<fieldname>

zARC	INT	4	(IBM name: SMF30ARC) Abend reason code.
------	-----	---	--

Secondary segment: SMF030_Processor_Accounting

Field Name	Type	Len	Description
<i>SMF030_Processor_Accounting.<fieldname></i>			
zPTY	INT	2	(IBM name: SMF30PTY) Reserved.

SMF030_Processor_Accounting.zTFL.<fieldname>

zTimer	BIT	1	Indicates that timer flags are used.
zCPTx	BIT	1	zCPT has an invalid value due to a timer value calculation error.
zCPSx	BIT	1	zCPS has an invalid value due to a timer value calculation error.
zJVUx	BIT	1	zJVU has an invalid value due to a timer value calculation error.
zJVAx	BIT	1	zJVA has an invalid value due to a timer value calculation error.
zISBx	BIT	1	zISB has an invalid value due to a timer value calculation error.
zICUx	BIT	1	zICU has an invalid value due to a timer value calculation error.
zIVUx	BIT	1	zIVU has an invalid value due to a timer value calculation error.
zIVAx	BIT	1	zIVA has an invalid value due to a timer value calculation error.
zIIPx	BIT	1	zIIP has an invalid value due to a timer value calculation error.
zHPTx	BIT	1	zHPT has an invalid value due to a timer value calculation error.
zRCTx	BIT	1	zRCT has an invalid value due to a timer value calculation error.
zASRx	BIT	1	zASR has an invalid value due to a timer value calculation error.
zENCx	BIT	1	

			zENC has an invalid value due to a timer value calculation error.
zDETx	BIT	1	zDET has an invalid value due to a timer value calculation error.

SMF030_Processor_Accounting.<fieldname>			
zCPT	TIME	4	(IBM name: SMF30CPT) All standard CPU step time. Includes enclave time, preempt-able class SRB time, client SRB time. Also includes time consumed by zAAP or zIIP eligible work running on a standard processor. This value includes the value in field zOST.
zCPS	TIME	4	(IBM name: SMF30CPS) Step CPU time under the service request block (SRB). You can calculate the SRB time in microseconds (1/100 of a second) using the following formula: (zSRB*10)/zSRC * zSUS/16 = SRB time in microseconds. This value includes the value in field zOST.
zICU	TIME	4	(IBM name: SMF30ICU) Initiator CPU time under the task control block (TCB). This field is set at step termination. zICU = zICU_STEP_INIT (for this step) + zICU_STEP_TERM (from the previous step)
zISB	TIME	4	(IBM name: SMF30ISB) Initiator CPU time under the service request block (SRB). This field is set at step termination. zISB = zISB_STEP_INIT (for this step) + zISB_STEP_TERM (from the previous step)
zJVU	TIME	4	(IBM name: SMF30JVU) Step vector CPU time.
zIVU	TIME	4	(IBM name: SMF30IVU) Initiator vector CPU time. This field is set at step termination.
zJVA	TIME	4	(IBM name: SMF30JVA) Step vector affinity time.
zIVA	TIME	4	(IBM name: SMF30IVA) Initiator vector affinity time. This field is set at step termination.
zIST	TSTMP	8	(IBM name: SMF30IST) Interval start time for type 30 SubType 2 AND 3 RECORDS.
zIIP	TIME	4	(IBM name: SMF30IIP) Amount of CPU time used to process I/O interrupts.
zRCT	TIME	4	(IBM name: SMF30RCT) Amount of CPU time used by the region control task (RCT).
zHPT	TIME	4	(IBM name: SMF30HPT) CPU time consumed for the step to support requests for data to be transferred between a hiperspace and an address space, when the hiperspace is backed by expanded storage. The CPU time may vary depending on the availability of expanded storage.
zCSC	INT	4	(IBM name: SMF30CSC) Integrated Cryptographic Service Facility/MVS (ICSF/MVS) service count. This is the number of cryptographic instructions executed on behalf of caller (within caller's address space).
zDMI	INT	4	(IBM name: SMF30DMI) ADMF-Number of pages moved with ADMF WRITE operation.
zDMO	INT	4	(IBM name: SMF30DMO) ADMF-Number of pages moved with ADMF READ operation.
zASR	TIME	4	(IBM name: SMF30ASR) Additional CPU time accumulated by the preemptible SRBs and client SRBs for this job. This value is also included in the value in zCPT.
zENC	INT	4	(IBM name: SMF30ENC) CPU time used by the independent enclave, but only when in

			the WLM enclave. Note that independent enclave time on an IFA is not included. See field z_ENCLAVE_TIME_ON_IFA for that value. zENC is also part of the value in zCPT.
zDET	INT	4	(IBM name: SMF30DET) CPU time used by the dependent enclave, but only when in the WLM enclave. Note that dependent enclave time on an IFA is not included see field z_DEP_ENCLAVE_TIME_ON_IFA for that value. zDET is also part of the value in zCPT.
zCEP	INT	4	(IBM name: SMF30CEP) Cumulative CPU time consumed for an address space or job while enqueue promoted (in 1.024 millisecond units).

SMF030_Processor_Accounting.zTF2.<fieldname>			
z_TIME_ON_IFAx	BIT	1	z_TIME_ON_IFA has an invalid value due to a timer value calculation error.
z_ENCLAVE_TIME_ON_IFAx	BIT	1	z_ENCLAVE_TIME_ON_IFA has an invalid value due to a timer value calculation error.
z_DEP_ENCLAVE_TIME_ON_IFAx	BIT	1	z_DEP_ENCLAVE_TIME_ON_IFA has an invalid value due to a timer value calculation error.
z_TIME_IFA_ON_CPx	BIT	1	z_TIME_IFA_ON_CP has an invalid value due to a timer value calculation error.
z_ENCLAVE_TIME_IFA_ON_CPx	BIT	1	z_ENCLAVE_TIME_IFA_ON_CP has an invalid value due to a timer value calculation error.
z_DEP_ENCLAVE_TIME_IFA_ON_CPx	BIT	1	z_DEP_ENCLAVE_TIME_IFA_ON_CP has an invalid value due to a timer value calculation error.
zCEPIx	BIT	1	Failure in zCEPI.
zCRPx	BIT	1	Failure in zCRP.

SMF030_Processor_Accounting.zT32.<fieldname>			
z_TIME_ON_zIIPx	BIT	1	z_TIME_ON_ZIIP has invalid value.
z_ENCLAVE_TIME_ON_zIIPx	BIT	1	z_ENCLAVE_TIME_ON_ZIIP has invalid value.
z_DEPENC_TIME_ON_zIIPx	BIT	1	z_DEP_ENCLAVE_TIME_ON_ZIIP has invalid value.
z_TIME_zIIP_ON_CPx	BIT	1	z_TIME_ZIIP_ON_CP has invalid value.
z_ENCLAVE_TIME_zIIP_ON_CPx	BIT	1	z_ENCLAVE_TIME_ZIIP_ON_CP has invalid value.
z_DEPENC_TIME_zIIP_ON_CPx	BIT	1	z_DEPENC_TIME_ZIIP_ON_CP has invalid value.

SMF030_Processor_Accounting.zT33.<fieldname>			
z_ENCLAVE_TIME_zIIP_QUALx	BIT	1	z_ENCLAVE_TIME_ZIIP_QUAL has invalid value.
z_DEPENC_TIME_zIIP_QUALx	BIT	1	z_DEPENC_TIME_ZIIP_QUAL has invalid value.

SMF030_Processor_Accounting.z_BoostInfo.<fieldname>			
z_zIIP_Boost	BIT	1	zIIP boost was active at some point within the interval. An SMF30 step-end record will have the 'active' bit on if the bit was on in any interval record created for the step. An SMF30 job record will have the 'active' bit on if the bit was on in any interval record created for the job.
z_Speed_Boost	BIT	1	Speed boost was active at some point within the interval. An SMF30 step-end record will have the 'active' bit on if the bit was on in any interval record created for the step. An SMF30 job record will have the 'active' bit on if the bit was on in any interval record created for the job.
z_Boost_Class	BINT (ENUM)	3	

SMF030_Processor_Accounting.<fieldname>			
z_TIME_ON_IFA	TIME	4	

			(IBM name: SMF30_TIME_ON_IFA) Accumulation of CPU time spent on zAAP. (includes enclave time).
z_ENCLAVE_TIME_ON_IFA	TIME	4	(IBM name: SMF30_ENCLAVE_TIME_ON_IFA) Accumulation of enclave time spent on zAAP.
z_DEP_ENCLAVE_TIME_ON_IFA	TIME	4	(IBM name: SMF30_DEP_ENCLAVE_TIME_ON_IFA) Accumulation of dependent enclave time spent on zAAP.
z_TIME_IFA_ON_CP	TIME	4	(IBM name: SMF30_TIME_IFA_ON_CP) Accumulation of CPU time spent running zAAP eligible work on a standard CP. (includes enclave time).
z_ENCLAVE_TIME_IFA_ON_CP	TIME	4	(IBM name: SMF30_ENCLAVE_TIME_IFA_ON_CP) Accumulation of zAAP enclave time spent on a standard CP.
z_DEP_ENCLAVE_TIME_IFA_ON_CP	TIME	4	(IBM name: SMF30_DEP_ENCLAVE_TIME_IFA_ON_CP) Accumulation of zAAP dependent enclave time spent on a standard CP.
zCEPI	INT	4	(IBM name: SMF30CEPI) CPU time consumed for an address space or job while enqueue promoted (in 1.024 millisecond units). Contains only the time consumed during the interval (not cumulative).
z_TIME_ON_zIIP	TIME	4	(IBM name: SMF30_TIME_ON_zIIP) Accumulation of time spent on zIIP. (includes enclave time).
z_ENCLAVE_TIME_ON_zIIP	TIME	4	(IBM name: SMF30_ENCLAVE_TIME_ON_zIIP) Accumulation of enclave time spent on zIIP.
z_DEPENC_TIME_ON_zIIP	TIME	4	(IBM name: SMF30_DEPENC_TIME_ON_zIIP) Accumulation of dependent enclave time spent on zIIP.
z_TIME_zIIP_ON_CP	TIME	4	(IBM name: SMF30_TIME_zIIP_ON_CP) Accumulation of CPU time spent running zIIP eligible work on a standard CP. (includes enclave time).
z_ENCLAVE_TIME_zIIP_ON_CP	TIME	4	(IBM name: SMF30_ENCLAVE_TIME_zIIP_ON_CP) Accumulation of zIIP enclave time spent on a standard CP.
z_DEPENC_TIME_zIIP_ON_CP	TIME	4	(IBM name: SMF30_DEPENC_TIME_zIIP_ON_CP) Accumulation of zIIP dependent enclave time spent on a standard CP.
z_ENCLAVE_TIME_zIIP_QUAL	TIME	4	(IBM name: SMF30_ENCLAVE_TIME_zIIP_QUAL) Normalized enclave time qualified to be on zIIP. Note that qualified time is the SRB time for an enclave that a program (DB2, for example) has identified to Workload Management for zIIP eligibility. The program also indicates the portion of the SRB time intended for eligibility to the zIIP(s). The eligible time achieved is reported in xxx_TIME_ON_ZIIP and xxx_TIME_ZIIP_ON_CP fields.
z_DEPENC_TIME_zIIP_QUAL	TIME	4	(IBM name: SMF30_DEPENC_TIME_zIIP_QUAL) Normalized dependent enclave time qualified to be on zIIP. Note that qualified time is the SRB time for an enclave that a program (DB2, for example) has identified to Workload Management for zIIP eligibility. The program also indicates the portion of the SRB time intended for eligibility to the zIIP(s). The eligible time achieved is reported in xxx_TIME_ON_ZIIP and xxx_TIME_ZIIP_ON_CP fields.
zCRP	INT	4	(IBM name: SMF30CRP) CPU time consumed for an address space or job while promoted because of chronic resource contention (in 1.024 millisecond units). For interval records, this field contains only the time consumed during the interval itself.
zICU_Step_Term	INT	4	(IBM name: SMF30ICU_Step_Term) CPU TCB time spent by the Initiator during job step termination processing. This field is the step termination portion of zICU that is reported in the next step end record.
zICU_Step_Init	INT	4	(IBM name: SMF30ICU_Step_Init) CPU TCB time spent by the Initiator during job step initialization processing. This field is the step initialization portion of zICU for this step end record.
zISB_Step_Term	INT	4	(IBM name: SMF30ISB_Step_Term) CPU SRB time spent by the Initiator during job step

			termination processing. This field is the step termination portion of zISB that is reported in the next step end record.
zISB_Step_Init	INT	4	(IBM name: SMF30ISB_Step_Init) CPU SRB time spent by the Initiator during job step initialization processing. This field is the step initialization portion of zISB for this step end record.
z_Missed_zBLK	INT	4	(IBM name: N/A) Accumulated value of I/O block counts when serialization could not be obtained for accumulating the value to zBLK. This value is maintained at the job step level as opposed to the DD level of its zBLK counterpart.
z_Missed_zDCT	INT	4	(IBM name: N/A) Accumulated value of device connect time when serialization could not be obtained for accumulating the value to zDCT. This value is maintained at the job step level as opposed to the DD level of its zDCT counterpart.
z_Highest_Task_CPU_Percent	INT	2	(IBM name: SMF30_Highest_Task_CPU_Percent) For interval records, the largest percentage of CPU time used by any task in the address space, rounded to the nearest integer. The percentage value is calculated as: TCB time * 100 / interval time. For step-end and job-end records, the value is the largest reported interval value.
z_Highest_Task_CPU_Program	CHAR	8	(IBM name: SMF30_Highest_Task_CPU_Program) Name of the program loaded by the task that used the largest percentage of CPU time in this address space. This field corresponds to z_Highest_Task_CPU_Percent. A value of blanks indicates that no task reported any CPU time in the address space, or that the CPU time could not be obtained. A value of ???????? indicates that the program name could not be obtained for the task that reported the highest percentage of CPU time. 180 BE zCAS_Flag 1 BINARY CPU accounting segment flags. Bit Meaning when set 0 zCAS_INELIGHONORPRIORITY indicates eligible work in this address space is not offloaded to CPs for help processing. Once this bit is set on for a job interval or step-end record, this bit will also be set on for step-total and job-end records. 181 BF zCAS_ROBB 1 BINARY Reserved.

SMF030_Processor_Accounting.zCAS_Flag.<fieldname>			
zCAS_InEligHonorPriority	BIT	1	Eligible work in this address space is not offloaded to CPs for help processing. Once this bit is set on for a job interval or step-end record, this bit will also be set on for step-total and job-end records.

SMF030_Processor_Accounting.<fieldname>			
zCAS_ROBB	INT	1	(IBM name: SMF30CAS_ROBB) Reserved.

SMF030_Processor_Accounting.zCAS_OA54589.<fieldname>			
---	--	--	--

SMF030_Processor_Accounting.zCAS_OA54589.zOSPROTECT1.<fieldname>			
OSPROTECT	BIT	1	ON => OSPROTECT=1 is in effect.
OSPROTECT_1	BIT	1	ON => OSPROTECT=1 is in effect.

SMF030_Processor_Accounting.zCAS_OA54589.<fieldname>			
zOSPROTECT4	HEX	1	The bits are defined as follows. (Bits not specified are reserved but might not be 0.) X'10'on => This job step turned on the JSCBAUTH bit at some point after the job step program received control. This can be a normal process for z/OS UNIX. The X'40', X'20', and X'02' bits identify the state of trust, with respect to OSPROTECT=1 functions, as follows: X'02' on, X'40' off => Untrusted X'02' on, X'40' on, X'20' off => Trusted X'02' on, X'40' on, X'20' on => Untrusted

X'02' off => Trusted.

Secondary segment: SMF030_EXCP

Field Name	Type	Len	Description
<i>SMF030_EXCP.<fieldname></i>			
SMF030_EXCP.zEXP.<fieldname>			
zDEV	INT	1	(IBM name: SMF30DEV) Device class.
zUTP	INT	1	(IBM name: SMF30UTP) Unit type.
zCUA	HEX	2	(IBM name: SMF30CUA) Device number.
zDDN	CHAR	8	(IBM name: SMF30DDN) DD Name used to access the data set.
zBLK	INT	4	(IBM name: SMF30BLK) Count of blocks issued for the device against the data set. This field has a maximum value of X'FFFFFFFF' = 4,294,967,295. If it exceeds that value it will wrap to zero and then continue to increase again for additional blocks transferred.
SMF030_EXCP.zEXP.zBSZ.<fieldname>			
zBSZChanged	BIT	1	Changed blocksize for the data set. Post processors should use this field to avoid the possibility of negative numbers.
zBSZLarge	BINT	15	Largest blocksize of the data set.
SMF030_EXCP.zEXP.<fieldname>			
zDCT	INT	4	(IBM name: SMF30DCT) Device connect time for this data set (in 128 MICRO-SECOND units). For DIV object, device connect time is not collected by SMF. however, this field may not always be zero. For example, if a user is using a DIV data set and calls a VSAM utility to process it using the same DD statement, this will result in device connect time being charged by VSAM to the DIV object.
zXBS	INT	8	(IBM name: SMF30XBS) Block size value.

Secondary segment: SMF030_Accounting

Field Name	Type	Len	Description
<i>SMF030_Accounting.<fieldname></i>			
zACL	INT	1	(IBM name: SMF30ACL) Length of accounting section (excluding this field).
zACT	XVCHAR	0 256	(IBM name: SMF30ACT) Job or step accounting field.

Secondary segment: SMF030_Storage_and_Paging

Field Name	Type	Len	Description
<i>SMF030_Storage_and_Paging.<fieldname></i>			

zRSV	INT	2	(IBM name: SMF30RSV) Note that zRGN, formerly a two-byte field at this offset, has been increased to four bytes and moved to the end of the Storage and Paging Section.
SMF030_Storage_and_Paging.zSFL.<fieldname>			
zVirtReal	BIT	1	V=R is specified. This bit has no meaning for SubType 5 records.
zRgnLimit	BIT	1	IEFUSI changed region limit values for the extended private area
zMemLimit	BIT	1	IEFUSI set MEMLIMIT value (even if IEFUSI did not change the value).
zIncomplete	BIT	1	Fields zERS, zKIE, zPOA, zBIA, zKOA, zPOE, zBIE, zKOE, zPSC, zBOA, zLPI, zPSF, zBOE, zNSW, zPSO, zCPI, zPAI, zPST, zCPM, zPEI, zVPI, zHPI, zPIA, zVPO, zHPO, zPIE, zVPR, zKIA contain incomplete data. (SRM could not deliver deltas or values for this interval.)
zInvalTI	BIT	1	The following fields are not valid: zTIH zTIU zTIS. These fields are populated at z/OS 2.4 and later.
SMF030_Storage_and_Paging.<fieldname>			
zSPK	INT	1	(IBM name: SMF30SPK) Storage protect key, in the form xxxx0000 , where xxxx is the key.
zPRV	INT	2	(IBM name: SMF30PRV) Largest amount of storage used from bottom of private area, in 1 K units. This storage area includes subpools 0-127, 129-132, 244, 251 AND 252. If ADDRSPC=REAL is specified, this field equals the amount of contiguous real storage that was used.
zSYS	INT	2	(IBM name: SMF30SYS) Largest amount of storage used from top of private area, in 1K units. This storage area includes the local system queue area (LSQA) and the SWA - subpools 229, 230, 236, 237, 249, and 253-255. If ADDRSPC=REAL is specified, this field equals the amount of storage used that was not from the contiguous real storage reserved for the program.
zPGI	INT	4	(IBM name: SMF30PGI) Number of pages that were paged in from auxiliary storage.
zPGO	INT	4	(IBM name: SMF30PGO) Number of pages that were paged out to auxiliary storage.
zCPM	INT	4	(IBM name: SMF30CPM) Number of attempts to read data from an ESO hiperspace that were not satisfied because the data has been deleted.
zNSW	INT	4	(IBM name: SMF30NSW) Number of address space swap sequences. (A swap sequence consists of an address space swap-out and swap-in. Logical swap-out and swap-in are not included.)
zPSI	INT	4	(IBM name: SMF30PSI) Number of pages swapped in from auxiliary storage to central storage. This field includes: (local system queue area (LSQA), fixed pages, and pages that the real storage manager determined to be active when the address space was swapping in. It does not include page reclaims or pages found in storage during the swap-in process (such as pages brought in by the service request blocks (SRB), started after completion of swap-in Stage 1 PROCESSING).
zPSO	INT	4	(IBM name: SMF30PSO) Number of pages swapped out from central storage to auxiliary storage. This field includes: local system queue area (LSQA), private area fixed pages, and private area non-fixed changed pages.
zVPI	INT	4	(IBM name: SMF30VPI) Number of VIO page-ins from auxiliary storage to central storage for this step. This field includes page-ins resulting from page faults or specific page requests on a VIO window. It does not include VIO swap-ins or page-ins for the common area.
zVPO	INT	4	(IBM name: SMF30VPO) Number of VIO page-outs from central storage to auxiliary storage for this step. This field includes page-outs resulting from specific page

			requests on a VIO window as well as those pages stolen by the paging supervisor through infrequent use. It does not include VIO swap-outs or page-outs for the common area.
zVPR	INT	4	(IBM name: SMF30VPR) Number of VIO reclaimis.
zCPI	INT	4	(IBM name: SMF30CPI) Number of common area page-ins (LPA + CSA) from auxiliary storage to central storage.
zHPI	INT	4	(IBM name: SMF30HPI) Number of hiperspace page-ins from auxiliary to processor storage.
zLPI	INT	4	(IBM name: SMF30LPI) Number of LPA page-ins from auxiliary storage to central storage.
zHPO	INT	4	(IBM name: SMF30HPO) Number of hiperspace page-outs from processor to auxiliary storage.
zPST	INT	4	(IBM name: SMF30PST) Number of pages stolen from this address space.
zPSC	INT	8	(IBM name: SMF30PSC) Number of CPU page seconds for this address space, in page millisecond units. (A page millisecond unit equals 1.024 milliseconds.)
zRGB	INT	4	(IBM name: SMF30RGB) Private area size in bytes (less than 16 MEGABYTES).
zERG	INT	4	(IBM name: SMF30ERG) Private area size in bytes (greater than 16 MEGABYTES).
zARB	INT	4	(IBM name: SMF30ARB) Maximum virtual storage in bytes allocated from the local system queue area (LSQA) and the SWA subpools (less than 16 MEGABYTES).
zEAR	INT	4	(IBM name: SMF30EAR) Maximum virtual storage in bytes allocated from the local system queue area (LSQA) and the SWA subpools (greater than 16 MEGABYTES).
zURB	INT	4	(IBM name: SMF30URB) Maximum virtual storage in bytes allocated from the user subpools (less than 16 MEGABYTES).
zEUR	INT	4	(IBM name: SMF30EUR) Maximum virtual storage in bytes allocated from the user subpools (greater than 16 MEGABYTES).
zRGN	INT	4	(IBM name: SMF30RGN) Region size established, in 1K units, rounded up to a 4K boundary. The contents of this field is determined as follows: v If the ADDRSPC=REAL parameter is specified in the JCL, the contents of this field equals the amount of contiguous central storage reserved for the program. v If the REGION= parameter value in the JCL exceeds 16 MEGABYTES: - If the IEFUSI exit changes the region limit or size above 16 MEGABYTES, the contents of this field equals the changed region limit or size - Otherwise, the contents of this field equals the REGION parameter value (minimum value of 32 MEGABYTES). v If the REGION= parameter value in the JCL equals or is less than 16 MEGABYTES: - If the IEFUSI exit changes the region limit or size below 16 MEGABYTES, the contents of this field equals the changed region limit or size - Otherwise, the contents of this field equals the REGION parameter value. Note: If both the region limit and size are changed, but do not match, the contents of this field equals the smaller of the changed region limit or size.
zDSV	INT	4	(IBM name: SMF30DSV) Amount of user key data space and hiperspace virtual storage (high water mark) used during the step/job (in megabytes). Must be in key 8 OR higher, and the creator of the dataspace must be in problem program state. If these two conditions are not true, this field contains zeros.
zPIE	INT	4	(IBM name: SMF30PIE) Number of unblocked pages that were paged in from expanded storage.
zPOE	INT	4	(IBM name: SMF30POE) Number of unblocked pages that were paged out to expanded

			storage.
zBIA	INT	4	(IBM name: SMF30BIA) Number of blocked pages that were paged in from auxiliary storage.
zBOA	INT	4	(IBM name: SMF30BOA) Number of blocked pages that were paged out to auxiliary storage.
zBIE	INT	4	(IBM name: SMF30BIE) Number of blocked pages that were paged in from expanded storage.
zBOE	INT	4	(IBM name: SMF30BOE) Number of blocked pages that were paged out to expanded storage.
zKIA	INT	4	(IBM name: SMF30KIA) Number of blocks that were paged in from auxiliary storage.
zKOA	INT	4	(IBM name: SMF30KOA) Number of blocks that were paged out to auxiliary storage.
zKIE	INT	4	(IBM name: SMF30KIE) Number of blocks that were paged in from expanded storage.
zKOE	INT	4	(IBM name: SMF30KOE) Number of blocks that were paged out to expanded storage.
zPSF	INT	8	(IBM name: SMF30PSF) Number of CPU page seconds for the IARVSERV shared central storage frames in use by this address space, in page milliseconds.
zPAI	INT	4	(IBM name: SMF30PAI) Number of IARVSERV shared pages that were paged in from auxiliary storage when referenced by a unit of work whose home space was this address space.
zPEI	INT	4	(IBM name: SMF30PEI) Number of IARVSERV shared pages that were paged in from expanded storage in this address space.
zERS	INT	8	(IBM name: SMF30ERS) Expanded storage page residency time in page-milliseconds.
zMEM	INT	8	(IBM name: SMF30MEM) MEMLIMIT value in 1MB units as determined at step initialization time, after IEFUSI processing. An increase in the system default memlimit value is not reflected here. The maximum value of this field is '0000FFFFFFFF000'x that is equivalent to MEMLIMIT having no limit.
zMES	INT (ENUM)	1	(IBM name: SMF30MES) Source of Memlimit which is one of the following: SMF => MEMLIMIT set by SMF. JCL => MEMLIMIT set explicitly in the JCL with MEMLIMIT parameter on JOB or EXEC statement. Unlimited => MEMLIMIT is unlimited based on REGION=0 specification. IEFUSI => MEMLIMIT set by IEFUSI (even if IEFUSI did not change the value). SysDefault => System provided a default for MEMLIMIT based on REGION=0 specification and a subsequent curtailment of REGION in the IEFUSI exit.

SMF030_Storage_and_Paging.zSLM.<fieldname>

zREGIONBELOW	BIT	1	SMFLIM REGIONBELOW acted on the non-extended REGION for this step.
zREGIONABOVE	BIT	1	SMFLIM REGIONABOVE acted on the extended REGION for this step.
zSYSRESVBELOW	BIT	1	SMFLIM SYSRESVBELOW acted on the non-extended REGION for this step.
zSYSRESVABOVE	BIT	1	SMFLIM SYSRESVABOVE acted on the extended REGION for this step.
zMEMLIMIT	BIT	1	SMFLIM MEMLIMIT acted on the MEMLIMIT for this step.
zIEFUSIExit	BIT	1	The IEFUSI exit set the output flag that caused all SMFLIM decision making to be bypassed.

SMF030_Storage_and_Paging.zRAXFLAGS.<fieldname>

zCommonAuditEnabled	BIT	1	
---------------------	-----	---	--

			When zCOMMONAUDITENABLED is on, auditing of user key common storage usage attempts enabled for this step/job. zCSAUSAGE, zCADSUSAGE and zCHANGKEYUSAGE are only applicable when this flag is on.
zCSAUsage	BIT	1	When zCSAUSAGE is on, attempts were made to obtain user key CSA or RUCSA storage for this step/job. This bit is only valid when zCOMMONAUDITENABLED is on. Once this bit is set on for an interval record, this bit will also be set on for all subsequent interval records for this step. Once this bit is set on for a job interval or step-end record, this bit will also be set on for step-total and job-end records.
zCADSUsage	BIT	1	When zCADSUSAGE is on, attempts were made to create a user key CADS for this step/job. This bit is only valid when zCOMMONAUDITENABLED is on. Once this bit is set on for an interval record, this bit will also be set on for all subsequent interval records for this step. Once this bit is set on for a job interval or step-end record, this bit will also be set on for step-total and job-end records.
zChangKeyUsage	BIT	1	When zCHANGKEYUSAGE is on, attempts were made to change the key of common ESQA storage to a user key (via CHANGKEY) for this step/job. This bit is only valid when zCOMMONAUDITENABLED is on. Once this bit is set on for an interval record, this bit will also be set on for all subsequent interval records for this step. Once this bit is set on for a job interval or step-end record, this bit will also be set on for step-total and job-end records.
zRUCSAUsage	BIT	1	When zRUCSAUsage is on, attempts were made to obtain, reference, free, or change the state of RUCSA storage for this step. Once this bit is set within a step, it stays on for that step. This bit will be on in job end records if it is on for any step in the job.
zRUCSAEarlyUsage	BIT	1	When zRUCSAEarlyUsage is on, attempts were made to obtain, reference, free or change the state of user key RUCSA which were permitted during early IPL or started task initialization due to DIAGxx VSM AllowEarlyRUCSA(Yes). Once this bit is set on it will remain on for the life of the address space.

SMF030_Storage_and_Paging.<fieldname>

zHVR	INT	8	(IBM name: SMF30HVR) High water mark for the number of real storage frames that is used to back 64-bit private storage.
zHVA	INT	8	(IBM name: SMF30HVA) High water mark for the amount of auxiliary storage that is used to back 64-bit private storage. This value is a total of the number of paging data set slots and storage-class memory (SCM) blocks.
zHVO	INT	8	(IBM name: SMF30HVO) Amount of 64-bit private storage in bytes that is obtained by this step or job. This includes guarded virtual storage. The zHVO field contains a snapshot value of high virtual private storage allocation. As the memory objects owned by the executed program have already been detached at the time the step or job goes through termination, zHVO contains the memory object size still allocated to the initiator address space, but no longer reflects the memory objects that may have been allocated by the program executed in the job step. In contrast to zHVO, the zHVH field is maintained as a high water mark. Its content reflects the high virtual memory object size that was once allocated by the job step being executed under the initiator address space.
zHVH	INT	8	(IBM name: SMF30HVH) High water mark for the number of usable bytes of 64-bit private storage that is obtained by this step or job. This does not include guarded virtual storage.
zHSO	INT	8	(IBM name: SMF30HSO) Amount of 64-bit IARV64 REQUEST=SHAREMEMOBJ shared storage, in bytes, to which this step or job has addressability or access.
zHSH	INT	8	(IBM name: SMF30HSH) High water mark for the number of usable bytes of 64-bit IARV64 REQUEST=SHAREMEMOBJ shared storage to which this step or job has access.
zTIH	INT	4	

			(IBM name: SMF30TIH) High water mark of TIOT space used for TIOT entries (in bytes.)
zTIU	INT	4	(IBM name: SMF30TIU) Current TIOT space used for TIOT entries (in bytes.) This will only contain a non-zero value for inter-val records, since TIOT entries are freed by unallocation processing at step end and job end.
zTIS	INT	4	(IBM name: SMF30TIS) Size of the TIOT available for TIOT entries (in bytes.) This does not include the space reserved by the system for the TIOT Prefix, Header, and Trailer.
zNumberOfDataSpacesHWM	INT	4	(IBM name: SMF30NumberOfDataSpacesHWM) The high water mark of the number of in use data spaces created by problem state user key DSPSERV invokers during this job step.
zDataSpaceCreateCount	INT	8	(IBM name: SMF30UserDataSpaceCreateReqCount) The total number of data spaces created by problem state user key callers during this job step.

Secondary segment: SMF030_Performance

Field Name	Type	Len	Description
<i>SMF030_Performance.<fieldname></i>			
zSRV	INT	4	(IBM name: SMF30SRV) Total service units. This field grows to X'FFFFFFFF' and then wraps back to zero and continues growing. When wrapping occurs, zSRV_INV is set to on. zSRV_L is the 8-byte equivalent of this field.
zCSU	INT	4	(IBM name: SMF30CSU) CPU service units. This field grows to X'FFFFFFFF' and then wraps back to zero and continues growing. When wrapping occurs, zCSU_INV is set to on. zCSU_L is the 8-byte equivalent of this field.
zSRB	INT	4	(IBM name: SMF30SRB) Service request block (SRB) service units. This field grows to X'FFFFFFFF' and then wraps back to zero and continues growing. When wrapping occurs, zSRB_INV is set to on. zSRB_L is the 8-byte equivalent of this field.
zIO	INT	4	(IBM name: SMF30IO) I/O service units. This field grows to X'FFFFFFFF' and then wraps back to zero and continues growing. When wrapping occurs, zIO_INV is set to on. zIO_L is the 8-byte equivalent of this field.
zMSO	INT	4	(IBM name: SMF30MSO) Main storage occupancy (MSO) service units. This field grows to X'FFFFFFFF' and then wraps back to zero and continues growing. When wrapping occurs, zMSO_INV is set to on. zMSO_L is the 8-byte equivalent of this field.
zTAT	TIME	4	(IBM name: SMF30TAT) System resources manager (SRM) transaction active time, in 1024-microsecond units.
zSUS	TIME	4	(IBM name: SMF30SUS) Copy of RmctAdjC when this SMF record was produced, number of sixteenths of one CPU microsecond per CPU service unit.
zRES	TIME	4	(IBM name: SMF30RES) System resources manager (SRM) transaction residency time, in 1024-microsecond units. That is the amount of time the SRM transaction was in real storage.
zTRS	INT	4	(IBM name: SMF30TRS) Number of system resources manager (SRM) transactions.
zWLM	CHAR	8	(IBM name: SMF30WLM) Workload name. This field is blank (X'40') when in workload management compatibility mode.

zSCN	CHAR	8	(IBM name: SMF30SCN) Service class name. This field will contain SYSOTHER during the time of a WLM POLICY switch.
zGRN	CHAR	8	(IBM name: SMF30GRN) Resource group name.
zRCN	CHAR	8	(IBM name: SMF30RCN) Report class name. This field is blank (X'40') during the time of a WLM POLICY switch.
zETA	TIME	4	(IBM name: SMF30ETA) Independent enclave transaction active time in 1024-microsecond units.
zESU	INT	4	(IBM name: SMF30ESU) Independent enclave CPU service units. This field grows to X'FFFFFFFF' and then wraps back to zero and continues growing. When wrapping occurs, zESU_INV is set to on. zESU_L is the 8-byte equivalent of this field.
zETC	INT	4	(IBM name: SMF30ETC) Independent enclave transaction count.
zPFL	CHAR	16	(IBM name: SMF30PFL) Scheduling environment name. Binary zeros if no scheduling environment is specified.
zJQT	TIME	4	(IBM name: SMF30JQT) Job preparation time. This is the elapsed time before the job was first queued for execution. It excludes time to read the job into the system. It includes delays incurred waiting for and during conversion, such as when eligible systems are not active to convert the job. If the JOB statement specified TYPRUN=JCLHOLD, this time is 0. The time is in 1024-microsecond units.
zRQT	TIME	4	(IBM name: SMF30RQT) Time following job preparation when the job was ineligible for execution due to either the job's eligible systems being inactive or the job's scheduling environment not being available. The time is in 1024-microsecond units.
zHQT	TIME	4	(IBM name: SMF30HQT) Time following job preparation when the job was ineligible for execution for reasons not included in zRQT. This includes job hold, job class hold, job queue hold, duplicate job name serialization, and job class execution limits. If the JOB statement specified TYPRUN=HOLD, the time that the job is held for this reason is not included. The time is in 1024-microsecond units.
zSQT	TIME	4	(IBM name: SMF30SQT) Time the job was eligible for execution. This is the amount of time between the end of job conversion and Problem Program Start time (zPPS). The time is in 1024-microsecond units. For JES3, this field includes time the job was ineligible for execution.

SMF030_Performance.zPF1.<fieldname>

zPFJ	BIT	1	Job service class association was modified by a system operator prior to job initiation.
zPFR	BIT	1	Job service class association was modified by a system operator during job execution.
zPFF	BIT	1	Job initiation forced by a system operator.
zRTR	BIT	1	Job has been restarted. There is one set of z records for each time the job is restarted.
zMSI	BIT	1	Remote system data is incomplete.
zWMI	BIT	1	Job is executing in a workload manager batch initiator.
zCCP	BIT	1	Service class assigned to the address space was designated CPU-critical in the WLM service definition.
zCSP	BIT	1	Service class assigned to the address space was designated storage-critical in the WLM service definition.

SMF030_Performance.zPF2.<fieldname>			
zASP	BIT	1	Address space was designated storage-critical.
zSME	BIT	1	Address space cannot be managed to transaction goals, because 'manage region to goals of region' was specified in the WLM service definition.
zCPR	BIT	1	Address space is currently CPU-protected.
zSPR	BIT	1	Address space is currently storage-protected.
zPIN	BIT	1	Fields zMSO zSPR, zESU, zPFL, zSQT, zETA, zPFR, zSRB, zETC, zRCN, zSRV, zGRN, zRES zSUS, zHQT, zRQT, zTAT, zIO, zRTR, zTRS, zJPN, zSCN, zWLM, zJQT, zSME zCRM, zSRV_L, zCSU_L, zSRB_L, zIO_L, zMSO_L, zESU_L contain incomplete data. (SRM could not deliver deltas or values for this interval.)
zCRM	BIT	1	If this bit is on, it indicates that the address space matched a classification rule that specified 'manage region using goals of both', which means it is managed towards the velocity goal of the region. But, transaction completions are reported and used for management of the transaction service classes with response time goals. This option must only be used with CICS TORs. The associated AORs must remain at the default 'manage region using goals of transaction'.

SMF030_Performance.zINV.<fieldname>			
zSRV_INV	BIT	1	When this bit is on, it indicates that the value in zSRV has grown past its four byte maximum value capacity of 'FFFFFFFF' and has wrapped back to zero. zSRV_L is the 8-byte equivalent of zSRV.
zCSU_INV	BIT	1	When this bit is on, it indicates that the value in zCSU has grown past its four byte maximum value capacity of 'FFFFFFFF' and has wrapped back to zero. zCSU_L is the 8-byte equivalent of zCSU.
zSRB_INV	BIT	1	When this bit is on, it indicates that the value in zSRB has grown past its four byte maximum value capacity of 'FFFFFFFF' and has wrapped back to zero. zSRB_L is the 8-byte equivalent of zSRB.
zIO_INV	BIT	1	When this bit is on, it indicates that the value in zIO has grown past its four byte maximum value capacity of 'FFFFFFFF' and has wrapped back to zero. zIO_L is the 8-byte equivalent of zIO.
zMSO_INV	BIT	1	When this bit is on, it indicates that the value in zMSO has grown past its four byte maximum value capacity of 'FFFFFFFF' and has wrapped back to zero. zMSO_L is the 8-byte equivalent of zMSO.
zESU_INV	BIT	1	When this bit is on, it indicates that the value in zESU has grown past its four byte maximum value capacity of 'FFFFFFFF' and has wrapped back to zero. zESU_L is the 8-byte equivalent of zESU.

SMF030_Performance.<fieldname>			
zZEP	INT	1	(IBM name: SMF30ZEP) Contains information associated with a potential future function and no further details are available at this time.
zJPN	CHAR	8	(IBM name: SMF30JPN) Subsystem collection name from IWMCLSFY SUBCOLN.
zMSC	INT	4	(IBM name: SMF30MSC) MSO Service Definition Coefficient (SDC) scaled by 10000.
zCPC	INT	2	(IBM name: SMF30CPC) CPU Service Definition Coefficient (SDC) scaled by 10.
zLOC	INT	2	(IBM name: SMF30LOC) IOC Service Definition Coefficient (SDC) scaled by 10.
zSRC	INT	2	(IBM name: SMF30SRC) SRB Service Definition Coefficient (SDC) scaled by 10.

zZNF	INT	2	(IBM name: SMF30ZNF) Normalization factor for IFA service time. Used to convert between real IFA times and 'normalized' IFA times, that is, the equivalent time on a standard CP. Multiply z_TIME_ON_IFA by this value and divide by 256 T0 calculate the normalized IFA time.
zSNF	INT	2	(IBM name: SMF30SNF) Normalization factor for zIIP service time. Used to convert between real zIIP times and normalized zIIP times, that is, the equivalent time on a standard CP. Multiply z_TIME_ON_zIIP by this value and divide by 256 T0 calculate the normalized zIIP time.
zRS6	CHAR	6	(IBM name: SMF30RS6) Reserved.
zSRV_L	INT	8	(IBM name: SMF30SRV_L) Total service units. This is the 8-byte equivalent of zSRV. The value of this field continues to grow after zSRV_INV is set.
zCSU_L	INT	8	(IBM name: SMF30CSU_L) CPU service units. This is the 8-byte equivalent of zCSU. The value of this field continues to grow after zCSU_INV is set.
zSRB_L	INT	8	(IBM name: SMF30SRB_L) SRB service units. This is the 8-byte equivalent of zSRB. The value of this field continues to grow after zSRB_INV is set.
zIO_L	INT	8	(IBM name: SMF30IO_L) I/O service units. This is the 8-byte equivalent of zIO. The value of this field continues to grow after zIO_INV is set.
zMSO_L	INT	8	(IBM name: SMF30MSO_L) MSO service units. This is the 8-byte equivalent of zMSO. The value of this field continues to grow after zMSO_INV is set.
zESU_L	INT	8	(IBM name: SMF30ESU_L) ESU service units. This is the 8-byte equivalent of zESU. The value of this field continues to grow after zESU_INV is set.
zACB	INT	1	(IBM name: SMF30ACB) Contains information associated with a potential future function, no further details are provided at this time.
zCR	INT	1	(IBM name: SMF30CR) Contains information associated with a potential future function, no further details are provided at this time.
z_Capacity_Change_Cnt	INT	2	(IBM name: SMF30_Capacity_Change_Cnt) The number of processor capacity changes that occurred since the previous interval or event interval. This number will be greater than 1 WHEN the number of processor capacity changes exceeded the number specified in the MAXEVENTINTRECS parmlib option.
z_RCTPCPUA_Actual	INT	4	(IBM name: SMF30_RCTPCPUA_Actual) Physical CPU adjustment factor (this is the adjustment factor for converting CPU time to equivalent service, in basic-mode with all processors online). Based on model capacity rating.
z_RCTPCPUA_Nominal	INT	4	(IBM name: SMF30_RCTPCPUA_Nominal) Physical CPU adjustment factor (this is the adjustment factor for converting CPU time to equivalent service in basic-mode with all processors online). Based on nominal model capacity rating.
z_RCTPCPUA_scaling_factor	INT	4	(IBM name: SMF30_RCTPCPUA_scaling_factor) Scaling factor for z_RCTPCPUA_actual and z_RCTPCPUA_nominal.
z_Capacity_Adjustment_Ind	INT	1	(IBM name: SMF30_Capacity_Adjustment_Ind) Field values and meanings are: 0 => The indication is not reported. 1-99 => Some amount of reduction is indicated. 100 => The machine is operating in normal capacity. Primary CPUs and all secondary-type CPUs are similarly affected.
z_Capacity_Change_Rsn	INT	1	(IBM name: SMF30_Capacity_Change_Rsn) Indicates the reason that is associated with the present value contained in z_Capacity_Adjustment_Ind. The bit values of this field correspond to those described in RMCTZ_Capacity_Adjustment_Indication of the IRARMCTZ mapping macro. (See MVS Data Areas.)

SMF030_Performance.z_Capacity_Flags.<fieldname>

z_EVENT_DRIVEN_INTVL_REC	BIT	1	Indicates that the current interval record was generated as a result of an event, rather than as a result of standard interval expiration based on time.
z_RQSVSUS_ERR	BIT	1	Indicates that an error occurred while collecting the data for zSUS following a change in processor capacity. If this bit is found to be on when the record is being written, an additional attempt to collect the data from SRM is made. If that attempt is successful, the data is filled in at that time and the zPIN error bit will be off.
z_CAPACITY_DATA_ERR	BIT	1	Indicates that error occurred while collecting the processor capacity data, therefore fields z_RCTPCPUA_Actual, z_RCTPCPUA_Nominal, z_RCTPCPUA_scaling_factor, z_Capacity_Adjustment_Ind, z_Capacity_Change_Rsn are reliable
z_PCD_RSVD_EXISTS	BIT	1	Indicates records generated on systems running z/OS V1R7 through z/OS V1R9. When off, this bit indicates records generated on systems running z/OS V1R10 and later.

SMF030_Performance.<fieldname>

z_RMCTADJN_Nominal	INT	4	(IBM name: SMF30_RMCTADJN_Nominal) Nominal CPU rate adjustment.
--------------------	-----	---	--

Secondary segment: SMF030_Operator

Field Name	Type	Len	Description
<i>SMF030_Operator.<fieldname></i>			
zPDM	INT	4	(IBM name: SMF30PDM) Number of non-specific DASD mounts.
zPRD	INT	4	(IBM name: SMF30PRD) Number of specific DASD mounts.
zPTM	INT	4	(IBM name: SMF30PTM) Number of non-specific tape mounts.
zTPR	INT	4	(IBM name: SMF30TPR) Number of specific tape mounts.
zMTM	INT	4	(IBM name: SMF30MTM) Number of non-specific MSS mounts. As of MVS/SP4.1, this field is no longer valid, and contains zeroes.
zMSR	INT	4	(IBM name: SMF30MSR) Number of specific MSS mounts. As of MVS/SP4.1, this field is no longer valid, and contains zeroes.

Secondary segment: SMF030_APPC_MVS_Resource

Field Name	Type	Len	Description
<i>SMF030_APPC_MVS_Resource.<fieldname></i>			
zDC	INT	4	(IBM name: SMF30DC) Number of conversations, both currently active and deallocated, associated with the transaction program ID.
zDCA	INT	4	(IBM name: SMF30DCA) Number of all conversations allocated.
zDSC	INT	4	(IBM name: SMF30DSC) Number of times the transaction program issued a Send call. Note: Because an interval or step might end in the middle of a Send call, this field might contain zero while zDDS contains a nonzero value.
zDDS	FLOAT	8	(IBM name: SMF30DDS) floating point hex Amount of data, in bytes, sent by the transaction program.

zDRC	INT	4	(IBM name: SMF30DRC) Number of times the transaction program issued a Receive call. Note: Because an interval or step might end in the middle of a Receive call, this field might contain zero while zDDR contains a nonzero value.
zDDR	FLOAT	8	(IBM name: SMF30DDR) floating point hex Amount of data, in bytes, received by the transaction program.
zDAC	INT	4	(IBM name: SMF30DAC) Number of active conversations.
zDTR	INT	4	(IBM name: SMF30DTR) Number of APPC/MVS transactions programs scheduled by the APPC/MVS transaction scheduler (ASCH).

Secondary segment: SMF030_APPC_MVS_Cumulative_Resource

Field Name	Type	Len	Description
<i>SMF030_APPC_MVS_Cumulative_Resource.<fieldname></i>			
zCN	INT	4	(IBM name: SMF30CN) Total number of conversations associated with the transaction program (TP) ID, both currently active and deallocated.
zCNA	INT	4	(IBM name: SMF30CNA) Total number of all conversations allocated.
zSEN	INT	4	(IBM name: SMF30SEN) Total number of times the transaction program (TP) issued a Send call.
zDAT	FLOAT	8	(IBM name: SMF30DAT) floating point hex Total amount of data sent by the transaction program (TP) in bytes (long floating point).
zREC	INT	4	(IBM name: SMF30REC) Total number of times the transaction program (TP) issued a Receive call.
zDAR	FLOAT	8	(IBM name: SMF30DAR) floating point hex Total amount of data received by the transaction program (TP) in bytes (long floating point).
zTAC	INT	4	(IBM name: SMF30TAC) Total number of active conversations.
zATR	INT	4	(IBM name: SMF30ATR) Total number of APPC/MVS transactions programs scheduled by the APPC/MVS transaction scheduler (ASCH).

Secondary segment: SMF030_z_OS_UNIX_Process

Field Name	Type	Len	Description
<i>SMF030_z_OS_UNIX_Process.<fieldname></i>			
zOPI	INT	4	(IBM name: SMF30OPI) z/OS UNIX process ID.
zOPG	INT	4	(IBM name: SMF30OPG) z/OS UNIX process group ID.
zOUI	INT	4	(IBM name: SMF30OUI) z/OS UNIX process user ID.
zOUG	INT	4	(IBM name: SMF30OUG) z/OS UNIX process user group ID.
zOSI	INT	4	(IBM name: SMF30OSI) z/OS UNIX process session ID.
zOSC	INT	4	

			(IBM name: SMF30OSC) Number of z/OS UNIX services requested by the process. When the z/OS UNIX parmlib option SYSCALL_COUNTS is set to NO, there is no collection of data for the count of syscalls. When gathering syscall counts for a job, do not switch between SYSCALL_COUNTS=YES and SYSCALL_COUNTS=NO because doing so can lead to inaccurate values in the zOSC field.
zOST	TIME	4	(IBM name: SMF30OST) Total CPU time accumulated by z/OS UNIX services requested by the process. Note that the value in zOST is already included in fields zCPT or zCPS. When the z/OS UNIX parmlib option SYSCALL_COUNTS is set to NO, there is no collection of data for CPU usage. When gathering CPU usage for a job, do not switch between SYSCALL_COUNTS=YES and SYSCALL_COUNTS=NO because doing so can lead to inaccurate values in the zOST field.
zODR	INT	4	(IBM name: SMF30ODR) Number of z/OS UNIX directory reads for the process.
zOFR	INT	4	(IBM name: SMF30OFR) Read I/O block count for z/OS UNIX regular files.
zOFW	INT	4	(IBM name: SMF30OFW) Write I/O block count for z/OS UNIX regular files.
zOPR	INT	4	(IBM name: SMF30OPR) Read I/O block count for z/OS UNIX pipes and AF_UNIX sockets.
zOPW	INT	4	(IBM name: SMF30OPW) Write I/O block count for z/OS UNIX pipes and AF_UNIX sockets.
zOSR	INT	4	(IBM name: SMF30OSR) Reserved.
zOSW	INT	4	(IBM name: SMF30OSW) Reserved.
zOLL	INT	4	(IBM name: SMF30OLL) Number of pathname lookup calls to the logical file system.
zOLP	INT	4	(IBM name: SMF30OLP) Number of pathname lookup calls to the physical file system.
zOGL	INT	4	(IBM name: SMF30OGL) Number of pathname generation calls to the logical file system.
zOGP	INT	4	(IBM name: SMF30OGP) Number of pathname generation calls to the physical file system to determine a pathname.
zOPP	INT	4	(IBM name: SMF30OPP) Parent process ID.
zOKR	INT	4	(IBM name: SMF30OKR) Reserved.
zOKW	INT	4	(IBM name: SMF30OKW) Reserved.
zOMS	INT	4	(IBM name: SMF30OMS) Reserved.
zOMR	INT	4	(IBM name: SMF30OMR) Reserved.
zOSY	INT	4	(IBM name: SMF30OSY) Number of times the sync() function was called.

Secondary segment: SMF030_Automatic_Restart_Management

Field Name	Type	Len	Description
<i>SMF030_Automatic_Restart_Management.<fieldname></i>			
zRNM	CHAR	16	(IBM name: SMF30RNM) Element name.

zRTP	CHAR	8	(IBM name: SMF30RTP) Element type.
zRRG	CHAR	16	(IBM name: SMF30RRG) Restart group for element in zRNM.
zRSN	CHAR	8	(IBM name: SMF30RSN) The system name for the system on which the element was initially started. blank, for the initial start. Note: The current system name is in the zSYN field.
zRGT	TSTMP	8	(IBM name: SMF30RGT) The time (local) when the element issued the IXCARM macro with the REGISTER parameter.
zRWT	TSTMP	8	(IBM name: SMF30RWT) The time (local) when the element issued the IXCARM macro with the WAITPRED parameter. This field will be zero if this function was not requested.
zRYT	TSTMP	8	(IBM name: SMF30RYT) The time (local) when the element issued the IXCARM macro with the READY parameter.
zRTT	TSTMP	8	(IBM name: SMF30RTT) The time (local) when the element was deregistered. This field will be zero if this element is not yet deregistered or if it ended abnormally.

Secondary segment: SMF030_Usage_Data

Field Name	Type	Len	Description
<i>SMF030_Usage_Data.<fieldname></i>			
zUPO	CHAR	16	(IBM name: SMF30UPO) Product owner or vendor name (specified on the PRODOWNER option of the IFAUSAGE macro).
zUPN	CHAR	16	(IBM name: SMF30UPN) Product name (specified on the PRODNAME option of the IFAUSAGE macro).
zUPV	CHAR	8	(IBM name: SMF30UPV) Product version (if specified on the PRODVERS option of the IFAUSAGE macro or 'NONE').
zUPQ	CHAR	8	(IBM name: SMF30UPQ) Product qualifier (if specified on the PRODQUAL option of the IFAUSAGE macro or 'NONE').
zUPI	CHAR	8	(IBM name: SMF30UPI) Product ID (if specified on the PRODID option of the IFAUSAGE macro or 'NONE').
zUCT	TIME	4	(IBM name: SMF30UCT) Product TCB Time.
zUCS	TIME	4	(IBM name: SMF30UCS) Product SRB Time.

<i>SMF030_Usage_Data.zURD.<fieldname></i>			
zURDx	HEX	8	(IBM name: N/A) IFAUSAGE data in hex.
zURDi	INT	8	(IBM name: N/A) IFAUSAGE data as an 8 byte bin integer.
zURDb	FLOAT	8	(IBM name: N/A) IFAUSAGE data as 8 byte hex-float.
zURDs	TIME	8	(IBM name: N/A) IFAUSAGE data as STCK value.

<i>SMF030_Usage_Data.<fieldname></i>			
--	--	--	--

zJDF	INT (ENUM)	1	(IBM name: SMF30UDF) Format of zURD field. No Value => No Product specific resource data. zURDs => CPU time in long floating Point (in hundredths of a second) as displayed in zURDs field. zURDi => Binary (64-bit) as displayed in zURDi field. zURDb => Long floating point as displayed in zURDb field.
SMF030_Usage_Data.zUFG.<fieldname>			
zUnauthReg	BIT	1	Unauthorized register

Secondary segment: SMF030_Multisystem_Enclave_Remote_System_Data

Field Name	Type	Len	Description
SMF030_Multisystem_Enclave_Remote_System_Data.<fieldname>			
zMRS	CHAR	8	(IBM name: SMF30MRS) System name on which enclaves created by this address space executed.
zMRA	TIME	4	(IBM name: SMF30MRA) CPU rate adjustment factor for the system named by zMRS. This is the number of sixteenths of one microsecond of CPU time per CPU service unit.
zMRD	TIME	4	(IBM name: SMF30MRD) CPU Time accumulated by dependent enclaves that executed on the system named by zMRS.
zMRI	TIME	4	(IBM name: SMF30MRI) CPU Time accumulated by independent enclaves that executed on the system named by zMRS.

Secondary segment: SMF030_Counter_Data

Field Name	Type	Len	Description
SMF030_Counter_Data.<fieldname>			
SMF030_Counter_Data.zInstFlgs1MRS.<fieldname>			
zCounts	BIT	1	When on, there was a disruption in the collection of instruction counts or the counts could not be obtained.
zSRMValues	BIT	1	Fields z_Inst_CP_Enclave, z_Inst_Offload_Enclave, z_Inst_OffloadOnCP_Enclave, z_Inst_CP_DepEnc, z_Inst_Offload_DepEnc, z_Inst_OffloadOnCP_DepEnc contain incomplete data. (SRM could not deliver deltas or values for this interval.)
SMF030_Counter_Data.<fieldname>			
z_Inst_CP_Task	INT	8	(IBM name: SMF30_Inst_CP_Task) The number of instructions executed while running on a standard processor as a task when it is not eligible for an offload processor and it is not associated with an enclave.
z_Inst_CP_NonPreemptSRB	INT	8	(IBM name: SMF30_Inst_CP_NonPreemptSRB) The number of instructions executed while running on a standard processor as a non-preemptable SRB.
z_Inst_CP_PreemptSRB	INT	8	(IBM name: SMF30_Inst_CP_PreemptSRB) The number of instructions executed while running on a standard processor as a preemptable or client SRB when it is not associated with an enclave.
z_Inst_Offload	INT	8	(IBM name: SMF30_Inst_Offload) The number of instructions executed while running on an offload processor when not associated with an enclave.
z_Inst_OffloadOnCP	INT	8	

			(IBM name: SMF30_Inst_OffloadOnCP) The number of instructions executed while running on a standard processor as eligible for an offload processor while not associated with an enclave.
z_Inst_CP_Enclave	INT	8	(IBM name: SMF30_Inst_CP_Enclave) The number of instructions executed while running on a standard processor as not eligible for an offload processor for an independent enclave.
z_Inst_Offload_Enclave	INT	8	(IBM name: SMF30_Inst_Offload_Enclave) The number of instructions executed while running on an offload processor for an independent enclave.
z_Inst_OffloadOnCP_Enclave	INT	8	(IBM name: SMF30_Inst_OffloadOnCP_Enclave) The number of instructions executed while running on a standard processor as eligible for an offload processor for an independent enclave.
z_Inst_CP_DepEnc	INT	8	(IBM name: SMF30_Inst_CP_DepEnc) The number of instructions executed while running on a standard processor as not eligible for an offload processor for a dependent enclave.
z_Inst_Offload_DepEnc	INT	8	(IBM name: SMF30_Inst_Offload_DepEnc) The number of instructions executed while running on an offload processor for a dependent enclave.
z_Inst_OffloadOnCP_DepEnc	INT	8	(IBM name: SMF30_Inst_OffloadOnCP_DepEnc) The number of instructions executed while running on a standard processor as eligible for an offload processor for a dependent enclave.

Secondary segment: **SMF030_zEDC_Usage_Statistics**

Field Name	Type	Len	Description
<i>SMF030_zEDC_Usage_Statistics.<fieldname></i>			
z_US_ComprReq	INT	8	(IBM name: SMF30_US_ComprReq) Total number of compression and decompression requests (both supervisor-state and problem-state requests). On a z15 and above processor, the request count will only represent the number of authorized requests.
z_US_ComprReq_Prob	INT	8	(IBM name: SMF30_US_ComprReq_Prob) Total number of problem-state compression and decompression requests. No longer captured on the z15 and above processors and will remain zero.
z_US_QueueTime	FIXED	8 (20,6)	(IBM name: SMF30_US_QueueTime) Total queue time. The amount of time, in seconds, from when the request was submitted until the adapter started executing the request. No longer captured on the z15 and above processors and will remain zero.
z_US_ExecTime	FIXED	8 (20,6)	(IBM name: SMF30_US_ExecTime) Total execution time, in seconds. No longer captured on the z15 and above processors and will remain zero.
z_US_Def_UncomprIn	INT	8	(IBM name: SMF30_US_Def_UncomprIn) Total number, in bytes, of uncompressed data input.
z_US_Def_ComprOut	INT	8	(IBM name: SMF30_US_Def_ComprOut) Total number, in bytes, of compressed data output.
z_US_Inf_ComprIn	INT	8	(IBM name: SMF30_US_Inf_ComprIn) Total number, in bytes, of compressed data input.
z_US_Inf-DecomprOut	INT	8	(IBM name: SMF30_US_Inf-DecomprOut) Total number, in bytes, of decompressed data output.

Record Type 32 - TSO/E User Work Accounting

SMF Record 32 (TSO/E User Work Accounting) is mapped by structure member "T032".

Primary Segment:

- [SMF032_TSO#E_User_Work_Accounting](#)

Secondary Segment(s): 3 (in alphabetical order)

- [SMF032_Command](#)
- [SMF032_Identification](#)
- [SMF032_Product](#)

Primary segment: [SMF032_TSO#E_User_Work_Accounting](#)

Field Name	Type	Len	Description
<i>SMF032_TSO#E_User_Work_Accounting.<fieldname></i>			
<i>SMF032_TSO#E_User_Work_Accounting.Header_Self_defining_Section.<fieldname></i>			
zFLG	HEX	1	(IBM name: SMF32FLG) System indicator Bit Meaning when set 0 SUBSYSTEM name follows system identification 1 SubTypeS used 2 RESERVED 3-6 Version indicators* 7 RESERVED. *See 'Standard and Extended SMF record headers' on page 174 F0R a detailed description.
zRTY	INT	1	(IBM name: SMF32RTY) type 32 (X'20').
zTME	TSTMP	8	(IBM name: SMF32TME) Date/Time that the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF32SID) identification (from the SID parameter).
zWID	CHAR	4	(IBM name: SMF32WID) Subsystem identifier.
zSTY	INT	2	(IBM name: SMF32STP) Record SubType.
zSTYe	INT (ENUM)	2	(IBM name: N/A) SubType expansion
zPOF	INT	4	(IBM name: SMF32POF) Offset to product section from start of record, including the record descriptor word (RDW).
zPLN	INT	2	(IBM name: SMF32PLN) Length of product section.
zPON	INT	2	(IBM name: SMF32PON) Number of product sections.
zIOF	INT	4	(IBM name: SMF32IOF) Offset to the identification section from start of record, including the record descriptor word (RDW).
zILN	INT	2	(IBM name: SMF32ILN) Length of the identification section.
zION	INT	2	(IBM name: SMF32ION) Number of identification sections.
zCOF	INT	4	(IBM name: SMF32COF) Offset to the TSO/E command section from start of record, including the record descriptor word (RDW).
zCLN	INT	2	(IBM name: SMF32CLN) Length of the TSO/E command section.
zCON	INT	2	(IBM name: SMF32CON) Number of TSO/E command sections.

Secondary segment: SMF032_Product

Field Name	Type	Len	Description
<i>SMF032_Product.<fieldname></i>			
zTYP	INT (ENUM)	2	(IBM name: SMF32TYP) SubType identification for the record
zRVN	CHAR	2	(IBM name: SMF32RVN) Record version number.
zPNM	CHAR	8	(IBM name: SMF32PNM) Product name.
zOSL	CHAR	8	(IBM name: SMF32OSL) MVS product name.
zSYN	CHAR	8	(IBM name: SMF32SYN) System name (from the SYSNAME parameter in the IEASYSxx parmlib member).
zSYP	CHAR	8	(IBM name: SMF32SYP) Sysplex name (from the SYSPLEX parameter in the COUPLExx parmlib member).

Secondary segment: SMF032_Identification

Field Name	Type	Len	Description
<i>SMF032_Identification.<fieldname></i>			
zUSERID	CHAR	8	(IBM name: SMF32JBN) TSO user id session name.
zPGM	CHAR	8	(IBM name: SMF32PGM) Program Name.
zSTM	CHAR	8	(IBM name: SMF32STM) Step name.
zUIF	CHAR	8	(IBM name: SMF32UIF) User-defined identification field (taken from common exit parameter area, not from USER=parameter on job statement).
zJNM	CHAR	8	(IBM name: SMF32JNM) JES job number.
zSTN	INT	2	(IBM name: SMF32STN) Step number.
zPGN	INT	2	(IBM name: SMF32PGN) Reserved.
zJPT	INT	2	(IBM name: SMF32JPT) JES input priority at initiation.
zAST	TIME	4	(IBM name: SMF32AST) Device allocation start time from midnight, in hundredths of seconds.
zPPS	TIME	4	(IBM name: SMF32PPS) Problem program start time from midnight, in hundredths of a second.
zSIT	TSTMP	8	(IBM name: SMF32SIT) Step initiation Date/Time
zRST	TSTMP	8	(IBM name: SMF32RST) Reader start time from midnight, in hundredths of second.
zRET	TSTMP	8	(IBM name: SMF32RET) Date/Time that the reader recognized the end of the job or started task. For TSO/E, this is the logon enqueue time.
zUSR	CHAR	20	(IBM name: SMF32USR) Programmer name.

zGRP	CHAR	8	(IBM name: SMF32GRP) RACF group ID.
zRUD	CHAR	8	(IBM name: SMF32RUD) RACF user ID.
zTID	CHAR	8	(IBM name: SMF32TID) RACF terminal ID. This field is zero if RACF is not active or if user is not a terminal user.

Secondary segment: SMF032_Command

Field Name	Type	Len	Description
<i>SMF032_Command.<fieldname></i>			
zCMD	CHAR	8	(IBM name: SMF32CMD) TSO/E command name. See 'DETAIL or NODETAIL - Performing TSO/E command accounting' on page 75 FOR additional information.
zCNT	INT	4	(IBM name: SMF32CNT) Number of times the TSO/E command was entered.
zTCB	TIME	4	(IBM name: SMF32TCB) Total task control block (TCB) time, in hundredths of a second, for the command.
zSRB	TIME	4	(IBM name: SMF32SRB) Total service request block (SRB) time, in hundredths of a second, for the command.
zTGT	INT	4	(IBM name: SMF32TGT) Total TGET (terminal read) count for the command.
zTPT	INT	4	(IBM name: SMF32TPT) Total TPUT (terminal output) count for the command.
zTRN	INT	4	(IBM name: SMF32TRN) Total transaction count for the command. Note: See the z/OS MVS Initialization and Tuning Guide for a definition of this field.
zEXP	INT	4	(IBM name: SMF32EXP) Total execute channel program (EXCP) count for the command. (Valid up to X'FFFFFFFE', zero and invalid when SMF32EXF is set)
zTCT	INT	4	(IBM name: SMF32TCT) Total device connect time (in 128 MICRO-SECOND units) for this command.
zFLG	HEX	4	(IBM name: SMF32FLG) Detail section flags Bit Meaning when set 0 COUNT in SMF32TRN is not valid. 1 COUNT in SMF32EXP is not valid.
zEXX	INT	8	(IBM name: SMF32EXX) EXCPs for command. This is the 8-byte equivalent of SMF32EXP. This field remains valid after SMF32EXP is invalid.

Record Type 33 - APPC/MVS TP Accounting

SMF Record 33 (APPC/MVS TP Accounting) is mapped by structure member "T033".

Primary Segment:

- [SMF033_APPC#MVS_TP_Accounting](#)

Secondary Segment(s): 13 (in alphabetical order)

- [SMF033_Address_Space_ID](#)
- [SMF033_Product](#)
- [SMF033_01_TP_Accounting](#)
- [SMF033_01_TP_Detail](#)
- [SMF033_01_TP_Ident](#)

- [SMF033_01_TP_Usage](#)
- [SMF033_02_Conversation](#)
- [SMF033_02_Local_TP_Prog](#)
- [SMF033_02_LUWID](#)
- [SMF033_02_Partner_TP_Prog](#)
- [SMF033_02_User_Data](#)

Primary segment: [SMF033_APPC#MVS_TP_Accounting](#)

Field Name	Type	Len	Description
<i>SMF033_APPC#MVS_TP_Accounting.<fieldname></i>			
<i>SMF033_APPC#MVS_TP_Accounting.Header_Self_defining_Section.<fieldname></i>			
zFLG	HEX	1	(IBM name: SMF33FLG) System indicator: Bit Meaning when set 0 SUBSYSTEM name follows standard header 1 SubTypeS used 2 RESERVED 3-6 Version indicators* 7 RESERVED. *See 'Standard and Extended SMF record headers' on page 174 F0R a detailed description.
zRTY	INT	1	(IBM name: SMF33RTY) Record type 33 (X'21')
zTME	TSTMP	8	(IBM name: SMF33TME) Date/Time when the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF33SID) System identification (from the SID parameter).
zWID	CHAR	4	(IBM name: SMF33WID) Subsystem identifier (ASCH for APPC/MVS-scheduled TPs).
zSTP	INT	2	(IBM name: SMF33STP) Record SubType v 1 - APPC/MVS transaction record. v 2 - APPC/MVS conversation record. Self-Defining Section:
zSDL	INT	4	(IBM name: SMF33SDL) Length of Self-defining Section.
zPOF	INT	4	(IBM name: SMF33POF) Offset to Product section.
zPLN	INT	2	(IBM name: SMF33PLN) Length of Product section.
zPON	INT	2	(IBM name: SMF33PON) Number of Product Sections in this record.
zIOF	INT	4	(IBM name: SMF33IOF) Offset to TP Identification Section.
zILN	INT	2	(IBM name: SMF33ILN) Length of TP Identification Section.
zION	INT	2	(IBM name: SMF33ION) Number of TP Identification Sections in this record.
zUOF	INT	4	(IBM name: SMF33UOF) Offset to TP Usage Section.

zULN	INT	2	(IBM name: SMF33ULN) Length of TP Usage Section.
zUON	INT	2	(IBM name: SMF33UON) Number of TP Usage Sections in this record.
zSOF	INT	4	(IBM name: SMF33SOF) Offset to Address Space ID Section.
zSLN	INT	2	(IBM name: SMF33SLN) Length of Address Space ID Section.
zSON	INT	2	(IBM name: SMF33SON) Number of Address Space ID Sections in this record.
zCOF	INT	4	(IBM name: SMF33COF) Offset to Conversation ID Section.
zCLN	INT	2	(IBM name: SMF33CLN) Length of Conversation ID Section.
zCON	INT	2	(IBM name: SMF33CON) Number of Conversation ID Sections in this record.
zFOF	INT	4	(IBM name: SMF33FOF) Offset to User Data Field Section.
zFLN	INT	2	(IBM name: SMF33FLN) Length of User Data Field Section.
zFON	INT	2	(IBM name: SMF33FON) Number of User Data Field Section.

Secondary segment: SMF033_Product

Field Name	Type	Len	Description
<i>SMF033_Product.<fieldname></i>			
zTYP	INT	2	(IBM name: SMF33TYP) Record SubType v 1 - APPC/MVS transaction record. v 2 - APPC/MVS conversation record.
zRVN	CHAR	2	(IBM name: SMF33RVN) Record version number - 01.
zPNM	CHAR	8	(IBM name: SMF33PNM) Product name - ASCH for APPC/MVS-scheduled TPs. APPC for APPC/MVS Conversion Records. If you use your own scheduler, you will not have access to IBM's APPC/MVS accounting support.
zOSL	CHAR	8	(IBM name: SMF33OSL) MVS operating system name.
zSYN	CHAR	8	(IBM name: SMF33SYN) System name (from the SYSNAME parameter in the IEASYSxx parmlib member).
zSYP	CHAR	8	(IBM name: SMF33SYP) Sysplex name (from the SYSPLEX parameter in the COUPLExx parmlib member).

Secondary segment: SMF033_Address_Space_ID

Field Name	Type	Len	Description
<i>SMF033_Address_Space_ID.<fieldname></i>			
zJID	CHAR	8	(IBM name: SMF33JID) Job or session name.
zRST	TSTMP	8	

			(IBM name: SMF33RST) Date/Time reader recognized this job.
zSTN	CHAR	8	(IBM name: SMF33STN) Step name (taken from the name on the EXEC card).

Secondary segment: SMF033_01_TP_Ident

Field Name	Type	Len	Description
<i>SMF033_01_TP_Ident.<fieldname></i>			
zTPO	INT	4	(IBM name: SMF33TPO) Offset to TP name section.
zTPC	CHAR	8	(IBM name: SMF33TPC) TP Class - a general grouping of TPs with related scheduling properties (like the MVS Job Class - CPU Time limit, shift execution requirements, etc).
zTSC	INT	4	(IBM name: SMF33TSC) APPC/MVS TP schedule type Value Schedule Type 0 STANDARD 1 MULTI-TRANS.
zTPF	CHAR	8	(IBM name: SMF33TPF) TP profile name.

Secondary segment: SMF033_01_TP_Name

Field Name	Type	Len	Description
<i>SMF033_01_TP_Name.<fieldname></i>			
zTPL	INT	2	(IBM name: SMF33TPN) TP name length.
zTPN	XVCHAR	0 255	(IBM name: SMF33TPN) TP name.

Secondary segment: SMF033_01_TP_Usage

Field Name	Type	Len	Description
<i>SMF033_01_TP_Usage.<fieldname></i>			
zUID	CHAR	8	(IBM name: SMF33UID) RACF user ID (of the requesting user).
zGRP	CHAR	8	(IBM name: SMF33GRP) RACF group ID (of the requesting user).
zUST	INT (ENUM)	4	(IBM name: SMF33UST) Type of user
zAOF	INT	4	(IBM name: SMF33AOF) Offset to Accounting Section.
zALN	INT	2	(IBM name: SMF33ALN) Length of Accounting Section.
zAON	INT	2	(IBM name: SMF33AON) Number of Accounting Sections in this record.
zUCT	INT	4	(IBM name: SMF33UCT) Count of uses of this TP (by this user).
zTDO	INT	4	

			(IBM name: SMF33TDO) Offset to TP Usage Detail Section.
zTDL	INT	2	(IBM name: SMF33TDL) Length of TP Usage Detail Section.
zTDN	INT	2	(IBM name: SMF33TDN) Number of TP Usage Detail Sections.

Secondary segment: SMF033_01_TP_Accounting

Field Name	Type	Len	Description
<i>SMF033_01_TP_Accounting.<fieldname></i>			
zACL	INT	1	(IBM name: SMF33ACL) First accounting sub-field length (this field is set to zero for no accounting data).
zACT	XVCHAR	0 175	(IBM name: SMF33ACT) Accounting sub-fields.

Secondary segment: SMF033_01_TP_Detail

Field Name	Type	Len	Description
<i>SMF033_01_TP_Detail.<fieldname></i>			
zTSO	INT	4	(IBM name: SMF33TSO) Offset to TP Usage Scheduler Section.
zTSL	INT	2	(IBM name: SMF33TSL) Length of TP Usage Scheduler Section.
zTSN	INT	2	(IBM name: SMF33TSN) Number of TP Usage Scheduler Sections.
zCN	INT	4	(IBM name: SMF33CN) Total number of conversations for this request.
zCNA	INT	4	(IBM name: SMF33CNA) Total number of conversations allocated by this request.
zSEN	INT	4	(IBM name: SMF33SEN) Total number of sends issued by this request.
zDAS	FLOAT	8	(IBM name: SMF33DAS) Total number of bytes sent by this request. floating point hex
zREC	INT	4	(IBM name: SMF33REC) Total number of receives issued by this request.
zDAR	FLOAT	8	(IBM name: SMF33DAR) floating point hex Total number of bytes received by this request.
zTCB	TIME	4	(IBM name: SMF33TCB) Task control block (TCB) time for this request, in hundredths of a second.
zSRB	TIME	4	(IBM name: SMF33SRB) Service request block (SRB) time for this request, in hundredths of a second.
zEXP	INT	4	(IBM name: SMF33EXP) Execute channel programs (EXCP) for this request. Valid up to X'FFFFFFFE', zero and invalid when SMF33EXF is set.
zDCT	INT	4	(IBM name: SMF33DCT) Total accumulated device connect time for the address during the life of the transaction. The field reported (in 128 MICR0-SEC0ND units) of I/O activity in the address space by some chargeback schemes. See SMF30TCN in the 'I/O Activity' section of SMF type 30 RECORD.

SMF033_01_TP_Detail.zDSF.<fieldname>			
zExplnval	BIT	1	Count in zExp is not valid.
SMF033_01_TP_Detail.<fieldname>			
zEXF	INT	8	(IBM name: SMF33EXF) EXCPs for this request. This is the 8-byte equivalent of SMF33EXP. This field remains valid after SMF33EXP is invalid.

Secondary segment: SMF033_01_TP_Scheduler

Field Name	Type	Len	Description
SMF033_01_TP_Scheduler.<fieldname>			
zLLU	CHAR	17	(IBM name: SMF33LLU) Local logical unit (LU) name for the TP.
zPLU	CHAR	17	(IBM name: SMF33PLU) Partner logical unit (LU) name for this user's use of this TP (format = node.LUname).
zRV2	CHAR	2	(IBM name: SMF33RV2) Reserved.
zFMT	TSTMP	8	(IBM name: SMF33FMT) Date/Time request recognized by functional manager header (FMH) 5.
zTQT	TSTMP	8	(IBM name: SMF33TQT) Date/Time that the request was placed on scheduler work queue.
zTST	TSTMP	8	(IBM name: SMF33TST) Date/Time that the request started execution.
zTET	TSTMP	8	(IBM name: SMF33TET) Date/Time that the request ended execution.

Secondary segment: SMF033_02_Conversation

Field Name	Type	Len	Description
SMF033_02_Conversation.<fieldname>			
zCID	INT	8	(IBM name: SMF33CID) The conversation ID. This ID uniquely identifies a particular conversation.
zCCO	INT	8	(IBM name: SMF33CCO) The conversation correlator. This field contains zeroes when there is no conversation correlator.
zCLO	INT	4	(IBM name: SMF33CLO) Offset to the logical unit of work ID (LUWID) section.
zCIO	INT (ENUM)	1	(IBM name: SMF33CIO) Conversation inbound / outbound indicator.
zCLR	INT (ENUM)	1	(IBM name: SMF33CLR) Conversation partner LU location
zCKD	INT (ENUM)	1	(IBM name: SMF33CKD) Conversation kind. For inbound conversations, this field indicates whether this conversation was processed by an APPC/MVS transaction scheduler or an APPC/MVS server.
zCSL	INT (ENUM)	1	(IBM name: SMF33CSL) Sync level of the conversation
zCLL	CHAR	17	(IBM name: SMF33CLL) Conversation local LU name (not fully qualified).

zCPL	CHAR	17	(IBM name: SMF33CPL) Conversation partner LU name (fully qualified).
zRS2	CHAR	2	(IBM name: SMF33RS2) Reserved.
zCSH	CHAR	8	(IBM name: SMF33CSH) Conversation scheduler name (for example, 'ASCH'). When there is no scheduler for this conversation (because an APPC/MVS server is processing the conversation), this field contains blanks.
zCPO	INT	4	(IBM name: SMF33CPO) Offset (from beginning of record) to Partner TP Name Section.
zCTO	INT	4	(IBM name: SMF33CTO) Offset (from beginning of record) to Local TP Name Section.
zRS1	CHAR	10	(IBM name: SMF33RS1) Reserved.
zCPU	CHAR	10	(IBM name: SMF33CPU) Partner user ID.
zCRT	TSTMP	8	(IBM name: SMF33CRT) Date/Time (in STCK format) allocate request was received for the conversation. The field is zero for outbound requests.
zCQT	TSTMP	8	(IBM name: SMF33CQT) Date/Time (in STCK format) conversation was put on allocate queue. The field is zero for outbound requests and for scheduled inbound requests. 112 6C SMF33CST 8 BINARY Inbound Requests: Date/Time (in STCK format) when the conversation was associated with a new address space for processing. If an APPC/MVS server processed this conversation, this field shows the time when the server received the conversation through the Receive_Allocate service. Outbound Requests: Date/Time (in STCK format) when the local program called the Allocate service.
zCET	TSTMP	8	(IBM name: SMF33CET) Date/time (in STCK format) when the conversation was deallocated.
zCMN	CHAR	8	(IBM name: SMF33CMN) Mode name of the conversation.
zCSN	INT	4	(IBM name: SMF33CSN) Number of Send calls issued during the conversation.
zCDS	FLOAT	8	(IBM name: SMF33CDR) Amount of data (in bytes) sent during the conversation.
zCRE	INT	4	(IBM name: SMF33CRE) Number of Receive calls issued during the conversation.
zCDR	FLOAT	8	(IBM name: SMF33CDR) Amount of data (in bytes) received during the conversation.
zCVB	INT	4	(IBM name: SMF33CVB) Number of callable service requests issued during the conversation.
zCRC	INT	4	(IBM name: SMF33CRC) Return code from the last callable service on this conversation (Possible return codes are documented in the APPC/MVS publications.)
zCRS	INT	4	(IBM name: SMF33CRS) Last reason code from a callable service in this conversation (Possible reason codes are documented in the APPC/MVS publications.)
zCSA	INT (ENUM)	4	(IBM name: SMF33CSA) Conversation state
zCSS	TSTMP	8	(IBM name: SMF33CSS) Date/Time (in STCK format) when the last APPC/MVS callable service was requested during the conversation.
zCSE	TSTMP	8	(IBM name: SMF33CSE) Date/Time (in STCK format) when the last APPC/MVS callable service completed during the conversation.

Secondary segment: SMF033_02_LUWID

Field Name	Type	Len	Description
<i>SMF033_02_LUWID.<fieldname></i>			
zLUL	INT	2	(IBM name: SMF33LUL) Length of logical unit of work ID (SMF33LUW).
zLUW	XVCHAR	0 26	(IBM name: SMF33LUW) Logical unit of work ID (LUW_ID).

Secondary segment: SMF033_02_Partner_TP_Prog

Field Name	Type	Len	Description
<i>SMF033_02_Partner_TP_Prog.<fieldname></i>			
zTPL	INT	2	(IBM name: SMF33TPL) Length of the partner TP name field (SMF33TPN).
zTPN	XVCHAR	0 64	(IBM name: SMF33TPN) Partner transaction program name. If this conversation is inbound, this field contains the name of the program that initiated the conversation (through the Allocate service). If this conversation is outbound, this field contains the name of the program that was attached on this LU as a result of an Allocate call.

Secondary segment: SMF033_02_Local_TP_Prog

Field Name	Type	Len	Description
<i>SMF033_02_Local_TP_Prog.<fieldname></i>			
zTPL	INT	2	(IBM name: SMF33TPL) Length of the local TP name field (SMF33TPN).
zTPN	XVCHAR	0 64	(IBM name: SMF33TPN) Local transaction program name. If this conversation is inbound, this field contains the name of the program that was attached on this LU in response to an Allocate call. If this conversation is outbound, this field contains the name of the program that initiated the conversation (that is, issued the Allocate call).

Secondary segment: SMF033_02_User_Data

Field Name	Type	Len	Description
<i>SMF033_02_User_Data.<fieldname></i>			
zUDL	INT	2	(IBM name: SMF33UDL) Length of data in user data field (SMF33UDF).
zUDF	XVCHAR	0 255	(IBM name: SMF33UDF) User data field. This is user-defined data that one of the (max) partner programs wrote to this record, through the Set_Conversation_Accounting_Information service.

Record Type 34 - TS-Step Termination

SMF Record 34 (TS-Step Termination) is mapped by structure member "T034".

Primary Segment:

- [SMF034_TS_Step_Term](#)

Secondary Segment(s): 3 (in alphabetical order)

- [SMF034_Accounting](#)
- [SMF034_EXCP](#)
- [SMF034_Relocate](#)

Primary segment: [SMF034_TS_Step_Term](#)

Field Name	Type	Len	Description
<i>SMF034_TS_Step_Term.<fieldname></i>			
zFLG	HEX	1	(IBM name: TIVRFLG) System indicator: Bit Meaning when set 0-2 Reserved 3-6 Version indicators* 7 RESERVED. *See 'Standard and Extended SMF record headers' on page 174 FOR a detailed description.
zRTY	INT	1	(IBM name: TIVRCDTY) Record type 34 (X'22').
zTME	TSTMP	8	(IBM name: TIVRCDS) Date/Time that the record is passed to the SMF writer. This is the time the step ended.
zCPUID	CHAR	4	(IBM name: TIVCPUID) System identification (from the SID parameter).
zUIF	CHAR	8	(IBM name: TIVUIF) Job name.
zONTME	TSTMP	8	(IBM name: TIVONTME) Logon Date/Time.
zUDATA	CHAR	8	(IBM name: TIVUDATA) User-defined identification field (taken from common exit parameter area, not from USER=parameter on job statement).
zINVSQ	INT	1	(IBM name: TIVINVSQ) Step number (this field always equals 1).
zSIT	TIME	4	(IBM name: TIVSIT) Time since midnight, in hundredths of a second, that the initiator selected this step.
zOUTCT	INT	4	(IBM name: TIVOUTCT) Number of lines of terminal output, that is, number of TPUTs issued.
zINCT	INT	4	(IBM name: TIVINCT) Number of lines of terminal input, that is, number of TGETs satisfied.
zSTAT	HEX	2	(IBM name: TIVSTAT) Step completion code: X'0ccc' indicates system ABEND where ccc is the system ABEND code. (See z/OS MVS System Codes.) X'8ccc' indicates user ABEND where ccc is the user ABEND code. X'nnn' indicates normal completion where nnn is the contents of the two low-order bytes in register 15 AT end. X'000' indicates either: (1) the job step was flushed (not processed) because of an error during allocation, or (2) normal job completion with a return code of 0. Use this field in conjunction with the step-termination indicator field (offset 87).
zPRI	INT	1	(IBM name: TIVPRI) Address space dispatching priority (taken from DPTRTY=parameter on the EXEC card or the default APG value).
zPRGNM	CHAR	8	(IBM name: TIVPRGNM) Program name (taken from PGM=parameter on EXEC card). If a backward reference was used, then this field contains *.DD.
zINVNM	CHAR	8	(IBM name: TIVINVNM) Step name (taken from name on EXEC card).

zRSV5	CHAR	2	(IBM name: TIVRSV5) Note that TIVEFRGN, formerly a two-byte field at this offset, has been increased to four bytes and moved to offset 82.
zSYST	INT	2	(IBM name: TIVSYST) Largest amount of storage used from top of private area, in 1K units. This storage area includes the local system queue area (LSQA) and SWA (subpools 229, 230, 236, 237, 249, and 253-255). If ADDRSPC=REAL is specified, this field equals the amount of storage used that was not from this contiguous real storage reserved for the program. See offsets 82 AND 102.
zMCRE	INT	2	(IBM name: TIVMCRE) Largest amount of storage used from bottom of private area, in 1K units. This storage area includes sub-pool 0-127, 129-132, 244, 251 AND 252. If ADDRSPC=REAL is specified, this field equals the amount of contiguous real storage that was used. See offsets 82 AND 102. If storage was not allocated (job step was flushed), these fields equal zero.
zRVC	CHAR	2	(IBM name: TIVRVC) Reserved.
zEFRGN	INT	4	(IBM name: TIVEFRGN) Region size established, in 1K units taken from the REGION=parameter in the JCL, and rounded up to a four K boundary. If ADDRSPC=REAL is specified, this field equals the amount of contiguous real storage reserved for the program. If the region requested was greater than 16 MEGABYTES, the region established resides above 16 MEGABYTES, and this field will contain a minimum value of 32 MEGABYTES.
zSPK	INT	1	(IBM name: TIVSPK) Storage protect key, in the form xxxx0000 where xxxx is the key.

SMF034_TS_Step_Term.zSTI.<fieldname>

zIEFUJV	BIT	1	Canceled by exit IEFUJV.
zIEFUJI	BIT	1	Canceled by exit IEFUJI. Job steps canceled by IEFUJI and IEFUSI will not be processed. therefore bit 7 will be on
zIEFUSI	BIT	1	Canceled by exit IEFUSI Job steps canceled by IEFUJI and IEFUSI will not be processed. therefore bit 7 will be on
zRestart	BIT	1	Step is to be restarted.
zAbEnd	BIT	1	If zero, then normal completion. If 1, then and abnormal end of task (abend) will occur. If step completion code (offset 55) equals 0322 or 0522, IEFUTL caused the abend. If step completion code equals 0722, IEFUSO caused the abend.
zFlushed	BIT	1	If zero, then normal completion. If 1, step was flushed.

SMF034_TS_Step_Term.<fieldname>

zRV1	CHAR	2	(IBM name: TIVRV1) Reserved.
zAST	TIME	4	(IBM name: TIVAST) Device allocation start time, in hundredths of a second.
zPPST	TIME	4	(IBM name: TIVPPST) Problem program start time, in hundredths of a second.
zRV2	CHAR	1	(IBM name: TIVRV2) Reserved.
zSRBT	INT	3	(IBM name: TIVSRBT) Step CPU time under SRBs, in hundredths of a second. This field includes the CPU time for various supervisory routines that are dispatched from SRBs: locking routines, page resolution, swap control, cross-memory communications (WAIT, POST, I/O POST), and TQE scheduling. CPU time is not expected to be constant between different runs of the same job step. (See Chapter 11, 'CPU time,' on page 139.)

SMF034_TS_Step_Term.zRIN.<fieldname>

zFIELD	BIT	1	Field TIVCPUTM is not valid. An overflow condition is when the length of the value for the step CPU time under TCBs is greater than 3 bytes. This condition is not recorded in the type 34 record (TIVCPUTM). The time is
--------	-----	---	---

			available in the type 30 record (SMF30CPT). If your installation uses an accounting program that does not use the type 30 record to gather step CPU time, you must update that program. Only the type 30 record should be considered valid.
zDEVICE	BIT	1	Device data not recorded. When there are more than 1635 DD statements, device data is not collected for the type 34 record. The data is available in the type 30 Record.
zEXCP	BIT	1	EXCP count may be wrong. For more information on EXCP count
zIF	BIT	1	If zero, storage is virtual (if 1, storage is real).

SMF034_TS_Step_Term.<fieldname>			
zRLCT	INT	2	(IBM name: TIVRLCT) Offset from the beginning of the record header to relocate section.
zVAR	INT	2	(IBM name: TIVVAR) Length of execute channel program (EXCP) count fields.

Secondary segment: SMF034_EXCP

Field Name	Type	Len	Description
<i>SMF034_EXCP.<fieldname></i>			
zDEVC	INT	1	(IBM name: TIVDEVC) Device class.
zUTYP	INT	1	(IBM name: TIVUTYP) Unit type.
zCUAD	HEX	2	(IBM name: TIVCUAD) Device number.
zNEXCP	INT	4	(IBM name: TIVNEXCP) Execute channel program (EXCP) count. See offset 102 - TIVRIN.

Secondary segment: SMF034_Accounting

Field Name	Type	Len	Description
<i>SMF034_Accounting.<fieldname></i>			
zVARA	INT	1	(IBM name: TIVVARA) Length of accounting section (excluding this field).
zCPUTM	INT	3	(IBM name: TIVCPUTM) CPU time under task control blocks (TCB), in hundredths of a second. This field includes the CPU time for all tasks that are dispatched from TCBs below the level of RCT. CPU time is not expected to be constant between different runs of the same job step. (See Chapter 11, 'CPU time,' on page 139.)
zNBRAC	INT	1	(IBM name: TIVNBRAC) Number of accounting fields.
zACFLD	VCHAR	1 257	(IBM name: TIVACFLD) Accounting fields. Each entry for an accounting field contains the length of the field (one byte, binary) followed by the field (EBCDIC). A zero indicates an omitted field.

Secondary segment: **SMF034_Relocate**

Field Name	Type	Len	Description
<i>SMF034_Relocate.<fieldname></i>			
zPGIN	INT	4	(IBM name: TIVPGIN) Number of non-VIO (virtual input/output) page-ins for this step. This field includes page-ins required through page faults, specific page requests, and page fixes. It does not include page reclaims, page-ins for VIO data sets, and page-ins for the common area.
zPGOUT	INT	4	(IBM name: TIVPGOUT) Number of non-VIO (virtual input/output) page-outs for this step. This field includes page-outs required through specific page requests including those pages 'stolen' by the paging supervisor through infrequent use. It does not include page-outs for VIO data sets, and page-outs for the common area.
zRGNS	INT	4	(IBM name: TIVRGNS) Number of address space swap sequences. A swap sequence consists of a swap-out and swap-in of an address space.
zSIN	INT	4	(IBM name: TIVSIN) Number of pages swapped in. This field includes: local system queue area (LSQA), fixed pages, and those pages that the real storage manager determined to be active when the address space was swapped out. It does not include page reclaims nor pages found in storage during the swap-in process (such as pages brought in from SRBs started after completion of swap-in Stage 1 PROCESSING).
zSOUT	INT	4	(IBM name: TIVSOUT) Number of pages swapped out. This field includes: local system queue area (LSQA), private area fixed pages, and private area non-fixed changed pages.
zVPI	INT	4	(IBM name: TIVVPI) Number of virtual input/output (VIO) page-ins for this step. This field includes page-ins resulting from page faults or specific page requests on a VIO window. It does not include VIO swap-ins or page-ins for the common area.
zVPO	INT	4	(IBM name: TIVVPO) Number of virtual input/output (VIO) page-outs for this step. This field includes page-outs resulting from specific page requests on a VIO window, and includes those pages 'stolen' by the paging supervisor through infrequent use. It does not include VIO swap-outs or page-outs for the common area.
zSST	INT	4	(IBM name: TIVSST) Step service, in service units. This field is calculated as total job service minus the accumulated job service before this step's initialization.
zACT	INT	4	(IBM name: TIVACT) Step transaction active time, in 1024-microsecond units. Calculated as total job transaction active time minus the accumulated transaction active time before this step's initialization.)
zPGNO	INT	2	(IBM name: TIVPGNO) Beginning with z/OS V1R3, this field is always zero.
zTRANT	INT	4	(IBM name: TIVTRANT) Step transaction residency time, in 1024-microsecond units. That is the amount of time the transaction was in real storage.
zCPM	INT	4	(IBM name: TIVCPM) Number of attempts to read data from an ESO hiperspace that were not satisfied because the data has been deleted.
zRCLAM	INT	4	(IBM name: TIVRCLAM) Number of virtual input/output (VIO) reclaims for this step.
zCPGIN	INT	4	(IBM name: TIVCPGIN) Number of common area page-ins for this step (link pack area (LPA) + CSA).
zHSPI	INT	4	(IBM name: TIVHSPI) Number of hiperspace page-ins from auxiliary to processor storage.
zPGSTL	INT	4	(IBM name: TIVPGSTL) Number of pages 'stolen' from the storage for this step.
zPGSEC	INT	8	

			(IBM name: TIVPGSEC) Number of page seconds for this step, in page millisecond units. Calculated as: the number of pages used by this step times the processing time it held that number of pages.
zLPAI	INT	4	(IBM name: TIVLPAI) Number of link pack area (LPA) page-ins for the step.
zHSPO	INT	4	(IBM name: TIVHSPO) Number of hiperspace page-outs from processor to auxiliary storage.
zCPUS	INT	4	(IBM name: TIVCPUS) Step CPU service, in service units.
zIOCS	INT	4	(IBM name: TIVIOCS) Step I/O service, in service units.
zMSOS	INT	4	(IBM name: TIVMSOS) Step main storage service, in service units.
zSRBS	INT	4	(IBM name: TIVSRBS) Step SRB service, in service units.
zTSN	CHAR	8	(IBM name: TIVTSN) Terminal symbolic name.

Record Type 35 - LOGOFF

SMF Record 35 (LOGOFF) is mapped by structure member "T035".

Primary Segment:

- **SMF035_LOGOFF**

Secondary Segment(s): 0

Primary segment: **SMF035_LOGOFF**

Field Name	Type	Len	Description
<i>SMF035_LOGOFF.<fieldname></i>			
SMF035_LOGOFF.Header_Self_defining_Section.<fieldname>			
zFLG	HEX	1	(IBM name: TLGRFLG) System indicator: Bit Meaning when set 0-2 Reserved 3-6 Version indicators 7 Reserved.
zRTY	INT	1	(IBM name: TLGRCDTY) Record type 35 (X'23').
zTME	TSTMP	8	(IBM name: TLGRCDTS) Date/Time that the record was moved to the SMF buffer.
zSID	CHAR	4	(IBM name: N/A) System identification (from the SID parameter).
zJOBNAME	CHAR	8	(IBM name: TLGUIF) Job name.
zONTME	TSTMP	8	(IBM name: TLGONTME) Logon time.
zUSERID	CHAR	8	(IBM name: TLGUIF) User-defined identification field (taken from common exit parameter area, not from USER=parameter on job statement).
zSTPCT	INT	1	(IBM name: TLGSTPCT) Number of steps in session. (This field always equals 1.)
zCRTME	CHAR	4	(IBM name: TLGCRTME) Reserved.
zOUTCT	INT	4	(IBM name: TLGOUTCT) Number of lines of terminal output, that is, number of TPUTs issued.
zINCT	INT	4	(IBM name: TLGINCT) Number of lines of terminal input, that is, number of TGETs satisfied.
zSTAT	INT	2	(IBM name: TLGSTAT) Job completion code: X'0ccc' indicates system ABEND where ccc is the system (See z/OS MVS System Codes.) X'8ccc' indicates user ABEND where ccc is the user ABEND code. X'nnnn' indicates normal completion where nnnn is the contents of the two low-order bytes in register 15 AT termination. X'0000' indicates normal job completion with return code of 0. Use this field in conjunction with the job termination indicator field (offset 66).
zPRI	INT	1	(IBM name: TLGPRI) Logon priority. This field normally equals the user-assigned priority of 0-13, but if the job fails while being scheduled, this field equals 14 (TAKEN from the PRTY parameter on the JOB card). If no value is specified for the PRTY parameter on the JOB card, this field contains: v For JES3, the default priority specified on the JES3 STANDARDS initialization card v For JES2, a zero JES2 does not use the priority value reported in this field. (The JES2 job selection priority is requested by the JES2 /*PRIORITY control statement.)
zNQTME	TSTMP	8	(IBM name: TLGNQTME) Logon enqueue time.

zTRMI	INT	1	(IBM name: TLGTRMI) Job termination indicator Bit Meaning when set 0 RESERVED 1 CANCELED at exit IEFUJV 2 CANCELED at exit IEFUJI 3 CANCELED at exit IEFUSI 4-5 Reserved 6 IF 0, normal completion. If 1, abnormal termination 7 RESERVED
zOUTCL	CHAR	1	(IBM name: TLGOUTCL) Reserved.
zTRANT	TIME	4	(IBM name: TLGTRANT) Job transaction residency time, in 1024-microsecond units. That is the total amount of time all transactions were in central storage.
zRVC	CHAR	4	(IBM name: TLGRVC) Reserved.
zSPK	INT	1	(IBM name: TLGSPK) Storage protect key, in the form xxxx0000 where xxxx is the key.
zSRBT	INT	3	(IBM name: TLGSRBT) Job CPU time under SRBs, in hundredths of a second. This field includes the CPU time for various supervisory routines that are dispatched from SRB: locking routines, page resolution, swap control, cross-memory communications (WAIT, POST, I/O POST), and TQE scheduling. CPU time may not be constant between different runs of the same job.
zTJS	INT	4	(IBM name: TLGTJS) Job service, in service units.
zTTAT	TIME	4	(IBM name: TLGTTAT) Job transaction active time, in 1024-microsecond units.
zNTSN	INT	4	(IBM name: TLGNTSN) Number of transactions.
zPGNO	INT	2	(IBM name: TLGPGNO) Beginning with z/OS V1R3, this field is always zero.
zRV2	CHAR	2	(IBM name: TLGRV2) Reserved.
zVAR	INT	1	(IBM name: TLGVAR) Length of rest of record, excluding this field.
zRVB	CHAR	20	(IBM name: TLGRVB) Reserved.
zCPUTM	INT	3	(IBM name: TLGCPUTM) Job CPU time under TCBs, in hundredths of a second. This field includes the CPU time for all tasks that are dispatched from TCBs below the level of RCT.
zNBRAC	INT	1	(IBM name: TLGNBRAC) Number of accounting fields.

SMF035_LOGOFF.Header_Self_defining_Section.zACFLD.<fieldname>

zACFLDL	INT	1	(IBM name: N/A) Accounting field length.
zACFLDD	XVCHAR	0 256	(IBM name: N/A) Accounting field data.

SMF035_LOGOFF.Relocate_Section.<fieldname>

zCPUS	INT	4	(IBM name: TLGCPUS) Job CPU service, in service units.
zIOCS	INT	4	(IBM name: TLGIOCS) Job I/O service, in service units.
zMSOS	INT	4	(IBM name: TLGMSOS) Job main storage service, in service units
zSRBS	INT	4	(IBM name: TLGSRBS) Job SRB service, in service units.
zTSN	CHAR	8	(IBM name: TLGTSN) Terminal symbolic name.

Record Type 36 - ICF Catalog Report

SMF Record 36 (ICF Catalog Report) is mapped by structure member "T036".

Primary Segment:

- **SMF036_ICF_Catalog_Export**

Secondary Segment(s): 0

Primary segment: **SMF036_ICF_Catalog_Export**

Field Name	Type	Len	Description
<i>SMF036_ICF_Catalog_Export.<fieldname></i>			
SMF036_ICF_Catalog_Export.Header_Self_defining_Section.<fieldname>			
zSYS	HEX	1	(IBM name: SMF36SYS) System indicator: Bit Meaning when set 0-2 Reserved 3-6 Version indicators* 7 RESERVED. *See 'Standard and Extended SMF record headers' on page 174 FOR a detailed description.
zRTY	INT	1	(IBM name: SMF36RTY) Record type 36 (X'24').
zTME	TSTMP	8	(IBM name: SMF36TME) Date/Time that the record was moved into the SMF buffer.
zCPU	CHAR	4	(IBM name: SMF36CPU) System identification.
zSBS	CHAR	4	(IBM name: SMF36SBS) Subsystem identification.
zSUB	CHAR	2	(IBM name: SMF36SUB) Record SubType '00' - Export integrated catalog facility catalog.
zNOT	INT	2	(IBM name: SMF36NOT) Number of triplets.
zPOF	INT	4	(IBM name: SMF36POF) Offset to product section.
zPLN	INT	2	(IBM name: SMF36PLN) Length of product section.
zPNO	INT	2	(IBM name: SMF36PNO) Number of product sections.
zDOF	INT	4	(IBM name: SMF36DOF) Offset to data section.
zDLN	INT	2	(IBM name: SMF36DLN) Length of data section.
zDNO	INT	2	(IBM name: SMF36DNO) Number of data sections.

SMF036_ICF_Catalog_Export.<fieldname>			
zPVN	CHAR	2	(IBM name: SMF36PVN) Product version.
zPNM	CHAR	8	(IBM name: SMF36PNM) Product name.
zPRL	CHAR	2	(IBM name: SMF36PRL) Record type 36 LEVEL.
zJNM	CHAR	8	(IBM name: SMF36JNM) Job name.
zRST	TSTMP	8	(IBM name: SMF36RST) Date/Time that the reader recognized the JOB card (for this job).
zUID	CHAR	8	(IBM name: SMF36UID) User-defined identification field (taken from common exit parameter area,

			not from USER=parameter on job statement).
zPGM	CHAR	8	(IBM name: SMF36PGM) Program name.
zCNM	CHAR	44	(IBM name: SMF36CNM) Integrated catalog facility catalog name.
zCVS	CHAR	6	(IBM name: SMF36CVS) Catalog volume serial, if available.
zCDT	INT	4	(IBM name: SMF36CDT) Catalog UCB device type, if available.
zEDT	CHAR	8	(IBM name: SMF36EDT) Date of export (mm/dd/yy).
zETM	CHAR	8	(IBM name: SMF36ETM) Time of export (hh:mm:ss).
zPDS	CHAR	44	(IBM name: SMF36PDS) Portable data set name.
zPVS	CHAR	6	(IBM name: SMF36PVS) Portable data set volume.
zPDT	INT	4	(IBM name: SMF36PDT) Portable data set UCB device type (associated with the first/only volume), if available.
zEIN	CHAR	2	(IBM name: SMF36EIN) Export Indicator. 'AE' - Aliases were exported. 'NE' - No aliases exported.

Record Type 40 - Dynamic DD

SMF Record 40 (Dynamic DD) is mapped by structure member "T040".

Primary Segment:

- SMF040_Dynamic_DD

Secondary Segment(s): 0

Primary segment: SMF040_Dynamic_DD

Field Name	Type	Len	Description
<i>SMF040_Dynamic_DD.<fieldname></i>			
SMF040_Dynamic_DD.Header_Self_defining_Section.<fieldname>			
zFLG	HEX	1	(IBM name: TDDRFLG) System indicator: Bit Meaning when set 0-2 Reserved 3-6 Version indicators 7 Reserved.
zRTY	INT	1	(IBM name: TDDRCDTY) Record type 40 (X'28').
zTME	TSTMP	8	(IBM name: TDDRCDTS) Date/Time that the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM name: N/A) System identification (from the SID parameter).
zJOBNAME	CHAR	8	(IBM name: TDDUIF) Job name.
zONTME	TSTMP	8	(IBM name: TDDONTME) Logon time. (If a background job, this field contains the time the reader recognized the JOB card.)
zUDATA	CHAR	8	(IBM name: TDDUDATA) User-defined identification field (taken from common exit parameter area, not from USER=parameter on job statement).
zINVSQ	INT	1	(IBM name: TDDINVSQ) Step number (first step = 1, etc).
zFLAG	INT (ENUM)	1	(IBM name: N/A) Functional indicator.
SMF040_Dynamic_DD.Header_Self_defining_Section.zRIN.<fieldname>			
zEXCP_Bad	BIT	1	EXCP count may be wrong.
SMF040_Dynamic_DD.Header_Self_defining_Section.<fieldname>			
zRCIND	INT	2	(IBM name: TDDRCIND) Index of record in sequence of records. Note: In releases prior to 4.2.2, this field is zero.
zRCTOT	INT	2	(IBM name: TDDRCTOT) Total number of records in sequence of records. Note: In releases prior to 4.2.2, this field is zero.
zRVA	CHAR	14	(IBM name: TDDRVA) Reserved.
zVAR	INT	2	(IBM name: TDDVAR) Length of device entry portion of this record. Calculated as: (8 times the number of devices) + 2.
SMF040_Dynamic_DD.Header_Self_defining_Section.zEXCP.<fieldname>			
zDEVIC	INT	1	

			(IBM name: TDDDEV) Device class.
zUTYP	INT	1	(IBM name: TDDUTYP) Unit type.
zCUAD	HEX	2	(IBM name: TDDCUAD) Device number.
zNEXCP	INT	4	(IBM name: TDDNEXCP) EXCP count (see zEXCP).

Record Type 41 - DIV Objects and VLF Statistics

SMF Record 41 (DIV Objects and VLF Statistics) is mapped by structure member "T041".

Primary Segment:

- SMF041_DIV_and_VLF

Secondary Segment(s): 5 (in alphabetical order)

- SMF041_Object_ACCESS
- SMF041_Product
- SMF041_02_IO_Activity
- SMF041_02_Object_UNACCESS
- SMF041_03_VLF_Stats

Primary segment: SMF041_DIV_and_VLF

Field Name	Type	Len	Description
SMF041_DIV_and_VLF.<fieldname>			
SMF041_DIV_and_VLF.Header_Self_defining_Section.<fieldname>			
zFLG	HEX	1	(IBM name: SMF41FLG) System indicator: Bit Meaning when set 0 SUBSYSTEM identification follows system identification 1 SubTypeS used 2 RESERVED 3-6 Version indicators* 7 RESERVED. *See 'Standard and Extended SMF record headers' on page 174 F0R a detailed description.
zRTY	INT	1	(IBM name: SMF41RTY) Record type 41 (X'29').
zTME	TSTMP	8	(IBM name: SMF41TME) Date/Time when the record was written.
zSID	CHAR	4	(IBM name: SMF41SID) System identification (from the SID parameter).
zSSI	CHAR	4	(IBM name: SMF41SSI) Subsystem identification (EBCDIC blanks).
zSTY	INT	2	(IBM name: SMF41STY) Record SubType
zSTYe	INT (ENUM)	2	(IBM name: SMF41STY) Record SubType Value Meaning
zTRP	INT	2	(IBM name: SMF41TRP) Number of triplets. A triplet is a set of offset/length/number values that defines a section of the record.
zxxx	CHAR	2	(IBM name: SMF41xxx) Reserved.
zOPD	INT	4	(IBM name: SMF41OPD) Offset to product section.
zLPD	INT	2	(IBM name: SMF41LPD) Length of product section.
zNPD	INT	2	(IBM name: SMF41NPD) Number of product sections.
zOD1	INT	4	(IBM name: SMF41OD1) Offset of object ACCESS data section.
zLD1	INT	2	(IBM name: SMF41LD1) Length of object ACCESS data section.
zND1	INT	2	(IBM name: SMF41ND1) Number of object ACCESS data sections.
zOD2	INT	4	(IBM name: SMF41OD2) Offset of object UNACCESS data section.
zLD2	INT	2	(IBM name: SMF41LD2) Length of object UNACCESS data section.

zND2	INT	2	(IBM name: SMF41ND2) Number of object UNACCESS data sections.
zOD3	INT	4	(IBM name: SMF41OD3) Offset of I/O activity section.
zLD3	INT	2	(IBM name: SMF41LD3) Length of I/O activity section.
zND3	INT	2	(IBM name: SMF41ND3) Number of I/O activity sections.
zOD4	INT	4	(IBM name: SMF41OD4) Offset to the VLF statistics section.
zLD4	INT	2	(IBM name: SMF41LD4) Length of the VLF statistics section.
zND4	INT	2	(IBM name: SMF41ND4) Number of VLF statistics sections.

Secondary segment: SMF041_Product

Field Name	Type	Len	Description
<i>SMF041_Product.<fieldname></i>			
zPL	CHAR	8	(IBM name: SMF41PL) Product level
zPN	CHAR	16	(IBM name: SMF41PN) Product name ('DATA-IN-VIRTUAL')

Secondary segment: SMF041_Object_ACCESS

Field Name	Type	Len	Description
<i>SMF041_Object_ACCESS.<fieldname></i>			
zDDA	CHAR	8	(IBM name: SMF41DDA) Object data definition name (ddname).
zAZA	INT	4	(IBM name: SMF41AZA) Object size, in units of blocks, when accessed.
zATA	TIME	4	(IBM name: SMF41ATA) Time since midnight when the object was accessed.
zTYA	INT (ENUM)	1	(IBM name: SMF41TYA) Object type Code Meaning 1 DA.
zAMA	INT (ENUM)	1	(IBM name: SMF41AMA) ACCESS mode.
zJobName	CHAR	8	(IBM name: SMF41JBN) Job name (initiator or started task).

Secondary segment: SMF041_02_Object_UNACCESS

Field Name	Type	Len	Description
<i>SMF041_02_Object_UNACCESS.<fieldname></i>			
zUZU	INT	4	(IBM name: SMF41UZU) Object size, in units of blocks, when unaccessed.
zUTU	TIME	4	

			(IBM name: SMF41UTU) Time since midnight when the object was unaccessed.
--	--	--	---

Secondary segment: SMF041_02_IO_Activity

Field Name	Type	Len	Description
<i>SMF041_02_IO_Activity.<fieldname></i>			
zBRD	INT	4	(IBM name: SMF41BRD) Total reads, including re-reads (number of blocks read from object).
zBWR	INT	4	(IBM name: SMF41BWR) Total writes (number of blocks written to object).
zBRR	INT	4	(IBM name: SMF41BRR) Total re-reads (number of blocks re-read from object).
zNC	INT	4	(IBM name: SMF41NC) Total I/O calls for reads.
zOUC	INT	4	(IBM name: SMF41OUC) Total I/O calls for writes.

Secondary segment: SMF041_03_VLF_Stats

Field Name	Type	Len	Description
<i>SMF041_03_VLF_Stats.<fieldname></i>			
zCLS	CHAR	8	(IBM name: SMF41CLS) Class name.
zMVT	INT	4	(IBM name: SMF41MVT) MAXVIRT specified, in 4K blocks. MAXVIRT is a VLF parameter specified in the COFVLFxx parmlib member.
zUSD	INT	4	(IBM name: SMF41USD) Amount of virtual storage currently being used, in 4K blocks.
zSRC	INT	4	(IBM name: SMF41SRC) Number of times the cache was searched in this interval.
zFND	INT	4	(IBM name: SMF41FND) Number of objects found in the cache in this interval.
zADD	INT	4	(IBM name: SMF41ADD) Number of objects added to the cache in this interval.
zDEL	INT	4	(IBM name: SMF41DEL) Number of objects deleted from the cache in this interval.
zTRM	INT	4	(IBM name: SMF41TRM) Number of objects trimmed from the cache in this interval.
zLRG	INT	4	(IBM name: SMF41LRG) Largest object attempted to put in the cache.
zTIM	TSTMP	8	(IBM name: SMF41TIM) Timestamp of last successful COFDEFIN in STCK format. Contains zero if the class is not currently active.
zAAG	TIME	4	(IBM name: SMF41AAG) Current ALERTAGE value
zYAG	TIME	4	(IBM name: SMF41YAG) Age of the youngest trimmed object since the last COFDEFIN for this class. A value of 'FFFFFFF'X means that no trimming has occurred.
zMAG	TIME	4	(IBM name: SMF41MAG) Age of the youngest trimmed object since the VLF_MAXVIRT health check last ran. A value of 'FFFFFFF'X means that no trimming has occurred.

zCAG	INT	4	(IBM name: SMF41CAG) Number of age exceptions raised by the VLF_MAXVIRT health check since the last COFDEFIN for this class.
------	-----	---	---

Record Type 42 - DFSMS Statistics and Configuration

SMF Record 42 (DFSMS statistics and configuration) has a number of subtypes, each mapped by a structure member name of the format "T042STnn".

Record Type 42 Subtype 1 - BMF Cache Summary

Primary Segment:

- SMF042#01_DFSMS

Secondary Segment(s): 3 (in alphabetical order)

- SMF042#01_BMF_Totals
- SMF042#01_Product_Section
- SMF042#01_Storage_Class_Summary

Primary segment: SMF042#01_DFSMS

Field Name	Type	Len	Description
<i>SMF042#01_DFSMS.<fieldname></i>			
SMF042#01_DFSMS.Header.<fieldname>			
zFLG	HEX	1	(IBM name: SMF42FLG) System indicator: Bit Meaning when set 0 Subsystem identification follows system identification 1 Subtypes used 2 Reserved 3-6 Version indicators 7 Reserved.
zRTY	INT	1	(IBM name: SMF42RTY) Record type 42 (X'2A').
zTME	TSTMP	8	(IBM name: SMF42TME) Date/Time when the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF42SID) System identification (from the SID parameter).
zSSI	CHAR	4	(IBM name: SMF42SSI) Subsystem identification.
zSTY	INT	2	(IBM name: SMF42STY) Record SubType.
zSTYe	INT (ENUM)	2	(IBM name: N/A) Record subtype description.

SMF042#01_DFSMS.Self_defining_Section.<fieldname>			
zNT	INT	2	(IBM name: SMF42NT) Number of triplets in record. A triplet is a set of offset/length/number values that defines a section of the record. (Optional.)
zOPS	INT	4	(IBM name: SMF42OPS) Offset to product section from start of record, including record descriptor word (RDW).
zLPS	INT	2	(IBM name: SMF42LPS) Length of product section.
zNPS	INT	2	(IBM name: SMF42NPS) Number of product sections.
zBMO	INT	4	(IBM name: SMF42BMO) Offset to BMF totals section from start of record, including record descriptor word (RDW).
zBML	INT	2	(IBM name: SMF42BML) Length of BMF totals section.

zBMN	INT	2	(IBM name: SMF42BMN) Number of BMF totals sections.
zSCO	INT	4	(IBM name: SMF42SCO) Offset to storage class summary section from start of record, including record descriptor word (RDW).
zSCL	INT	2	(IBM name: SMF42SCL) Length of storage class summary section.
zSCN	INT	2	(IBM name: SMF42SCN) Number of storage class summary sections. The following six fields are only included with SubType 2:

Secondary segment: **SMF042#01_Product_Section**

Field Name	Type	Len	Description
<i>SMF042#01_Product_Section.<fieldname></i>			
zPDL	CHAR	8	(IBM name: SMF42PDL) Product level.
zPDN	CHAR	10	(IBM name: SMF42PDN) Product name.
zPSV	INT	1	(IBM name: SMF42PSV) SubType version number 0 => VOLUME header section does not exist, 1 => VOLUME header section exists.
zPTS	TSTMP	8	(IBM name: SMF42PTS) Interval Start or OPEN time of day. This is zero if not available. These values are in time-of-day (TOD) clock format, and reflect GMT time, not local time.
zPTE	TSTMP	8	(IBM name: SMF42PTE) Interval End or CLOSE time of day. This is zero if not available. These values are in time-of-day (TOD) clock format, and reflect GMT time, not local time.

Secondary segment: **SMF042#01_BMF_Totals**

Field Name	Type	Len	Description
<i>SMF042#01_BMF_Totals.<fieldname></i>			
zTNA	INT	4	(IBM name: SMF42TNA) Total number of storage classes.
zTMT	INT	4	(IBM name: SMF42TMT) Interval length. This is the elapsed time of the measurement period in seconds.
zTRT	INT	4	(IBM name: SMF42TRT) Total number of member data page reads.
zTRH	INT	4	(IBM name: SMF42TRH) Total number of member data page read hits handled by BMF.
zTDT	INT	4	(IBM name: SMF42TDT) Total number of directory data page reads.
zTDH	INT	4	(IBM name: SMF42TDH) Total number of directory data page read hits handled by BMF.
zBUF	INT	4	(IBM name: SMF42BUF) Total number of active BMF 4K buffers.
zBMX	INT	4	(IBM name: SMF42BMX) High water mark of BMF buffers.
zLRU	INT	2	

			(IBM name: SMF42LRU) BMF LRU interval time.
zUIC	INT	2	(IBM name: SMF42UIC) BMF LRU cycles until inactive buffers are cast out.

Secondary segment: SMF042#01_Storage_Class_Summary

Field Name	Type	Len	Description
<i>SMF042#01_Storage_Class_Summary.<fieldname></i>			
zPNL	INT	2	(IBM name: SMF42PNL) Length of storage class name.
zPNN	CHAR	30	(IBM name: SMF42PNN) Storage class name.
zSRT	INT	4	(IBM name: SMF42SRT) Total number of member data page reads.
zSRH	INT	4	(IBM name: SMF42SRH) Total number of member data page read hits handled by BMF.
zSDT	INT	4	(IBM name: SMF42SDT) Total number of directory data page reads.
zSDH	INT	4	(IBM name: SMF42SDH) Total number of directory data page read hits handled by BMF.

Record Type 42 Subtype 2 - Cache CUs with SMS-managed Device(s)**Primary Segment:**

- SMF042#02_DFSMS

Secondary Segment(s): 3 (in alphabetical order)

- SMF042#02_Control_Unit_Cache
- SMF042#02_Product_Section
- SMF042#02_Volume_Status

Primary segment: SMF042#02_DFSMS

Field Name	Type	Len	Description
SMF042#02_DFSMS.<fieldname>			
SMF042#02_DFSMS.Header.<fieldname>			
zFLG	HEX	1	(IBM name: SMF42FLG) System indicator: Bit Meaning when set 0 Subsystem identification follows system identification 1 Subtypes used 2 Reserved 3-6 Version indicators 7 Reserved.
zRTY	INT	1	(IBM name: SMF42RTY) Record type 42 (X'2A').
zTME	TSTMP	8	(IBM name: SMF42TME) Date/Time when the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF42SID) System identification (from the SID parameter).
zSSI	CHAR	4	(IBM name: SMF42SSI) Subsystem identification.
zSTY	INT	2	(IBM name: SMF42STY) Record SubType.
zSTYe	INT (ENUM)	2	(IBM name: N/A) Record subtype description.
SMF042#02_DFSMS.Self_defining_Section.<fieldname>			
zNT	INT	2	(IBM name: SMF42NT) Number of triplets in record. A triplet is a set of offset/length/number values that defines a section of the record. (Optional.)
zOPS	INT	4	(IBM name: SMF42OPS) Offset to product section from start of record, including record descriptor word (RDW).
zLPS	INT	2	(IBM name: SMF42LPS) Length of product section.
zNPS	INT	2	(IBM name: SMF42NPS) Number of product sections.
zCUO	INT	4	(IBM name: SMF42CUO) Offset to control unit cache section from start of record, including record descriptor word (RDW).
zCUL	INT	2	(IBM name: SMF42CUL) Length of control unit cache section.
zCUN	INT	2	(IBM name: SMF42CUN) Number of control unit cache sections.
zVLO	INT	4	(IBM name: SMF42VLO) Offset to volume section from start of record, including record descriptor word (RDW).
zVLL	INT	2	(IBM name: SMF42VLL) Total length of all volume sections. (Number of volume sections multiplied

			by the length of one volume section.)
zVLN	INT	2	(IBM name: SMF42VLN) Number of volume sections. The following three fields are only included with SubType 3:

Secondary segment: **SMF042#02_Product_Section**

Field Name	Type	Len	Description
<i>SMF042#02_Product_Section.<fieldname></i>			
zPDL	CHAR	8	(IBM name: SMF42PDL) Product level.
zPDN	CHAR	10	(IBM name: SMF42PDN) Product name.
zPSV	INT	1	(IBM name: SMF42PSV) SubType version number 0 => VOLUME header section does not exist, 1 => VOLUME header section exists.
zPTS	TSTMP	8	(IBM name: SMF42PTS) Interval Start or OPEN time of day. This is zero if not available. These values are in time-of-day (TOD) clock format, and reflect GMT time, not local time.
zPTE	TSTMP	8	(IBM name: SMF42PTE) Interval End or CLOSE time of day. This is zero if not available. These values are in time-of-day (TOD) clock format, and reflect GMT time, not local time.

Secondary segment: **SMF042#02_Control_Unit_Cache**

Field Name	Type	Len	Description
<i>SMF042#02_Control_Unit_Cache.<fieldname></i>			
SMF042#02_Control_Unit_Cache.zSCS.<fieldname>			
zCache	BINT (ENUM)	3	(IBM name: SMF42SCS) Storage director caching status. ACTIVE => Caching is active. PENDING => Caching is pending active. ERROR => Internal subsystem error (Caching has ended). DEACT => Caching deactivated due to explicit host system request. PENDO => Pending off is in progress (Command to deactivate cache received, but de-stage is still in progress). PENDINGOFF => Pending off destage has failed.
zSMaint	BIT	1	Subsystem storage disabled for maintenance.
zIML	BIT	1	IML device is not available.
zNRet	BIT	1	Non-retentive data is deactivated.

SMF042#02_Control_Unit_Cache.zNCS.<fieldname>			
zNVCache	BINT (ENUM)	2	(IBM name: SMF42NCS) Subsystem non-volatile storage caching status. ACTIVE => Non-volatile cache is active. ERROR => Internal subsystem error (Non-volatile cache availability is ended). DEACT => Non-volatile cache has been deactivated due to explicit host system request. PENDING => Pending non-volatile unavailable has been received, but destage is still in progress.
zNVSMaint	BIT	1	Non-volatile storage disabled for maintenance.
zNVSError	BIT	1	Non-volatile storage disabled due to error.

SMF042#02_Control_Unit_Cache.<fieldname>			
zCID	INT	2	

			(IBM name: SMF42CID) Subsystem identifier.
zCSS	INT	4	(IBM name: SMF42CSS) Configured subsystem storage capacity, in bytes. F'1' means the capacity could not be determined.
zSSA	INT	4	(IBM name: SMF42SSA) Subsystem storage available, in bytes, for allocation as cache space.
zSAP	INT	4	(IBM name: SMF42SAP) Subsystem storage allocated, in bytes, for pinned data.
zSSU	INT	4	(IBM name: SMF42SSU) Subsystem storage unavailable, in bytes, due to subsystem failures.
zNSZ	INT	4	(IBM name: SMF42NSZ) Configured non-volatile cache capacity, in bytes. F'1' means the capacity could not be determined.
zSPR	INT	4	(IBM name: SMF42SPR) Non-volatile cache allocated, in bytes, for pinned data.

SMF042#02_Control_Unit_Cache.zLUPD.<fieldname>

zLCT	INT	4	(IBM name: SMF42LCT) I/O count for the subsystem.
zLFW	INT	4	(IBM name: SMF42LFW) Fast write bypass count.
zLRH	INT	4	(IBM name: SMF42LRH) Cache normal read hit percent, between 0 AND 100.
zLWM	INT	4	(IBM name: SMF42LWM) Fast write bypasses per minute (an integer).
zLDate	DATE	3	(IBM name: N/A) Date of last update period.
zLTime	TIME	4	(IBM name: N/A) Time of last update period.

SMF042#02_Control_Unit_Cache.zCUPD.<fieldname>

zCCT	INT	4	(IBM name: SMF42CCT) I/O count for the subsystem.
zCFW	INT	4	(IBM name: SMF42CFW) Fast write bypass count.
zCRH	INT	4	(IBM name: SMF42CRH) Cache normal read hit percent, between 0 AND 100.
zCWM	INT	4	(IBM name: SMF42CWM) Fast write bypasses per minute (an integer).
zCDate	DATE	3	(IBM name: N/A) Date of current update period.
zCTime	TIME	4	(IBM name: N/A) Time of current update period.

SMF042#02_Control_Unit_Cache.<fieldname>

zIHR	INT	2	(IBM name: SMF42IHR) Average hit ratio, between 0 and 100.
zIFW	INT	2	(IBM name: SMF42IFW) Average fast-write bypasses per minute (an integer).

Secondary segment: SMF042#02_Volume_Status

Field Name	Type	Len	Description
------------	------	-----	-------------

SMF042#02_Volume_Status.<fieldname>			
zVOL	CHAR	6	(IBM name: SMF42VOL) Volume serial number.
zDEV	HEX	4	(IBM name: SMF42DEV) Device number.

SMF042#02_Volume_Status.zDFL.<fieldname>			
zDEVCache	BINT (ENUM)	2	(IBM name: N/A) Device cache status. ACTIVE => Caching is activated. Unused => Unused. DEACTPDG => Deactivate pending by explicit host system request (Transfer of modified data to DASD has failed). DEACTNA => Caching deactivated is unavailable.
zDEVFastWr	BINT (ENUM)	2	Fast write status. ACTIVE => Fast write is activated. Unused => Unused. DEACTPDG => Fast-write deactivate pending (Transfer of data to DASD has failed). DEACT => Fast write deactivated.
zDEVDup	BINT (ENUM)	2	Duplex pair flags. PRI => Primary of duplex pair. SEC => Secondary of duplex pair.
zDEVDupS	BINT (ENUM)	2	Duplex pair status. ACTIVE => Duplex pair available. PENDING => Duplex pair is pending (copy to establish duplex pair is in progress or failed). FAILCMD => Failed duplex by command. FAILSYS => Failed duplex by subsystem.
zDEVPin	BINT (ENUM)	2	Pinned Data status. NOPIN => No pinned data exists for the device, and fast write was not suspended. PINFW => Pinned data exists for the device, but fast write was not suspended. PIN => Pinned data exists for the device, and fast write was suspended.
zDEVCon	BINT	6	Channel connect address for other device in duplex pair.

Record Type 42 Subtype 3 - SMS Configuration Changed

Primary Segment:

- SMF042#03_DFSMS

Secondary Segment(s): 2 (in alphabetical order)

- SMF042#03_Event_Audit
- SMF042#03_Product_Section

Primary segment: SMF042#03_DFSMS

Field Name	Type	Len	Description
<i>SMF042#03_DFSMS.<fieldname></i>			
SMF042#03_DFSMS.Header.<fieldname>			
zFLG	HEX	1	(IBM name: SMF42FLG) System indicator: Bit Meaning when set 0 Subsystem identification follows system identification 1 Subtypes used 2 Reserved 3-6 Version indicators 7 Reserved.
zRTY	INT	1	(IBM name: SMF42RTY) Record type 42 (X'2A').
zTME	TSTMP	8	(IBM name: SMF42TME) Date/Time when the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF42SID) System identification (from the SID parameter).
zSSI	CHAR	4	(IBM name: SMF42SSI) Subsystem identification.
zSTY	INT	2	(IBM name: SMF42STY) Record SubType.
zSTYe	INT (ENUM)	2	(IBM name: N/A) Record subtype description.

SMF042#03_DFSMS.Self_defining_Section.<fieldname>			
zNT	INT	2	(IBM name: SMF42NT) Number of triplets in record. A triplet is a set of offset/length/number values that defines a section of the record. (Optional.)
zOPS	INT	4	(IBM name: SMF42OPS) Offset to product section from start of record, including record descriptor word (RDW).
zLPS	INT	2	(IBM name: SMF42LPS) Length of product section.
zNPS	INT	2	(IBM name: SMF42NPS) Number of product sections.
zEAO	INT	4	(IBM name: SMF42EAO) Offset to event audit section from start of record, including record descriptor word (RDW).
zEAL	INT	2	(IBM name: SMF42EAL) Length of event audit section.
zEAN	INT	2	(IBM name: SMF42EAN) Number of event audit sections.

Secondary segment: SMF042#03_Product_Section

Field Name	Type	Len	Description
<i>SMF042#03_Product_Section.<fieldname></i>			
zPDL	CHAR	8	(IBM name: SMF42PDL) Product level.
zPDN	CHAR	10	(IBM name: SMF42PDN) Product name.
zPSV	INT	1	(IBM name: SMF42PSV) SubType version number 0 => VOLUME header section does not exist, 1 => VOLUME header section exists.
zPTS	TSTMP	8	(IBM name: SMF42PTS) Interval Start or OPEN time of day. This is zero if not available. These values are in time-of-day (TOD) clock format, and reflect GMT time, not local time.
zPTE	TSTMP	8	(IBM name: SMF42PTE) Interval End or CLOSE time of day. This is zero if not available. These values are in time-of-day (TOD) clock format, and reflect GMT time, not local time.

Secondary segment: SMF042#03_Event_Audit

Field Name	Type	Len	Description
<i>SMF042#03_Event_Audit.<fieldname></i>			
zEAC	CHAR	8	(IBM name: SMF42EAC) The action that caused the record to be created, ACTIVATE, ENF, or VARY SMS.
zERC	INT	4	(IBM name: SMF42ERC) Return code from resulting event.
zERS	INT	4	(IBM name: SMF42ERS) Reason code from resulting event.

SMF042#03_Event_Audit.zEENF.<fieldname>

zEUA	INT	4	(IBM name: SMF42EUA) UCB address for the device.
zEVO	CHAR	6	(IBM name: SMF42EVO) VOLSER for device is online.
zEOS	INT (ENUM)	1	(IBM name: SMF42EOS) Old MVS volume status.
zENS	INT (ENUM)	1	(IBM name: SMF42ENS) New MVS volume status.

SMF042#03_Event_Audit.zEVARY.<fieldname>

zETY	CHAR	8	(IBM name: SMF42ETY) Type of VARY or UPDATE request: STORGRP, LIBRARY, DRIVE or VOLUME.
zESL	INT	2	(IBM name: SMF42ESL) Name length.
zENM	CHAR	30	(IBM name: SMF42ENM) STORAGE name or LIBRARY name or DRIVE name.
zEVL	CHAR	6	(IBM name: SMF42EVL) Volume serial.
zESY	CHAR	8	(IBM name: SMF42ESY) System name (up to 8 SYSTEMS, separated by commas) or '(ALL)'.
zEST	CHAR	12	(IBM name: SMF42EST) Resulting status: ENABLE or ENABLE,NEW or QUIESCE or

			QUIESCE,NEW or DISABLE or DISABLE,NEW.
--	--	--	--

SMF042#03_Event_Audit.zEACT.<fieldname>			
zESD	CHAR	44	(IBM name: SMF42ESD) Source control data set name.
zEAD	CHAR	44	(IBM name: SMF42EAD) Active control data set name.

Primary segment: SMF042#06_DFSMS

Field Name	Type	Len	Description
<i>SMF042#06_DFSMS.<fieldname></i>			
<i>SMF042#06_DFSMS.Header.<fieldname></i>			
zFLG	HEX	1	(IBM name: SMF42FLG) System indicator: Bit Meaning when set 0 Subsystem identification follows system identification 1 Subtypes used 2 Reserved 3-6 Version indicators 7 Reserved.
zRTY	INT	1	(IBM name: SMF42RTY) Record type 42 (X'2A').
zTME	TSTMP	8	(IBM name: SMF42TME) Date/Time when the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF42SID) System identification (from the SID parameter).
zSSI	CHAR	4	(IBM name: SMF42SSI) Subsystem identification.
zSTY	INT	2	(IBM name: SMF42STY) Record SubType.
zSTYe	INT (ENUM)	2	(IBM name: N/A) Record subtype description.

<i>SMF042#06_DFSMS.Self_defining_Section.<fieldname></i>			
zNT	INT	2	(IBM name: SMF42NT) Number of triplets in record. A triplet is a set of offset/length/number values that defines a section of the record. (Optional.)
zOPS	INT	4	(IBM name: SMF42OPS) Offset to product section from start of record, including record descriptor word (RDW).
zLPS	INT	2	(IBM name: SMF42LPS) Length of product section.
zNPS	INT	2	(IBM name: SMF42NPS) Number of product sections.
zJHO	INT	4	(IBM name: SMF42JHO) Offset to job header section from start of record, including record descriptor word (RDW).
zJHL	INT	2	(IBM name: SMF42JHL) Length of job header section.
zJHN	INT	2	(IBM name: SMF42JHN) Number of job header sections.

Secondary segment: **SMF042#06_Product_Section**

Field Name	Type	Len	Description
<i>SMF042#06_Product_Section.<fieldname></i>			
zPDL	CHAR	8	(IBM name: SMF42PDL) Product level.
zPDN	CHAR	10	(IBM name: SMF42PDN) Product name.
zPSV	INT	1	(IBM name: SMF42PSV) SubType version number 0 => VOLUME header section does not exist, 1 => VOLUME header section exists.
zPTS	TSTMP	8	(IBM name: SMF42PTS) Interval Start or OPEN time of day. This is zero if not available. These values are in time-of-day (TOD) clock format, and reflect GMT time, not local time.
zPTE	TSTMP	8	(IBM name: SMF42PTE) Interval End or CLOSE time of day. This is zero if not available. These values are in time-of-day (TOD) clock format, and reflect GMT time, not local time.

Secondary segment: **SMF042#06_Job_Header**

Field Name	Type	Len	Description
<i>SMF042#06_Job_Header.<fieldname></i>			
zJOBNAME	CHAR	8	(IBM name: S42JDJNM) Job name.
zRST	TSTMP	8	(IBM name: S42JDRST) Time that reader recognized the JOB card for this job.
zUSERID	CHAR	8	(IBM name: S42JDUID) User-defined identification field (taken from common exit parameter area, not from USER=parameter on job statement).
zDSO	INT	4	(IBM name: S42JDDSO) Offset to first data set header section.
zDSL	INT	2	(IBM name: S42JDDSL) Length of data set header section.
zCOD	INT	1	(IBM name: S42JDCOD) 0=Close, 1=Interval record.
zPGN	INT	2	(IBM name: S42JDPGN) Job performance group number.
zIOL	INT	2	(IBM name: S42JDIOL) Length of data set I/O statistics section.
zAML	INT	2	(IBM name: S42JDAML) Length of access method statistics section.
zGMO	TIME	4	(IBM name: S42JDGMO) Greenwich Mean Time (GMT) offset represented in 1.048576 seconds.
zWSC	CHAR	8	(IBM name: S42JDWSC) Workload Manager (WLM) Service Class Name.
zWLD	CHAR	8	(IBM name: S42JDWLD) Workload Manager (WLM) workload name.

Secondary segment: **SMF042#06_Data_Set_Header**

Field Name	Type	Len	Description
<i>SMF042#06_Data_Set_Header.<fieldname></i>			
zNXT	INT	4	(IBM name: S42DSNXT) Offset to the next data set header section (0 if the last data set).
zDSN	CHAR	44	(IBM name: S42DSN) Data set name.
zTYP	INT (ENUM)	1	(IBM name: S42DSTYP) Data set type. Other => Unknown data set type, PS => Physical Sequential, PO => Partitioned, PO-E => Partitioned Extended (PDSE), DA => DIRECT, IS => Indexed Sequential, EXCP => EXCP, PS-E => Physical Sequential Extended format, HFS => MVS Hierarchical File System, KSDS-D => KSDS data component, KSDS-I => KSDS index component, VRDS-D => Variable RRDS data component, VRDS-I => Variable RRDS index component, RRDS => Fixed length RRDS, LDS => Linear data set, ESDS => ESDS.

SMF042#06_Data_Set_Header.zCOD.<fieldname>

zFIRST	BIT	1	First data set entry since Open.
--------	-----	---	----------------------------------

SMF042#06_Data_Set_Header.zFL1.<fieldname>

zVSAMBuf	BINT (ENUM)	2	(IBM name: S42DSFL1) VSAM buffer flags.
zEXC	BIT	1	Open for EXCP processing.
zFXD	BIT	1	Non-VSAM fixed length records.
zPL	BIT	1	Program library.
zEF	BIT	1	Extended format.
zEFC	BIT	1	Extended Format Compressed.

SMF042#06_Data_Set_Header.<fieldname>

zIOO	INT	4	(IBM name: S42DSIOO) Offset to data set I/O statistics section.
zAMO	INT	4	(IBM name: S42DSAMO) Offset to access method statistics section.
zVOL	CHAR	6	(IBM name: S42DSVOL) Volume serial number.
zDEV	HEX	2	(IBM name: S42DSDEV) Device number.
zSC	CHAR	8	(IBM name: SMF42SC) Storage class name.
zBSZ	INT	4	(IBM name: S42DSBSZ) Block size. For concatenated data sets, this data is taken from the first data set.
zTRP	INT	2	(IBM name: S42DSTRP) Number of stripes
zENT	HEX	2	(IBM name: S42DSENT) Encryption type Value Meaning 0100x AES-256
zCMT	INT (ENUM)	1	(IBM name: S42DSCMT) Data Set Compression type.
zSNO	INT	4	(IBM name: S42DSSNO) Offset to Sync_io section.
zSNL	INT	2	(IBM name: S42DSSNL) Length of Sync_io section.
zDSS2O	INT	4	(IBM name: S42DSS2O) Offset to synchronous I/O section 2.

zDSS2L	INT	2	(IBM name: S42DSS2L) Length of synchronous I/O section 2
SMF042#06_Data_Set_Header.zDS2FL.<fieldname>			
zDS2DL	BIT	1	Media Manager dual logging is installed on this system and the newly defined dual logging sync_io SMF fields are valid if S42DSS2O is not 0.
SMF042#06_Data_Set_Header.<fieldname>			
zDSS3O	INT	4	(IBM name: S42DSS3O) Offset to synchronous I/O section 3.
zDSS3L	INT	2	(IBM name: S42DSS3L) Length of synchronous I/O section 3

Secondary segment: SMF042#06_Data_Set_IO

Field Name	Type	Len	Description
SMF042#06_Data_Set_IO.<fieldname>			
zIOR	TIME	4	(IBM name: S42DSIOR) Average response time.
zIOC	TIME	4	(IBM name: S42DSIOC) Average I/O connect time. There is one SMF SubType 6 RECORD per data set, and each record has its own zIOC field.
zIOP	TIME	4	(IBM name: S42DSIOP) Average I/O pending time.
zIOD	TIME	4	(IBM name: S42DSIOD) Average I/O disconnect time.
zIOQ	TIME	4	(IBM name: S42DSIOQ) Average control unit queue time.
zION	INT	4	(IBM name: S42DSION) Total number of I/Os. There is one SMF SubType 6 RECORD per data set, and each record has its own zION field.
zCND	INT	4	(IBM name: S42DSCND) Number of cache candidates.
zSHTS	INT	4	(IBM name: S42DSSHTS) Number of cache hits.
zWCN	INT	4	(IBM name: S42DSWCN) Number of write candidates.
zWHI	INT	4	(IBM name: S42DSWHI) Number of write hits.
zSEQ	INT	4	(IBM name: S42DSSEQ) Number of sequential I/O operations. Operations counted here are not accumulated in zCND and zWCN.
zRLC	INT	4	(IBM name: S42DSRLC) Number of record level cache I/O operations.
zICL	INT	4	(IBM name: S42DSICL) Number of inhibit cache load I/O operations.
zDA0	TIME	4	(IBM name: S42DSDA0) Average I/O device-active-only time.
zMXR	TIME	4	(IBM name: S42DSMXR) Maximum data set I/O response time.
zMXS	TIME	4	(IBM name: S42DSMXS) Maximum data set service time.
zRDD	TIME	4	(IBM name: S42DSRDD) Average disconnect time for reads.

zRDT	INT	4	(IBM name: S42DSRDT) Total number of read operations.
zHRD	INT	4	(IBM name: S42DSHRD) Number of zHPF read operations.
zHWR	INT	4	(IBM name: S42DSHWR) Number of zHPF write operations.
zR1U	TIME	4	(IBM name: S42DSR1U) Average response time in microseconds.
zC1U	TIME	4	(IBM name: S42DSC1U) Average I/O connect time in microseconds. There is one SMF SubType 6 REC0RD per data set, and each record has its own zIOC field.
zP1U	TIME	4	(IBM name: S42DSP1U) Average I/O pending time in microseconds.
zD1U	TIME	4	(IBM name: S42DSD1U) Average I/O disconnect time in microseconds.
zQ1U	TIME	4	(IBM name: S42DSQ1U) Average control unit queue time in microseconds.
zA1U	TIME	4	(IBM name: S42DSA1U) Average I/O device-active-only time in microseconds.
zT1U	TIME	4	(IBM name: S42DST1U) Average disconnect time for reads in microseconds.
zB1U	TIME	4	(IBM name: S42DSB1U) Average device busy time in microseconds.
zM1U	TIME	4	(IBM name: S42DSM1U) Average initial command response time in microseconds.
zIOS	INT	4	(IBM name: S42DSIOS) Total number of zHyperWrite requests issued to a Metro Mirror secondary device. Note: I/O operations to the Metro Mirror secondary volume are included in the Data Set I/O reporting fields.
zRRU	TIME	4	(IBM name: S42DSRRU) Average random read cache hit reponse time.
zRSU	TIME	4	(IBM name: S42DSRSU) Average random read cache hit service time.
zMXI	INT	2	(IBM name: S42DSMXI) Storage Subsystem ID of device associated with max response time zMXR.

Secondary segment: **SMF042#06_Data_Access_Method**

Field Name	Type	Len	Description
<i>SMF042#06_Data_Access_Method.<fieldname></i>			
zSRB	INT	4	(IBM name: S42AMSRB) Sequential read: number of blocks
zSRR	TIME	4	(IBM name: S42AMSRR) Sequential read: I/O delay
zSWB	INT	4	(IBM name: S42AMSWB) Sequential write: number of blocks
zSWR	TIME	4	(IBM name: S42AMSWR) Sequential write: I/O delay
zDRB	INT	4	(IBM name: S42AMDRB) Direct read: number of blocks
zDRR	TIME	4	(IBM name: S42AMDRR) Direct read: total I/O delay
zDWB	INT	4	(IBM name: S42AMDWB) Direct write: number of blocks

zDWR	TIME	4	(IBM name: S42AMDWR) Direct write: total I/O delay
zZRB	INT	4	(IBM name: S42AMZRB) Number of directory reads
zZRR	TIME	4	(IBM name: S42AMZRR) Directory read: I/O delay
zZWB	INT	4	(IBM name: S42AMZWB) Number of directory writes
zZWR	TIME	4	(IBM name: S42AMZWR) Directory write: I/O delay.
zRIB	INT	8	(IBM name: S42AMRIB) Number of bytes read.
zWIB	INT	8	(IBM name: S42AMWIB) Number of bytes written.
zRBD	INT	8	(IBM name: S42AMRBD) For encrypted data sets, number of bytes decrypted when reading. For non-encrypted data sets, number of bytes that would be eligible for decryption when reading if the data set was allocated as encrypted.
zWBE	INT	8	(IBM name: S42AMWBE) For encrypted data sets, number of bytes encrypted when writing. For non-encrypted data sets, number of bytes that would be eligible for encryption when writing if the data set was allocated as encrypted.
zRCI	INT	4	(IBM name: S42AMRCI) Number of VSAM CIs read. For non-VSAM, this is the number of physical blocks.
zWCI	INT	4	(IBM name: S42AMWCI) Number of VSAM CIs written. For non-VSAM, this is the number of physical blocks.

Secondary segment: SMF042#06_Sync_IO

Field Name	Type	Len	Description
<i>SMF042#06_Sync_IO.<fieldname></i>			
zNERD	INT	4	(IBM name: S42SNERD) Number of read requests eligible for synchronous I/O but not attempted.
zNERH	INT	4	(IBM name: S42SNERH) Number of read hits eligible for synchronous I/O but not attempted.
zNEWR	INT	4	(IBM name: S42SNEWR) Number of write requests eligible for synchronous I/O but not attempted.
zNRDT	INT	4	(IBM name: S42SNRDT) Number of synchronous I/O read attempts.
zNROS	INT	4	(IBM name: S42SNROS) Number of synchronous I/O read successes.
zNWTT	INT	4	(IBM name: S42SNWTT) Number of synchronous I/O write attempts.
zNWOS	INT	4	(IBM name: S42SNWOS) Number of synchronous I/O write successes.
zNSEQ	INT	4	(IBM name: S42SNSEQ) Number of synchronous I/O sequential operations.
zNCND	INT	4	(IBM name: S42SNCND) Number of synchronous I/O cache candidates.
zNHTS	INT	4	(IBM name: S42SNHTS) Number of synchronous I/O cache hits.
zNWCN	INT	4	(IBM name: S42SNWCN) Number of synchronous I/O write candidates.

zNWHI	INT	4	(IBM name: S42SNWHI) Number of synchronous I/O write hits.
zNRMS	INT	4	(IBM name: S42SNRMS) Number of synchronous I/O read misses.
zNWMS	INT	4	(IBM name: S42SNWMS) Number of synchronous I/O write misses.
zNMXR	TIME	4	(IBM name: S42SNMXR) Maximum response time, in microseconds, for synchronous I/O cache read operation. Note: Subtype 6 only.
zNMXW	TIME	4	(IBM name: S42SNMXW) Maximum response time, in microseconds, for synchronous I/O cache write operation. Note: Subtype 6 only.
zNRDU	TIME	4	(IBM name: S42SNRDU) Average response time, in microseconds, per synchronous I/O cache read operation.
zNWTU	TIME	4	(IBM name: S42SNWTU) Average response time, in microseconds, per synchronous I/O cache write operation.
zNCONC	INT	4	(IBM name: S42SNCONC) Number of concurrent synchronous I/O operations initiated to satisfy a read or write request (S42SNRDT and S42SNWTT).

Secondary segment: **SMF042#06_Sync_IO2**

Field Name	Type	Len	Description
<i>SMF042#06_Sync_IO2.<fieldname></i>			
zSNTWR	INT	4	(IBM name: S42SNTWR) Number of SyncIO write requests
zSNTWO	INT	4	(IBM name: S42SNTWO) Number of SyncIO write requests that were completed synchronously
zSNTWS	INT	4	(IBM name: S42SNTWS) Number of SyncIO write requests that were skipped for zHyperLink due to a previous asynchronous write
zSNTWB	INT	4	(IBM name: S42SNTWB) Number of SyncIO write requests that went asynchronous due to a busy link condition
zSNTWM	INT	4	(IBM name: S42SNTWM) Number of SyncIO write requests that went asynchronous due to a cache miss
zSNTWP	INT	4	(IBM name: S42SNTWP) Number of SyncIO write requests that went asynchronous due to an operation delay
zSNTWE	INT	4	(IBM name: S42SNTWE) Number of SyncIO write requests that went asynchronous due to not having a complete write token set
zSNTWI	INT	4	(IBM name: S42SNTWI) Number of SyncIO write requests that went asynchronous due to an invalid write token
zSNTWC	INT	4	(IBM name: S42SNTWC) Number of SyncIO write requests that went asynchronous due to inconsistent writes
zSNTWD	INT	4	(IBM name: S42SNTWD) Number of SyncIO write requests that went asynchronous due to zHyperLink writes being disabled on a device
zSNTWA	INT	4	(IBM name: S42SNTWA) Number of read requests to a data set open for SyncIO writes
zSNTWK	INT	4	

			(IBM name: S42SNTWK) Number of SyncIO write requests where zHyperLink could not be performed.
zSNTWV	INT	4	(IBM name: S42SNTWV) Number of SyncIO write requests where a device was reserved to another system.
zSNTWL	INT	4	(IBM name: S42SNTWL) Number of SyncIO write requests where zHyperLink write was disabled due to not being opened for SyncIO writes
zSNTWT	INT	4	(IBM name: S42SNTWT) Number of SyncIO write requests where zHyperLink write was disabled due to the data set being extended after Open
zSNTWN	INT	4	(IBM name: S42SNTWN) Number of SyncIO write requests where zHyperLink write was disabled due to the data set being ineligible for SyncIO writes, such as a multivolume data set, or CI size not 4K
zSNTWG	INT	4	(IBM name: S42SNTWG) Number of SyncIO write requests where zHyperLink write was disabled due to storage class or operator setting
zSNTWY	INT	4	(IBM name: S42SNTWY) Number of SyncIO write requests where zHyperLink writes were disabled due to a token array error.
zSNTWU	INT	4	(IBM name: S42SNTWU) Number of SyncIO write requests where zHyperLink writes were disabled due to an unsupported copy relationship.
zSNTWF	INT	4	(IBM name: S42SNTWF) Number of SyncIO write requests where zHyperLink writes were disabled due to buffers not being on a page boundary.
zSNTWQ	INT	4	(IBM name: S42SNTWQ) Number of SyncIO write requests where zHyperLink writes were disabled due to invalid zHyperLink write requests.
zSNTWZ	INT	4	(IBM name: S42SNTWZ) Number of SyncIO write requests where zHyperLink writes were disabled due to zHPF being disabled.
zSNTWW	INT	4	(IBM name: S42SNTWW) Number of SyncIO write requests where zHyperLink writes were disabled due to an internal error.
zSNTWX	INT	4	(IBM name: S42SNTWX) Number of SyncIO write requests where zHyperLink writes were disabled due to miscellaneous reasons
zSNTWH	INT	4	(IBM name: S42SNTWH) Number of SyncIO write requests where zHyperLink writes were disabled due to the other data set in a dual logging request being disabled for zHyperLink writes. Valid when S42DS2DL is ON.
zSNTDR	INT	4	(IBM name: S42SNTDR) Number of SyncIO write requests where dual logging was specified. Valid when S42DS2DL is ON.
zSNTDX	INT	4	(IBM name: S42SNTDX) Number of dual logging SyncIO write requests in which all IO to this data set was completed synchronously, but the IO to the other data set was completed asynchronously, resulting in the entire request being completed asynchronously. Valid when S42DS2DL is ON.

Secondary segment: **SMF042#06_Sync_IO3**

Field Name	Type	Len	Description
SMF042#06_Sync_IO3.<fieldname>			
zSNDWH	INT	2	(IBM name: S42SNDWH) Storage subsystem ID for this device.

zSNDWJ	INT	1	(IBM name: S42SNDWJ) Subchannel Set ID for this device.
zSNDWN	INT	2	(IBM name: S42SNDWN) Device Number for this device.
zSNDWT	INT	4	(IBM name: S42SNDWT) Number of SyncIO writes for this device (attempts and skips).
zSNDWO	INT	4	(IBM name: S42SNDWO) Number of SyncIO writes for this device that were successful.
zSNDWS	INT	4	(IBM name: S42SNDWS) Number of SyncIO writes for this device that went asynchronous due to a previous asynchronous write.
zSNDWB	INT	4	(IBM name: S42SNDWB) Number of SyncIO writes for this device that went asynchronous due to a busy link condition.
zSNDWM	INT	4	(IBM name: S42SNDWM) Number of SyncIO writes for this device that went asynchronous due to a cache miss.
zSNDWP	INT	4	(IBM name: S42SNDWP) Number of SyncIO writes for this device that went asynchronous due to an operation delay.
zSNDWE	INT	4	(IBM name: S42SNDWE) Number of SyncIO writes for this device that went asynchronous due to not having a write token.
zSNDWI	INT	4	(IBM name: S42SNDWI) Number of SyncIO writes for this device that went asynchronous due to an invalid write token.
zSNDWC	INT	4	(IBM name: S42SNDWC) Number of SyncIO writes for this device that went asynchronous due to an inconsisten write pattern.
zSNDWD	INT	4	(IBM name: S42SNDWD) Number of SyncIO writes for this device that went asynchronous due to zHyperLink writes being disabled on this device.
zSNDWU	INT	4	(IBM name: S42SNDWU) Number of SyncIO writes for this device that went asynchronous due to an unsupported copy relationship.
zSNDWK	INT	4	(IBM name: S42SNDWK) Number of SyncIO writes for this device that went asynchronous because zHyperLink could not be performed.
zSNDWV	INT	4	(IBM name: S42SNDWV) Number of SyncIO writes for this device that went asynchronous because this device was reserved to another system.
zSNDWX	INT	4	(IBM name: S42SNDWX) Number of SyncIO writes for this device that went asynchronous due to miscellaneous reasons.

Secondary segment: SMF042#11_XRC_Session

Field Name	Type	Len	Description
<i>SMF042#11_XRC_Session.<fieldname></i>			
zID	CHAR	8	(IBM name: S42XRID) Logical session ID.
zTYP	CHAR	8	(IBM name: S42XRTP) Session type 'XRC' = Extended Remote Copy
zSSO	INT	4	(IBM name: S42XRSSO) Offset to first storage subsystem identifier (SSID) data section.
zSSN	INT	2	(IBM name: S42XRSSN) Number of SSIDs in the XRC session.
zSSL	INT	2	(IBM name: S42XRSSL) Length of SSID data section.

Secondary segment: SMF042#11_XRC_SSID_Data

Field Name	Type	Len	Description
<i>SMF042#11_XRC_SSID_Data.<fieldname></i>			
zSNX	INT	4	(IBM name: S42XRSNX) Offset to next SSID data section (0 if last SSID).
zSID	INT	2	(IBM name: SMF42SID) SSID.
zIDP	INT	1	(IBM name: S42XRIDP) Controller session ID.
zVSH	INT	4	(IBM name: S42XRVSH) Number of volumes being shadowed for this SSID that are still active in the XRC session at the end of the SMF interval.
zTPR	INT	4	(IBM name: S42XRTPR) Total number of primary data mover reads.
zNWD	INT	4	(IBM name: S42XRNWD) Number of data mover reads with data.

zNND	INT	4	(IBM name: S42XRNND) Number of data mover reads with no data.
zNLR	INT	4	(IBM name: S42XRNLR) Number of data mover reads left to be read.
zNFW	INT	4	(IBM name: S42XRNFW) Number of format writes.
zNUW	INT	4	(IBM name: S42XRNUW) Number of update writes.
zARS	INT	4	(IBM name: S42XRARS) Average record size.

Record Type 42 Subtype 14 - ADSM Session Resource Usage

Primary Segment:

- SMF042#14_DFSMS

Secondary Segment(s): 2 (in alphabetical order)

Primary segment: SMF042#14_DFSMS

Field Name	Type	Len	Description
<i>SMF042#14_DFSMS.<fieldname></i>			
SMF042#14_DFSMS.Header.<fieldname>			
zFLG	HEX	1	System indicator: Bit Meaning when set 0 Subsystem identification follows system identification 1 Subtypes used 2 Reserved 3-6 Version indicators 7 Reserved.
zRTY	INT	1	Record type 42 (X'2A').
zTME	TSTMP	8	Date/Time when the record was moved into the SMF buffer.
zSID	CHAR	4	System identification (from the SID parameter).
zSSI	CHAR	4	Subsystem identification.
zSTY	INT	2	Record SubType.
zSTYe	INT (ENUM)	2	(IBM name: N/A) Record subtype description.

SMF042#14_DFSMS.Self_defining_Section.<fieldname>			
zNT	INT	2	Number of triplets in record. A triplet is a set of offset/length/number values that defines a section of the record. (Optional.)
zOPS	INT	4	Offset to product section from start of record, including record descriptor word (RDW).
zLPS	INT	2	Length of product section.
zNPS	INT	2	Number of product sections.
zT1O	INT	4	Offset to ADSM section.
zT1L	INT	2	Length of ADSM section.
zT1N	INT	2	Number of ADSM sections, 1.

Secondary segment: SMF042#14_Product_Section

Field Name	Type	Len	Description
<i>SMF042#14_Product_Section.<fieldname></i>			
zPDL	CHAR	8	Product level.
zPDN	CHAR	10	Product name.
zPSV	INT	1	SubType version number 0 => VOLUME header section does not exist, 1 => VOLUME header section exists.
zPTS	TSTMP	8	Interval Start or OPEN time of day. This is zero if not available. These values are in time-of-day (TOD) clock format, and reflect GMT time, not local time.

zPTE	TSTMP	8	Interval End or CLOSE time of day. This is zero if not available. These values are in time-of-day (TOD) clock format, and reflect GMT time, not local time.
------	-------	---	---

Secondary segment: **SMF042#14_ADSM_Accounting**

Field Name	Type	Len	Description
<i>SMF042#14_ADSM_Accounting.<fieldname></i>			
zLEV	CHAR	2	Product level.
zNME	CHAR	8	Product name, ADSM.
zNCL	CHAR	30	Node name of ADSM client. If the node name does not fit completely within 30 CHARACTERS, the client node name is listed as: first...last where first is the first 17 CHARACTERS of the node name and last is the last 10 CHARACTERS of the node name.
zTME	CHAR	14	Data and time of accounting (yyyymmddhhmmss).
zDUR	INT	4	Duration of session, in seconds.
zNAI	INT	4	Number of archive database objects inserted during session.
zNBI	INT	4	Number of backup database objects inserted during session.
zAFS	INT	4	Amount of archived files, in kilobytes, sent by the client to the server.
zBFS	INT	4	Amount of backed up files, in kilobytes, sent by the client to the server
zDKB	INT	4	Amount of data, in kilobytes, communicated between a client node and the server during this session.
zOWN	CHAR	8	Client owner name (UNIX).
zNTY	CHAR	8	Node type.
zCOM	CHAR	8	Communication method used for session.
zNAR	INT	4	Number of archive database objects retrieved during session.
zNBR	INT	4	Number of backup database objects retrieved during session.
zASR	INT	4	Amount of space, in kilobytes, retrieved by archived objects.
zBSR	INT	4	Amount of space, in kilobytes, retrieved by backed up objects.
zIWT	INT	4	Amount of Idle Wait time, in seconds, during the session.
zCWT	INT	4	Amount of Communications Wait time, in seconds, during the session.
zMWT	INT	4	Amount of Media Wait time, in seconds, during the session.
zCPU	INT	4	Amount of CPU time, in seconds, used by the server for basic client activity. This amount includes CPU time to send or receive data from the client but does not include CPU time to place data on, or retrieve it from database storage.
zAUT	INT	1	Authentication method used.
zTRM	INT	1	Normal termination indicator (Normal=X'01').
zNSI	INT	4	Number of space managed database objects inserted during session.
zSDS	INT	4	Amount of space managed data, in kilobytes, sent by the client to the server.
zNSR	INT	4	Number of space managed database objects retrieved during session.
zSDR	INT	4	Amount of space, in kilobytes, retrieved by space managed objects.

zLPS	INT	2	(IBM name: SMF42LPS) Length of product section.
zNPS	INT	2	(IBM name: SMF42NPS) Number of product sections.
zFX1	INT	4	(IBM name: SMF42FX1) Offset to sysplex-wide storage class (SC) summary data section.
zFX2	INT	2	(IBM name: SMF42FX2) Length of sysplex-wide SC summary data section.
zFX3	INT	2	(IBM name: SMF42FX3) Number of sysplex-wide SC summary data sections.
zFX4	INT	4	(IBM name: SMF42FX4) Offset to SC, CF, SYS summary section.
zFX5	INT	2	(IBM name: SMF42FX5) Length of SC, CF, SYS summary section.

zFX6	INT	2	(IBM name: N/A) Number of SC, CF, SYS summary sections.
zFX7	INT	4	(IBM name: SMF42FX7) Offset to sysplex-wide storage class (SC) summary data section.
zFX8	INT	2	(IBM name: SMF42FX8) Length of sysplex-wide SC summary data section.
zFX9	INT	2	(IBM name: N/A) Number of sysplex-wide SC summary data sections.
zFXA	INT	4	(IBM name: N/A) Offset to SC, CF, SYS summary section.
zFXB	INT	2	(IBM name: N/A) Length of SC, CF, SYS summary section.
zFXC	INT	2	(IBM name: N/A) Number of SC, CF, SYS summary sections. The following six fields are only included with SubType 16 FOR buffers below the bar:

Secondary segment: **SMF042#15_Product_Section**

Field Name	Type	Len	Description
<i>SMF042#15_Product_Section.<fieldname></i>			
zPDL	CHAR	8	(IBM name: SMF42PDL) Product level.
zPDN	CHAR	10	(IBM name: SMF42PDN) Product name.
zPSV	INT	1	(IBM name: SMF42PSV) SubType version number 0 => VOLUME header section does not exist, 1 => VOLUME header section exists.
zPTS	TSTMP	8	(IBM name: SMF42PTS) Interval Start or OPEN time of day. This is zero if not available. These values are in time-of-day (TOD) clock format, and reflect GMT time, not local time.
zPTE	TSTMP	8	(IBM name: SMF42PTE) Interval End or CLOSE time of day. This is zero if not available. These values are in time-of-day (TOD) clock format, and reflect GMT time, not local time.

Secondary segment: **SMF042#15_VSAM_RLS_StorClass_SysplexWide**

Field Name	Type	Len	Description
<i>SMF042#15_VSAM_RLS_StorClass_SysplexWide.<fieldname></i>			
zFAA	INT	4	(IBM name: SMF42FAA) Interval length. This is the total length, in seconds, of the measurement period.
zF00	CHAR	12	(IBM name: SMF42F00) Indicates if DFSMS greater than 4K CF caching is active. Value is GT4KACTIVE or GT4KNOTACT.
zFAB	INT	2	(IBM name: SMF42FAB) Length of the storage class name.
zFAC	CHAR	30	(IBM name: SMF42FAC) Storage class name.
zF01	INT	2	(IBM name: SMF42F01) Length of DFSMS cache set name.
zFAD	CHAR	30	

			(IBM name: SMF42FAD) DFSMS cache set name.
zFAE	INT	4	(IBM name: SMF42FAE) Number of lock requests processed.
zFAF	INT	4	(IBM name: SMF42FAF) Number of true contention lock requests.
zFAG	INT	4	(IBM name: SMF42FAG) Number of false contention lock requests.
zF02	INT	2	(IBM name: SMF42F02) DFSMS direct weight
zF12	INT	2	(IBM name: SMF42F12) DFSMS sequential weight
zFAH	CHAR	7	(IBM name: SMF42FAH) Reserved.

SMF042#15_VSAM_RLS_StorClass_SysplexWide.zFY3.<fieldname>

zFSC	BIT	1	CA and CI count valid.
zFST	BIT	1	Local contention fields valid.

SMF042#15_VSAM_RLS_StorClass_SysplexWide.<fieldname>

zFSA	INT	4	(IBM name: SMF42FSA) Total number of CI splits for this interval (across the sysplex)
zFSB	INT	4	(IBM name: SMF42FSB) Total number of CA splits for this interval (across the sysplex).

SMF042#15_VSAM_RLS_StorClass_SysplexWide.zDASumm.<fieldname>

zFCA	INT	4	(IBM name: SMF42FCA) Coupling facility cache partition number.
zFCB	INT	4	(IBM name: SMF42FCB) Total number of direct access requests.
zFCC	INT	4	(IBM name: SMF42FCC) Total number of Read requests - no read integrity.
zFCD	INT	4	(IBM name: SMF42FCD) Total number of Read Requests - Consistent reads.
zFCE	INT	4	(IBM name: SMF42FCE) Total number of Write requests.
zFCF	INT	4	(IBM name: SMF42FCF) Number of direct access BMF requests.
zFCG	INT	4	(IBM name: SMF42FCG) Number of direct access BMF Read Requests.
zFCH	INT	4	(IBM name: SMF42FCH) Number of direct access BMF Write requests.
zFCI	INT	4	(IBM name: SMF42FCI) Number of direct access BMF Read hits.
zFCJ	INT	4	(IBM name: SMF42FCJ) Number of BMF valid Read hits.
zFCK	INT	4	(IBM name: SMF42FCK) Number of BMF false invalids.
zFCL	INT	4	(IBM name: SMF42FCL) Number of requests processed by the sysplex cache manager.
zFCM	INT	4	(IBM name: SMF42FCM) Number of CF Read requests.
zFCN	INT	4	(IBM name: SMF42FCN) Number of CF Write requests.
zFCO	INT	4	(IBM name: SMF42FCO) Number of CF Read hits

zFCP	INT	4	(IBM name: SMF42FCP) Number of Read castins
zFCQ	INT	8	(IBM name: SMF42FCQ) Number of bytes transferred into the DFSMS cache structure.
zFCR	INT	4	(IBM name: SMF42FCR) Number of READ real I/O requests to DASD.
zFCS	INT	4	(IBM name: SMF42FCS) Number of WRITE real I/O requests to DASD.
zFCT	INT	8	(IBM name: SMF42FCT) Total number of bytes transferred for all direct access requests where the data was retrieved from DASD.
zFCU	INT	8	(IBM name: SMF42FCU) Number of DASD for the write requests.
zFCV	CHAR	16	(IBM name: SMF42FCV) Reserved.
zFCW	FIXED	8 (20,3)	(IBM name: SMF42FCW) Total amount of time, in milli seconds, for all the direct access requests in this interval.
zFCX	FIXED	4 (10,3)	(IBM name: SMF42FCX) Average response time for all of the requests in this interval (total time/number of requests).
zFCY	FIXED	4 (10,3)	(IBM name: SMF42FCY) Normalized response time for all of the requests in this interval (total time/number of bytes transferred/4K).
zFCZ	CHAR	8	(IBM name: SMF42FCZ) Reserved.
zFC7	CHAR	32	(IBM name: SMF42FC7) Reserved.

SMF042#15_VSAM_RLS_StorClass_SysplexWide.zDAREDOSumm.<fieldname>

zFDA	INT	4	(IBM name: SMF42FDA) Coupling facility Cache partition number (RE-DO).
zFDB	INT	4	(IBM name: SMF42FDB) Total number of requests to DASD (RE-DO).
zFDC	INT	4	(IBM name: SMF42FDC) Number of read requests - NRI protocol (No Read Integrity) (RE-DO).
zFDD	INT	4	(IBM name: SMF42FDD) Number of read requests - Consistent read protocol (RE-DO).
zFDE	INT	4	(IBM name: SMF42FDE) Number of WRITE requests (RE-DO).
zFDF	INT	4	(IBM name: SMF42FDF) Number of direct access BMF requests (RE-DO).
zFDG	INT	4	(IBM name: SMF42FDG) Number of direct access BMF Read requests (RE-DO).
zFDH	INT	4	(IBM name: SMF42FDH) Number of direct access BMF Write requests (RE-DO).
zFDI	INT	4	(IBM name: SMF42FDI) Number of direct access BMF read hits (RE-DO).
zFDJ	INT	4	(IBM name: SMF42FDJ) Number of direct access BMF valid read hits (RE-DO).
zFDK	INT	4	(IBM name: SMF42FDK) Number of BMF false invalids (RE-DO).
zFDL	INT	4	(IBM name: SMF42FDL) Number of requests processed by the Sysplex Cache Manager
zFDM	INT	4	(IBM name: SMF42FDM) Number of CF cache structure Read requests (RE-DO).
zFDN	INT	4	

			(IBM name: SMF42FDN) Number of CF cache structure Write requests (RE-DO).
zFDO	INT	4	(IBM name: SMF42FDO) Number of CF cache structure read hits (RE-DO).
zFDP	INT	4	(IBM name: SMF42FDP) Number of CF cache structure read castins (RE-DO).
zFDQ	INT	8	(IBM name: SMF42FDQ) Number of bytes transferred into DFSMS cache structure (RE-DO).
zFDR	INT	4	(IBM name: SMF42FDR) Number of READ real I/O direct requests to DASD (RE-DO).
zFDS	INT	4	(IBM name: SMF42FDS) Number of WRITE real I/O direct requests to DASD (RE-DO).
zFDT	INT	8	(IBM name: SMF42FDT) Total number of bytes transferred to DASD for the read requests.
zFDU	INT	8	(IBM name: SMF42FDU) Total number of bytes transferred to DASD for the write requests.
zFDV	CHAR	16	(IBM name: SMF42FDV) Reserved. (RE-DO)
zFDW	FIXED	8 (20,3)	(IBM name: SMF42FDW) Total amount of time, in milli seconds, for all direct access requests in this interval (RE-DO).
zFDX	FIXED	4 (10,3)	(IBM name: SMF42FDX) Average response time for all of the direct access requests in this interval (total time/number of requests) (RE-DO).
zFDY	FIXED	4 (10,3)	(IBM name: SMF42FDY) Normalized response time for all of the requests in this interval (total time/number of bytes transferred/4K) (RE-DO).

Secondary segment: **SMF042#15_VSAM_RLS_StorClass_CF_SYS**

Field Name	Type	Len	Description
<i>SMF042#15_VSAM_RLS_StorClass_CF_SYS.<fieldname></i>			
zFBA	INT	4	(IBM name: SMF42FBA) Interval length. This is the total length, in seconds, of the measurement period.
zF03	CHAR	12	(IBM name: SMF42F03) Indicates if DFSMS greater than 4K CF caching is active. Value is GT4KACTIVE or GT4KNOTACT.
zFBB	INT	2	(IBM name: SMF42FBB) Length of the storage class name.
zFBC	CHAR	30	(IBM name: SMF42FBC) Storage class name.
zF04	INT	2	(IBM name: SMF42F04) Cache Set Name Length
zFBD	CHAR	30	(IBM name: SMF42FBD) DFSMS Cache Set name.
zFBE	CHAR	8	(IBM name: SMF42FBE) MVS system name.
zF05	CHAR	8	(IBM name: SMF42F05) Reserved.
zFBF	CHAR	2	(IBM name: SMF42FBF) Reserved.
zFBG	CHAR	30	(IBM name: SMF42FBG) DFP CF cache structure name.
zFBH	INT	4	

			(IBM name: SMF42FBH) Number of lock requests processed.
zFBI	INT	4	(IBM name: SMF42FBI) Number of true contention lock requests.
zFBJ	INT	4	(IBM name: SMF42FBJ) Number of false contention lock requests.
zFB2	INT	2	(IBM name: SMF42FB2) SMS Direct Weight
zFB3	INT	2	(IBM name: SMF42FB3) SMS Sequential Weight
zFBL	CHAR	8	(IBM name: SMF42FBL) Reserved.
zFTA	INT	4	(IBM name: SMF42FTA) Total number of CI splits for this interval.
zFTB	INT	4	(IBM name: SMF42FTB) Total number of CA splits for this interval.

zFKB	INT	4	(IBM name: SMF42FKB) Total number of sequential access requests.
zFKC	INT	4	(IBM name: SMF42FKC) Number of read requests - NRI protocol (No Read Integrity).
zFKD	INT	4	(IBM name: SMF42FKD) Number of read requests - Consistent read protocol.
zFKE	INT	4	(IBM name: SMF42FKE) Number of Write requests.
zFKF	INT	4	(IBM name: SMF42FKF) Number of sequential access BMF requests.
zFKG	INT	4	(IBM name: SMF42FKG) Number of sequential access BMF Read requests.
zFKH	INT	4	(IBM name: SMF42FKH) Number of sequential access BMF Write requests.
zFKI	INT	4	(IBM name: SMF42FKI) Number of sequential access BMF read hits.
zFKJ	INT	4	(IBM name: SMF42FKJ) Number of sequential access BMF valid read hits.
zFKK	INT	4	(IBM name: SMF42FKK) Number of sequential BMF false invalids.
zFKL	INT	4	(IBM name: SMF42FKL) Number of sequential access CF cache structure requests.
zFKM	INT	4	(IBM name: SMF42FKM) Number of sequential access CF cache structure Read requests.
zFKN	INT	4	(IBM name: SMF42FKN) Number of sequential access CF cache structure Write requests.
zFKO	INT	4	(IBM name: SMF42FKO) Number of sequential access CF cache structure read hits.
zFKP	INT	4	(IBM name: SMF42FKP) Number of sequential access CF cache structure read castins.
zFKQ	INT	8	(IBM name: SMF42FKQ) Number of sequential access CF cache structure bytes transferred.

zFKR	INT	4	(IBM name: SMF42FKR) Total number of READ real I/O sequential requests to DASD.
zFKS	INT	4	(IBM name: SMF42FKS) Total number of WRITE real I/O sequential requests to DASD.
zFKT	INT	8	(IBM name: SMF42FKT) Total number of bytes transferred to DASD for the read requests.
zFKU	INT	8	(IBM name: SMF42FKU) Total number of bytes transferred to DASD for the write requests.
zFKV	CHAR	16	(IBM name: SMF42FKV) Reserved.
zFKW	FIXED	8 (20,3)	(IBM name: SMF42FKW) Total amount of time, in milli seconds, for all sequential access requests in this interval.
zFKX	FIXED	4 (10,3)	(IBM name: SMF42FKX) Average response time for all of the sequential access requests in this interval (total time/number of requests).
zFKY	FIXED	4 (10,3)	(IBM name: SMF42FKY) Normalized response time for all of the requests in this interval (total time/number of bytes transferred/4K).
zFKZ	CHAR	8	(IBM name: SMF42FKZ) Reserved.
zFK7	CHAR	32	(IBM name: SMF42FK7) Reserved.

zFNA	INT	4	(IBM name: SMF42FNA) Coupling facility cache partition number.
zFNB	INT	4	(IBM name: SMF42FNB) Total number of sequential access requests. (Pre-format)
zFNC	INT	4	(IBM name: SMF42FNC) Number of read requests - NRI protocol (No Read Integrity). (Pre-format)
zFND	INT	4	(IBM name: SMF42FND) Number of read requests - Consistent read protocol. (Pre-format)
zFNE	INT	4	(IBM name: SMF42FNE) Number of Write requests. (Pre-format)
zFNF	INT	4	(IBM name: SMF42FNF) Number of sequential access BMF requests. (Pre-format)
zFNG	INT	4	(IBM name: SMF42FNG) Number of sequential access BMF Read requests. (Pre-format)
zFNH	INT	4	(IBM name: SMF42FNH) Number of sequential access BMF Write requests. (Pre-format)
zFNI	INT	4	(IBM name: SMF42FNI) Number of sequential access BMF read hits. (Pre-format)
zFNJ	INT	4	(IBM name: SMF42FNJ) Number of sequential access BMF valid read hits. (Pre-format)
zFNK	INT	4	(IBM name: SMF42FNK) Number of BMF false invalids. (Pre-format)
zFNL	INT	4	(IBM name: SMF42FNL) Number of sequential access CF cache structure requests. (Pre-format)

zFNM	INT	4	(IBM name: SMF42FNM) Number of sequential access CF cache structure Read requests. (Pre-format)
zFNN	INT	4	(IBM name: SMF42FNN) Number of sequential access CF cache structure Write requests. (read ahead)
zFNO	INT	4	(IBM name: SMF42FNO) Number of sequential access CF cache structure read hits. (read ahead)
zFNP	INT	4	(IBM name: SMF42FNP) Number of sequential access CF cache structure read castins. (Pre-format)
zFNQ	INT	8	(IBM name: SMF42FNQ) Number of sequential access CF cache structure bytes transferred. (Pre-format)
zFNR	INT	4	(IBM name: SMF42FNR) Total number of READ real I/O sequential requests to DASD. (Pre-format)
zFNS	INT	4	(IBM name: SMF42FNS) Total number of WRITE real I/O sequential requests to DASD. (pre-format)
zFNT	INT	8	(IBM name: SMF42FNT) Total number of bytes transferred to DASD for the read requests.
zFNU	INT	8	(IBM name: SMF42FNU) Total number of bytes transferred to DASD for the write requests.
zFNV	CHAR	16	(IBM name: SMF42FNV) Reserved.
zFNW	FIXED	8 (20,3)	(IBM name: SMF42FNW) Total amount of time, in milli seconds, for all sequential access (pre-format) requests in this interval.
zFNX	FIXED	4 (10,3)	(IBM name: SMF42FNX) Average response time for all of the sequential access (pre-format) requests in this interval (total time/number of requests).
zFNY	FIXED	4 (10,3)	(IBM name: SMF42FNY) Normalized response time for all of the requests in this interval (total time/number of bytes transferred/4K). (pre-format)
zFNZ	CHAR	8	(IBM name: SMF42FNZ) Reserved.
zFN7	CHAR	32	(IBM name: SMF42FN7) Reserved.
zFRA	INT	4	(IBM name: SMF42FRA) Number of record lock requests (obtain/alter/promote).
zFRB	INT	4	(IBM name: SMF42FRB) Number of record lock requests that cause true contention.
zFRC	INT	4	(IBM name: SMF42FRC) Number of record lock requests that cause false contention.
zFRD	INT	4	(IBM name: SMF42FRD) Number of record lock release requests.
zFRE	INT	4	(IBM name: SMF42FRE) Number of component_1 type lock requests.
zFRF	INT	4	(IBM name: SMF42FRF) Number of component_1 type release lock requests.
zFVA	INT	4	(IBM name: SMF42FVA) Accumulation of waiters for record lock.
zFVB	INT	4	(IBM name: SMF42FVB) Number of record locks hashed to the same hash table entry.
zFRH	INT	4	(IBM name: SMF42FRH) Number of component_1 class_1 (DIWA) locks (obtain/alter/promote).
zFRI	INT	4	(IBM name: SMF42FRI) Number of component_1 class_1 (DIWA) locks that cause true contention.
zFRJ	INT	4	(IBM name: SMF42FRJ) Number of component_1 class_1 (DIWA) locks that cause false contention.

zFRK	INT	4	(IBM name: SMF42FRK) Number of component_1 class_1 (DIWA) release lock requests.
zFRL	INT	4	(IBM name: SMF42FRL) Number of component_1 class_2 (UPGRADE) locks (obtain/alter/promote).
zFRM	INT	4	(IBM name: SMF42FRM) Number of component_1 class_2 (UPGRADE) locks that cause true contention.
zFRN	INT	4	(IBM name: SMF42FRN) Number of component_1 class_2 (UPGRADE) locks that cause false contention.
zFRO	INT	4	(IBM name: SMF42FRO) Number of component_1 class_2 (UPGRADE) release lock requests.
zFRP	INT	4	(IBM name: SMF42FRP) Number of component_1 class_3 (PREFORMAT) locks (obtain/alter/promote).
zFRQ	INT	4	(IBM name: SMF42FRQ) Number of component_1 class_3 (PREFORMAT) locks that cause true contention.
zFRR	INT	4	(IBM name: SMF42FRR) Number of component_1 class_3 (PREFORMAT) locks that cause false contention.
zFRS	INT	4	(IBM name: SMF42FRS) Number of component_1 class_3 (PREFORMAT) release lock requests.
zFRT	INT	4	(IBM name: SMF42FRT) Number of component_2 lock requests (obtain/alter/promote).
zFRU	INT	4	(IBM name: SMF42FRU) Number of component_2 locks that cause true contention.
zFRV	INT	4	(IBM name: SMF42FRV) Number of component_2 locks that cause false contention.
zFRW	INT	4	(IBM name: SMF42FRW) Number of component_2 release lock requests.
zFVD	INT	4	(IBM name: SMF42FVD) Accumulation of waiters for DIWA lock.
zFVE	INT	4	(IBM name: SMF42FVE) Accumulation of waiters for UPGRADE lock.
zFVF	INT	4	(IBM name: SMF42FVF) Accumulation of waiters for COMP2 lock.
zFVG	INT	4	(IBM name: SMF42FVG) Number of locks (DIWA, UPGRADE, and COMP2) hashed to the same hash table entry.
zFSH	INT	4	(IBM name: SMF42FSH) Number of component_1 class 4 (INDEX Record) locks (obtain/alter/promote).
zFSI	INT	4	(IBM name: SMF42FSI) Number of component_1 class 4 (INDEX Record) locks that cause true contention.
zFSJ	INT	4	(IBM name: SMF42FSJ) Number of component_1 class 4 (INDEX Record) locks that cause false contention.
zFSK	INT	4	(IBM name: SMF42FSK) Number of component_1 class 4 (INDEX Record) release lock requests.
zFQR	FIXED	8 (20,3)	(IBM name: SMF42FQR) Total time all thread requests.
zFQS	INT	4	(IBM name: SMF42FQS) Total number of all thread requests.
zFQT	CHAR	4	(IBM name: SMF42FQT) Reserved.
zFQU	FIXED	4 (10,3)	(IBM name: SMF42FQU) Average response time for all of the thread requests in the interval. (Total

			time/number of thread requests)
zFQV	FIXED	4 (10,3)	(IBM name: SMF42FQV) Normalized response time for all of the thread requests in the interval. (Total time/number of bytes transferred/4K)
zFQW	CHAR	8	(IBM name: SMF42FQW) Reserved.
zFBM	CHAR	16	(IBM name: SMF42FBM) Lock structure name.
zFBN	CHAR	8	(IBM name: SMF42FBN) Lock set.

Secondary segment: SMF042#15_VSAM_RLS_StorClass_SysplexWide_64

Field Name	Type	Len	Description
<i>SMF042#15_VSAM_RLS_StorClass_SysplexWide_64.<fieldname></i>			
zFAA	INT	4	(IBM name: SMF42FAA) Interval length. This is the total length, in seconds, of the measurement period.
zF00	CHAR	12	(IBM name: SMF42F00) Indicates if DFSMS greater than 4K CF caching is active. Value is GT4KACTIVE or GT4KNOTACT.
zFAB	INT	2	(IBM name: SMF42FAB) Length of the storage class name.
zFAC	CHAR	30	(IBM name: SMF42FAC) Storage class name.
zF01	INT	2	(IBM name: SMF42F01) Length of DFSMS cache set name.
zFAD	CHAR	30	(IBM name: SMF42FAD) DFSMS cache set name.
zFAE	INT	4	(IBM name: SMF42FAE) Number of lock requests processed.
zFAF	INT	4	(IBM name: SMF42FAF) Number of true contention lock requests.
zFAG	INT	4	(IBM name: SMF42FAG) Number of false contention lock requests.
zF02	INT	2	(IBM name: SMF42F02) DFSMS direct weight
zF12	INT	2	(IBM name: SMF42F12) DFSMS sequential weight
zFAH	CHAR	8	(IBM name: SMF42FAH) Reserved.
zFSA	INT	4	(IBM name: SMF42FSA) Total number of CI splits for this interval (across the sysplex).
zFSB	INT	4	(IBM name: SMF42FSB) Total number of CA splits for this interval (across the sysplex).
<i>SMF042#15_VSAM_RLS_StorClass_SysplexWide_64.zDASumm.<fieldname></i>			
zFCA	INT	4	(IBM name: SMF42FCA) Coupling facility cache partition number.
zFCB	INT	4	(IBM name: SMF42FCB) Total number of direct access requests.
zFCC	INT	4	(IBM name: SMF42FCC) Total number of Read requests - no read integrity.
zFCD	INT	4	

			(IBM name: SMF42FCD) Total number of Read Requests - Consistent reads.
zFCE	INT	4	(IBM name: SMF42FCE) Total number of Write requests.
zFCF	INT	4	(IBM name: SMF42FCF) Number of direct access BMF requests.
zFCG	INT	4	(IBM name: SMF42FCG) Number of direct access BMF Read Requests.
zFCH	INT	4	(IBM name: SMF42FCH) Number of direct access BMF Write requests.
zFCI	INT	4	(IBM name: SMF42FCI) Number of direct access BMF Read hits.
zFCJ	INT	4	(IBM name: SMF42FCJ) Number of BMF valid Read hits.
zFCK	INT	4	(IBM name: SMF42FCK) Number of BMF false invalids.
zFCL	INT	4	(IBM name: SMF42FCL) Number of requests processed by the sysplex cache manager.
zFCM	INT	4	(IBM name: SMF42FCM) Number of CF Read requests.
zFCN	INT	4	(IBM name: SMF42FCN) Number of CF Write requests.
zFCO	INT	4	(IBM name: SMF42FCO) Number of CF Read hits
zFCP	INT	4	(IBM name: SMF42FCP) Number of Read castins
zFCQ	INT	8	(IBM name: SMF42FCQ) Number of bytes transferred into the DFSMS cache structure.
zFCR	INT	4	(IBM name: SMF42FCR) Number of READ real I/O requests to DASD.
zFCS	INT	4	(IBM name: SMF42FCS) Number of WRITE real I/O requests to DASD.
zFCT	INT	8	(IBM name: SMF42FCT) Total number of bytes transferred for all direct access requests where the data was retrieved from DASD.
zFCU	INT	8	(IBM name: SMF42FCU) Number of DASD for the write requests.
zFCV	CHAR	16	(IBM name: SMF42FCV) Reserved.
zFCW	FIXED	8 (20,3)	(IBM name: SMF42FCW) Total amount of time, in milli seconds, for all the direct access requests in this interval.
zFCX	FIXED	4 (10,3)	(IBM name: SMF42FCX) Average response time for all of the requests in this interval (total time/number of requests).
zFCY	FIXED	4 (10,3)	(IBM name: SMF42FCY) Normalized response time for all of the requests in this interval (total time/number of bytes transferred/4K).
zFCZ	CHAR	8	(IBM name: SMF42FCZ) Reserved.
zFC7	CHAR	32	(IBM name: SMF42FC7) Reserved.

zFOA	INT	4	(IBM name: SMF42FOA) Number of record lock requests (obtain/alter/promote).
zFOB	INT	4	(IBM name: SMF42FOB) Number of record lock requests that cause true contention.
zFOC	INT	4	(IBM name: SMF42FOC) Number of record lock requests that cause false contention.
zFOD	INT	4	(IBM name: SMF42FOD) Number of record lock release requests.
zFOE	INT	4	(IBM name: SMF42FOE) Number of component_1 type lock requests.
zFOF	INT	4	(IBM name: SMF42FOF) Number of component_1 type release lock requests.
zFUA	INT	4	(IBM name: SMF42FUA) Accumulation of waiters for record lock.
zFUB	INT	4	(IBM name: SMF42FUB) Number of record locks hashed to the same hash table entry.
zFOH	INT	4	(IBM name: SMF42FOH) Number of component_1 class_1 (DIWA) locks (obtain/alter/promote).
zFOI	INT	4	(IBM name: SMF42FOI) Number of component_1 class_1 (DIWA) locks that cause true contention.
zFOJ	INT	4	(IBM name: SMF42FOJ) Number of component_1 class_1 (DIWA) locks that cause false contention.
zFOK	INT	4	(IBM name: SMF42FOK) Number of component_1 class_1 (DIWA) release lock requests.
zFOL	INT	4	(IBM name: SMF42FOL) Number of component_1 class_2 (UPGRADE) locks (obtain/alter/promote).
zFOM	INT	4	(IBM name: SMF42FOM) Number of component_1 class_2 (UPGRADE) locks that cause true contention.
zFON	INT	4	(IBM name: SMF42FON) Number of component_1 class_2 (UPGRADE) locks that cause false contention.
zFOO	INT	4	(IBM name: SMF42FOO) Number of component_1 class_2 (UPGRADE) release lock requests.
zFOP	INT	4	(IBM name: SMF42FOP) Number of component_1 class_3 (PREFORMAT) locks (obtain/alter/promote).

zFOQ	INT	4	(IBM name: SMF42FOQ) Number of component_1 class_3 (PREFORMAT) locks that cause true contention.
zFOR	INT	4	(IBM name: SMF42FOR) Number of component_1 class_3 (PREFORMAT) locks that cause false contention.
zFOS	INT	4	(IBM name: SMF42FOS) Number of component_1 class_3 (PREFORMAT) release lock requests.
zFOT	INT	4	(IBM name: SMF42FOT) Number of component_2 lock requests (obtain/alter/ promote).
zFOU	INT	4	(IBM name: SMF42FOU) Number of component_2 locks that cause true contention.
zFOV	INT	4	(IBM name: SMF42FOV) Number of component_2 locks that cause false contention.
zFOW	INT	4	(IBM name: SMF42FOW) Number of component_2 release lock requests.
zFUD	INT	4	(IBM name: SMF42FUD) Accumulation of waiters for DIWA lock.
zFUE	INT	4	(IBM name: SMF42FUE) Accumulation of waiters for UPGRADE lock.
zFUF	INT	4	(IBM name: SMF42FUF) Accumulation of waiters for COMP2 lock.
zFUG	INT	4	(IBM name: SMF42FUG) Number of locks (DIWA, UPGRADE, and COMP2) hashed to the same hash table entry.
zFPH	INT	4	(IBM name: SMF42FPH) Number of component_1 class 4 (INDEX Record) locks (obtain/alter/promote).
zFPI	INT	4	(IBM name: SMF42FPI) Number of component_1 class 4 (INDEX Record) locks that cause true contention.
zFPJ	INT	4	(IBM name: SMF42FPJ) Number of component_1 class 4 (INDEX Record) locks that cause false contention.
zFPK	INT	4	(IBM name: SMF42FPK) Number of component_1 class 4 (INDEX Record) release lock requests.
zFPR	FIXED	8 (20,3)	(IBM name: SMF42FPR) Total time all thread requests.
zFPS	INT	4	(IBM name: SMF42FPS) Total number of all thread requests.
zFPT	CHAR	4	(IBM name: SMF42FPT) Reserved.
zFPU	FIXED	4 (10,3)	(IBM name: SMF42FPU) Average response time for all of the thread requests in the interval. (Total time/number of thread requests).
zFPV	FIXED	4 (10,3)	(IBM name: SMF42FPV) Normalized response time for all of the thread requests in the interval. (Total time/number of bytes transferred/4K).
zFPW	CHAR	8	(IBM name: SMF42FPW) Reserved.
zFAI	CHAR	16	(IBM name: SMF42FAI) Lock structure name.
zFAJ	CHAR	8	(IBM name: SMF42FAJ) Lock set.

Secondary segment: **SMF042#15_VSAM_RLS_StorClass_CF_SYS_64**

Field Name	Type	Len	Description
<i>SMF042#15_VSAM_RLS_StorClass_CF_SYS_64.<fieldname></i>			
zFBA	INT	4	(IBM name: SMF42FBA) Interval length. This is the total length, in seconds, of the measurement period.
zF03	CHAR	12	(IBM name: SMF42F03) Indicates if DFSMS greater than 4K CF caching is active. Value is GT4KACTIVE or GT4KNOTACT.
zFBB	INT	2	(IBM name: SMF42FBB) Length of the storage class name.
zFBC	CHAR	30	(IBM name: SMF42FBC) Storage class name.
zF04	INT	2	(IBM name: SMF42F04) Cache Set Name Length
zFBD	CHAR	30	(IBM name: SMF42FBD) DFSMS Cache Set name.
zFBE	CHAR	8	(IBM name: SMF42FBE) MVS system name.
zF05	CHAR	8	(IBM name: SMF42F05) Reserved.
zFBF	CHAR	2	(IBM name: SMF42FBF) Reserved.
zFBG	CHAR	30	(IBM name: SMF42FBG) DFP CF cache structure name.
zFBH	INT	4	(IBM name: SMF42FBH) Number of lock requests processed.
zFBI	INT	4	(IBM name: SMF42FBI) Number of true contention lock requests.
zFBJ	INT	4	(IBM name: SMF42FBJ) Number of false contention lock requests.
zFB2	INT	2	(IBM name: SMF42FB2) SMS Direct Weight
zFB3	INT	2	(IBM name: SMF42FB3) SMS Sequential Weight
zFBL	CHAR	8	(IBM name: SMF42FBL) Reserved.
zFTA	INT	4	(IBM name: SMF42FTA) Total number of CI splits for this interval.
zFTB	INT	4	(IBM name: SMF42FTB) Total number of CA splits for this interval.

<i>SMF042#15_VSAM_RLS_StorClass_CF_SYS_64.zDASumm.<fieldname></i>			
zFIA	INT	4	(IBM name: SMF42FIA) Coupling facility cache partition number.
zFIB	INT	4	(IBM name: SMF42FIB) Number of direct requests.
zFIC	INT	4	(IBM name: SMF42FIC) Number of read requests - NRI protocol (No Read Integrity).
zFID	INT	4	(IBM name: SMF42FID) Number of read requests - Consistent read protocol.
zFIE	INT	4	(IBM name: SMF42FIE) Number of Write requests.
zFIF	INT	4	(IBM name: SMF42FIF) Number of direct access BMF requests.

zFIG	INT	4	(IBM name: SMF42FIG) Number of direct access BMF Read requests.
zFIH	INT	4	(IBM name: SMF42FIH) Number of direct access BMF Write requests.
zFII	INT	4	(IBM name: SMF42FII) Number of direct access BMF read hits.
zFIJ	INT	4	(IBM name: SMF42FIJ) Number of direct access BMF valid read hits.
zFIK	INT	4	(IBM name: SMF42FIK) Number of BMF false invalids.
zFIL	INT	4	(IBM name: SMF42FIL) Number of direct access CF Cache structure requests.
zFIM	INT	4	(IBM name: SMF42FIM) Number of direct access CF cache structure Read requests.
zFIN	INT	4	(IBM name: SMF42FIN) Number of direct access CF cache structure Write requests.
zFIO	INT	4	(IBM name: SMF42FIO) Number of direct access CF cache structure read hits.
zFIP	INT	4	(IBM name: SMF42FIP) Number of direct access CF cache structure read castins.
zFIQ	INT	8	(IBM name: SMF42FIQ) Number of direct access CF cache structure bytes transferred.
zFIR	INT	4	(IBM name: SMF42FIR) Number of READ real I/O direct requests to DASD.
zFIS	INT	4	(IBM name: SMF42FIS) Number of WRITE real I/O direct requests to DASD.
zFIT	INT	8	(IBM name: SMF42FIT) Total number of bytes transferred to DASD for the read requests.
zFIU	INT	8	(IBM name: SMF42FIU) Total number of bytes transferred to DASD for the write requests.
zFIV	CHAR	16	(IBM name: SMF42FIV) Reserved.
zFIW	FIXED	8 (20,3)	(IBM name: SMF42FIW) Total amount of time, in milli seconds, for all the direct access requests in this interval.
zFIX	FIXED	4 (10,3)	(IBM name: SMF42FIX) Average response time for all of the requests in this interval (total time/number of requests).
zFIY	FIXED	4 (10,3)	(IBM name: SMF42FIY) Normalized response time for all of the requests in this interval (total time/number of bytes transferred/4K).

zFN7	CHAR	32	(IBM name: SMF42FN7) Reserved.
zFRA	INT	4	(IBM name: SMF42FRA) Number of record lock requests (obtain/alter/promote).
zFRB	INT	4	(IBM name: SMF42FRB) Number of record lock requests that cause true contention.
zFRC	INT	4	(IBM name: SMF42FRC) Number of record lock requests that cause false contention.
zFRD	INT	4	(IBM name: SMF42FRD) Number of record lock release requests.
zFRE	INT	4	(IBM name: SMF42FRE) Number of component_1 type lock requests.
zFRF	INT	4	(IBM name: SMF42FRF) Number of component_1 type release lock requests.
zFVA	INT	4	(IBM name: SMF42FVA) Accumulation of waiters for record lock.
zFVB	INT	4	(IBM name: SMF42FVB) Number of record locks hashed to the same hash table entry.
zFRH	INT	4	(IBM name: SMF42FRH) Number of component_1 class_1 (DIWA) locks (obtain/alter/promote).
zFRI	INT	4	(IBM name: SMF42FRI) Number of component_1 class_1 (DIWA) locks that cause true contention.
zFRJ	INT	4	(IBM name: SMF42FRJ) Number of component_1 class_1 (DIWA) locks that cause false contention.
zFRK	INT	4	(IBM name: SMF42FRK) Number of component_1 class_1 (DIWA) release lock requests.
zFRL	INT	4	(IBM name: SMF42FRL) Number of component_1 class_2 (UPGRADE) locks (obtain/alter/promote).
zFRM	INT	4	(IBM name: SMF42FRM) Number of component_1 class_2 (UPGRADE) locks that cause true contention.
zFRN	INT	4	(IBM name: SMF42FRN) Number of component_1 class_2 (UPGRADE) locks that cause false contention.
zFRO	INT	4	(IBM name: SMF42FRO) Number of component_1 class_2 (UPGRADE) release lock requests.
zFRP	INT	4	(IBM name: SMF42FRP) Number of component_1 class_3 (PREFORMAT) locks (obtain/alter/promote).
zFRQ	INT	4	(IBM name: SMF42FRQ) Number of component_1 class_3 (PREFORMAT) locks that cause true contention.
zFRR	INT	4	(IBM name: SMF42FRR) Number of component_1 class_3 (PREFORMAT) locks that cause false contention.
zFRS	INT	4	(IBM name: SMF42FRS) Number of component_1 class_3 (PREFORMAT) release lock requests.
zFRT	INT	4	(IBM name: SMF42FRT) Number of component_2 lock requests (obtain/alter/promote).
zFRU	INT	4	(IBM name: SMF42FRU) Number of component_2 locks that cause true contention.
zFRV	INT	4	(IBM name: SMF42FRV) Number of component_2 locks that cause false contention.

zFRW	INT	4	(IBM name: SMF42FRW) Number of component_2 release lock requests.
zFVD	INT	4	(IBM name: SMF42FVD) Accumulation of waiters for DIWA lock.
zFVE	INT	4	(IBM name: SMF42FVE) Accumulation of waiters for UPGRADE lock.
zFVF	INT	4	(IBM name: SMF42FVF) Accumulation of waiters for COMP2 lock.
zFVG	INT	4	(IBM name: SMF42FVG) Number of locks (DIWA, UPGRADE, and COMP2) hashed to the same hash table entry.
zFSH	INT	4	(IBM name: SMF42FSH) Number of component_1 class 4 (INDEX Record) locks (obtain/alter/promote).
zFSI	INT	4	(IBM name: SMF42FSI) Number of component_1 class 4 (INDEX Record) locks that cause true contention.
zFSJ	INT	4	(IBM name: SMF42FSJ) Number of component_1 class 4 (INDEX Record) locks that cause false contention.
zFSK	INT	4	(IBM name: SMF42FSK) Number of component_1 class 4 (INDEX Record) release lock requests.
zFQR	FIXED	8 (20,3)	(IBM name: SMF42FQR) Total time all thread requests.
zFQS	INT	4	(IBM name: SMF42FQS) Total number of all thread requests.
zFQT	CHAR	4	(IBM name: SMF42FQT) Reserved.
zFQU	FIXED	4 (10,3)	(IBM name: SMF42FQU) Average response time for all of the thread requests in the interval. (Total time/number of thread requests)
zFQV	FIXED	4 (10,3)	(IBM name: SMF42FQV) Normalized response time for all of the thread requests in the interval. (Total time/number of bytes transferred/4K)
zFQW	CHAR	8	(IBM name: SMF42FQW) Reserved.
zFBM	CHAR	16	(IBM name: SMF42FBM) Lock structure name.
zFBN	CHAR	8	(IBM name: SMF42FBN) Lock set.

Record Type 42 Subtype 16 - VSAM RLS CF Data Set Response Time

Primary Segment:

- SMF042#16_DFSMS

Secondary Segment(s): 5 (in alphabetical order)

- SMF042#16_Product_Section
- SMF042#16_VSAM_RLS_Dataset_CF_SYS
- SMF042#16_VSAM_RLS_Dataset_CF_SYS_64
- SMF042#16_VSAM_RLS_Dataset_SysplexWide
- SMF042#16_VSAM_RLS_Dataset_SysplexWide_64

Primary segment: SMF042#16_DFSMS

Field Name	Type	Len	Description
SMF042#16_DFSMS.<fieldname>			
SMF042#16_DFSMS.Header.<fieldname>			
zFLG	HEX	1	(IBM name: SMF42FLG) System indicator: Bit Meaning when set 0 Subsystem identification follows system identification 1 Subtypes used 2 Reserved 3-6 Version indicators 7 Reserved.
zRTY	INT	1	(IBM name: SMF42RTY) Record type 42 (X'2A').
zTME	TSTMP	8	(IBM name: SMF42TME) Date/Time when the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF42SID) System identification (from the SID parameter).
zSSI	CHAR	4	(IBM name: SMF42SSI) Subsystem identification.
zSTY	INT	2	(IBM name: SMF42STY) Record SubType.
zSTYe	INT (ENUM)	2	(IBM name: N/A) Record subtype description.
SMF042#16_DFSMS.Self_defining_Section.<fieldname>			
zNT	INT	2	(IBM name: SMF42NT) Number of triplets in record. A triplet is a set of offset/length/number values that defines a section of the record. (Optional.)
zOPS	INT	4	(IBM name: SMF42OPS) Offset to product section from start of record, including record descriptor word (RDW).
zLPS	INT	2	(IBM name: SMF42LPS) Length of product section.
zNPS	INT	2	(IBM name: SMF42NPS) Number of product sections.
zGX1	INT	4	(IBM name: N/A) Offset to sysplex-wide data set summary section.
zGX2	INT	2	(IBM name: N/A) Length of sysplex-wide data set summary section.
zGX3	INT	2	(IBM name: N/A) Number of sysplex-wide data set summary sections.
zGX4	INT	4	(IBM name: N/A) Offset to data set, CF, SYS summary section.
zGX5	INT	2	(IBM name: N/A) Total length of all data set, CF, SYS summary sections.

zGX6	INT	2	(IBM name: SMF42GX6) Number of data set, CF, SYS summary sections.
zGX7	INT	4	(IBM name: N/A) Offset to sysplex-wide data set summary section.
zGX8	INT	2	(IBM name: N/A) Length of sysplex-wide data set summary section.
zGX9	INT	2	(IBM name: N/A) Number of sysplex-wide data set summary sections.
zGXA	INT	4	(IBM name: N/A) Offset to data set, CF, SYS summary section.
zGXB	INT	2	(IBM name: N/A) Total length of all data set, CF, SYS summary sections.
zGXC	INT	2	(IBM name: N/A) Number of data set, CF, SYS summary sections.

Secondary segment: **SMF042#16_Product_Section**

Field Name	Type	Len	Description
<i>SMF042#16_Product_Section.<fieldname></i>			
zPDL	CHAR	8	(IBM name: SMF42PDL) Product level.
zPDN	CHAR	10	(IBM name: SMF42PDN) Product name.
zPSV	INT	1	(IBM name: SMF42PSV) SubType version number 0 => VOLUME header section does not exist, 1 => VOLUME header section exists.
zPTS	TSTMP	8	(IBM name: SMF42PTS) Interval Start or OPEN time of day. This is zero if not available. These values are in time-of-day (TOD) clock format, and reflect GMT time, not local time.
zPTE	TSTMP	8	(IBM name: SMF42PTE) Interval End or CLOSE time of day. This is zero if not available. These values are in time-of-day (TOD) clock format, and reflect GMT time, not local time.

Secondary segment: **SMF042#16_VSAM_RLS_Dataset_SysplexWide**

Field Name	Type	Len	Description
<i>SMF042#16_VSAM_RLS_Dataset_SysplexWide.<fieldname></i>			
zGAA	INT	4	(IBM name: SMF42GAA) Interval length. This is the total time, in seconds, of the measurement period.
zGAB	CHAR	44	(IBM name: SMF42GAB) Data set name
zGAC	CHAR	44	(IBM name: SMF42GAC) VSAM sphere name.
zGAD	INT	2	(IBM name: SMF42GAD) Length of the storage class name.
zGAE	CHAR	30	(IBM name: SMF42GAE) Storage class name.
zA03	INT	2	(IBM name: SMF42A03) Length of DFSMS CacheSet name.

zGAF	CHAR	30	(IBM name: SMF42GAF) DFSMS CacheSet name.
zGAH	CHAR	30	(IBM name: SMF42GAH) DFP CF cache structure name.

SMF042#16_VSAM_RLS_Dataset_SysplexWide.zGAI.<fieldname>

zGDATA	BIT	1	DATA component.
zGINDEX	BIT	1	INDEX component.

SMF042#16_VSAM_RLS_Dataset_SysplexWide.<fieldname>

zGAJ	CHAR	12	(IBM name: SMF42GAJ) Indicates DFSMS greater than 4K CF caching status. Value is ALL, NONE, UPDATESONLY, DIRONLY or GT4KNOTACT.
zGZ1	INT	2	(IBM name: SMF42GZ1) SMS Direct Weight.
zGZ2	INT	2	(IBM name: SMF42GZ2) SMS Sequential Weight.
zGAN	CHAR	8	(IBM name: SMF42GAN) In DFSMS 1.4 WLM Server class name
zGAO	CHAR	8	(IBM name: SMF42GAO) In DFSMS 1.4 WLM report class name
zGAP	CHAR	16	(IBM name: SMF42GAP) SMS data class name

SMF042#16_VSAM_RLS_Dataset_SysplexWide.zDASumm.<fieldname>

zGCA	INT	4	(IBM name: SMF42GCA) Coupling facility cache partition number.
zGCB	INT	4	(IBM name: SMF42GCB) Total number of direct access requests.
zGCC	INT	4	(IBM name: SMF42GCC) Number of read requests - NRI protocol (No Read Integrity).
zGCD	INT	4	(IBM name: SMF42GCD) Number of read requests - Consistent read protocol.
zGCE	INT	4	(IBM name: SMF42GCE) Number of Write requests.
zCGF	INT	4	(IBM name: SMF42CGF) Number of direct access BMF requests.
zGCG	INT	4	(IBM name: SMF42GCG) Number of direct access BMF Read requests.
zGCH	INT	4	(IBM name: SMF42GCH) Number of direct access BMF Write requests.
zGCI	INT	4	(IBM name: SMF42GCI) Number of direct access BMF read hits.
zGCJ	INT	4	(IBM name: SMF42GCJ) Number of direct access BMF valid read hits.
zGCK	INT	4	(IBM name: SMF42GCK) Number of BMF false invalids.
zGCL	INT	4	(IBM name: SMF42GCL) Number of direct access CF cache structure requests.
zGCM	INT	4	(IBM name: SMF42GCM) Number of direct access CF cache structure Read requests.
zGCN	INT	4	(IBM name: SMF42GCN) Number of direct access CF cache structure Write requests.
zGCO	INT	4	(IBM name: SMF42GCO) Number of direct access CF cache structure read hits.
zGCP	INT	4	

			(IBM name: SMF42GCP) Number of direct access CF cache structure read castins.
zGCQ	INT	8	(IBM name: SMF42GCQ) Number of bytes transferred into the DFSMS cache structure.
zGCR	INT	4	(IBM name: SMF42GCR) Total number READ of real I/O direct requests to DASD.
zGCS	INT	4	(IBM name: SMF42GCS) Total number WRITE of real I/O direct requests to DASD.
zGCT	INT	8	(IBM name: SMF42GCT) Total number of bytes transferred to DASD for the read requests.
zGCU	INT	8	(IBM name: SMF42GCU) Total number of bytes transferred to DASD for the write requests.
zGCW	FIXED	8 (20,3)	(IBM name: SMF42GCW) Total amount of time, in milli seconds, for all the direct access requests in this interval.
zGCX	FIXED	4 (10,3)	(IBM name: SMF42GCX) Average response time for all of the requests in this interval (total time/number of requests).
zGCY	FIXED	4 (10,3)	(IBM name: SMF42GCY) Normalized response time for all of the requests in this interval (total time/number of bytes transferred/4K).

SMF042#16_VSAM_RLS_Dataset_SysplexWide.zDAREDOSumm.<fieldname>

zGDA	INT	4	(IBM name: SMF42GDA) Coupling facility cache partition number.
zGDB	INT	4	(IBM name: SMF42GDB) Total number of direct access requests. (RE-DO)
zGDC	INT	4	(IBM name: SMF42GDC) Number of read requests - NRI protocol (No Read Integrity). (RE-DO)
zGDD	INT	4	(IBM name: SMF42GDD) Number of read requests - Consistent read protocol. (RE-DO)
zGDE	INT	4	(IBM name: SMF42GDE) Number of Write requests. (RE-DO)
zGDF	INT	4	(IBM name: SMF42GDF) Number of direct access BMF requests. (RE-DO)
zGDG	INT	4	(IBM name: SMF42GDG) Number of direct access BMF Read requests. (RE-DO)
zGDH	INT	4	(IBM name: SMF42GDH) Number of direct access BMF Write requests. (RE-DO)
zGDI	INT	4	(IBM name: SMF42GDI) Number of direct access BMF read hits. (RE-DO)
zGDJ	INT	4	(IBM name: SMF42GDJ) Number of direct access BMF valid read hits. (RE-DO)
zGDK	INT	4	(IBM name: SMF42GDK) Number of BMF false invalids. (RE-DO)
zGDL	INT	4	(IBM name: SMF42GDL) Number of direct access CF cache structure requests. (RE-DO)
zGDM	INT	4	(IBM name: SMF42GDM) Number of direct access CF cache structure Read requests. (RE-DO)
zGDN	INT	4	(IBM name: SMF42GDN) Number of direct access CF cache structure Write requests. (RE-DO)
zGDO	INT	4	(IBM name: SMF42GDO) Number of direct access CF cache structure read hits. (RE-DO)
zGDP	INT	4	(IBM name: SMF42GDP) Number of direct access CF cache structure read castins. (RE-DO)
zGDQ	INT	8	(IBM name: SMF42GDQ) Number of direct access CF cache structure byte transferred. (RE-DO)

zGDR	INT	4	(IBM name: SMF42GDR) Total number of READ real I/O direct requests to DASD. (RE-DO)
zGDS	INT	4	(IBM name: SMF42GDS) Total number of WRITE real I/O direct requests to DASD. (RE-DO)
zGDT	INT	8	(IBM name: SMF42GDT) Total number of bytes transferred to DASD for the read requests.
zGDU	INT	8	(IBM name: SMF42GDU) Total number of bytes transferred to DASD for the write requests.
zGDW	FIXED	8 (20,3)	(IBM name: SMF42GDW) Total amount of time, in milli seconds, for all direct access (RE-DO) requests in this interval.
zGDX	FIXED	4 (10,3)	(IBM name: SMF42GDX) Average response time for all of the direct access (RE-DO) requests in this interval (total time/number of requests).
zGDY	FIXED	4 (10,3)	(IBM name: SMF42GDY) Normalized response time for all of the requests in this interval (total time/number of bytes transferred/4K). (RE-DO)

SMF042#16_VSAM_RLS_Dataset_SysplexWide.zSASumm.<fieldname>

zGEA	INT	4	(IBM name: SMF42GEA) Coupling facility cache partition number.
zGEB	INT	4	(IBM name: SMF42GEB) Total number of sequential access requests.
zGDC	INT	4	(IBM name: SMF42GDC) Number of read requests - NRI protocol (No Read Integrity).
zGED	INT	4	(IBM name: SMF42GED) Number of read requests - Consistent read protocol.
zGEE	INT	4	(IBM name: SMF42GEE) Number of Write requests.
zGEF	INT	4	(IBM name: SMF42GEF) Number of direct access BMF requests.
zGEG	INT	4	(IBM name: SMF42GEG) Number of direct access BMF Read requests.
zGEH	INT	4	(IBM name: SMF42GEH) Number of direct access BMF Write requests.
zGEI	INT	4	(IBM name: SMF42GEI) Number of direct access BMF read hits.
zGEJ	INT	4	(IBM name: SMF42GEJ) Number of direct access BMF valid read hits.
zGEK	INT	4	(IBM name: SMF42GEK) Number of BMF false invalids.
zGEL	INT	4	(IBM name: SMF42GEL) Number of direct access CF cache structure requests.
zGEM	INT	4	(IBM name: SMF42GEM) Number of direct access CF cache structure Read requests.
zGEN	INT	4	(IBM name: SMF42GEN) Number of direct access CF cache structure Write requests.
zGEO	INT	4	(IBM name: SMF42GEO) Number of direct access CF cache structure read hits.
zGEP	INT	4	(IBM name: SMF42GEP) Number of direct access CF cache structure read castins.
zGEQ	INT	8	(IBM name: SMF42GEQ) Number of direct access CF cache structure byte transferred.
zGER	INT	4	(IBM name: SMF42GER) Total number of READ real I/O sequential requests to DASD.
zGES	INT	4	(IBM name: SMF42GES) Total number of WRITE real I/O sequential requests to DASD.

zGET	INT	8	(IBM name: SMF42GET) Total number of bytes transferred to DASD for the read requests.
zGEU	INT	8	(IBM name: SMF42GEU) Total number of bytes transferred to DASD for the write requests.
zGEW	FIXED	8 (20,3)	(IBM name: SMF42GEW) Total amount of time, in milli seconds, for all sequential access requests in this interval.
zGEX	FIXED	4 (10,3)	(IBM name: SMF42GEX) Average response time for all of the sequential access requests in this interval (total time/number of requests).
zGEY	FIXED	4 (10,3)	(IBM name: SMF42GEY) Normalized response time for all of the requests in this interval (total time/number of bytes transferred/4K).

SMF042#16_VSAM_RLS_Dataset_SysplexWide.zSAREDOSumm.<fieldname>

zGFA	INT	4	(IBM name: SMF42GFA) Coupling facility cache partition number.
zGFB	INT	4	(IBM name: SMF42GFB) Total number of direct access requests. (RE-DO)
zGFC	INT	4	(IBM name: SMF42GFC) Number of read requests - NRI protocol (No Read Integrity). (RE-DO)
zGFD	INT	4	(IBM name: SMF42GFD) Number of read requests - Consistent read protocol. (RE-DO)
zGFE	INT	4	(IBM name: SMF42GFE) Number of Write requests.(RE-DO)
zGFF	INT	4	(IBM name: SMF42GFF) Number of direct access BMF requests. (RE-DO)
zGFG	INT	4	(IBM name: SMF42GFG) Number of direct access BMF Read requests. (RE-DO)
zGFH	INT	4	(IBM name: SMF42GFH) Number of direct access BMF Write requests. (RE-DO)
zGFI	INT	4	(IBM name: SMF42GFI) Number of direct access BMF read hits. (RE-DO)
zGFJ	INT	4	(IBM name: SMF42GFJ) Number of direct access BMF valid read hits. (RE-DO)
zGFK	INT	4	(IBM name: SMF42GFK) Number of BMF false invalids. (RE-DO)
zGFL	INT	4	(IBM name: SMF42GFL) Number of direct access CF cache structure requests. (RE-DO)
zGFM	INT	4	(IBM name: SMF42GFM) Number of direct access CF cache structure Read requests. (RE-DO)
zGFN	INT	4	(IBM name: SMF42GFN) Number of direct access CF cache structure Write requests. (RE-DO)
zGFO	INT	4	(IBM name: SMF42GFO) Number of direct access CF cache structure read hits. (RE-DO)
zGFP	INT	4	(IBM name: SMF42GFP) Number of direct access CF cache structure read castins. (RE-DO)
zGFQ	INT	8	(IBM name: SMF42GFQ) Number of direct access CF cache structure byte transferred. (RE-DO)
zGFR	INT	4	(IBM name: SMF42GFR) Total number of real READ I/O sequential requests to DASD. (RE-DO)
zGFS	INT	4	(IBM name: SMF42GFS) Total number of real WRITE I/O sequential requests to DASD. (RE-DO)
zGFT	INT	8	(IBM name: SMF42GFT) Total number of bytes transferred to DASD for the read requests.
zGFU	INT	8	(IBM name: SMF42GFU) Total number of bytes transferred to DASD for the write requests.

zGFW	FIXED	8 (20,3)	(IBM name: SMF42GFW) Total amount of time, in milli seconds, for all sequential access (RE-DO) requests in this interval.
zGFX	FIXED	4 (10,3)	(IBM name: SMF42GFX) Average response time for all of the sequential access (RE-DO) requests in this interval (total time/number of requests).
zGFY	FIXED	4 (10,3)	(IBM name: SMF42GFY) Normalized response time for all of the requests in this interval (total time/number of bytes transferred/4K). (RE-DO)

zGHL	INT	4	(IBM name: SMF42GHL) Number of direct access CF cache structure requests. (pre-format)
zGHM	INT	4	(IBM name: SMF42GHM) Number of direct access CF cache structure Read requests. (pre-format)
zGHN	INT	4	(IBM name: SMF42GHN) Number of direct access CF cache structure Write requests. (pre-format)
zGHO	INT	4	(IBM name: SMF42GHO) Number of direct access CF cache structure read hits. (pre-format)
zGHP	INT	4	(IBM name: SMF42GHP) Number of direct access CF cache structure read castins. (pre-format)
zGHQ	INT	8	(IBM name: SMF42GHQ) Number of direct access CF cache structure byte transferred. (pre-format)
zGHR	INT	4	(IBM name: SMF42GHR) Total number of READ real I/O sequential requests to DASD. (pre-format)
zGHS	INT	4	(IBM name: SMF42GHS) Total number of WRITE real I/O sequential requests to DASD. (pre-format)
zGHT	INT	8	(IBM name: SMF42GHT) Total number of bytes transferred to DASD for the read requests.
zGHU	INT	8	(IBM name: SMF42GHU) Total number of bytes transferred to DASD for the write requests.
zGHW	FIXED	8 (20,3)	(IBM name: SMF42GHW) Total amount of time, in milli seconds, for all sequential access (pre-format) requests in this interval.
zGHX	FIXED	4 (10,3)	(IBM name: SMF42GHX) Average response time for all of the sequential access (pre-format) requests in this interval (total time/number of requests).
zGHY	FIXED		

		4 (10,3)	(IBM name: SMF42GHY) Normalized response time for all of the requests in this interval (total time/number of bytes transferred/4K). (pre-format)
SMF042#16_VSAM_RLS_Dataset_SysplexWide.zLockSumm.<fieldname>			
zGPA	INT	4	(IBM name: SMF42GPA) Number of record lock requests (obtain/alter/promote)
zGPB	INT	4	(IBM name: SMF42GPB) Number of record lock requests that cause true contention.
zGPC	INT	4	(IBM name: SMF42GPC) Number of record lock requests that cause false contention.
zGPD	INT	4	(IBM name: SMF42GPD) Number of record lock release requests.
zGPE	INT	4	(IBM name: SMF42GPE) Number of component_1 type lock requests.
zGPF	INT	4	(IBM name: SMF42GPF) Number of component_1 type release lock requests.
zGUA	INT	4	(IBM name: SMF42GUA) Accumulation of waiters for record lock.
zGUB	INT	4	(IBM name: SMF42GUB) Number of record locks hashed to the same hash table entry.
zGPH	INT	4	(IBM name: SMF42GPH) Number of component_1 class_1 (DIWA) locks (obtain/alter/promote).
zGPI	INT	4	(IBM name: SMF42GPI) Number of component_1 class_1 (DIWA) locks that cause true contention.
zGPJ	INT	4	(IBM name: SMF42GPJ) Number of component_1 class_1 (DIWA) locks that cause false contention.
zGPK	INT	4	(IBM name: SMF42GPK) Number of component_1 class_1 (DIWA) release lock requests.
zGPL	INT	4	(IBM name: SMF42GPL) Number of component_1 class_2 (UPGRADE) locks (obtain/alter/promote).
zGPM	INT	4	(IBM name: SMF42GPM) Number of component_1 class_2 (UPGRADE) locks that cause true contention.
zGPN	INT	4	(IBM name: SMF42GPN) Number of component_1 class_2 (UPGRADE) locks that cause false contention.
zGPO	INT	4	(IBM name: SMF42GPO) Number of component_1 class_2 (UPGRADE) release lock requests.
zGPP	INT	4	(IBM name: SMF42GPP) Number of component_1 class_3 (PREFORMAT) locks (obtain/alter/promote).
zGPQ	INT	4	(IBM name: SMF42GPQ) Number of component_1 class_3 (PREFORMAT) locks that cause true contention.
zGPR	INT	4	(IBM name: SMF42GPR) Number of component_1 class_3 (PREFORMAT) locks that cause false contention.
zGPS	INT	4	(IBM name: SMF42GPS) Number of component_1 class_3 (PREFORMAT) release lock requests.
zGPT	INT	4	(IBM name: SMF42GPT) Number of component_2 lock requests (obtain/alter/promote).
zGPU	INT	4	(IBM name: SMF42GPU) Number of component_2 locks that cause true contention.
zGPV	INT	4	(IBM name: SMF42GPV) Number of component_2 locks that cause false contention.
zGPW	INT	4	(IBM name: SMF42GPW) Number of component_2 release lock requests.

zGUD	INT	4	(IBM name: SMF42GUD) Accumulation of waiters for DIWA lock.
zGUE	INT	4	(IBM name: SMF42GUE) Accumulation of waiters for UPGRADE lock.
zGUF	INT	4	(IBM name: SMF42GUF) Accumulation of waiters for COMP2 lock.
zGUG	INT	4	(IBM name: SMF42GUG) Number of locks (DIWA, UPGRADE, and COMP2) hashed to the same hash table entry.
zGSH	INT	4	(IBM name: SMF42GSH) Number of component_1 class 4 (INDEX Record) locks (obtain/alter/promote).
zGSI	INT	4	(IBM name: SMF42GSI) Number of component_1 class 4 (INDEX Record) locks that cause true contention.
zGSJ	INT	4	(IBM name: SMF42GSJ) Number of component_1 class 4 (INDEX Record) locks that cause false contention.
zGSK	INT	4	(IBM name: SMF42GSK) Number of component_1 class 4 (INDEX Record) release lock requests.

SMF042#16_VSAM_RLS_Dataset_SysplexWide.zBMFSumm.<fieldname>

zGRA	INT	4	(IBM name: SMF42GRA) Number of RE-DO's.
zGRB	INT	4	(IBM name: SMF42GRB) Number of recursive RE-DO's.
zGRC	INT	4	(IBM name: SMF42GRC) Number of BMF writes.
zGRD	INT	4	(IBM name: SMF42GRD) Number of SCM read requests.
zGRE	INT	4	(IBM name: SMF42GRE) Number of SCM read requests that encountered castout lock contention.
zGRG	INT	4	(IBM name: SMF42GRG) RE-DO percentage.
zGRH	INT	4	(IBM name: SMF42GRH) Recursive RE-DO percentage.
zGRI	INT	4	(IBM name: SMF42GRI) SCM castout lock percentage.
zGRJ	INT	4	(IBM name: SMF42GRJ) Total number of CF read requests that encountered retries for cast out locks.
zGSA	INT	4	(IBM name: SMF42GSA) Total number of CI splits for this interval (across the sysplex).
zGSB	INT	4	(IBM name: SMF42GSB) Total number of CA splits for this interval (across the sysplex).
zGAQ	CHAR	16	(IBM name: SMF42GAQ) Lock structure name.

Secondary segment: SMF042#16_VSAM_RLS_Dataset_CF_SYS

Field Name	Type	Len	Description
SMF042#16_VSAM_RLS_Dataset_CF_SYS.<fieldname>			
zGBA	INT	4	(IBM name: SMF42GBA) Interval length. This is the total length, in seconds, of the measurement period.

zGGB	CHAR	44	(IBM name: SMF42GGB) Data set name.
zGBC	CHAR	44	(IBM name: SMF42GBC) VSAM sphere name.
zGBD	INT	2	(IBM name: SMF42GBD) Length of storage class name.
zGBE	CHAR	30	(IBM name: SMF42GBE) Storage class name.
zA08	INT	2	(IBM name: SMF42A08) Length of cache set name.
zGBF	CHAR	30	(IBM name: SMF42GBF) Cache set name.
zGBG	CHAR	30	(IBM name: SMF42GBG) Cache structure name.
zGBH	CHAR	8	(IBM name: SMF42GBH) MVS system name.

SMF042#16_VSAM_RLS_Dataset_CF_SYS.zGBI.<fieldname>

zGDATA	BIT	1	DATA component.
zGINDEX	BIT	1	INDEX component.

SMF042#16_VSAM_RLS_Dataset_CF_SYS.<fieldname>

zA09	CHAR	12	(IBM name: SMF42A09) Indicates DFSMS greater than 4K CF caching status. Value is ALL, NONE, UPDATESONLY, DIRONLY or GT4KNOTACT.
zGBK	INT	4	(IBM name: SMF42GBK) Number of lock requests processed by this MVS system.
zGBL	INT	4	(IBM name: SMF42GBL) Number of true contention lock requests.
zGBM	INT	4	(IBM name: SMF42GBM) Number of false contention lock requests.
zGZ8	INT	2	(IBM name: SMF42GZ8) SMS DIRECT WEIGHT
zGZ9	INT	2	(IBM name: SMF42GZ9) SMS SEQUENTIAL WEIGHT
zGBN	CHAR	8	(IBM name: SMF42GBN) In DFSMS 1.4, WLM SERV Class Name
zGBO	CHAR	8	(IBM name: SMF42GBO) In DFSMS 1.4, WLM Report Class Name
zGBP	CHAR	16	(IBM name: SMF42GBP) SMS data class name.

SMF042#16_VSAM_RLS_Dataset_CF_SYS.zDASumm.<fieldname>

zGIA	INT	4	(IBM name: SMF42GIA) Coupling facility cache partition number.
zGIB	INT	4	(IBM name: SMF42GIB) Total number of direct access requests.
zGIC	INT	4	(IBM name: SMF42GIC) Number of read requests - NRI protocol (No Read Integrity). (pre-format)
zGID	INT	4	(IBM name: SMF42GID) Number of read requests - Consistent read protocol.
zGIE	INT	4	(IBM name: SMF42GIE) Number of Write requests.
zGIF	INT	4	(IBM name: SMF42GIF) Number of direct access BMF requests.
zGIG	INT	4	

			(IBM name: SMF42GIG) Number of direct access BMF Read requests.
zGIH	INT	4	(IBM name: SMF42GIH) Number of direct access BMF Write requests.
zGII	INT	4	(IBM name: SMF42GII) Number of direct access BMF read hits.
zGIJ	INT	4	(IBM name: SMF42GIJ) Number of direct access BMF valid read hits.
zGIK	INT	4	(IBM name: SMF42GIK) Number of BMF false invalids.
zGIL	INT	4	(IBM name: SMF42GIL) Number of direct access CF cache structure requests.
zGIM	INT	4	(IBM name: SMF42GIM) Number of direct access CF cache structure Read requests.
zGIN	INT	4	(IBM name: SMF42GIN) Number of direct access CF cache structure Write requests.
zGIO	INT	4	(IBM name: SMF42GIO) Number of direct access CF cache structure read hits.
zGIP	INT	4	(IBM name: SMF42GIP) Number of direct access CF cache structure read castins.
zGIQ	INT	8	(IBM name: SMF42GIQ) Number of direct access CF cache structure byte transferred.
zGIR	INT	4	(IBM name: SMF42GIR) Total number of real READ I/O direct requests to DASD.
zGIS	INT	4	(IBM name: SMF42GIS) Total number of real WRITE I/O direct requests to DASD.
zGIT	INT	8	(IBM name: SMF42GIT) Total number of bytes transferred to DASD for the read requests.
zGIU	INT	8	(IBM name: SMF42GIU) Total number of bytes transferred to DASD for the write requests.
zGIW	FIXED	8 (20,3)	(IBM name: SMF42GIW) Total amount of time, in milli seconds, for all the direct access requests in this interval.
zGIX	FIXED	4 (10,3)	(IBM name: SMF42GIX) Average response time for all of the requests in this interval (total time/number of requests).
zGIY	FIXED	4 (10,3)	(IBM name: SMF42GIY) Normalized response time for all of the requests in this interval (total time/number of bytes transferred/4K).

SMF042#16_VSAM_RLS_Dataset_CF_SYS.zDAREDOSumm.<fieldname>

zGJA	INT	4	(IBM name: SMF42GJA) Coupling facility cache partition number.
zGJB	INT	4	(IBM name: SMF42GJB) Total number of direct access requests. (RE-DO)
zGJC	INT	4	(IBM name: SMF42GJC) Number of read requests - NRI protocol (No Read Integrity). (RE-DO)
zGJD	INT	4	(IBM name: SMF42GJD) Number of read requests - Consistent read protocol. (RE-DO)
zGJE	INT	4	(IBM name: SMF42GJE) Number of Write requests. (RE-DO)
zGJF	INT	4	(IBM name: SMF42GJF) Number of direct access BMF requests. (RE-DO)
zGJG	INT	4	(IBM name: SMF42GJG) Number of direct access BMF Read requests. (RE-DO)
zGJH	INT	4	(IBM name: SMF42GJH) Number of direct access BMF Write requests. (RE-DO)

zGJI	INT	4	(IBM name: SMF42GJI) Number of direct access BMF read hits. (RE-DO)
zGJJ	INT	4	(IBM name: SMF42GJJ) Number of direct access BMF valid read hits. (RE-DO)
zGJK	INT	4	(IBM name: SMF42GJK) Number of BMF false invalids. (RE-DO)
zGJL	INT	4	(IBM name: SMF42GJL) Number of direct access CF cache structure requests. (RE-DO)
zGJM	INT	4	(IBM name: SMF42GJM) Number of direct access CF cache structure Read requests. (RE-DO)
zGJN	INT	4	(IBM name: SMF42GJN) Number of direct access CF cache structure Write requests. (RE-DO)
zGJO	INT	4	(IBM name: SMF42GJO) Number of direct access CF cache structure read hits. (RE-DO)
zGJP	INT	4	(IBM name: SMF42GJP) Number of direct access CF cache structure read castins.
zGJQ	INT	8	(IBM name: SMF42GJQ) Number of direct access CF cache structure bytes transferred.
zGJR	INT	4	(IBM name: SMF42GJR) Total number of READ real I/O direct requests to DASD. (RE-DO)
zGJS	INT	4	(IBM name: SMF42GJS) Total number of WRITE real I/O direct requests to DASD. (RE-DO)
zGJT	INT	8	(IBM name: SMF42GJT) Total number of bytes transferred to DASD for the read requests.
zGJU	INT	8	(IBM name: SMF42GJU) Total number of bytes transferred to DASD for the write requests.
zGJW	FIXED	8 (20,3)	(IBM name: SMF42GJW) Total amount of time, in milli seconds, for all direct access (RE-DO) requests in this interval.
zGJX	FIXED	4 (10,3)	(IBM name: SMF42GJX) Average response time for all of the direct access (RE-DO) requests in this interval (total time/number of requests).
zGJY	FIXED	4 (10,3)	(IBM name: SMF42GJY) Normalized response time for all of the requests in this interval (total time/number of bytes transferred/4K). (RE-DO)

SMF042#16_VSAM_RLS_Dataset_CF_SYS.zSASumm.<fieldname>

zGKA	INT	4	(IBM name: SMF42GKA) Coupling facility cache partition number.
zGKB	INT	4	(IBM name: SMF42GKB) Total number of sequential access requests.
zGKC	INT	4	(IBM name: SMF42GKC) Number of read requests - NRI protocol (No Read Integrity).
zGKD	INT	4	(IBM name: SMF42GKD) Number of read requests - Consistent read protocol.
zGKE	INT	4	(IBM name: SMF42GKE) Number of Write requests.
zGKF	INT	4	(IBM name: SMF42GKF) Number of direct access BMF requests.
zGKG	INT	4	(IBM name: SMF42GKG) Number of direct access BMF Read requests.
zGKH	INT	4	(IBM name: SMF42GKH) Number of direct access BMF Write requests.
zGKI	INT	4	(IBM name: SMF42GKI) Number of direct access BMF read hits.
zGKJ	INT	4	(IBM name: SMF42GKJ) Number of direct access BMF valid read hits.

zGKK	INT	4	(IBM name: SMF42GKK) Number of BMF false invalids.
zGKL	INT	4	(IBM name: SMF42GKL) Number of direct access CF cache structure requests.
zGKM	INT	4	(IBM name: SMF42GKM) Number of direct access CF cache structure Read requests.
zGKN	INT	4	(IBM name: SMF42GKN) Number of direct access CF cache structure Write requests.
zGKO	INT	4	(IBM name: SMF42GKO) Number of direct access CF cache structure read hits.
zGKP	INT	4	(IBM name: SMF42GKP) Number of direct access CF cache structure read castins.
zGKQ	INT	8	(IBM name: SMF42GKQ) Number of direct access CF cache structure byte transferred.
zGKR	INT	4	(IBM name: SMF42GKR) Total number of READ real I/O sequential requests to DASD.
zGKS	INT	4	(IBM name: SMF42GKS) Total number of WRITE real I/O sequential requests to DASD.
zGKT	INT	8	(IBM name: SMF42GKT) Total number of bytes transferred for all sequential access requests where the data was retrieved from DASD. (real I/O DASD)
zGKU	INT	8	(IBM name: SMF42GKU) Total number of bytes transferred for all sequential access requests where the data was retrieved from DASD or a coupling facility cache structure. (real I/O DASD)
zGKW	INT	8	(IBM name: SMF42GKW) Total amount of time, in milli seconds, for all sequential access requests in this interval.
zGKX	INT	4	(IBM name: SMF42GKX) Average response time for all of the sequential access requests in this interval (total time/number of requests).
zGKY	INT	4	(IBM name: SMF42GKY) Normalized response time for all of the requests in this interval (total time/number of bytes transferred/4K).

SMF042#16_VSAM_RLS_Dataset_CF_SYS.zSAREDOSumm.<fieldname>

zGLA	INT	4	(IBM name: SMF42GLA) Coupling facility cache partition number.
zGLB	INT	4	(IBM name: SMF42GLB) Total number of sequential access requests. (RE-DO)
zGLC	INT	4	(IBM name: SMF42GLC) Number of read requests - NRI protocol (No Read Integrity). (RE-DO)
zGLD	INT	4	(IBM name: SMF42GLD) Number of read requests - Consistent read protocol. (RE-DO)
zGLE	INT	4	(IBM name: SMF42GLE) Number of Write requests. (RE-DO)
zGLF	INT	4	(IBM name: SMF42GLF) Number of direct access BMF requests. (RE-DO)
zGLG	INT	4	(IBM name: SMF42GLG) Number of direct access BMF Read requests.
zGLH	INT	4	(IBM name: SMF42GLH) Number of direct access BMF Write requests.
zGLI	INT	4	(IBM name: SMF42GLI) Number of direct access BMF read hits.
zGLJ	INT	4	(IBM name: SMF42GLJ) Number of direct access BMF valid read hits.
zGLK	INT	4	(IBM name: SMF42GLK) Number of BMF false invalids. (RE-DO)

zGLL	INT	4	(IBM name: SMF42GLL) Number of direct access CF cache structure requests.
zGLM	INT	4	(IBM name: SMF42GLM) Number of direct access CF cache structure Read requests.
zGLN	INT	4	(IBM name: SMF42GLN) Number of direct access CF cache structure Write requests.
zGLO	INT	4	(IBM name: SMF42GLO) Number of direct access CF cache structure read hits. (RE-DO)
zGLP	INT	4	(IBM name: SMF42GLP) Number of direct access CF cache structure read castins.
zGLQ	INT	8	(IBM name: SMF42GLQ) Number of direct access CF cache structure bytes transferred.
zGLR	INT	4	(IBM name: SMF42GLR) Total number of READ real I/O sequential requests to DASD. (RE-DO)
zGLS	INT	4	(IBM name: SMF42GLS) Total number of WRITE real I/O sequential requests to DASD. (RE-DO)
zGLT	INT	8	(IBM name: SMF42GLT) Total number of bytes transferred to DASD for the read requests.
zGLU	INT	8	(IBM name: SMF42GLU) Total number of bytes transferred to DASD for the write requests.
zGLW	FIXED	8 (20,3)	(IBM name: SMF42GLW) Total amount of time, in milli seconds, for all sequential access (RE-DO) requests in this interval.
zGLX	FIXED	4 (10,3)	(IBM name: SMF42GLX) Average response time for all of the sequential access (RE-DO) requests in this interval (total time/number of requests).
zGLY	FIXED	4 (10,3)	(IBM name: SMF42GLY) Normalized response time for all of the requests in this interval (total time/number of bytes transferred/4K). (RE-DO)

SMF042#16_VSAM_RLS_Dataset_CF_SYS.zSARASumm.<fieldname>

zGMA	INT	4	(IBM name: SMF42GMA) Coupling facility cache partition number.
zGMB	INT	4	(IBM name: SMF42GMB) Total number of sequential access requests. (read ahead)
zGMC	INT	4	(IBM name: SMF42GMC) Number of read requests - NRI protocol (No Read Integrity). (read-ahead)
zGMD	INT	4	(IBM name: SMF42GMD) Number of read requests - Consistent read protocol. (read-ahead)
zGME	INT	4	(IBM name: SMF42GME) Number of Write requests. (read-ahead)
zGMF	INT	4	(IBM name: SMF42GMF) Number of direct access BMF requests. (read-ahead)
zGMG	INT	4	(IBM name: SMF42GMG) Number of direct access BMF Read requests.
zGMH	INT	4	(IBM name: SMF42GMH) Number of direct access BMF Write requests.
zGMI	INT	4	(IBM name: SMF42GMI) Number of direct access BMF read hits.
zGMJ	INT	4	(IBM name: SMF42GMJ) Number of direct access BMF valid read hits.
zGMK	INT	4	(IBM name: SMF42GMK) Number of BMF false invalids. (read-ahead)
zGML	INT	4	(IBM name: SMF42GML) Number of direct access CF cache structure requests.
zGMM	INT	4	(IBM name: SMF42GMM) Number of direct access CF cache structure Read requests.

zGMN	INT	4	(IBM name: SMF42GMN) Number of direct access CF cache structure Write requests.
zGMO	INT	4	(IBM name: SMF42GMO) Number of direct access CF cache structure read hits. (read-ahead)
zGMP	INT	4	(IBM name: SMF42GMP) Number of direct access CF cache structure read castins.
zGMQ	INT	8	(IBM name: SMF42GMQ) Number of direct access CF cache structure byte transferred.
zGMR	INT	4	(IBM name: SMF42GMR) Total number of real READ I/O sequential requests to DASD. (read ahead)
zGMS	INT	4	(IBM name: SMF42GMS) Total number of real WRITE I/O sequential requests to DASD. (read ahead)
zGMT	INT	8	(IBM name: SMF42GMT) Total number of bytes transferred to DASD for the read requests.
zGMU	INT	8	(IBM name: SMF42GMU) Total number of bytes transferred to DASD for the write requests.
zGMW	FIXED	8 (20,3)	(IBM name: SMF42GMW) Total amount of time, in milli seconds, for all sequential access (read ahead) requests in this interval.
zGMX	FIXED	4 (10,3)	(IBM name: SMF42GMX) Average response time for all of the sequential access (read ahead) requests in this interval (total time/number of requests).
zGMY	FIXED	4 (10,3)	(IBM name: SMF42GMY) Normalized response time for all of the requests in this interval (total time/number of bytes transferred/4K). (read ahead)

zGNA	INT	4	(IBM name: SMF42GNA) Coupling facility cache partition number.
zGNB	INT	4	(IBM name: SMF42GNB) Total number of sequential access requests. (pre-format)
zGNC	INT	4	(IBM name: SMF42GNC) Number of read requests - NRI protocol (No Read Integrity). (pre-format)
zGND	INT	4	(IBM name: SMF42GND) Number of read requests - Consistent read protocol. (pre-format)
zGNE	INT	4	(IBM name: SMF42GNE) Number of Write requests. (pre-format)
zGNF	INT	4	(IBM name: SMF42GNF) Number of direct access BMF requests. (pre-format)
zGNG	INT	4	(IBM name: SMF42GNG) Number of direct access BMF Read requests.
zGNH	INT	4	(IBM name: SMF42GNH) Number of direct access BMF Write requests.
zGNI	INT	4	(IBM name: SMF42GNI) Number of direct access BMF read hits.
zGNJ	INT	4	(IBM name: SMF42GNJ) Number of direct access BMF valid read hits.
zGNK	INT	4	(IBM name: SMF42GNK) Number of BMF false invalids. (pre-format)
zGNL	INT	4	(IBM name: SMF42GNL) Number of direct access CF cache structure requests.
zGNM	INT	4	(IBM name: SMF42GNM) Number of direct access CF cache structure Read requests.
zGNN	INT	4	(IBM name: SMF42GNN) Number of direct access CF cache structure Write requests.
zGNO	INT	4	

			(IBM name: SMF42GNO) Number of direct access CF cache structure read hits. (pre-format)
zGNP	INT	4	(IBM name: SMF42GNP) Number of direct access CF cache structure read castins.
zGNQ	INT	8	(IBM name: SMF42GNQ) Number of direct access CF cache structure byte transferred.
zGNR	INT	4	(IBM name: SMF42GNR) Total number of READ real I/O sequential requests to DASD. (pre-format)
zGNS	INT	4	(IBM name: SMF42GNS) Total number of WRITE real I/O sequential requests to DASD. (pre-format)
zGNT	INT	8	(IBM name: SMF42GNT) Total number of bytes transferred to DASD for the read requests.
zGNU	INT	8	(IBM name: SMF42GNU) Total number of bytes transferred to DASD for the write requests.
zGNW	FIXED	8 (20,3)	(IBM name: SMF42GNW) Total amount of time, in milli seconds, for all sequential access. (pre-format) requests in this interval.
zGNX	FIXED	4 (10,3)	(IBM name: SMF42GNX) Average response time for all of the sequential access (pre-format) requests in this interval (total time/number of requests).
zGNY	FIXED	4 (10,3)	(IBM name: SMF42GNY) Normalized response time for all of the requests in this interval (total time/number of bytes transferred/4K). (pre-format)
zGQA	INT	4	(IBM name: SMF42GQA) Number of record lock requests (obtain/alter/promote)
zGQB	INT	4	(IBM name: SMF42GQB) Number of record lock requests that cause true contention.
zGQC	INT	4	(IBM name: SMF42GQC) Number of record lock requests that cause false contention.
zGQD	INT	4	(IBM name: SMF42GQD) Number of record lock release requests.
zGQE	INT	4	(IBM name: SMF42GQE) Number of component_1 type lock requests.
zGQF	INT	4	(IBM name: SMF42GQF) Number of component_1 type release lock requests.
zGVA	INT	4	(IBM name: SMF42GVA) Accumulation of waiters for record lock.
zGVB	INT	4	(IBM name: SMF42GVB) Number of record locks hashed to the same hash table entry.
zGQH	INT	4	(IBM name: SMF42GQH) Number of component_1 class_1 (DIWA) locks (obtain/alter/promote).
zGQI	INT	4	(IBM name: SMF42GQI) Number of component_1 class_1 (DIWA) locks that cause true contention.
zGQJ	INT	4	(IBM name: SMF42GQJ) Number of component_1 class_1 (DIWA) locks that cause false contention.
zGQK	INT	4	(IBM name: SMF42GQK) Number of component_1 class_1 (DIWA) release lock requests.
zGQL	INT	4	(IBM name: SMF42GQL) Number of component_1 class_2 (UPGRADE) locks (obtain/alter/promote).
zGQM	INT	4	(IBM name: SMF42GQM) Number of component_1 class_2 (UPGRADE) locks that cause true contention.
zGQN	INT	4	(IBM name: SMF42GQN) Number of component_1 class_2 (UPGRADE) locks that cause false contention.
zGQO	INT	4	(IBM name: SMF42GQO) Number of component_1 class_2 (UPGRADE) release lock requests.

zGQP	INT	4	(IBM name: SMF42GQP) Number of component_1 class_3 (PREFORMAT) locks (obtain/alter/promote).
zGQQ	INT	4	(IBM name: SMF42GQQ) Number of component_1 class_3 (PREFORMAT) locks that cause true contention.
zGQR	INT	4	(IBM name: SMF42GQR) Number of component_1 class_3 (PREFORMAT) locks that cause false contention.
zGQS	INT	4	(IBM name: SMF42GQS) Number of component_1 class_3 (PREFORMAT) release lock requests.
zGQT	INT	4	(IBM name: SMF42GQT) Number of component_2 lock requests (obtain/alter/promote).
zGQU	INT	4	(IBM name: SMF42GQU) Number of component_2 locks that cause true contention.
zGQV	INT	4	(IBM name: SMF42GQV) Number of component_2 locks that cause false contention.
zGQW	INT	4	(IBM name: SMF42GQW) Number of component_2 release lock requests.
zGVD	INT	4	(IBM name: SMF42GVD) Accumulation of waiters for DIWA lock.
zGVE	INT	4	(IBM name: SMF42GVE) Accumulation of waiters for UPGRADE lock.
zGVF	INT	4	(IBM name: SMF42GVF) Accumulation of waiters for COMP2 lock.
zGVG	INT	4	(IBM name: SMF42GVG) Number of locks (DIWA, UPGRADE, and COMP2) hashed to the same hash table entry.
zGTH	INT	4	(IBM name: SMF42GTH) Number of component_1 class 4 (INDEX Record) locks (obtain/alter/promote).
zGTI	INT	4	(IBM name: SMF42GTI) Number of component_1 class 4 (INDEX Record) locks that cause true contention.
zGTJ	INT	4	(IBM name: SMF42GTJ) Number of component_1 class 4 (INDEX Record) locks that cause false contention.
zGTK	INT	4	(IBM name: SMF42GTK) Number of component_1 class 4 (INDEX Record) release lock requests.
zGRL	INT	4	(IBM name: SMF42GRL) Number of RE-DO's.
zGRM	INT	4	(IBM name: SMF42GRM) Number of recursive RE-DO's.
zGRN	INT	4	(IBM name: SMF42GRN) Number of BMF writes.
zGRO	INT	4	(IBM name: SMF42GRO) Number of SCM read requests.
zGRP	INT	4	(IBM name: SMF42GRP) Number of SCM read requests that encountered castout lock contention.
zGRR	INT	4	(IBM name: SMF42GRR) RE-DO percentage.
zGRS	INT	4	(IBM name: SMF42GRS) Recursive RE-DO percentage.
zGRT	INT	4	(IBM name: SMF42GRT) SCM castout lock percentage.
zGRU	INT	4	(IBM name: SMF42GRU) Total number of CF read requests that encountered retries for cast out locks.

zGTA	INT	4	(IBM name: SMF42GTA) Total number of CI splits for this interval.
zGTB	INT	4	(IBM name: SMF42GTB) Total number of CA splits for this interval.
zGBQ	CHAR	16	(IBM name: SMF42GBQ) Lock structure name.

Secondary segment: **SMF042#16_VSAM_RLS_Dataset_SysplexWide_64**

Field Name	Type	Len	Description
<i>SMF042#16_VSAM_RLS_Dataset_SysplexWide_64.<fieldname></i>			
zGAA	INT	4	(IBM name: SMF42GAA) Interval length. This is the total time, in seconds, of the measurement period.
zGAB	CHAR	44	(IBM name: SMF42GAB) Data set name
zGAC	CHAR	44	(IBM name: SMF42GAC) VSAM sphere name.
zGAD	INT	2	(IBM name: SMF42GAD) Length of the storage class name.
zGAE	CHAR	30	(IBM name: SMF42GAE) Storage class name.
zA03	INT	2	(IBM name: SMF42A03) Length of DFSMS CacheSet name.
zGAF	CHAR	30	(IBM name: SMF42GAF) DFSMS CacheSet name.
zGAH	CHAR	30	(IBM name: SMF42GAH) DFP CF cache structure name.

SMF042#16_VSAM_RLS_Dataset_SysplexWide_64.zGAI.<fieldname>

zGDATA	BIT	1	DATA component.
zGINDEX	BIT	1	INDEX component.

SMF042#16_VSAM_RLS_Dataset_SysplexWide_64.<fieldname>

zGAJ	CHAR	12	(IBM name: SMF42GAJ) Indicates DFSMS greater than 4K CF caching status. Value is ALL, NONE, UPDATESONLY, DIRONLY or GT4KNOTACT.
zGZ1	INT	2	(IBM name: SMF42GZ1) SMS Direct Weight.
zGZ2	INT	2	(IBM name: SMF42GZ2) SMS Sequential Weight.
zGAN	CHAR	8	(IBM name: SMF42GAN) In DFSMS 1.4 WLM Server class name
zGAO	CHAR	8	(IBM name: SMF42GAO) In DFSMS 1.4 WLM report class name
zGAP	CHAR	16	(IBM name: SMF42GAP) SMS data class name.

SMF042#16_VSAM_RLS_Dataset_SysplexWide_64.zDASumm.<fieldname>

zGCA	INT	4	(IBM name: SMF42GCA) Coupling facility cache partition number.
zGCB	INT	4	(IBM name: SMF42GCB) Total number of direct access requests.

zGCC	INT	4	(IBM name: SMF42GCC) Number of read requests - NRI protocol (No Read Integrity).
zGCD	INT	4	(IBM name: SMF42GCD) Number of read requests - Consistent read protocol.
zGCE	INT	4	(IBM name: SMF42GCE) Number of Write requests.
zCGF	INT	4	(IBM name: SMF42CGF) Number of direct access BMF requests.
zGCG	INT	4	(IBM name: SMF42GCG) Number of direct access BMF Read requests.
zGCH	INT	4	(IBM name: SMF42GCH) Number of direct access BMF Write requests.
zGCI	INT	4	(IBM name: SMF42GCI) Number of direct access BMF read hits.
zGCJ	INT	4	(IBM name: SMF42GCJ) Number of direct access BMF valid read hits.
zGCK	INT	4	(IBM name: SMF42GCK) Number of BMF false invalids.
zGCL	INT	4	(IBM name: SMF42GCL) Number of direct access CF cache structure requests.
zGCM	INT	4	(IBM name: SMF42GCM) Number of direct access CF cache structure Read requests.
zGCN	INT	4	(IBM name: SMF42GCN) Number of direct access CF cache structure Write requests.
zGCO	INT	4	(IBM name: SMF42GCO) Number of direct access CF cache structure read hits.
zGCP	INT	4	(IBM name: SMF42GCP) Number of direct access CF cache structure read castins.
zGCQ	INT	8	(IBM name: SMF42GCQ) Number of bytes transferred into the DFSMS cache structure.
zGCR	INT	4	(IBM name: SMF42GCR) Total number READ of real I/O direct requests to DASD.
zGCS	INT	4	(IBM name: SMF42GCS) Total number WRITE of real I/O direct requests to DASD.
zGCT	INT	8	(IBM name: SMF42GCT) Total number of bytes transferred to DASD for the read requests.
zGCU	INT	8	(IBM name: SMF42GCU) Total number of bytes transferred to DASD for the write requests.
zGCW	FIXED	8 (20,3)	(IBM name: SMF42GCW) Total amount of time, in milli seconds, for all the direct access requests in this interval.
zGCX	FIXED	4 (10,3)	(IBM name: SMF42GCX) Average response time for all of the requests in this interval (total time/number of requests).
zGCY	FIXED	4 (10,3)	(IBM name: SMF42GCY) Normalized response time for all of the requests in this interval (total time/number of bytes transferred/4K).

zGPA	INT	4	(IBM name: SMF42GPA) Number of record lock requests (obtain/alter/promote)
zGPB	INT	4	(IBM name: SMF42GPB) Number of record lock requests that cause true contention.
zGPC	INT	4	(IBM name: SMF42GPC) Number of record lock requests that cause false contention.
zGPD	INT	4	(IBM name: SMF42GPD) Number of record lock release requests.
zGPE	INT	4	(IBM name: SMF42GPE) Number of component_1 type lock requests.
zGPF	INT	4	(IBM name: SMF42GPF) Number of component_1 type release lock requests.
zGUA	INT	4	(IBM name: SMF42GUA) Accumulation of waiters for record lock.
zGUB	INT	4	(IBM name: SMF42GUB) Number of record locks hashed to the same hash table entry.
zGPH	INT	4	(IBM name: SMF42GPH) Number of component_1 class_1 (DIWA) locks (obtain/alter/promote).
zGPI	INT	4	(IBM name: SMF42GPI) Number of component_1 class_1 (DIWA) locks that cause true contention.
zGPJ	INT	4	(IBM name: SMF42GPJ) Number of component_1 class_1 (DIWA) locks that cause false contention.
zGPK	INT	4	(IBM name: SMF42GPK) Number of component_1 class_1 (DIWA) release lock requests.
zGPL	INT	4	(IBM name: SMF42GPL) Number of component_1 class_2 (UPGRADE) locks (obtain/alter/promote).

zGPM	INT	4	(IBM name: SMF42GPM) Number of component_1 class_2 (UPGRADE) locks that cause true contention.
zGPN	INT	4	(IBM name: SMF42GPN) Number of component_1 class_2 (UPGRADE) locks that cause false contention.
zGPO	INT	4	(IBM name: SMF42GPO) Number of component_1 class_2 (UPGRADE) release lock requests.
zGPP	INT	4	(IBM name: SMF42GPP) Number of component_1 class_3 (PREFORMAT) locks (obtain/alter/promote).
zGPQ	INT	4	(IBM name: SMF42GPQ) Number of component_1 class_3 (PREFORMAT) locks that cause true contention.
zGPR	INT	4	(IBM name: SMF42GPR) Number of component_1 class_3 (PREFORMAT) locks that cause false contention.
zGPS	INT	4	(IBM name: SMF42GPS) Number of component_1 class_3 (PREFORMAT) release lock requests.
zGPT	INT	4	(IBM name: SMF42GPT) Number of component_2 lock requests (obtain/alter/promote).
zGPU	INT	4	(IBM name: SMF42GPU) Number of component_2 locks that cause true contention.
zGPV	INT	4	(IBM name: SMF42GPV) Number of component_2 locks that cause false contention.
zGPW	INT	4	(IBM name: SMF42GPW) Number of component_2 release lock requests.
zGUD	INT	4	(IBM name: SMF42GUD) Accumulation of waiters for DIWA lock.
zGUE	INT	4	(IBM name: SMF42GUE) Accumulation of waiters for UPGRADE lock.
zGUF	INT	4	(IBM name: SMF42GUF) Accumulation of waiters for COMP2 lock.
zGUG	INT	4	(IBM name: SMF42GUG) Number of locks (DIWA, UPGRADE, and COMP2) hashed to the same hash table entry.
zGSH	INT	4	(IBM name: SMF42GSH) Number of component_1 class 4 (INDEX Record) locks (obtain/alter/promote).
zGSI	INT	4	(IBM name: SMF42GSI) Number of component_1 class 4 (INDEX Record) locks that cause true contention.
zGSJ	INT	4	(IBM name: SMF42GSJ) Number of component_1 class 4 (INDEX Record) locks that cause false contention.
zGSK	INT	4	(IBM name: SMF42GSK) Number of component class 4 (INDEX Record) release lock requests. Sysplex-wide data set BMF LRU statistical section:

SMF042#16_VSAM_RLS_Dataset_SysplexWide_64.zBMFSumm.<fieldname>

zGRA	INT	4	(IBM name: SMF42GRA) Number of RE-DO's.
zGRB	INT	4	(IBM name: SMF42GRB) Number of recursive RE-DO's.
zGRC	INT	4	(IBM name: SMF42GRC) Number of BMF writes.
zGRD	INT	4	(IBM name: SMF42GRD) Number of SCM read requests.
zGRE	INT	4	

			(IBM name: SMF42GRE) Number of SCM read requests that encountered castout lock contention.
zGRG	INT	4	(IBM name: SMF42GRG) RE-DO percentage.
zGRH	INT	4	(IBM name: SMF42GRH) Recursive RE-DO percentage.
zGRI	INT	4	(IBM name: SMF42GRI) SCM castout lock percentage.
zGRJ	INT	4	(IBM name: SMF42GRJ) Total number of CF read requests that encountered retries for cast out locks.
zGSA	INT	4	(IBM name: SMF42GSA) Total number of CI splits for this interval (across the sysplex).
zGSB	INT	4	(IBM name: SMF42GSB) Total number of CA splits for this interval (across the sysplex).
zGAQ	CHAR	16	(IBM name: SMF42GAQ) Lock structure name.

Secondary segment: **SMF042#16_VSAM_RLS_Dataset_CF_SYS_64**

Field Name	Type	Len	Description
<i>SMF042#16_VSAM_RLS_Dataset_CF_SYS_64.<fieldname></i>			
zGBA	INT	4	(IBM name: SMF42GBA) Interval length. This is the total length, in seconds, of the measurement period.
zGBB	CHAR	44	(IBM name: SMF42GBB) Data set name.
zGBC	CHAR	44	(IBM name: SMF42GBC) VSAM sphere name.
zGBD	INT	2	(IBM name: SMF42GBD) Length of storage class name.
zGBE	CHAR	30	(IBM name: SMF42GBE) Storage class name.
zA08	INT	2	(IBM name: SMF42A08) Length of cache set name.
zGBF	CHAR	30	(IBM name: SMF42GBF) Cache set name.
zGBG	CHAR	30	(IBM name: SMF42GBG) Cache structure name.
zGBH	CHAR	8	(IBM name: SMF42GBH) MVS system name.

SMF042#16_VSAM_RLS_Dataset_CF_SYS_64.zGBI.<fieldname>

zGDATA	BIT	1	DATA component.
zGINDEX	BIT	1	INDEX component.

SMF042#16_VSAM_RLS_Dataset_CF_SYS_64.<fieldname>

zA09	CHAR	12	(IBM name: SMF42A09) Indicates DFSMS greater than 4K CF caching status. Value is ALL, NONE, UPDATESONLY, DIRONLY or GT4KNOTACT.
zGBK	INT	4	(IBM name: SMF42GBK) Number of lock requests processed by this MVS system.
zGBL	INT	4	(IBM name: SMF42GBL) Number of true contention lock requests.

zGBM	INT	4	(IBM name: SMF42GBM) Number of false contention lock requests.
zGZ8	INT	2	(IBM name: SMF42GZ8) SMS DIRECT WEIGHT
zGZ9	INT	2	(IBM name: SMF42GZ9) SMS SEQUENTIAL WEIGHT
zGBN	CHAR	8	(IBM name: SMF42GBN) In DFSMS 1.4, WLM SERV Class Name
zGBO	CHAR	8	(IBM name: SMF42GBO) In DFSMS 1.4, WLM Report Class Name
zGBP	CHAR	16	(IBM name: SMF42GBP) SMS data class name.

SMF042#16_VSAM_RLS_Dataset_CF_SYS_64.zDASumm.<fieldname>

zGIA	INT	4	(IBM name: SMF42GIA) Coupling facility cache partition number.
zGIB	INT	4	(IBM name: SMF42GIB) Total number of direct access requests.
zGIC	INT	4	(IBM name: SMF42GIC) Number of read requests - NRI protocol (No Read Integrity). (pre-format)
zGID	INT	4	(IBM name: SMF42GID) Number of read requests - Consistent read protocol.
zGIE	INT	4	(IBM name: SMF42GIE) Number of Write requests.
zGIF	INT	4	(IBM name: SMF42GIF) Number of direct access BMF requests.
zGIG	INT	4	(IBM name: SMF42GIG) Number of direct access BMF Read requests.
zGIH	INT	4	(IBM name: SMF42GIH) Number of direct access BMF Write requests.
zGII	INT	4	(IBM name: SMF42GII) Number of direct access BMF read hits.
zGIJ	INT	4	(IBM name: SMF42GIJ) Number of direct access BMF valid read hits.
zGIK	INT	4	(IBM name: SMF42GIK) Number of BMF false invalids.
zGIL	INT	4	(IBM name: SMF42GIL) Number of direct access CF cache structure requests.
zGIM	INT	4	(IBM name: SMF42GIM) Number of direct access CF cache structure Read requests.
zGIN	INT	4	(IBM name: SMF42GIN) Number of direct access CF cache structure Write requests.
zGIO	INT	4	(IBM name: SMF42GIO) Number of direct access CF cache structure read hits.
zGIP	INT	4	(IBM name: SMF42GIP) Number of direct access CF cache structure read castins.
zGIQ	INT	8	(IBM name: SMF42GIQ) Number of direct access CF cache structure byte transferred.
zGIR	INT	4	(IBM name: SMF42GIR) Total number of real READ I/O direct requests to DASD.
zGIS	INT	4	(IBM name: SMF42GIS) Total number of real WRITE I/O direct requests to DASD.
zGIT	INT	8	(IBM name: SMF42GIT) Total number of bytes transferred to DASD for the read requests.
zGIU	INT	8	(IBM name: SMF42GIU) Total number of bytes transferred to DASD for the write requests.

zGIW	FIXED	8 (20,3)	(IBM name: SMF42GIW) Total amount of time, in milli seconds, for all the direct access requests in this interval.
zGIX	FIXED	4 (10,3)	(IBM name: SMF42GIX) Average response time for all of the requests in this interval (total time/number of requests).
zGIY	FIXED	4 (10,3)	(IBM name: SMF42GIY) Normalized response time for all of the requests in this interval (total time/number of bytes transferred/4K).

zGNE	INT	4	(IBM name: SMF42GNE) Number of Write requests. (pre-format)
zGNF	INT	4	(IBM name: SMF42GNF) Number of direct access BMF requests. (pre-format)
zGNG	INT	4	(IBM name: SMF42GNG) Number of direct access BMF Read requests.
zGNH	INT	4	(IBM name: SMF42GNH) Number of direct access BMF Write requests.
zGNI	INT	4	(IBM name: SMF42GNI) Number of direct access BMF read hits.
zGNJ	INT	4	(IBM name: SMF42GNJ) Number of direct access BMF valid read hits.
zGNK	INT	4	(IBM name: SMF42GNK) Number of BMF false invalids. (pre-format)
zGNL	INT	4	(IBM name: SMF42GNL) Number of direct access CF cache structure requests.
zGNM	INT	4	(IBM name: SMF42GNM) Number of direct access CF cache structure Read requests.
zGNN	INT	4	(IBM name: SMF42GNN) Number of direct access CF cache structure Write requests.
zGNO	INT	4	(IBM name: SMF42GNO) Number of direct access CF cache structure read hits. (pre-format)
zGNP	INT	4	(IBM name: SMF42GNP) Number of direct access CF cache structure read castins.
zGNQ	INT	8	(IBM name: SMF42GNQ) Number of direct access CF cache structure byte transferred.
zGNR	INT	4	(IBM name: SMF42GNR) Total number of READ real I/O sequential requests to DASD. (pre-format)
zGNS	INT	4	(IBM name: SMF42GNS) Total number of WRITE real I/O sequential requests to DASD. (pre-format)
zGNT	INT	8	(IBM name: SMF42GNT) Total number of bytes transferred to DASD for the read requests.
zGNU	INT	8	(IBM name: SMF42GNU) Total number of bytes transferred to DASD for the write requests.
zGNW	FIXED	8 (20,3)	(IBM name: SMF42GNW) Total amount of time, in milli seconds, for all sequential access. (pre-format) requests in this interval.
zGNX	FIXED	4 (10,3)	(IBM name: SMF42GNX) Average response time for all of the sequential access (pre-format) requests in this interval (total time/number of requests).
zGNY	FIXED	4 (10,3)	(IBM name: SMF42GNY) Normalized response time for all of the requests in this interval (total time/number of bytes transferred/4K). (pre-format)
zGQA	INT	4	(IBM name: SMF42GQA) Number of record lock requests (obtain/alter/promote)
zGQB	INT	4	(IBM name: SMF42GQB) Number of record lock requests that cause true contention.
zGQC	INT	4	(IBM name: SMF42GQC) Number of record lock requests that cause false contention.

zGQD	INT	4	(IBM name: SMF42GQD) Number of record lock release requests.
zGQE	INT	4	(IBM name: SMF42GQE) Number of component_1 type lock requests.
zGQF	INT	4	(IBM name: SMF42GQF) Number of component_1 type release lock requests.
zGVAA	INT	4	(IBM name: SMF42GVAA) Accumulation of waiters for record lock.
zGVBA	INT	4	(IBM name: SMF42GVBA) Number of record locks hashed to the same hash table entry.
zGQH	INT	4	(IBM name: SMF42GQH) Number of component_1 class_1 (DIWA) locks (obtain/alter/promote).
zGQI	INT	4	(IBM name: SMF42GQI) Number of component_1 class_1 (DIWA) locks that cause true contention.
zGQJ	INT	4	(IBM name: SMF42GQJ) Number of component_1 class_1 (DIWA) locks that cause false contention.
zGQK	INT	4	(IBM name: SMF42GQK) Number of component_1 class_1 (DIWA) release lock requests.
zGQL	INT	4	(IBM name: SMF42GQL) Number of component_1 class_2 (UPGRADE) locks (obtain/alter/promote).
zGQM	INT	4	(IBM name: SMF42GQM) Number of component_1 class_2 (UPGRADE) locks that cause true contention.
zGQN	INT	4	(IBM name: SMF42GQN) Number of component_1 class_2 (UPGRADE) locks that cause false contention.
zGQO	INT	4	(IBM name: SMF42GQO) Number of component_1 class_2 (UPGRADE) release lock requests.
zGQP	INT	4	(IBM name: SMF42GQP) Number of component_1 class_3 (PREFORMAT) locks (obtain/alter/promote).
zGQQ	INT	4	(IBM name: SMF42GQQ) Number of component_1 class_3 (PREFORMAT) locks that cause true contention.
zGQR	INT	4	(IBM name: SMF42GQR) Number of component_1 class_3 (PREFORMAT) locks that cause false contention.
zGQS	INT	4	(IBM name: SMF42GQS) Number of component_1 class_3 (PREFORMAT) release lock requests.
zGQT	INT	4	(IBM name: SMF42GQT) Number of component_2 lock requests (obtain/alter/promote).
zGQU	INT	4	(IBM name: SMF42GQU) Number of component_2 locks that cause true contention.
zGQV	INT	4	(IBM name: SMF42GQV) Number of component_2 locks that cause false contention.
zGQW	INT	4	(IBM name: SMF42GQW) Number of component_2 release lock requests.
zGVDA	INT	4	(IBM name: SMF42GVDA) Accumulation of waiters for DIWA lock.
zGVEA	INT	4	(IBM name: SMF42GVEA) Accumulation of waiters for UPGRADE lock.
zGVFA	INT	4	(IBM name: SMF42GVFA) Accumulation of waiters for COMP2 lock.
zGVGA	INT	4	(IBM name: SMF42GVGA) Number of locks (DIWA, UPGRADE, and COMP2) hashed to the same hash table entry.
zGTHA	INT	4	(IBM name: SMF42GTHA) Number of component_1 class 4 (INDEX Record) locks

			(obtain/alter/promote).
zGTIA	INT	4	(IBM name: SMF42GTIA) Number of component_1 class 4 (INDEX Record) locks that cause true contention.
zGTJA	INT	4	(IBM name: SMF42GTJA) Number of component_1 class 4 (INDEX Record) locks that cause false contention.
zGTKA	INT	4	(IBM name: SMF42GTKA) Number of component_1 class 4 (INDEX Record) release lock requests.
zGRL	INT	4	(IBM name: SMF42GRL) Number of RE-DO's.
zGRM	INT	4	(IBM name: SMF42GRM) Number of recursive RE-DO's.
zGRN	INT	4	(IBM name: SMF42GRN) Number of BMF writes.
zGRO	INT	4	(IBM name: SMF42GRO) Number of SCM read requests.
zGRP	INT	4	(IBM name: SMF42GRP) Number of SCM read requests that encountered castout lock contention.
zGRR	INT	4	(IBM name: SMF42GRR) RE-DO percentage.
zGRS	INT	4	(IBM name: SMF42GRS) Recursive RE-DO percentage.
zGRT	INT	4	(IBM name: SMF42GRT) SCM castout lock percentage.
zGRU	INT	4	(IBM name: SMF42GRU) Total number of CF read requests that encountered retries for cast out locks.
zGTAA	INT	4	(IBM name: SMF42GTAA) Total number of CI splits for this interval.
zGTBA	INT	4	(IBM name: SMF42GTBA) Total number of CA splits for this interval.
zGBQ	CHAR	16	(IBM name: SMF42GBQ) Lock structure name.

Record Type 42 Subtype 17 - VSAM RLS CF Lock Structure Usage

zICH	INT	4	(IBM name: SMF42ICH) Read-miss assignment suppressed counter.
zICI	INT	4	(IBM name: SMF42ICI) Read-miss name assigned counter.
zICJ	INT	4	(IBM name: SMF42ICJ) Read-miss target storage class full counter.
zICK	INT	4	(IBM name: SMF42ICK) Write-hit change bit 0 COUNTER.
zICL	INT	4	(IBM name: SMF42ICL) Write-hit change bit 1 COUNTER.
zICM	INT	4	(IBM name: SMF42ICM) Write-miss not-registered counter.
zICN	INT	4	(IBM name: SMF42ICN) Write-miss invalid state counter.
zICO	INT	4	(IBM name: SMF42ICO) Write-miss target storage class full counter.
zICP	INT	4	(IBM name: SMF42ICP) Directory entry reclaim counter.
zICQ	INT	4	(IBM name: SMF42ICQ) Data table entry reclaim counter.
zICR	INT	4	(IBM name: SMF42ICR) XI for directory reclaim counter.
zICS	INT	4	(IBM name: SMF42ICS) XI for write counter.
zICT	INT	4	(IBM name: SMF42ICT) XI for name invalidation counter.
zICU	INT	4	(IBM name: SMF42ICU) XI for complement invalidation counter.
zICV	INT	4	(IBM name: SMF42ICV) Cast-out counter.
zICW	INT	4	(IBM name: SMF42ICW) Reference signal miss counter.
zICX	INT	4	(IBM name: SMF42ICX) Target storage class full counter.
zICY	INT	4	(IBM name: SMF42ICY) Directory entry counter.
zICZ	INT	4	(IBM name: SMF42ICZ) Data area element counter.
zIDA	INT	4	

			(IBM name: SMF42IDA) Total changed counter.
zIDB	INT	4	(IBM name: SMF42IDB) Data area counter.
zIDC	INT	4	(IBM name: SMF42IDC) Completed reference lists counter.
zIDD	INT	4	(IBM name: SMF42IDD) Partially completed reference lists counter.
zIDE	INT	4	(IBM name: SMF42IDE) XI for local cache vector entry replacement counter.
zIDF	INT	4	(IBM name: SMF42IDF) Write unchanged with XI counter.

Secondary segment: SMF042#18_VSAM_RLS_CFCache_DirElem

Field Name	Type	Len	Description
<i>SMF042#18_VSAM_RLS_CFCache_DirElem.<fieldname></i>			
zIEA	INT	4	(IBM name: SMF42IEA) Interval length. This is the total length, in seconds, of the measurement period.
zIEB	CHAR	30	(IBM name: SMF42IEB) DFSMS cache structure name.
zIEC	INT	4	(IBM name: SMF42IEC) Number of changes to directory portion of directory/element ratio.
zIED	INT	4	(IBM name: SMF42IED) Number of changes to element portion of directory/element ratio.
zIEE	INT	4	(IBM name: SMF42IEE) Low ratio value for directory portion of directory/element ratio.
zIEF	INT	4	(IBM name: SMF42IEF) Low ratio value for element portion of directory/element ratio.
zIEG	INT	4	(IBM name: SMF42IEG) High ratio value for directory portion of directory/element ratio.
zIEH	INT	4	(IBM name: SMF42IEH) High ratio value for element portion of directory/element ratio.
zIEI	INT	4	(IBM name: SMF42IEI) Current ratio value for directory portion of directory/element ratio.
zIEJ	INT	4	(IBM name: SMF42IEJ) Current ratio value for element portion of directory/element ratio.

Record Type 42 Subtype 19 - VSAM RLS Buffer Manager LRU Activity

Primary Segment:

- SMF042#19_DFSMS

Secondary Segment(s): 5 (in alphabetical order)

- SMF042#19_Product_Section
- SMF042#19_VSAM_RLS_Local_Buffer_Manager_Sysplex
- SMF042#19_VSAM_RLS_Local_Buffer_Manager_Sysplex_64

Primary segment: SMF042#19_DFSMS

Field Name	Type	Len	Description
SMF042#19_DFSMS.<fieldname>			
SMF042#19_DFSMS.Header.<fieldname>			
zFLG	HEX	1	(IBM name: SMF42FLG) System indicator: Bit Meaning when set 0 Subsystem identification follows system identification 1 Subtypes used 2 Reserved 3-6 Version indicators 7 Reserved.
zRTY	INT	1	(IBM name: SMF42RTY) Record type 42 (X'2A').
zTME	TSTMP	8	(IBM name: SMF42TME) Date/Time when the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF42SID) System identification (from the SID parameter).
zSSI	CHAR	4	(IBM name: SMF42SSI) Subsystem identification.
zSTY	INT	2	(IBM name: SMF42STY) Record SubType.
zSTYe	INT (ENUM)	2	(IBM name: N/A) Record subtype description.
SMF042#19_DFSMS.Self_defining_Section.<fieldname>			
zNT	INT	2	(IBM name: SMF42NT) Number of triplets in record. A triplet is a set of offset/length/number values that defines a section of the record. (Optional.)
zOPS	INT	4	(IBM name: SMF42OPS) Offset to product section from start of record, including record descriptor word (RDW).
zLPS	INT	2	(IBM name: SMF42LPS) Length of product section.
zNPS	INT	2	(IBM name: SMF42NPS) Number of product sections.
zJX1	INT	4	(IBM name: N/A) Offset to Sysplex Buffer Manager LRU activity totals section.
zJX2	INT	2	(IBM name: N/A) Length of Sysplex Buffer Manager LRU activity totals section.
zJX3	INT	2	(IBM name: N/A) Number of Sysplex Buffer Manager LRU activity totals sections.
zJX4	INT	4	(IBM name: N/A) Offset to Local Buffer Manager LRU activity section.
zJX5	INT	2	(IBM name: N/A) Length of Local Buffer Manager LRU activity section.

zJX6	INT	2	(IBM name: N/A) Number of Local Buffer Manager LRU activity sections.
zJX7	INT	4	(IBM name: N/A) Offset to Sysplex Buffer Manager LRU activity totals section.
zJX8	INT	2	(IBM name: N/A) Length of Sysplex Buffer Manager LRU activity totals section.
zJX9	INT	2	(IBM name: N/A) Number of Sysplex Buffer Manager LRU activity totals sections.
zJXA	INT	4	(IBM name: N/A) Offset to Local Buffer Manager LRU activity section.
zJXB	INT	2	(IBM name: N/A) Length of Local Buffer Manager LRU activity section.
zJXC	INT	2	(IBM name: N/A) Number of Local Buffer Manager LRU activity sections.

Secondary segment: **SMF042#19_Product_Section**

Field Name	Type	Len	Description
<i>SMF042#19_Product_Section.<fieldname></i>			
zPDL	CHAR	8	(IBM name: SMF42PDL) Product level.
zPDN	CHAR	10	(IBM name: SMF42PDN) Product name.
zPSV	INT	1	(IBM name: SMF42PSV) SubType version number 0 => VOLUME header section does not exist, 1 => VOLUME header section exists.
zPTS	TSTMP	8	(IBM name: SMF42PTS) Interval Start or OPEN time of day. This is zero if not available. These values are in time-of-day (TOD) clock format, and reflect GMT time, not local time.
zPTE	TSTMP	8	(IBM name: SMF42PTE) Interval End or CLOSE time of day. This is zero if not available. These values are in time-of-day (TOD) clock format, and reflect GMT time, not local time.

Secondary segment: **SMF042#19_VSAM_RLS_Local_Buffer_Manager_Sysplex**

Field Name	Type	Len	Description
<i>SMF042#19_VSAM_RLS_Local_Buffer_Manager_Sysplex.<fieldname></i>			
zJNA	INT	4	(IBM name: SMF42JNA) Interval length. This is the total length, in seconds, of the measurement period.
zJNE	FIXED	8 (20,3)	(IBM name: SMF42JNE) Average CPU time for all systems in sysplex (in milli-seconds).
zJNF	FIXED	8 (20,3)	(IBM name: SMF42JNF) Total CPU time for this record (in milli-seconds).
zJN7	INT	4	(IBM name: SMF42JN7) Total number of write requests (sysplex totals).
zJNG	INT	4	(IBM name: SMF42JNG) Average number of Buffer Manager LRU intervals processed (sysplex totals).
zJNH	INT	4	(IBM name: SMF42JNH) Total number of Buffer Manager LRU intervals processed (across sysplex).

zJNI	INT	4	(IBM name: SMF42JNI) Average number of Buffer Manager LRU intervals where BMF was over the goal, and normal algorithms were bypassed to reclaim buffers.
zJNJ	INT	4	(IBM name: SMF42JNJ) Total number of Buffer Manager LRU intervals where BMF was over the goal, and normal algorithms were bypassed to reclaim buffers (across sysplex).
zJNK	INT	4	(IBM name: SMF42JNK) Average number of times that BMF was called in this interval.
zJNL	INT	4	(IBM name: SMF42JNL) Total number of times that BMF was called in this interval (across sysplex).
zJNM	INT	4	(IBM name: SMF42JNM) Average number of Buffer Manager 'hits' during this interval.
zJNN	INT	4	(IBM name: SMF42JNN) Total number of Buffer Manager 'hits' during this interval.
zJNO	INT	4	(IBM name: SMF42JNO) Buffer Manager 'hits' current percentage during this interval.
zJNP	INT	4	(IBM name: SMF42JNP) Buffer Manager 'hits' low percentage during this interval.
zJNQ	INT	4	(IBM name: SMF42JNQ) Buffer Manager 'hits' high percentage during this interval.
zJNR	INT	4	(IBM name: SMF42JNR) Buffer Manager average 'hits' during this interval.
zJNS	INT	4	(IBM name: SMF42JNS) Average Sysplex Cache manager number of 'hits' during this interval.
zJNT	INT	4	(IBM name: SMF42JNT) Total Sysplex Cache manager number of 'hits' during this interval.
zJNU	INT	4	(IBM name: SMF42JNU) Sysplex Cache manager number of 'hits' current percentage during this interval.
zJNV	INT	4	(IBM name: SMF42JNV) Sysplex Cache manager number of 'hits' low percentage during this interval.
zJNW	INT	4	(IBM name: SMF42JNW) Sysplex Cache manager number of 'hits' high percentage during this interval.
zJNX	INT	4	(IBM name: SMF42JNX) Sysplex Cache manager number of 'hits' average percentage during this interval.
zJNY	INT	4	(IBM name: SMF42JNY) Average DASD number of 'hits' during this interval.
zJNZ	INT	4	(IBM name: SMF42JNZ) Total DASD number of 'hits' during this interval.
zJOA	INT	4	(IBM name: SMF42JOA) DASD 'hits' current percentage during this interval.
zJOB	INT	4	(IBM name: SMF42JOB) DASD 'hits' low percentage during this interval.
zJOC	INT	4	(IBM name: SMF42JOC) DASD 'hits' high percentage during this interval.
zJOD	INT	4	(IBM name: SMF42JOD) DASD average 'hits' during this interval.

SMF042#19_VSAM_RLS_Local_Buffer_Manager_Sysplex.zJOE.<fieldname>

zJOF	INT	4	(IBM name: SMF42JOF) Average low value of the number of BMF buffers for this pool during this interval.
zJOG	INT	4	(IBM name: SMF42JOG) Average high value of the number of BMF buffers for this pool during this interval.

zJOH	INT	4	(IBM name: SMF42JOH) Average current value of the number of BMF buffers for this pool during this interval.
zJOJ	INT	4	(IBM name: SMF42JOJ) Average low value of the number of extents for this pool during this interval.
zJOK	INT	4	(IBM name: SMF42JOK) Average high value of the number of extents for this pool during this interval.
zJOL	INT	4	(IBM name: SMF42JOL) Average current value of the number of extents for this pool during this interval.

SMF042#19_VSAM_RLS_Local_Buffer_Manager_Sysplex.zJRI.<fieldname>

zJRJ	INT	4	(IBM name: SMF42JRJ) Low value of the number of BMF buffers for this pool during this interval.
zJRK	INT	4	(IBM name: SMF42JRK) High value of the number of BMF buffers for this pool during this interval.
zJRL	INT	4	(IBM name: SMF42JRL) Value of the number of BMF buffers for this pool during this interval.
zJRN	INT	4	(IBM name: SMF42JRN) Low value of the number of extents for this pool during this interval.
zJRO	INT	4	(IBM name: SMF42JRO) High value of the number of extents for this pool during this interval.
zJRP	INT	4	(IBM name: SMF42JRP) Current value of the number of extents for this pool during this interval.

SMF042#19_VSAM_RLS_Local_Buffer_Manager_Sysplex.<fieldname>

zJON	INT	4	(IBM name: SMF42JON) Average buffer size goal (in megabytes) - low value.
zJOO	INT	4	(IBM name: SMF42JOO) Total Buffer size goal (in megabytes) - Low value.
zJOP	INT	4	(IBM name: SMF42JOP) Average Buffer size goal (in megabytes) - high value.
zJOQ	INT	4	(IBM name: SMF42JOQ) Total Buffer size goal (in megabytes) - high value.
zJOR	INT	4	(IBM name: SMF42JOR) Average Buffer size goal (in megabytes) - current value.
zJOS	INT	4	(IBM name: SMF42JOS) Total Buffer size goal (in megabytes) - current value.
zJOT	INT	4	(IBM name: SMF42JOT) Total Buffer size goal (in megabytes) - average value.
zJOV	INT	4	(IBM name: SMF42JOV) Average Buffer size Calculated (in megabytes) - low value.
zJOW	INT	4	(IBM name: SMF42JOW) Total Buffer size Calculated (in megabytes) - low value.
zJOX	INT	4	(IBM name: SMF42JOX) Average Buffer size Calculated (in megabytes) - high value.
zJOY	INT	4	(IBM name: SMF42JOY) Total Buffer size Calculated (in megabytes) - high value.
zJOZ	INT	4	(IBM name: SMF42JOZ) Average Buffer size Calculated (in megabytes) - current value.
zJRA	INT	4	(IBM name: SMF42JRA) Total Buffer size Calculated (in megabytes) - current value.
zJRB	INT	4	(IBM name: SMF42JRB) Total Buffer size Calculated (in megabytes) - Average value.
zJRC	INT	4	

			(IBM name: SMF42JRC) Total number of CF read requests that encountered retries for cast out locks for this interval (across the sysplex).
zJRF	INT	4	(IBM name: SMF42JRF) Average calculated megabytes distribution array (16 entries). Each entry contains the number of times the calculated value occurred within a 100MB span. 1st => 0-99MB, 2nd => 100-199MB, ..., 16th => >1500MB.
zJRH	INT	4	(IBM name: SMF42JRH) Total calculated megabytes distribution array (16 entries). Each entry contains the number of times the calculated value occurred within a 100MB span. 1st => 0-99MB, 2nd => 100-199MB, ..., 16th => >1500MB.
zJTA	INT	4	(IBM name: SMF42JTA) Average number of SCM read requests which encountered castout lock contention during this interval (across the sysplex).
zJTB	INT	4	(IBM name: SMF42JTB) Total number of SCM read requests which encountered castout lock contention during this interval (across the sysplex).
zJTC	INT	4	(IBM name: SMF42JTC) Average number of SCM read requests during this interval (across the sysplex).
zJTD	INT	4	(IBM name: SMF42JTD) Total number of SCM read requests during this interval (across the sysplex).
zJTE	INT	4	(IBM name: SMF42JTE) Current percentage of SCM read requests which encountered castout lock contention during this interval (across the sysplex).
zJTF	INT	4	(IBM name: SMF42JTF) Low percentage of SCM read requests which encountered castout lock contention during this interval (across the sysplex).
zJTG	INT	4	(IBM name: SMF42JTG) High percentage of SCM read requests which encountered castout lock contention during this interval (across the sysplex).
zJTH	INT	4	(IBM name: SMF42JTH) Average percentage of SCM read requests which encountered castout lock contention during this interval (across the sysplex).
zJTI	INT	4	(IBM name: SMF42JTI) Average number of RE-DO's during this interval (across the sysplex).
zJTJ	INT	4	(IBM name: SMF42JTJ) Total number of RE-DO's during this interval (across the sysplex).
zJTK	INT	4	(IBM name: SMF42JTK) Average number of recursive RE-DO's during this interval (across the sysplex).
zJTL	INT	4	(IBM name: SMF42JTL) Total number of recursive redo during this interval (across the sysplex).
zJTM	INT	4	(IBM name: SMF42JTM) Current percentage of RE-DO's during this interval (across the sysplex).
zJTN	INT	4	(IBM name: SMF42JTN) Low percentage of RE-DO's during this interval (across the sysplex).
zJTO	INT	4	(IBM name: SMF42JTO) High percentage of RE-DO's during this interval (across the sysplex).
zJTP	INT	4	(IBM name: SMF42JTP) Average percentage of RE-DO's during this interval (across the sysplex).
zJTQ	INT	4	(IBM name: SMF42JTQ) Current percentage of Recursive RE-DO's during this interval (across the sysplex).
zJTR	INT	4	(IBM name: SMF42JTR) Low percentage of Recursive RE-DO's during this interval (across the sysplex).
zJTS	INT	4	(IBM name: SMF42JTS) High percentage of Recursive RE-DO's during this interval (across the sysplex).

zJTT	INT	4	(IBM name: SMF42JTT) Average percentage of Recursive RE-DO's during this interval (across the sysplex).
zJUA	INT	4	(IBM name: SMF42JUA) Average number of buffer manager LRU intervals processed, where BMF was over the goal accelerated the aging, but did not go into panic mode (across the sysplex).
zJUB	INT	4	(IBM name: SMF42JUB) Total number of buffer manager LRU intervals processed, where BMF was over the goal accelerated the aging, but did not go into panic mode (across the sysplex).

Secondary segment: SMF042#19_VSAM_RLS_Local_Buffer_Manager_System

Field Name	Type	Len	Description
<i>SMF042#19_VSAM_RLS_Local_Buffer_Manager_System.<fieldname></i>			
zJPA	INT	4	(IBM name: SMF42JPA) Interval length. This is the total length, in seconds, of the measurement period.
zJPB	CHAR	8	(IBM name: SMF42JPB) MVS system name.
zJPE	FIXED	8 (20,3)	(IBM name: SMF42JPE) Average CPU time for all systems in sysplex (in milliseconds).
zJPF	FIXED	8 (20,3)	(IBM name: SMF42JPF) Total CPU time for this record (in milliseconds).
zJP6	INT	4	(IBM name: SMF42JP6) Total number of write requests.
zJPG	INT	4	(IBM name: SMF42JPG) Number of Buffer Manager LRU intervals processed.
zJPH	INT	4	(IBM name: SMF42JPH) Number of Buffer Manager LRU intervals where BMF was over the goal, and normal algorithms were bypassed to reclaim buffers
zJPI	INT	4	(IBM name: SMF42JPI) Total number of times that BMF was called in this interval.
zJP2	INT	4	(IBM name: SMF42JP2) Number of buffer manager LRU intervals processed, where BMF was over the goal, accelerated the aging, but did not go into panic mode.
zJPJ	INT	4	(IBM name: SMF42JPJ) Buffer Manager number of hits during this interval.
zJPK	INT	4	(IBM name: SMF42JPK) Buffer Manager number of hits current percentage during this interval.
zJPL	INT	4	(IBM name: SMF42JPL) Buffer Manager number of hits low percentage during this interval.
zJPM	INT	4	(IBM name: SMF42JPM) Buffer Manager number of hits high percentage during this interval.
zJPN	INT	4	(IBM name: SMF42JPN) Buffer Manager average hits during this interval.
zJPO	INT	4	(IBM name: SMF42JPO) Sysplex Cache manager number of hits during this interval.
zJPP	INT	4	(IBM name: SMF42JPP) Sysplex Cache manager number of hits current percentage during this interval.
zJPQ	INT	4	(IBM name: SMF42JPQ) Sysplex Cache manager number of hits low percentage during this interval.
zJPR	INT	4	(IBM name: SMF42JPR) Sysplex Cache manager number of hits high percentage during this

			interval.
zJPS	INT	4	(IBM name: SMF42JPS) Sysplex Cache manager number of hits average percentage during this interval.
zJPT	INT	4	(IBM name: SMF42JPT) DASD number of hits during this interval.
zJPU	INT	4	(IBM name: SMF42JPU) DASD hits current percentage during this interval.
zJPV	INT	4	(IBM name: SMF42JPV) DASD hits low percentage during this interval.
zJPW	INT	4	(IBM name: SMF42JPW) DASD hits high percentage during this interval.
zJPX	INT	4	(IBM name: SMF42JPX) DASD average hits during this interval.

SMF042#19_VSAM_RLS_Local_Buffer_Manager_System.zJPY.<fieldname>

zJPZ	INT	4	(IBM name: SMF42JPZ) Low value of the number of BMF buffers for this pool during this interval.
zJQA	INT	4	(IBM name: SMF42JQA) High value of the number of BMF buffers for this pool during this interval.
zJQB	INT	4	(IBM name: SMF42JQB) Current value of the number of BMF buffers for this pool during this interval.
zJQC	INT	4	(IBM name: SMF42JQC) Low value of the number of extents for this pool during this interval.
zJQD	INT	4	(IBM name: SMF42JQD) High value of the number of extents for this pool during this interval.
zJQF	INT	4	(IBM name: SMF42JQF) Current value of the number of extents for this pool during this interval.

SMF042#19_VSAM_RLS_Local_Buffer_Manager_System.<fieldname>

zJQG	INT	4	(IBM name: SMF42JQG) Buffer size goal (in megabytes) - low value.
zJQH	INT	4	(IBM name: SMF42JQH) Buffer size goal (in megabytes) - high value.
zJQI	INT	4	(IBM name: SMF42JQI) Buffer size goal (in megabytes) - current value.
zJQJ	INT	4	(IBM name: SMF42JQJ) Buffer size goal (in megabytes) - average value.
zJQK	INT	4	(IBM name: SMF42JQK) Buffer size Calculated (in megabytes) - low value.
zJQL	INT	4	(IBM name: SMF42JQL) Buffer size Calculated (in megabytes) - high value.
zJQM	INT	4	(IBM name: SMF42JQM) Buffer size Calculated (in megabytes) - current value.
zJQN	INT	4	(IBM name: SMF42JQN) Buffer size Calculated (in megabytes) - Average value.
zJQ2	INT	4	(IBM name: SMF42JQ2) Total number of CF read requests that encountered retries for cast out locks for this interval.
zJQP	INT	4	(IBM name: SMF42JQP) Calculated megabytes distribution array (16 entries). Each entry contains the number of times the calculated value occurred within a 100MB span. 1st => 0-99MB, 2nd => 100-199MB, ..., 16th => >1500MB.
zJSA	INT	4	(IBM name: SMF42JSA) Number of SCM read requests, which encountered castout contention during this interval.

zJSB	INT	4	(IBM name: SMF42JSB) Number of SCM read requests during this interval.
zJSC	INT	4	(IBM name: SMF42JSC) Current percentage of SCM read requests, which encountered cast contention during this interval. (Value is for the last LRU cycle before the SMF record was processed.)
zJSD	INT	4	(IBM name: SMF42JSD) Low percentage during this interval for zJSC.
zJSE	INT	4	(IBM name: SMF42JSE) High percentage during this interval for zJSC.
zJSF	INT	4	(IBM name: SMF42JSF) Average percentage during this interval for zJSC.
zJSG	INT	4	(IBM name: SMF42JSG) Number of RE-DO's during this interval.
zJSH	INT	4	(IBM name: SMF42JSH) Current percentage of RE-DO's during this interval. (Value is for the last LRU cycle before the SMF record was processed.)
zJSI	INT	4	(IBM name: SMF42JSI) Low percentage during this interval for zJSH.
zJSJ	INT	4	(IBM name: SMF42JSJ) High percentage during this interval for zJSH.
zJSK	INT	4	(IBM name: SMF42JSK) Average percentage during this interval for zJSH.
zJSL	INT	4	(IBM name: SMF42JSL) Number of recursive RE-DO's during this interval.
zJSM	INT	4	(IBM name: SMF42JSM) Current percentage of recursive RE-DO's during this interval. (Value is for the last LRU cycle before the SMF record was processed.)
zJSN	INT	4	(IBM name: SMF42JSN) Low percentage during this interval for zJSM.
zJSO	INT	4	(IBM name: SMF42JSO) High percentage during this interval for zJSM.
zJSP	INT	4	(IBM name: SMF42JSP) Average percentage during this interval for zJSM.
zJUC	INT	4	(IBM name: SMF42JUC) Low number of fixed 4 K pages in use (above and below the bar).
zJUD	INT	4	(IBM name: SMF42JUD) High number of fixed 4 K pages in use (above and below the bar).
zJUE	INT	4	(IBM name: SMF42JUE) Average number of fixed 4 K pages in use (above and below the bar).
zJUF	INT	4	(IBM name: SMF42JUF) Maximum amount of fixed storage (in megabytes). Set by RLSFIXEDPOOLSIZE.
zJUG	INT	4	(IBM name: SMF42JUG) Percentage of available real storage that can be used by fixed pages.

Secondary segment: SMF042#19_VSAM_RLS_Local_Buffer_Manager_Sysplex_64

Field Name	Type	Len	Description
SMF042#19_VSAM_RLS_Local_Buffer_Manager_Sysplex_64.<fieldname>			
zJNA	INT	4	(IBM name: SMF42JNA) Interval length. This is the total length, in seconds, of the measurement period.
zJNE	FIXED	8 (20,3)	(IBM name: SMF42JNE) Average CPU time for all systems in sysplex (in milli-seconds).

zJNF	FIXED	8 (20,3)	(IBM name: SMF42JNF) Total CPU time for this record (in milli-seconds).
zJN7	INT	4	(IBM name: SMF42JN7) Total number of write requests (sysplex totals).
zJNG	INT	4	(IBM name: SMF42JNG) Average number of Buffer Manager LRU intervals processed (sysplex totals).
zJNH	INT	4	(IBM name: SMF42JNH) Total number of Buffer Manager LRU intervals processed (across sysplex).
zJNI	INT	4	(IBM name: SMF42JNI) Average number of Buffer Manager LRU intervals where BMF was over the goal, and normal algorithms were bypassed to reclaim buffers.
zJNJ	INT	4	(IBM name: SMF42JNJ) Total number of Buffer Manager LRU intervals where BMF was over the goal, and normal algorithms were bypassed to reclaim buffers (across sysplex).
zJNK	INT	4	(IBM name: SMF42JNK) Average number of times that BMF was called in this interval.
zJNL	INT	4	(IBM name: SMF42JNL) Total number of times that BMF was called in this interval (across sysplex).
zJNM	INT	4	(IBM name: SMF42JNM) Average number of Buffer Manager 'hits' during this interval.
zJNN	INT	4	(IBM name: SMF42JNN) Total number of Buffer Manager 'hits' during this interval.
zJNO	INT	4	(IBM name: SMF42JNO) Buffer Manager 'hits' current percentage during this interval.
zJNP	INT	4	(IBM name: SMF42JNP) Buffer Manager 'hits' low percentage during this interval.
zJNQ	INT	4	(IBM name: SMF42JNQ) Buffer Manager 'hits' high percentage during this interval.
zJNR	INT	4	(IBM name: SMF42JNR) Buffer Manager average 'hits' during this interval.
zJNS	INT	4	(IBM name: SMF42JNS) Average Sysplex Cache manager number of 'hits' during this interval.
zJNT	INT	4	(IBM name: SMF42JNT) Total Sysplex Cache manager number of 'hits' during this interval.
zJNU	INT	4	(IBM name: SMF42JNU) Sysplex Cache manager number of 'hits' current percentage during this interval.
zJNV	INT	4	(IBM name: SMF42JNV) Sysplex Cache manager number of 'hits' low percentage during this interval.
zJNW	INT	4	(IBM name: SMF42JNW) Sysplex Cache manager number of 'hits' high percentage during this interval.
zJNX	INT	4	(IBM name: SMF42JNX) Sysplex Cache manager number of 'hits' average percentage during this interval.
zJNY	INT	4	(IBM name: SMF42JNY) Average DASD number of 'hits' during this interval.
zJNZ	INT	4	(IBM name: SMF42JNZ) Total DASD number of 'hits' during this interval.
zJOA	INT	4	(IBM name: SMF42JOA) DASD 'hits' current percentage during this interval.
zJOB	INT	4	(IBM name: SMF42JOB) DASD 'hits' low percentage during this interval.
zJOC	INT	4	(IBM name: SMF42JOC) DASD 'hits' high percentage during this interval.

zJOD	INT	4	(IBM name: SMF42JOD) DASD average 'hits' during this interval.
------	-----	---	---

SMF042#19_VSAM_RLS_Local_Buffer_Manager_Sysplex_64.zJOE.<fieldname>

zJOF	INT	4	(IBM name: SMF42JOF) Average low value of the number of BMF buffers for this pool during this interval.
zJOG	INT	4	(IBM name: SMF42JOG) Average high value of the number of BMF buffers for this pool during this interval.
zJOH	INT	4	(IBM name: SMF42JOH) Average current value of the number of BMF buffers for this pool during this interval.
zJOJ	INT	4	(IBM name: SMF42JOJ) Average low value of the number of extents for this pool during this interval.
zJOK	INT	4	(IBM name: SMF42JOK) Average high value of the number of extents for this pool during this interval.
zJOL	INT	4	(IBM name: SMF42JOL) Average current value of the number of extents for this pool during this interval.

SMF042#19_VSAM_RLS_Local_Buffer_Manager_Sysplex_64.zJRI.<fieldname>

zJRJ	INT	4	(IBM name: SMF42JRJ) Low value of the number of BMF buffers for this pool during this interval.
zJRK	INT	4	(IBM name: SMF42JRK) High value of the number of BMF buffers for this pool during this interval.
zJRL	INT	4	(IBM name: SMF42JRL) Value of the number of BMF buffers for this pool during this interval.
zJRN	INT	4	(IBM name: SMF42JRN) Low value of the number of extents for this pool during this interval.
zJRO	INT	4	(IBM name: SMF42JRO) High value of the number of extents for this pool during this interval.
zJRP	INT	4	(IBM name: SMF42JRP) Current value of the number of extents for this pool during this interval.

SMF042#19_VSAM_RLS_Local_Buffer_Manager_Sysplex_64.<fieldname>

zJON	INT	4	(IBM name: SMF42JON) Average buffer size goal (in megabytes) - low value.
zJOO	INT	4	(IBM name: SMF42JOO) Total Buffer size goal (in megabytes) - Low value.
zJOP	INT	4	(IBM name: SMF42JOP) Average Buffer size goal (in megabytes) - high value.
zJOQ	INT	4	(IBM name: SMF42JOQ) Total Buffer size goal (in megabytes) - high value.
zJOR	INT	4	(IBM name: SMF42JOR) Average Buffer size goal (in megabytes) - current value.
zJOS	INT	4	(IBM name: SMF42JOS) Total Buffer size goal (in megabytes) - current value.
zJOT	INT	4	(IBM name: SMF42JOT) Total Buffer size goal (in megabytes) - average value.
zJOV	INT	4	(IBM name: SMF42JOV) Average Buffer size Calculated (in megabytes) - low value.
zJOW	INT	4	(IBM name: SMF42JOW) Total Buffer size Calculated (in megabytes) - low value.
zJOX	INT	4	(IBM name: SMF42JOX) Average Buffer size Calculated (in megabytes) - high value.

zJOY	INT	4	(IBM name: SMF42JOY) Total Buffer size Calculated (in megabytes) - high value.
zJOZ	INT	4	(IBM name: SMF42JOZ) Average Buffer size Calculated (in megabytes) - current value.
zJRA	INT	4	(IBM name: SMF42JRA) Total Buffer size Calculated (in megabytes) - current value.
zJRB	INT	4	(IBM name: SMF42JRB) Total Buffer size Calculated (in megabytes) - Average value.
zJRC	INT	4	(IBM name: SMF42JRC) Total number of CF read requests that encountered retries for cast out locks for this interval (across the sysplex).
zJRF	INT	4	(IBM name: SMF42JRF) Average calculated megabytes distribution array (16 entries). Each entry contains the number of times the calculated value occurred within a 100MB span. 1st => 0-99MB, 2nd => 100-199MB, ..., 16th => >1500MB.
zJRH	INT	4	(IBM name: SMF42JRH) Total calculated megabytes distribution array (16 entries). Each entry contains the number of times the calculated value occurred within a 100MB span. 1st => 0-99MB, 2nd => 100-199MB, ..., 16th => >1500MB.
zJTA	INT	4	(IBM name: SMF42JTA) Average number of SCM read requests which encountered castout lock contention during this interval (across the sysplex).
zJTB	INT	4	(IBM name: SMF42JTB) Total number of SCM read requests which encountered castout lock contention during this interval (across the sysplex).
zJTC	INT	4	(IBM name: SMF42JTC) Average number of SCM read requests during this interval (across the sysplex).
zJTD	INT	4	(IBM name: SMF42JTD) Total number of SCM read requests during this interval (across the sysplex).
zJTE	INT	4	(IBM name: SMF42JTE) Current percentage of SCM read requests which encountered castout lock contention during this interval (across the sysplex).
zJTF	INT	4	(IBM name: SMF42JTF) Low percentage of SCM read requests which encountered castout lock contention during this interval (across the sysplex).
zJTG	INT	4	(IBM name: SMF42JTG) High percentage of SCM read requests which encountered castout lock contention during this interval (across the sysplex).
zJTH	INT	4	(IBM name: SMF42JTH) Average percentage of SCM read requests which encountered castout lock contention during this interval (across the sysplex).
zJTI	INT	4	(IBM name: SMF42JTI) Average number of RE-DO's during this interval (across the sysplex).
zJTJ	INT	4	(IBM name: SMF42JTJ) Total number of RE-DO's during this interval (across the sysplex).
zJTK	INT	4	(IBM name: SMF42JTK) Average number of recursive RE-DO's during this interval (across the sysplex).
zJTL	INT	4	(IBM name: SMF42JTL) Total number of recursive redo during this interval (across the sysplex).
zJTM	INT	4	(IBM name: SMF42JTM) Current percentage of RE-DO's during this interval (across the sysplex).
zJTN	INT	4	(IBM name: SMF42JTN) Low percentage of RE-DO's during this interval (across the sysplex).
zJTO	INT	4	(IBM name: SMF42JTO) High percentage of RE-DO's during this interval (across the sysplex).
zJTP	INT	4	(IBM name: SMF42JTP) Average percentage of RE-DO's during this interval (across the sysplex).

zJTQ	INT	4	(IBM name: SMF42JTQ) Current percentage of Recursive RE-DO's during this interval (across the sysplex).
zJTR	INT	4	(IBM name: SMF42JTR) Low percentage of Recursive RE-DO's during this interval (across the sysplex).
zJTS	INT	4	(IBM name: SMF42JTS) High percentage of Recursive RE-DO's during this interval (across the sysplex).
zJTT	INT	4	(IBM name: SMF42JTT) Average percentage of Recursive RE-DO's during this interval (across the sysplex).
zJUA	INT	4	(IBM name: SMF42JUA) Average number of buffer manager LRU intervals processed, where BMF was over the goal accelerated the aging, but did not go into panic mode (across the sysplex).
zJUB	INT	4	(IBM name: SMF42JUB) Total number of buffer manager LRU intervals processed, where BMF was over the goal accelerated the aging, but did not go into panic mode (across the sysplex).

Secondary segment: **SMF042#19_VSAM_RLS_Local_Buffer_Manager_System_64**

Field Name	Type	Len	Description
<i>SMF042#19_VSAM_RLS_Local_Buffer_Manager_System_64.<fieldname></i>			
zJPA	INT	4	(IBM name: SMF42JPA) Interval length. This is the total length, in seconds, of the measurement period.
zJPB	CHAR	8	(IBM name: SMF42JPB) MVS system name.
zJPE	FIXED	8 (20,3)	(IBM name: SMF42JPE) Average CPU time for all systems in sysplex (in milliseconds).
zJPF	FIXED	8 (20,3)	(IBM name: SMF42JPF) Total CPU time for this record (in milliseconds).
zJP6	INT	4	(IBM name: SMF42JP6) Total number of write requests.
zJPG	INT	4	(IBM name: SMF42JPG) Number of Buffer Manager LRU intervals processed.
zJPH	INT	4	(IBM name: SMF42JPH) Number of Buffer Manager LRU intervals where BMF was over the goal, and normal algorithms were bypassed to reclaim buffers
zJPI	INT	4	(IBM name: SMF42JPI) Total number of times that BMF was called in this interval.
zJP2	INT	4	(IBM name: SMF42JP2) Number of buffer manager LRU intervals processed, where BMF was over the goal, accelerated the aging, but did not go into panic mode.
zJPJ	INT	4	(IBM name: SMF42JPJ) Buffer Manager number of hits during this interval.
zJPK	INT	4	(IBM name: SMF42JPK) Buffer Manager number of hits current percentage during this interval.
zJPL	INT	4	(IBM name: SMF42JPL) Buffer Manager number of hits low percentage during this interval.
zJPM	INT	4	(IBM name: SMF42JPM) Buffer Manager number of hits high percentage during this interval.
zJPN	INT	4	(IBM name: SMF42JPN) Buffer Manager average hits during this interval.

zJPO	INT	4	(IBM name: SMF42JPO) Sysplex Cache manager number of hits during this interval.
zJPP	INT	4	(IBM name: SMF42JPP) Sysplex Cache manager number of hits current percentage during this interval.
zJPQ	INT	4	(IBM name: SMF42JPQ) Sysplex Cache manager number of hits low percentage during this interval.
zJPR	INT	4	(IBM name: SMF42JPR) Sysplex Cache manager number of hits high percentage during this interval.
zJPS	INT	4	(IBM name: SMF42JPS) Sysplex Cache manager number of hits average percentage during this interval.
zJPT	INT	4	(IBM name: SMF42JPT) DASD number of hits during this interval.
zJPU	INT	4	(IBM name: SMF42JPU) DASD hits current percentage during this interval.
zJPV	INT	4	(IBM name: SMF42JPV) DASD hits low percentage during this interval.
zJPW	INT	4	(IBM name: SMF42JPW) DASD hits high percentage during this interval.
zJPX	INT	4	(IBM name: SMF42JPX) DASD average hits during this interval.

SMF042#19_VSAM_RLS_Local_Buffer_Manager_System_64.zJPY.<fieldname>

zJPZ	INT	4	(IBM name: SMF42JPZ) Low value of the number of BMF buffers for this pool during this interval.
zJQA	INT	4	(IBM name: SMF42JQA) High value of the number of BMF buffers for this pool during this interval.
zJQB	INT	4	(IBM name: SMF42JQB) Current value of the number of BMF buffers for this pool during this interval.
zJQC	INT	4	(IBM name: SMF42JQC) Low value of the number of extents for this pool during this interval.
zJQD	INT	4	(IBM name: SMF42JQD) High value of the number of extents for this pool during this interval.
zJQF	INT	4	(IBM name: SMF42JQF) Current value of the number of extents for this pool during this interval.

SMF042#19_VSAM_RLS_Local_Buffer_Manager_System_64.<fieldname>

zJQG	INT	8	(IBM name: SMF42JQG) Buffer size goal (in megabytes) - low value.
zJQH	INT	8	(IBM name: SMF42JQH) Buffer size goal (in megabytes) - high value.
zJQI	INT	8	(IBM name: SMF42JQI) Buffer size goal (in megabytes) - current value.
zJQJ	INT	8	(IBM name: SMF42JQJ) Buffer size goal (in megabytes) - average value.
zJQK	INT	8	(IBM name: SMF42JQK) Buffer size Calculated (in megabytes) - low value.
zJQL	INT	8	(IBM name: SMF42JQL) Buffer size Calculated (in megabytes) - high value.
zJQM	INT	8	(IBM name: SMF42JQM) Buffer size Calculated (in megabytes) - current value.
zJQN	INT	8	(IBM name: SMF42JQN) Buffer size Calculated (in megabytes) - Average value.
zJQ2	INT	4	

			(IBM name: SMF42JQ2) Total number of CF read requests that encountered retries for cast-out locks for this interval.
zJQP	INT	4	(IBM name: SMF42JQP) Calculated megabytes distribution array (16 entries). Each entry contains the number of times the calculated value occurred within a 100MB span. 1st => 0-99MB, 2nd => 100-199MB, ..., 16th => >1500MB.
zJSA	INT	4	(IBM name: SMF42JSA) Number of SCM read requests, which encountered castout contention during this interval.
zJSB	INT	4	(IBM name: SMF42JSB) Number of SCM read requests during this interval.
zJSC	INT	4	(IBM name: SMF42JSC) Current percentage of SCM read requests, which encountered cast contention during this interval. (Value is for the last LRU cycle before the SMF record was processed.)
zJSD	INT	4	(IBM name: SMF42JSD) Low percentage during this interval for zJSC.
zJSE	INT	4	(IBM name: SMF42JSE) High percentage during this interval for zJSC.
zJSF	INT	4	(IBM name: SMF42JSF) Average percentage during this interval for zJSC.
zJSG	INT	4	(IBM name: SMF42JSG) Number of RE-DO's during this interval.
zJSH	INT	4	(IBM name: SMF42JSH) Current percentage of RE-DO's during this interval. (Value is for the last LRU cycle before the SMF record was processed.)
zJSI	INT	4	(IBM name: SMF42JSI) Low percentage during this interval for zJSH.
zJSJ	INT	4	(IBM name: SMF42JSJ) High percentage during this interval for zJSH.
zJSK	INT	4	(IBM name: SMF42JSK) Average percentage during this interval for zJSH.
zJSL	INT	4	(IBM name: SMF42JSL) Number of recursive RE-DO's during this interval.
zJSM	INT	4	(IBM name: SMF42JSM) Current percentage of recursive RE-DO's during this interval. (Value is for the last LRU cycle before the SMF record was processed.)
zJSN	INT	4	(IBM name: SMF42JSN) Low percentage during this interval for zJSM.
zJSO	INT	4	(IBM name: SMF42JSO) High percentage during this interval for zJSM.
zJSP	INT	4	(IBM name: SMF42JSP) Average percentage during this interval for zJSM.
zJUC	INT	4	(IBM name: SMF42JUC) Low number of fixed 4 K pages in use (above and below the bar).
zJUD	INT	4	(IBM name: SMF42JUD) High number of fixed 4 K pages in use (above and below the bar).
zJUE	INT	4	(IBM name: SMF42JUE) Average number of fixed 4 K pages in use (above and below the bar).
zJUF	INT	4	(IBM name: SMF42JUF) Maximum amount of fixed storage (in megabytes). Set by RLSFIXEDPOOLSIZE.
zJUG	INT	4	(IBM name: SMF42JUG) Percentage of available real storage that can be used by fixed pages.

Record Type 42 Subtype 20 - STOW Initialize

Primary Segment:

- SMF042#20_DFSMS

Secondary Segment(s): 3 (in alphabetical order)

- SMF042#20_Product_Section
- SMF042#20_STOW_Initialise
- SMF042#20_STOW_Initialise_User

Primary segment: SMF042#20_DFSMS

Field Name	Type	Len	Description
SMF042#20_DFSMS.<fieldname>			
SMF042#20_DFSMS.Header.<fieldname>			
zFLG	HEX	1	(IBM name: SMF42FLG) System indicator: Bit Meaning when set 0 Subsystem identification follows system identification 1 Subtypes used 2 Reserved 3-6 Version indicators 7 Reserved.
zRTY	INT	1	(IBM name: SMF42RTY) Record type 42 (X'2A').
zTME	TSTMP	8	(IBM name: SMF42TME) Date/Time when the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF42SID) System identification (from the SID parameter).
zSSI	CHAR	4	(IBM name: SMF42SSI) Subsystem identification.
zSTY	INT	2	(IBM name: SMF42STY) Record SubType.
zSTYe	INT (ENUM)	2	(IBM name: N/A) Record subtype description.

SMF042#20_DFSMS.Self_defining_Section.<fieldname>			
zNT	INT	2	(IBM name: SMF42NT) Number of triplets in record. A triplet is a set of offset/length/number values that defines a section of the record. (Optional.)
zOPS	INT	4	(IBM name: SMF42OPS) Offset to product section from start of record, including record descriptor word (RDW).
zLPS	INT	2	(IBM name: SMF42LPS) Length of product section.
zNPS	INT	2	(IBM name: SMF42NPS) Number of product sections.
zKN1	INT	4	(IBM name: SMF42KN1) Offset to STOW Initialize section.
zKN2	INT	2	(IBM name: SMF42KN2) Length of STOW Initialize section.
zKN3	INT	2	(IBM name: SMF42KN3) Number of STOW Initialize sections.
zKN4	INT	4	(IBM name: SMF42KN4) Offset to STOW Initialize additional information section.
zKN5	INT	2	(IBM name: SMF42KN5) Length of STOW Initialize additional information section.
zKN6	INT	2	

			(IBM name: SMF42KN6) Number of STOW Initialize additional information section.

zSTRP	BIT	1	Extended format data set.
zPDSEX	BIT	1	HFS data set.
zDSAE	BIT	1	Extended attributes are maintained in catalog entry.

SMF042#27_VTOC_Audit_DSCB_Old.zSCEXT.<fieldname>

zSCXTF	INT (ENUM)	1	(IBM name: N/A) Secondary space extension value (zSCXTV) units. 'None' => No secondary space extension. 'AVB' => zSCXTV is the original average block length. 'MB' => zSCXTV is in megabytes. 'KB' => zSCXTV is in kilobytes. 'UB' => zSCXTV is in bytes. 'CP1' => zSCXTV has been compacted by a factor of 256. 'CP2' => zSCXTV has been compacted by a factor of 65536.
zSCXTV	INT	2	(IBM name: N/A) Secondary space extension value.

SMF042#27_VTOC_Audit_DSCB_Old.<fieldname>

zDSORG	INT (ENUM)	2	Data set organization. 'Unknown' => No DSORG recorded. 'IS' => Indexed sequential organization. 'PS' => Physical sequential organization. 'DA' => Direct organization. 'CX' => BTAM or QTAM line group. 'CQ' => QTAM direct access msg queue. 'MQ' => QTAM problem prog msg queue. 'PO' => Partitioned organization. 'U' => Unmovable, the data set contains location dependent information. 'GS' => Graphics organization. 'TX' => TCAM line group. 'TQ' => TCAM message queue. 'AM' => Access method control block or VSAM data set/space. 'TR' => TCAM 3705.
zRECFM	INT (ENUM)	1	Record Format. 'Unk' => No RECFM recorded. 'F' => Fixed length. 'FA' => Fixed length (ANSI format). 'FB' => Fixed length (blocked). 'FBA' => Fixed length (blocked, ANSI format). 'FBM' => Fixed length (blocked, machine code format). 'FBS' => Fixed length (blocked, standard blocks). 'FBSA' => Fixed length (blocked, standard blocks, ANSI format). 'FBSM' => Fixed length (blocked, standard blocks, machine code format). 'FBT' => Fixed length (blocked, track overflow). 'FBTA' => Fixed length (blocked, track overflow, ANSI format). 'FBTM' => Fixed length (blocked, track overflow, machine code format). 'FM' => Fixed length (machine code format). 'FS' => Fixed length (standard blocks). 'FSA' => Fixed length (standard blocks, ANSI format). 'FSM' => Fixed length (standard blocks, machine code format). 'FT' => Fixed length (track overflow). 'FTA' => Fixed length (track overflow, ANSI format). 'FTM' => Fixed length (track overflow, machine code format). 'U' => Undefined-length. 'UA' => Undefined-length (ANSI format). 'UM' => Undefined-length (machine code format). 'UT' => Undefined-length (track overflow). 'UTA' => Undefined-length (track overflow, ANSI format). 'UTM' => Undefined-length (track overflow, machine code format). 'V' => Variable length. 'VA' => Variable length (ANSI format). 'VB' => Variable length (blocked). 'VBA' => Variable length (blocked, ANSI format). 'VBM' => Variable length (blocked, machine code format). 'VBS' => Variable length (blocked, spanned). 'VBSA' => Variable length (blocked, spanned, ANSI format). 'VBSM' => Variable length (blocked, spanned, machine code format). 'VBST' => Variable length (blocked, spanned, track overflow). 'VBSTA' => Variable length (blocked, spanned, track overflow, ANSI format). 'VBSTM' => Variable length (blocked, spanned, track overflow, machine code format). 'VBT' => Variable length (blocked, track overflow). 'VBTA' => Variable length (blocked, track overflow, ANSI format). 'VBTM' => Variable length (blocked, track overflow, machine code format). 'VM' => Variable length (machine code format). 'VS' => Variable length (spanned). 'VSA' => Variable length (spanned, ANSI format). 'VSM' => Variable length (spanned, machine code format). 'VT' => Variable length (track overflow). 'VTA' => Variable length (track overflow, ANSI format). 'VTM' => Variable length (track overflow, machine code format).

SMF042#27_VTOC_Audit_DSCB_Old.zOPTCD.<fieldname>

zW	BIT	1	Write validity check.
zU	BIT	1	Allow data check (1403 prtr) if zDSORG=PO or PS. Data set cataloged in ICF catalog if zDSORG=AM. Track overflow if zDSORG=DA. Accumulate track index entries if zDSORG=IS.
zC	BIT	1	Chained scheduling using PCI if zDSORG=PO or PS. Data set is ICF catalog if zDSORG=AM. Extended search if zDSORG=DA. Master indices if zDSORG=IS.

zH	BIT	1	VSE/OS interchange feature if zDSORG=PO or PS. Not used if zDSORG=AM. Feedback if zDSORG=DA. Independent overflow area if zDSORG=IS.
zB	BIT	1	Treat EOF as EOVS (tape) if zDSORG=PO or PS. Not used if zDSORG=AM. Actual addressing if zDSORG=DA. Cylinder overflow area if zDSORG=IS.
zZ	BIT	1	Search direct if zDSORG=PO or PS. Not used if zDSORG=AM. Dynamic buffering if zDSORG=DA. Not used if zDSORG=IS.
zT	BIT	1	User label totaling if zDSORG=PO or PS. Not used if zDSORG=AM. Read exclusive if zDSORG=DA. Delete option if zDSORG=IS.
zJ	BIT	1	For 3800 printing subsystem if zDSORG=PO or PS. Not used if zDSORG=AM. Relative block addressing if zDSORG=DA. Reorganization criteria if zDSORG=IS.

SMF042#27_VTOC_Audit_DSCB_Old.<fieldname>

zBLKL	INT	2	Block length for RECFM=F records, maximum BLKSIZE for RECFM=U or RECFM=V records.
zLRECL	INT	2	Logical record length. Record length for RECFM=F, 0 for RECFM=U, Maximum record length for RECFM=V, Maximum record length (if <= 32756) or 32768 (if >32756) for RECFM=VS.
zKEYL	INT	1	Key length (0 - 255).
zRKP	HEX	2	Relative key position.

SMF042#27_VTOC_Audit_DSCB_Old.zDSIND.<fieldname>

zIND80	BIT	1	Last volume containing data in this data set.
zIND40	BIT	1	Data set is racf defined.
zIND20	BIT	1	Block length is a multiple of 8 bytes.
zIND10	BIT	1	Password is required to read or write or both.
zIND08	BIT	1	Data set modified since recall.
zIND04	BIT	1	If zIND10 is 1 then 1 => Password required to write but not to read, 0 => Password required to write or to read.
zIND02	BIT	1	Data set opened for other than input since last backup copy made.
zIND01	BIT	1	Secure checkpoint data set.

SMF042#27_VTOC_Audit_DSCB_Old.zSCALO.<fieldname>

zSCAL1	BINT (ENUM)	2	Space Parameters.
zEXT	BIT	1	Extension to secondary space description exists (zSCEXT).
zCONTG	BIT	1	Contiguous request.
zMXIG	BIT	1	MXIG request.
zALX	BIT	1	ALX request.
zAVRND	BIT	1	Round request.
zSCAL3	INT	3	(IBM name: N/A) Secondary Allocation quantity.

SMF042#27_VTOC_Audit_DSCB_Old.<fieldname>

zLSTAR	HEX	3	Last used track and block on track (TTR). Note: for EXTENDED format, high order bytes of TT may be contained zTRBAL.
zTRBAL	HEX	2	2 High order bytes of last used track for EXTENDED format (TTTTR). Zeroes (00) for PDSE, HFS, or VSAM. Otherwise code indicating space remaining on last used track.
zTTTHI	HEX	1	High order byte of zLSTAR. See zLARGE in zFLAG1.

SMF042#27_VTOC_Audit_DSCB_Old.zEXT.<fieldname>			
zEXTIN	HEX	1	(IBM name: N/A) Extent type indicator. X'81' => Extent on cylinder boundaries. X'40' => User label extent (first extent only, and is not counted in zNOEPV). X'04' => Index area extent (ISAM). X'02' => Overflow area extent (ISAM). X'01' => User's data block extent or is a prime area extent (ISAM).
zEXTSQ	INT	1	(IBM name: N/A) Extent sequence number.
zEXTLO	HEX	4	(IBM name: N/A) Lower limit (CCHH or, for a volume with more than 65,520 cylinders, CCCCcccH where 'CCCC' are the 16 low-order bits of the cylinder address and 'ccc' are the 12 high-order bits of the cylinder address. The head address 'H' is the 4 bit address of the track).
zEXTUP	HEX	4	(IBM name: N/A) Upper limit (CCHH or, for a volume with more than 65,520 cylinders, CCCCcccH where 'CCCC' are the 16 low-order bits of the cylinder address and 'ccc' are the 12 high-order bits of the cylinder address. The head address 'H' is the 4 bit address of the track).

SMF042#27_VTOC_Audit_DSCB_Old.<fieldname>			
zPTRDS	HEX	5	Zeroes or pointer (CCHHR) to format 2 or 3 DSCB for zFMTID=1. Pointer to format 9 DSCB for zFMTID=8.

Secondary segment: **SMF042#27_VTOC_Audit_DSCB_New**

Field Name	Type	Len	Description
SMF042#27_VTOC_Audit_DSCB_New.<fieldname>			
zDSNAM	CHAR	44	Data set name.
zFMTID	CHAR	1	Format identifier
zDSSN	CHAR	6	Data set serial number. (Identifies the first or only volume containing the data set/space).
zVOLSQ	INT	2	Volume sequence number (1-9999).
zCREDIT	DATE	3	Creation date.
zEXPDT	DATE	3	Expiration date.
zNOEPV	INT	1	Number of data extents on volume.
zNOBDB	INT	1	Number of bytes used in last directory block (PDS only).

SMF042#27_VTOC_Audit_DSCB_New.zFLAG1.<fieldname>			
zCOMPR	BIT	1	Compressable extended format (zSTRP must also be set).
zCPOIT	BIT	1	Checkpointed dataset.
zEXPBY	BIT	1	VSE exp date spec by ret period.
zRECAL	BIT	1	Data set has been recalled.
zLARGE	BIT	1	>64K track data set coexistence.
zENCRP	BIT	1	Access method encrypted data set.
zEATTR	BINT (ENUM)	2	Extended attribute setting as specified on the allocation request (EATTR=). 'Dflt' => EATTR has not been specified. The defaults for EAS eligibility apply. VSAM data sets default is EAS-eligible. This is equivalent to EATTR=OPT being specified. Non-VSAM data sets default is not EAS eligible. This is equivalent to EATTR=NO being specified. 'NO' => EATTR=NO has been specified. The data set cannot have extended attributes (format 8 and 9 DSCBs) or optionally reside in EAS. 'OPT' => EATTR=OPT has been specified. The data set can have extended attributes and optionally reside in EAS. This is the default for VSAM data sets. 'Unused' => Not Used. EATTR treated as not specified.

SMF042#27_VTOC_Audit_DSCB_New.<fieldname>			
zSYSCD	CHAR	13	System code.
zREFD	DATE	3	Date last referenced. Zero if not maintained

SMF042#27_VTOC_Audit_DSCB_New.zSMSFG.<fieldname>			
zSMSDS	BIT	1	System managed data set.
zSMSUC	BIT	1	No BCS entry exists for data set.
zREBLK	BIT	1	SDB and D.S. may be reblocked.
zCRSDB	BIT	1	DADSM CREATE originated BLKSIZE.
zPDSE	BIT	1	PDSE data set.
zSTRP	BIT	1	Extended format data set.
zPDSEX	BIT	1	HFS data set.
zDSAE	BIT	1	Extended attributes are maintained in catalog entry.

SMF042#27_VTOC_Audit_DSCB_New.zSCEXT.<fieldname>			
zSCXTF	INT (ENUM)	1	(IBM name: N/A) Secondary space extension value (zSCXTV) units. 'None' => No secondary space extension. 'AVB' => zSCXTV is the original average block length. 'MB' => zSCXTV is in megabytes. 'KB' => zSCXTV is in kilobytes. 'UB' => zSCXTV is in bytes. 'CP1' => zSCXTV has been compacted by a factor of 256. 'CP2' => zSCXTV has been compacted by a factor of 65536.
zSCXTV	INT	2	(IBM name: N/A) Secondary space extension value.

SMF042#27_VTOC_Audit_DSCB_New.<fieldname>			
zDSORG	INT (ENUM)	2	Data set organization. 'Unknown' => No DSORG recorded. 'IS' => Indexed sequential organization. 'PS' => Physical sequential organization. 'DA' => Direct organization. 'CX' => BTAM or QTAM line group. 'CQ' => QTAM direct access msg queue. 'MQ' => QTAM problem prog msg queue. 'PO' => Partitioned organization. 'U' => Unmovable, the data set contains location dependent information. 'GS' => Graphics organization. 'TX' => TCAM line group. 'TQ' => TCAM message queue. 'AM' => Access method control block or VSAM data set/space. 'TR' => TCAM 3705.
zRECFM	INT (ENUM)	1	Record Format. 'Unk' => No RECFM recorded. 'F' => Fixed length. 'FA' => Fixed length (ANSI format). 'FB' => Fixed length (blocked). 'FBA' => Fixed length (blocked, ANSI format). Record Type 43 - JES Startup

SMF Record 43 (JES Startup) is mapped by structure member "T043".

Primary Segment:

- SMF043_JES_Startup

Secondary Segment(s): 2 (in alphabetical order)

- SMF043_JES2_Start
- SMF043_JES3_Start

Primary segment: SMF043_JES_Startup

Field Name	Type	Len	Description
<i>SMF043_JES_Startup.<fieldname></i>			
SMF043_JES_Startup.Header_Self_Defining_Section.<fieldname>			
zFLG	HEX	1	(IBM name: SMF43FLG) System indicator: Bit Meaning when set 0-2 Reserved 3-6 Version indicators 7 Reserved.
zRTY	INT	1	(IBM name: SMF43RTY) Record type 43 (X'2B').
zTME	TSTMP	8	(IBM name: SMF43TME) Time when the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF43SID) System identification (from the SID parameter).
zSBS	INT (ENUM)	2	(IBM name: SMF43SBS) Subsystem identification.
zLRR	INT	2	(IBM name: SMF43LRR) Length of rest of record, excluding this field.

Secondary segment: SMF043_JES2_Start

Field Name	Type	Len	Description
<i>SMF043_JES2_Start.<fieldname></i>			
SMF043_JES2_Start.zRST.<fieldname>			
zRWR	BIT	1	If 1, record written for \$E SYS command, otherwise record written for \$S JES2 command.
SMF043_JES2_Start.zOPT.<fieldname>			
zFORMAT	BIT	1	FORMAT the spool.
zCOLD	BIT	1	COLD start.
zREQ	BIT	1	REQ option was specified.
zLIST	BIT	1	LIST option was specified.
zLOG	BIT	1	LOG option was specified.
zRECONFIG	BIT	1	RECONFIG option was specified.
zCONSOLE	BIT	1	CONSOLE option was specified.
zJES2	BIT	1	JES2 determined that it could perform a quick start.
SMF043_JES2_Start.<fieldname>			

zEID	CHAR	4	(IBM name: SMF43EID) If \$E SYS command, identification of system whose job processing is to be reclaimed. If \$\$ JES2 command, zero.
------	------	---	---

Secondary segment: **SMF043_JES3_Start**

Field Name	Type	Len	Description
<i>SMF043_JES3_Start.<fieldname></i>			
SMF043_JES3_Start.zRST.<fieldname>			
zCOLD	BIT	1	COLD start
zWARM	BIT	1	WARM start
zHOT	BIT	1	HOT start
zQUEUE	BIT	1	START is with JES3 queue analysis
zGLOBAL	BIT	1	JES3 global processor. This bit is always set if start is a cold start or warm start.
zLOCAL	BIT	1	JES3 local processor. This bit is always set if start is a hot start.
zDSI	BIT	1	DYNAMIC system interchange (DSI) was invoked by operator to convert a local processor to the global processor. zHOT and zGLOBAL will also be set.

SMF043_JES3_Start.<fieldname>			
zUS1	INT	1	(IBM name: SMF43US1) User flags.
zNMU	CHAR	1	(IBM name: SMF43NMU) JES3 initialization deck origin type (taken from operator's response to WTOR macro).
zORG	CHAR	8	(IBM name: SMF43ORG) JES3 initialization deck origin location (taken from operator's response to WTOR macro). Contents are as follows: If zNMU=N, the member name from JCL in the JES3 procedure. If zNMU=M, the member name on Dataset in the JES3 procedure. If zNMU=U, the unit address of the 3 or 4 digit unit at the specified address (stored in 4-digit format).
zPJ3	CHAR	4	(IBM name: SMF43PJ3) JES3 procedure name.

Record Type 45 - JES Stop

SMF Record 45 (JES Stop) is mapped by structure member "T045".

Primary Segment:

- SMF045_JES_Stop

Secondary Segment(s): 0

Primary segment: SMF045_JES_Stop

Field Name	Type	Len	Description
<i>SMF045_JES_Stop.<fieldname></i>			
zFLG	HEX	1	(IBM name: SMF45FLG) System indicator: Bit Meaning when set 0-2 Reserved 3-6 Version indicators* 7 RESERVED. *See 'Standard and Extended SMF record headers' on page 174 FOR a detailed description.
zRTY	INT	1	(IBM name: SMF45RTY) Record type 45 (X'2B').
zTME	TSTMP	8	(IBM name: SMF45TME) Date/Time that the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF45SID) System identification (from the SID parameter).
zSBS	INT (ENUM)	2	(IBM name: SMF45SBS) Subsystem identification.
zRSV	CHAR	2	(IBM name: SMF45RSV) Reserved.
zLRR	INT	2	(IBM name: SMF45LRR) Length of rest of record, excluding this field.
<i>SMF045_JES_Stop.zIND.<fieldname></i>			
zAbnorm	BIT	1	Abnormal JES2 termination
<i>SMF045_JES_Stop.<fieldname></i>			
zJCC	INT	2	(IBM name: SMF45JCC) JES2 completion code.

Record Type 47 - JES SIGNON / Start Line

SMF Record 47 (JES SIGNON / Start Line) is mapped by structure member "T047".

Primary Segment:

- [SMF047_JES_Start_Line](#)

Secondary Segment(s): 0

Primary segment: [SMF047_JES_Start_Line](#)

Field Name	Type	Len	Description

<i>SMF048_JES_Stop_Line.<fieldname></i>			
<i>SMF048_JES_Stop_Line.Header_Self_defining_Section.<fieldname></i>			
zFLG	INT	1	(IBM name: SMF48FLG) System indicator: Bit Meaning when set 0-2 Reserved 3-6 Version indicators* 7 RESERVED. *See 'Standard and Extended SMF record headers' on page 174 FOR a detailed description.
zRTY	INT	1	(IBM name: SMF48RTY) Record type 48 (X'30').
zTME	TSTMP	8	(IBM name: SMF48TME) Date/Time that the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF48SID) System identification (from the MEMBER statement).
zSBS	INT (ENUM)	2	(IBM name: SMF48SBS) Subsystem identification.
zRSV	CHAR	2	(IBM name: SMF48RSV) Reserved.
zLRR	INT	2	(IBM name: SMF48LRR) Length of rest of record, excluding this field.
<i>SMF048_JES_Stop_Line.Header_Self_defining_Section.zEVT.<fieldname></i>			
zLNE	BIT	1	Record written for \$S LNE command
zSignOff	BIT	1	Record written for SIGNOFF.
<i>SMF048_JES_Stop_Line.Header_Self_defining_Section.<fieldname></i>			
zRV1	CHAR	2	(IBM name: SMF48RV1) Reserved.
zRMT	CHAR	8	(IBM name: SMF48RMT) Remote name as defined in JESPARMS. (This field is filled in only if a remote terminal is connected to this line.)
zLIN	CHAR	8	(IBM name: SMF48LIN) Line name as defined in JESPARMS.
zPSW	CHAR	8	(IBM name: SMF48PSW) Password as defined in JESPARMS.
zIO	INT	4	(IBM name: SMF48IO) Number of EXCPs for this line.
zNAK	INT	4	(IBM name: SMF48NAK) Number of negative acknowledgements to write text.
zDCK	INT	4	(IBM name: SMF48DCK) Number of data checks to read text.
zOUT	INT	4	(IBM name: SMF48OUT) Number of time outs to read text.
zERR	INT	4	(IBM name: SMF48ERR) Sum of all other line errors.

zLAA	HEX	3	(IBM name: SMF48LAA) 3-digit hexadecimal device number.
zLA4	HEX	4	(IBM name: SMF48LA4) 4-digit hexadecimal device number.

Record Type 49 - JES Integrity

SMF Record 49 (JES Integrity) is mapped by structure member "T049".

Primary Segment:

- [SMF049_JES_Integrity](#)

Secondary Segment(s): 0

Primary segment: [SMF049_JES_Integrity](#)

Field Name	Type	Len	Description
<i>SMF049_JES_Integrity.<fieldname></i>			
<i>SMF049_JES_Integrity.Header_Self_defining_Section.<fieldname></i>			
zFLG	HEX	1	(IBM name: SMF49FLG) System indicator: Bit Meaning when set 0-2 Reserved 3-6 Version indicators* 7 RESERVED. *See 'Standard and Extended SMF record headers' on page 174 FOR a detailed description.
zRTY	INT	1	(IBM name: SMF49RTY) Record type 49 (X'31').
zTME	TSTMP	8	(IBM name: SMF49TME) Date/Time that the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF49SID) System identification (from the SID parameter).
zSBS	INT (ENUM)	2	(IBM name: SMF49SBS) Subsystem identification.
zRSV	CHAR	2	(IBM name: SMF49RSV) Reserved.
zLRR	INT	2	(IBM name: SMF49LRR) Length of rest of record, excluding this field.
<i>SMF049_JES_Integrity.Header_Self_defining_Section.zEVT.<fieldname></i>			
zStartedLine	BIT	1	Started line
zSignOn	BIT	1	Record written for SIGNON.
<i>SMF049_JES_Integrity.Identification.<fieldname></i>			
zLN1	INT	2	(IBM name: SMF49LN1) Length of identification section, including this field.
zRMT	CHAR	8	(IBM name: SMF49RMT) Remote name as defined in JESPARMS. (This field is filled in only if a remote terminal is connected to this line.)
zLIN	CHAR	8	(IBM name: SMF49LIN) Line name as defined in JESPARMS.
zPSW	CHAR	8	(IBM name: SMF49PSW) Incorrect password.
<i>SMF049_JES_Integrity.Message.<fieldname></i>			
zLN2	INT	2	(IBM name: SMF49LN2) Length of rest of record, including this field.
zMSG	CHAR	36	(IBM name: SMF49MSG) Message text. This field includes columns 35-70 of the SIGNON card image.

Record Type 50 - VTAM Tuning Statistics

SMF Record 50 (VTAM Tuning Statistics) is mapped by structure member "T050".

Primary Segment:

- [SMF050_VTAM_Tuning_Statistics](#)

Secondary Segment(s): 11 (in alphabetical order)

- [SMF050_CTCA](#)

- [SMF050_MPC_XCF_RW](#)
- [SMF050_RoCE_Port](#)
- [SMF050_RoCE_User](#)
- [SMF050_SNA_Controllers](#)
- [SMF050_TCP](#)

Primary segment: [SMF050_VTAM_Tuning_Statistics](#)

Field Name	Type	Len	Description
<i>SMF050_VTAM_Tuning_Statistics.<fieldname></i>			
<i>SMF050_VTAM_Tuning_Statistics.Header_Self_Defining_Section.<fieldname></i>			
zFLG	HEX	1	System indicator: Bit Meaning when set 0-2 Reserved 3-6 Version indicators 7 Reserved.
zRTY	INT	1	Record type 14 (X'0E').
zTME	TSTMP	8	Date/Time that the record was moved into the SMF buffer.
zSID	CHAR	4	System identification (from the SID parameter).

Secondary segment: [SMF050_SNA_Controllers](#)

Field Name	Type	Len	Description
<i>SMF050_SNA_Controllers.<fieldname></i>			
zID	CHAR	8	Controller name.
zDLRMAX	INT	4	Dump load restart requests (DLRMAX).
zCHWR	INT	4	Write channel program count (CHWR).
zCHRD	INT	4	Read channel program count (CHRD).
zATTN	INT	4	Total attention interrupts received (ATTN).
zRDATN	INT	4	Attentions on ends of READs (RDATN).
zIPDU	INT	4	Number of PDUs inbound (IPIU).
zOPDU	INT	4	Number of PDUs outbound (OPIU).
zRDBUF	INT	4	Total read buffers used (RDBUF).
zSLODN	INT	4	Number of slowdowns (SLODN).
zXL	INT	1	Extension length (including this field).
zVER	CHAR	2	Version = X'F0F4'.
zINLP	INT	4	Number of inbound NLPs (INLP).

zONLP	INT	4	Number of outbound NLPs (ONLP).
zNBYTECT	INT	4	Number of bytes read from inbound NLPs (BFNLP).

Secondary segment: SMF050_CTCA

Field Name	Type	Len	Description
<i>SMF050_CTCA.<fieldname></i>			
zID	CHAR	8	CTCA name (ID).
zDLRMAX	INT	4	Dump load restart requests (DLRMAX).
zCHWR	INT	4	Normal-sized channel program count (CHNRM).
zCHRD	INT	4	Large-sized channel program count (CHMAX).
zATTN	INT	4	Total attention interrupts received (ATTN).
zRDATN	INT	4	Number of write buffers used (WRBUF). For packed channel programs the counts represent the number of bytes read or written. For old style (nonpacked format) it is the number of buffers.
zIPDU	INT	4	Number of PIUs inbound (IPIU)
zOPDU	INT	4	Number of PIUs outbound (OPIU)
zRDBUF	INT	4	Total input bytes used (RDBUF). For packed channel programs the counts represent the number of bytes read or written. For old style (nonpacked format) it is the number of buffers.
zSLODN	INT	4	Number of slowdowns (SLODN).
zXL	INT	1	CTCA extension length (including this field).
zTYPE	INT	1	CTCA attachment type.
zVER	CHAR	2	CTCA version = X'F0F1'.
zTIMERS	INT	4	Channel program starts because of timer trigger (TIMERS).
zQDPTH	INT	4	Channel program starts because of queue depth limit trigger (QDPTH).
zBUFCAP	INT	4	Channel program starts because of destination capacity limit trigger (BUFCAP).
zPRI	INT	4	Channel program starts because of high priority request trigger (PRI).

Secondary segment: SMF050_MPC_XCF_Group

Field Name	Type	Len	Description
<i>SMF050_MPC_XCF_Group.<fieldname></i>			
zID	CHAR	8	TRLE name.
zTOK	HEX	8	MVS token.
zTSWEEP	INT	4	Number of timer sweeps (TSWEEP). Group statistics only, this value is always 0 for HPDT MPC connections.
zQSWEEP	INT	4	Number of queue sweeps (QSWEEP). Group statistics only, this value is always 0 for HPDT MPC connections.
zRECW	INT	4	Number of write records. Group statistics only.
zRECR	INT	4	Number of read records. Group statistics only.
zRECRW	INT	4	Number of READ/WRITE records. Group statistics only.
zXL	INT	1	CTCA extension length (including this field).

zTYPE	INT (ENUM)	1	CTCA attachment type. Group => Statistics for entire MPC group. This is the 1st record in the group. RorW => Statistics for a READ or WRITE subchannel (MPC using channels only). RW => Statistics for the READ/WRITE subchannel (MPC XCF only). This is the 2nd record in the group. OSA => Statistics for the OSA-Express or Hipersockets datapath queue (MPC using channels only).
zVER	CHAR	2	CTCA version = X'F0F2'.
zINLP	INT	4	Number of inbound NLPs (INLP).
zONLP	INT	4	Number of outbound NLPs (ONLP).
zNBYTECT	INT	4	NLP byte count.
zNBYTECTO	INT	4	NLP byte count overflow.

Secondary segment: **SMF050_MPC_XCF_RW**

Field Name	Type	Len	Description
<i>SMF050_MPC_XCF_RW.<fieldname></i>			
zID	CHAR	8	TRLE name.
zTOK	HEX	8	MVS token.
zBYTER	INT	4	Number of received bytes. READ/WRITE subchannel statistics only.
zBYTEO	INT	4	Receive byte overflow count. READ/WRITE subchannel statistics only.
zXCF	CHAR	4	XCF identifier (XCF). READ/WRITE subchannel statistics only.
zBSIZE	INT	4	Transmit block size (BSIZE). READ/WRITE subchannel statistics only.
zRDWR	CHAR	4	READ/WRITE indicator (RDWR). READ/WRITE subchannel statistics only.
zBYTECNT	INT	4	Sent byte count. READ/WRITE subchannel statistics only.
zXL	INT	1	CTCA extension length (including this field).
zTYPE	INT (ENUM)	1	CTCA attachment type. Group => Statistics for entire MPC group. This is the 1st record in the group. RorW => Statistics for a READ or WRITE subchannel (MPC using channels only). RW => Statistics for the READ/WRITE subchannel (MPC XCF only). This is the 2nd record in the group. OSA => Statistics for the OSA-Express or Hipersockets datapath queue (MPC using channels only).
zVER	CHAR	2	CTCA version = X'F0F2'.
zBYTECNTO	INT	4	Send byte overflow count. READ/WRITE subchannel statistics only.
zMAXBYTES	INT	4	Max transmit size (MAXBYTES). READ/WRITE subchannel statistics only.
zINLP	INT	4	Number of inbound NLPs (INLP).
zONLP	INT	4	Number of outbound NLPs (ONLP).
zNBYTECT	INT	4	NLP byte count.
zNBYTECTO	INT	4	NLP byte count overflow.

Secondary segment: **SMF050_MPC_Channel_Group**

Field Name	Type	Len	Description
------------	------	-----	-------------

SMF050_MPC_Channel_Group.<fieldname>			
zID	CHAR	8	MPC line name.
zDLRMAX	INT	4	Dump load restart requests (DLRMAX).
zIPDU	INT	4	Number of PDUs inbound (IPIU).
zOPDU	INT	4	Number of PDUs outbound (OPIU).
zTSWEEP	INT	4	Number of timer sweeps (TSWEEP). Group statistics only, this value is always 0 for HPDT MPC connections.
zQSWEEP	INT	4	Number of queue sweeps (QSWEEP). Group statistics only, this value is always 0 for HPDT MPC connections.
zRECW	INT	4	Number of write records. Group statistics only.
zRECR	INT	4	Number of read records. Group statistics only.
zXL	INT	1	CTCA extension length (including this field).
zTYPE	INT (ENUM)	1	CTCA attachment type. Group => Statistics for entire MPC group. This is the 1st record in the group. RorW => Statistics for a READ or WRITE subchannel (MPC using channels only). RW => Statistics for the READ/WRITE subchannel (MPC XCF only). This is the 2nd record in the group. OSA => Statistics for the OSA-Express or Hipersockets datapath queue (MPC using channels only).
zVER	CHAR	2	CTCA version = X'F0F2'.
zINLP	INT	4	Number of inbound NLPs (INLP).
zONLP	INT	4	Number of outbound NLPs (ONLP).
zNBYTECT	INT	4	NLP byte count.
zNBYTECTO	INT	4	NLP byte count overflow.
zOSAQ	INT	4	Number of OSA-Express datapath queues.

Secondary segment: SMF050_MPC_Channel_Read_or_Write

Field Name	Type	Len	Description
SMF050_MPC_Channel_Read_or_Write.<fieldname>			
zID	CHAR	8	MPC line name.
zDLRMAX	INT	4	Dump load restart requests (DLRMAX).
zDEV	CHAR	4	Device address (DEV). Read and Write subchannel statistics only.
zBSIZE	INT	4	Transmit block size (BSIZE). READ and WRITE subchannel statistics only.
zDIR	CHAR	4	Subchannel polarity (DIR).
zBYTECNT	INT	4	Transmit or receive byte count (BYTECNT). READ and WRITE subchannel and OSA datapath statistics only.
zXL	INT	1	CTCA extension length (including this field).
zTYPE	INT (ENUM)	1	CTCA attachment type. Group => Statistics for entire MPC group. This is the 1st record in the group. RorW => Statistics for a READ or WRITE subchannel (MPC using channels only). RW => Statistics for the READ/WRITE subchannel (MPC XCF only). This is the 2nd record in the group. OSA => Statistics for the OSA-Express or Hipersockets datapath queue (MPC using channels only).
zVER	CHAR	2	CTCA version = X'F0F2'.
zBYTECNTO	INT	4	

			Overflow byte count (BYTECNTO). READ and WRITE subchannel and OSA datapath statistics only.
zSLOWDOWN	INT	4	Slowdown frequency (SLOWDOWN). READ and WRITE subchannel statistics only.
zSIO	INT	4	Number of SIO issued (SIO). READ and WRITE subchannel statistics only.
zMAXBYTES	INT	4	Max transmit size (MAXBYTES). READ and WRITE subchannel statistics only.
zINLP	INT	4	Number of inbound NLPs (INLP).
zONLP	INT	4	Number of outbound NLPs (ONLP).
zNBYTECT	INT	4	NLP byte count.
zNBYTECTO	INT	4	NLP byte count overflow.

Secondary segment: SMF050_MPC_Channel_OSA_Read

Field Name	Type	Len	Description
<i>SMF050_MPC_Channel_OSA_Read.<fieldname></i>			
zID	CHAR	8	MPC line name.
zDLRMAX	INT	4	Dump load restart requests (DLRMAX).
zDEV	CHAR	4	Device address (DEV). Read and Write subchannel statistics only.
zBSIZE	INT	4	Transmit block size (BSIZE). READ and WRITE subchannel statistics only.
zDIR	CHAR	4	Subchannel polarity (DIR).
zBYTECNT	INT	4	Transmit or receive byte count (BYTECNT). READ and WRITE subchannel and OSA datapath statistics only.
zXL	INT	1	CTCA extension length (including this field).
zTYPE	INT (ENUM)	1	CTCA attachment type. Group => Statistics for entire MPC group. This is the 1st record in the group. RorW => Statistics for a READ or WRITE subchannel (MPC using channels only). RW => Statistics for the READ/WRITE subchannel (MPC XCF only). This is the 2nd record in the group. OSA => Statistics for the OSA-Express or Hipersockets datapath queue (MPC using channels only).
zVER	CHAR	2	CTCA version = X'F0F2'.
zBYTECNTO	INT	4	Overflow byte count (BYTECNTO). READ and WRITE subchannel and OSA datapath statistics only.
zINLP	INT	4	Number of inbound NLPs (INLP).
zONLP	INT	4	Number of outbound NLPs (ONLP).
zNBYTECT	INT	4	NLP byte count.
zNBYTECTO	INT	4	NLP byte count overflow.
zPCIREALO	INT	4	OSA-Express READ queue: PCIR overflow.
zPCIREAL	INT	4	OSA-Express READ queue: PCIR count.
zPCIVIRTO	INT	4	OSA-Express READ queue: PCIV overflow.
zPCIVIRT	INT	4	OSA-Express READ queue: PCIV count.
zPCITHRSO	INT	4	OSA-Express READ queue: PCIT overflow.
zPCITHRSH	INT	4	OSA-Express READ queue: PCIT count.
zPCIUNPRO	INT	4	OSA-Express READ queue: PCIU overflow.
zPCIUNPRD	INT	4	OSA-Express READ queue: PCIU count.

zRPROCDEO	INT	4	OSA-Express READ queue: processing deferrals overflow.
zRPROCDEF	INT	4	OSA-Express READ queue: processing deferrals.
zRREPLDEO	INT	4	OSA-Express READ queue: replenishment deferrals overflow.
zRREPLDEF	INT	4	OSA-Express READ queue: replenishment deferrals.
zNOREADSO	INT	4	OSA-Express READ queue: reads exhausted overflow.
zNOREADS	INT	4	OSA-Express READ queue: reads exhausted.
zSBALCNTO	INT	4	OSA-Express READ queue: SBAL count overflow.
zSBALCNT	INT	4	OSA-Express READ queue: SBAL count.
zEARLYINO	INT	4	OSA-Express READ queue: early interrupt count overflow.
zEARLYINT	INT	4	OSA-Express READ queue: early interrupt count.
zULPRETUO	INT	4	OSA-Express READ queue: early interrupt phase II spinout count overflow.
zULPRETU	INT	4	OSA-Express READ queue: early interrupt phase II spinout count overflow.
zPACKCNTO	INT	4	OSA-Express READ queue: packet count overflow.
zPACKCNT	INT	4	OSA-Express READ queue: packet count.
zPKTIQDO	INT	4	OSA-Express or Hipersockets READ queue: accelerated packet count overflow.
zPKTIQD	INT	4	OSA-Express or Hipersockets READ queue: accelerated packet count.
zBYTIQDO	INT	4	OSA-Express or Hipersockets READ queue: accelerated byte count overflow.
zBYTIQD	INT	4	OSA-Express or Hipersockets READ queue: accelerated byte count.
zFRINVCTO	INT	4	OSA-Express3 or later READ queue: frame invalidation packet count overflow.
zFRINVCT	INT	4	OSA-Express3 or later READ queue: frame invalidation packet count.
zREADQ	CHAR	8	READ queue name.

Secondary segment: SMF050_MPC_Channel_OSA_Write

Field Name	Type	Len	Description
<i>SMF050_MPC_Channel_OSA_Write.<fieldname></i>			
zID	CHAR	8	MPC line name.
zDLRMAX	INT	4	Dump load restart requests (DLRMAX).
zDEV	CHAR	4	Device address (DEV). Read and Write subchannel statistics only.
zBSIZE	INT	4	Transmit block size (BSIZE). READ and WRITE subchannel statistics only.
zDIR	CHAR	4	Subchannel polarity (DIR).
zBYTECNT	INT	4	Transmit or receive byte count (BYTECNT). READ and WRITE subchannel and OSA datapath statistics only.
zXL	INT	1	CTCA extension length (including this field).
zTYPE	INT (ENUM)	1	CTCA attachment type. Group => Statistics for entire MPC group. This is the 1st record in the group. RorW => Statistics for a READ or WRITE subchannel (MPC using channels only). RW => Statistics for the READ/WRITE subchannel (MPC XCF only). This is the 2nd record in the group. OSA => Statistics for the OSA-Express or Hipersockets datapath queue (MPC using channels only).
zVER	CHAR	2	CTCA version = X'F0F2'.
zBYTECNTO	INT	4	

			Overflow byte count (BYTECNTO). READ and WRITE subchannel and OSA datapath statistics only.
zINLP	INT	4	Number of inbound NLPs (INLP).
zONLP	INT	4	Number of outbound NLPs (ONLP).
zNBYTECT	INT	4	NLP byte count.
zNBYTECTO	INT	4	NLP byte count overflow.
zSBALMAX	INT	4	OSA-Express WR/x queue: maximum SBALs.
zSBALAVG	INT	4	OSA-Express WR/x queue: average SBALs.
zQDPHMAX	INT	4	OSA-Express WR/x queue: maximum queue depth.
zQDPHAVG	INT	4	OSA-Express WR/x queue: average queue depth.
zSIGACNTO	INT	4	OSA-Express WR/x queue: SIGA overflow.
zSIGACNT	INT	4	OSA-Express WR/x queue: SIGA count.
zSBALCNTO	INT	4	OSA-Express WR/x queue: SBAL count overflow.
zSBALCNT	INT	4	OSA-Express WR/x queue: SBAL count.
zPACKCNTO	INT	4	OSA-Express WR/x queue: packet count overflow.
zPACKCNT	INT	4	OSA-Express WR/x queue: packet count.
zPKTIQDO	INT	4	OSA-Express or Hipersockets WR/x queue: accelerated packet count overflow.
zPKTIQD	INT	4	OSA-Express or Hipersockets WR/x queue: accelerated packet count.
zBYTIQDO	INT	4	OSA-Express or Hipersockets WR/x queue: accelerated byte count overflow.
zBYTIQD	INT	4	OSA-Express or Hipersockets WR/x queue: accelerated byte count.
zOSA_RQNME	CHAR	8	READ queue name.

Secondary segment: SMF050_TCP

Field Name	Type	Len	Description
<i>SMF050_TCP.<fieldname></i>			
zID	CHAR	8	TCP line name.
zCHWR	INT	4	Count of write channel programs (not CDLC).
zCHRD	INT	4	Count of read channel programs (not CDLC).
zATTN	INT	4	Number of attentions.
zRDATN	INT	4	Largest outbound packet sent.
zIPDU	INT	4	Largest packet received.
zXL	INT	1	Extension length (including this field).
zVER	CHAR	2	CTCA version = X'F0F3'.
zIPACK	INT	4	Inbound packet count.
zOPACK	INT	4	Outbound packet count.
zIBYTE	INT	4	Inbound byte count.
zIBYTEO	INT	4	Inbound byte count, overflow.
zOBYTE	INT	4	Outbound byte count.
zOBYTEO	INT	4	Outbound byte count, overflow.
zLTYPE	INT (ENUM)	1	TCP legacy type.

zPCII	INT	4	Number of PCI interrupts (CLAW only).
zRCCW	INT	4	Number of READ CCWs completed (CLAW only).
zWCCW	INT	4	Number of WRITE CCWs completed (CLAW only).
zWAPP	INT	4	Number of WRITE appends (CLAW only).
zSIO	INT	4	Number of READ/WRITE SIOs (CLAW only).

Secondary segment: SMF050_RoCE_Port

Field Name	Type	Len	Description
<i>SMF050_RoCE_Port.<fieldname></i>			
zID	CHAR	8	RoCE connection name.
zXL	INT	1	Extension length (including this field).
zTYPE	INT (ENUM)	1	Attachment type. Port => RoCE port record (global statistics). This is the first record in the group. User => RoCE individual user record.
zVER	CHAR	2	CTCA version = X'F0F5'.
zUSERS	INT	4	Number of RoCE users.
zPOLLO	INT	4	Poll EQ overflow.
zPOLLC	INT	4	Poll EQ count.
zPOLLEO	INT	4	Poll EQ entries overflow.
zPOLLEC	INT	4	Poll EQ entries count.
zPCIIO	INT	4	PCI real interrupts overflow.
zPCIIC	INT	4	PCI real interrupts count.
zUPCIO	INT	4	Unproductive PCI overflow.
zUPCIC	INT	4	Unproductive PCI count.

Secondary segment: SMF050_RoCE_User

Field Name	Type	Len	Description
<i>SMF050_RoCE_User.<fieldname></i>			
zID	CHAR	8	RoCE connection name.
zXL	INT	1	Extension length (including this field).
zTYPE	INT (ENUM)	1	Attachment type. Port => RoCE port record (global statistics). This is the first record in the group. User => RoCE individual user record.
zVER	CHAR	2	CTCA version = X'F0F5'.
zULP	CHAR	8	ULP ID.
zODATARO	INT	4	Outbound data request overflow.
zODATARC	INT	4	Outbound data request count.
zORDMARO	INT	4	Outbound RDMA request overflow.
zORDMARC	INT	4	Outbound RDMA request count.
zORDMAOO	INT	4	Outbound RDMA operation overflow.

zORDMAOC	INT	4	Outbound RDMA operation count.
zQRDMARO	INT	4	Queued outbound RDMA request overflow.
zQRDMARC	INT	4	Queued outbound RDMA request count.
zOINLBO	INT	4	Outbound RoCE inline data bytes overflow.
zOINLBC	INT	4	Outbound RoCE inline data bytes count.
zOIMMBO	INT	4	Outbound RoCE immediate data bytes overflow.
zOIMMBC	INT	4	Outbound RoCE immediate data bytes count.
zORDMABO	INT	4	Outbound RDMA data bytes overflow.
zORDMABC	INT	4	Outbound RDMA data bytes count.
zIPOLLRO	INT	4	RoCE inbound poll request overflow.
zIPOLLRC	INT	4	RoCE inbound poll request count.
zIPOLLROO	INT	4	RoCE inbound poll request operation overflow.
zIPOLLROC	INT	4	RoCE inbound poll request operation count.
zUPOLLRO	INT	4	Unproductive RoCE inbound poll request overflow.
zUPOLLRC	INT	4	Unproductive RoCE inbound poll request count.
zISRBO	INT	4	Interrupt handler SRB dispatch overflow.
zISRBC	INT	4	Interrupt handler SRB dispatch count.
zASRBO	INT	4	Additional SRB dispatch overflow.
zASRBC	INT	4	Additional SRB dispatch count.
zIINLBO	INT	4	Inbound RoCE inline data bytes overflow.
zIINLBC	INT	4	Inbound RoCE inline data bytes count.
zIIMMBO	INT	4	Inbound RoCE immediate data bytes overflow.
zIIMMBC	INT	4	Inbound RoCE immediate data bytes count.
zIRDMABO	INT	4	Inbound RDMA data bytes overflow.
zIRDMABC	INT	4	Inbound RDMA data bytes count.

Record Type 52 - JES2 LOGON/Start Line SNA

SMF Record 52 (JES2 LOGON/Start Line SNA) is mapped by structure member "T052".

<i>SMF052_JES_Start_Line_SNA.Product.<fieldname></i>			
zSUB	INT (ENUM)	2	(IBM name: SMF52SUB) SubType ID.
zVER	CHAR	2	(IBM name: SMF52VER) Record version number.
zSYS	CHAR	4	(IBM name: SMF52SYS) Subsystem name, 'JES2' when JES2 creates the record, 'PPCC' when PSF creates the record.
<i>SMF052_JES_Start_Line_SNA.Identification.<fieldname></i>			
zRMT	CHAR	8	(IBM name: SMF52RMT) Remote name as defined in JESPARMS (only for SubType ID = 1).
zLIN	CHAR	8	(IBM name: SMF52LIN) Line name as defined in JESPARMS.
zPSW	CHAR	8	(IBM name: SMF52PSW) Line password as defined in JESPARMS.

Record Type 53 - JES2 LOGOFF/Stop Line SNA

SMF Record 53 (JES2 LOGOFF/Stop Line SNA) is mapped by structure member "T053".

Primary Segment:

- [SMF053_JES_Stop_Line_SNA](#)

Secondary Segment(s): 0

Primary segment: [SMF053_JES_Stop_Line_SNA](#)

Field Name	Type	Len	Description
<i>SMF053_JES_Stop_Line_SNA.<fieldname></i>			
<i>SMF053_JES_Stop_Line_SNA.Header_Self_defining_Section.<fieldname></i>			
zFLG	HEX	1	(IBM name: SMF53FLG) System indicator: Bit Meaning when set 0-2 Reserved 3-6 Version indicators* 7 RESERVED. *See 'Standard and Extended SMF record headers' on page 174 FOR a detailed description.
zRTY	INT	1	(IBM name: SMF53RTY) Record type 53 (X'35').
zTME	TSTMP	8	(IBM name: SMF53TME) Date/Time that the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF53SID) System identification (from the SID parameter).
zPRD	INT	2	(IBM name: SMF53PRD) Offset to product section from start of record, including record descriptor word (RDW).
zPRL	INT	2	(IBM name: SMF53PRL) Length of product section.
zPRN	INT	2	(IBM name: SMF53PRN) Number of product section.
zIDO	INT	2	(IBM name: SMF53IDO) Offset to identification section from start of record, including record descriptor word (RDW).
zIDL	INT	2	(IBM name: SMF53IDL) Length of identification section.
zIDN	INT	2	(IBM name: SMF53IDN) Number of identification section. Product Section:

<i>SMF053_JES_Stop_Line_SNA.Product.<fieldname></i>			
zSUB	INT (ENUM)	2	(IBM name: SMF53SUB) SubType ID.
zVER	CHAR	2	(IBM name: SMF53VER) Record version number.
zSYS	CHAR	4	(IBM name: SMF53SYS) Subsystem name, 'JES2'. Identification Section:

<i>SMF053_JES_Stop_Line_SNA.Identification.<fieldname></i>			
zRMT	CHAR	8	(IBM name: SMF53RMT) Remote name as defined in JESPARMS.
zLIN	CHAR	8	(IBM name: SMF53LIN) Line name as defined in JESPARMS.
zPSW	CHAR	8	(IBM name: SMF53PSW) Line password as defined in JESPARMS.
zVtamReq	INT	4	(IBM name: SMF53CTR) Number of VTAM requests processed.

zException	INT	4	(IBM name: SMF53CTR+4) Number of exception responses.
zLUSTATs	INT	4	(IBM name: SMF53CTR+8) Number of LUSTATs received.
zBidRej	INT	4	(IBM name: SMF53CTR+12) Number of bid rejects.
zTempErr	INT	4	(IBM name: SMF53CTR+16) Number of temporary errors.
zADP	CHAR	3	(IBM name: SMF53ADP) Line identifier, 'SNA'.

Record Type 54 - JES2 Integrity SNA

SMF Record 54 (JES2 Integrity SNA) is mapped by structure member "T054".

Primary Segment:

- **SMF054_JES_Integrity_SNA**

Secondary Segment(s): 0

Primary segment: **SMF054_JES_Integrity_SNA**

Field Name	Type	Len	Description
<i>SMF054_JES_Integrity_SNA.<fieldname></i>			
<i>SMF054_JES_Integrity_SNA.Header_Self_defining_Section.<fieldname></i>			
zFLG	HEX	1	(IBM name: SMF54FLG) System indicator: Bit Meaning when set 0-2 Reserved 3-6 Version indicators* 7 RESERVED. *See 'Standard and Extended SMF record headers' on page 174 FOR a detailed description.
zRTY	INT	1	(IBM name: SMF54RTY) Record type 54 (X'36').
zTME	TSTMP	8	(IBM name: SMF54TME) Date/Time that the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF54SID) System identification (from the SID parameter).
zPOF	INT	2	(IBM name: SMF54POF) Offset to product section from start of record, including record descriptor word (RDW).
zPRL	INT	2	(IBM name: SMF54PRL) Length of product section.
zPRN	INT	2	(IBM name: SMF54PRN) Number of product section.
zIDO	INT	2	(IBM name: SMF54IDO) Offset to identification section from start of record, including record descriptor word (RDW).
zIDL	INT	2	(IBM name: SMF54IDL) Length of identification section.
zIDN	INT	2	(IBM name: SMF54IDN) Number of identification section.

SMF054_JES_Integrity_SNA.Product.<fieldname>

zSUB	INT (ENUM)	2	(IBM name: SMF55SUB) SubType ID.
zVER	CHAR	2	(IBM name: SMF54VER) Record version number.
zSYS	CHAR	4	(IBM name: SMF54SYS) Subsystem name

SMF054_JES_Integrity_SNA.Identification.<fieldname>

zRMT	CHAR	8	(IBM name: SMF54RMT) Remote name as defined in JESPARMS.
zRPW	CHAR	8	(IBM name: SMF54RPW) Remote password as defined in JESPARMS.
zPSW	CHAR	8	(IBM name: SMF54PSW) Line password as defined in JESPARMS.

Record Type 55 - JES Network SIGNON

SMF Record 55 (JES2 Network SIGNON) is mapped by structure member "T055".

Primary Segment:

- **SMF055_JES_Network_SIGNON**

Secondary Segment(s): 0

Primary segment: **SMF055_JES_Network_SIGNON**

Field Name	Type	Len	Description
<i>SMF055_JES_Network_SIGNON.<fieldname></i>			
<i>SMF055_JES_Network_SIGNON.Header_Self_defining_Section.<fieldname></i>			
zFLG	HEX	1	(IBM name: SMF55FLG) System indicator: Bit Meaning when set 0-2 Reserved 3-6 Version indicators* 7 RESERVED. *See 'Standard and Extended SMF record headers' on page 174 FOR a detailed description.
zRTY	INT	1	(IBM name: SMF55RTY) Record type 55 (X'37').
zTME	TSTMP	8	(IBM name: SMF55TME) Date/Time that the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF55SID) System identification (from the SID parameter).
zSBS	INT	2	(IBM name: SMF55SBS) Subsystem identification - X'0002' signifies JES2.
zSUB	INT	2	(IBM name: SMF55SUB) Record SubType.
zLRR	INT	2	(IBM name: SMF55LRR) Length of rest of record, not including this field.
zNNM	CHAR	8	(IBM name: SMF55NNM) Node name.
zMEM	INT	1	(IBM name: SMF55MEM) Member number.
<i>SMF055_JES_Network_SIGNON.Header_Self_defining_Section.zFG1.<fieldname></i>			
zSignOff	BIT	1	Response sign-on (off = initial sign-on)
zReset	BIT	1	Reset/concur sign-on
zSecure	BIT	1	Secure sign-on. (Line password and node password are not set with this protocol.)
<i>SMF055_JES_Network_SIGNON.Header_Self_defining_Section.<fieldname></i>			
zLPW	CHAR	8	(IBM name: SMF55LPW) Line password as defined in JESPARMS.
zNPW	CHAR	8	(IBM name: SMF55NPW) Node password as defined in JESPARMS.
zLNM	CHAR	8	(IBM name: SMF55LNM) Line name as defined in JESPARMS.

Record Type 56 - JES2 Network Integrity

SMF Record 56 (JES2 Network Integrity) is mapped by structure member "T056".

Primary Segment:

- [SMF056_JES_Network_Integrity](#)

Secondary Segment(s): 0

Primary segment: [SMF056_JES_Network_Integrity](#)

Field Name	Type	Len	Description

zRTY	INT	1	(IBM name: SMF56RTY) Record type 56 (X'38').
zTME	TSTMP	8	(IBM name: SMF56TME) Date/Time that the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF56SID) System identification (from the SID parameter).
zSBS	INT	2	(IBM name: SMF56SBS) Subsystem identification - X'0002' signifies JES2.
zSUB	INT	2	(IBM name: SMF56SUB) Record SubType.
zLRR	INT	2	(IBM name: SMF56LRR) Length of rest of record, not including this field.
zNNM	CHAR	8	(IBM name: SMF56NNM) Node name.
zMEM	INT	1	(IBM name: SMF56MEM) Member number.
<i>SMF056_JES_Network_Integrity.Header_Self_defining_Section.zFG1.<fieldname></i>			
zResponse	BIT	1	Response sign-on (off = initial sign-on)
zReset	BIT	1	Reset/concur sign-on
zSecure	BIT	1	Secure sign-on. (Line password and node password are not set with this protocol.)
<i>SMF056_JES_Network_Integrity.Header_Self_defining_Section.<fieldname></i>			
zLPW	CHAR	8	(IBM name: SMF56LPW) Line password.
zNPW	CHAR	8	(IBM name: SMF56NPW) Node password.
zLNM	CHAR	8	(IBM name: SMF56LNM) Line name.

Record Type 57 - JES2 Network SYSOUT Transmission

SMF Record 57 (JES2 Network SYSOUT Transmission) is mapped by structure member "T057".

Primary Segment:

- [SMF057_JES_Net_Trans](#)

Secondary Segment(s): 1

- [SMF057_ESS](#)

Primary segment: [SMF057_JES_Net_Trans](#)

Field Name	Type	Len	Description
<i>SMF057_JES_Net_Trans.<fieldname></i>			
SMF057_JES_Net_Trans.Header_Self_defining_Section.<fieldname>			
zFLG	HEX	1	(IBM name: SMF57FLG) System indicator: Bit Meaning when set 0-2 Reserved 3-6 Version indicators (See 'Standard and Extended SMF record headers' on page 174 FOR a detailed description.) 7 RESERVED.
zRTY	INT	1	(IBM name: SMF57RTY) Record type 57 (X'39').
zTME	TSTMP	8	(IBM name: SMF57TME) Date/Time that the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF57SID) System identifier (from the SID parameter).
zSBS	INT	2	(IBM name: SMF57SBS) Subsystem identifier - X'0002' signifies JES2.
zSUB	INT	2	(IBM name: SMF57SUB) Record SubType.
zLRR	INT	2	(IBM name: SMF57LRR) Length of rest of record, not including this field.
zJID	CHAR	8	(IBM name: SMF57JID) Original job identification.
zCJD	CHAR	8	(IBM name: SMF57CJD) Current job identification.
zONN	CHAR	8	(IBM name: SMF57ONN) Original node name.
zENN	CHAR	8	(IBM name: SMF57ENN) Processing node name.
zNNN	CHAR	8	(IBM name: SMF57NNN) Next node name.
zDVN	CHAR	8	(IBM name: SMF57DVN) SYSOUT transmitter device name.
zTSS	INT	4	(IBM name: SMF57TSS) SYSOUT transmitter start time.
zDSS	DEC	4 (7,0)	(IBM name: SMF57DSS) SYSOUT transmitter start date.
zTPS	INT	4	(IBM name: SMF57TPS) SYSOUT transmitter stop time.
zDPS	DEC	4 (7,0)	(IBM name: SMF57DPS) SYSOUT transmitter stop date.
zACN	CHAR	8	(IBM name: SMF57ACN) Network account number.
zTSI	CHAR	4	(IBM name: SMF57TSI) SYSOUT transmitter system identification.

zCNT	INT	4	(IBM name: SMF57CNT) Count of logical TP records.
zNTR	INT	2	(IBM name: SMF57NTR) Number of triplets in record. A triplet is a set of offset/length/number values that defines a section of the record.
zOSW	INT	4	(IBM name: SMF57OSW) Offset to Enhanced SYSOUT Support (ESS) section.
zLSW	INT	4	(IBM name: SMF57LSW) Length of Enhanced SYSOUT Support (ESS) section.
zNSW	INT	4	(IBM name: SMF57NSW) Number of Enhanced SYSOUT Support (ESS) sections.

Secondary segment: SMF057_ESS

Field Name	Type	Len	Description
<i>SMF057_ESS.<fieldname></i>			
zLN5	INT	2	(IBM name: SMF57LN5) Length of ESS section (including this field).
zSGT	INT	4	(IBM name: SMF57SGT) Segment identifier.

<i>SMF057_ESS.zIND.<fieldname></i>			
zSjfErr	BIT	1	Error obtaining scheduler JCL facility (SJF) information. Scheduler work block text unit (SWBTU) data area is not present.

<i>SMF057_ESS.<fieldname></i>			
zJDT	CHAR	8	(IBM name: SMF57JDT) JCL definition table (JDT) name in JCL definition vector table (JDTV).
zTUL	INT	2	(IBM name: SMF57TUL) Text unit (SWBTU) data area length.
zTU	XVCHAR	0 1000	(IBM name: SMF57TU) Text unit (SWBTU) data area. The data area can be processed using the SWBTUREQ macro.

Record Type 58 - JES2 Network SIGNOFF

SMF Record 58 (JES2 Network SIGNOFF) is mapped by structure member "T058".

Primary Segment:

- **SMF058_JES_Network_SIGNOFF**

Secondary Segment(s): 0

Primary segment: **SMF058_JES_Network_SIGNOFF**

Field Name	Type	Len	Description
<i>SMF058_JES_Network_SIGNOFF.<fieldname></i>			
<i>SMF058_JES_Network_SIGNOFF.Header_Self_defining_Section.<fieldname></i>			
zFLG	HEX	1	(IBM name: SMF58FLG) System indicator: Bit Meaning when set 0-2 Reserved 3-6 Version indicators* 7 RESERVED. *See 'Standard and Extended SMF record headers' on page 174 FOR a detailed description.
zRTY	INT	1	(IBM name: SMF58RTY) Record type 58 (X'3A').
zTME	TSTMP	8	(IBM name: SMF58TME) Date/Time that the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF58SID) System identification (from the SID parameter).
zSBS	INT	2	(IBM name: SMF58SBS) Subsystem identification - X'0002' signifies JES2.
zSUB	INT	2	(IBM name: SMF58SUB) Record SubType.
zLRR	INT	2	(IBM name: SMF58LRR) Length of rest of record, not including this field.
zNNM	CHAR	8	(IBM name: SMF58NNM) Node name.
zMEM	INT	1	(IBM name: SMF58MEM) Member number.
zRVI	CHAR	1	(IBM name: SMF58RVI) Reserved.
zLNM	CHAR	8	(IBM name: SMF58LNM) Line name.

Record Type 59 - MVS/BDT File-to-File Transmission

SMF Record 59 (MVS/BDT File-to-File Transmission) is mapped by structure member "T059".

Primary Segment:

Primary segment: [SMF060_VSAM_Volume_Dataset_Updated](#)

Field Name	Type	Len	Description
<i>SMF060_VSAM_Volume_Dataset_Updated.<fieldname></i>			
<i>SMF060_VSAM_Volume_Dataset_Updated.Header_Self_Defining_Section.<fieldname></i>			
zFLG	HEX	1	(IBM name: SMF60SYS) System indicator: Bit Meaning when set 0-2 Reserved 3-6 Version indicators 7 Reserved.
zRTY	INT	1	(IBM name: SMF60RTY) Record type 60 (X'3C').
zTME	TSTMP	8	(IBM name: SMF60TME) Date/Time that the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF60CPU) System identification (from the SID parameter).
zSBS	CHAR	4	(IBM name: SMF60SBS) Reserved.
zSUB	CHAR	2	(IBM name: SMF60SUB) Indicates that the VVR is updated, deleted, or inserted in the VVDS: Contents Meaning UP Updated DE Deleted IN Inserted
zPOF	INT	4	(IBM name: SMF60POF) Offset of product section from start of record, including the record descriptor word (RDW).
zPLN	INT	2	(IBM name: SMF60PLN) Length of product section.
zPNO	INT	2	(IBM name: SMF60PNO) Number of product sections.
zDOF	INT	4	(IBM name: SMF60DOF) Offset of data section from start of record, including the record descriptor word (RDW).
zDLN	INT	2	(IBM name: SMF60DLN) Length of data section.
zDNO	INT	2	(IBM name: SMF60DNO) Number of data sections. Product and data section:
<i>SMF060_VSAM_Volume_Dataset_Updated.Product_and_Data_Section.<fieldname></i>			
zVER	CHAR	2	(IBM name: SMF60VER) Version of the type 60 RECORDS.
zVB2	INT	1	(IBM name: N/A) Version of the type 60 RECORDS as a binary integer (for internal use).
zPNM	CHAR	8	(IBM name: SMF60PNM) Catalog management product identifier.
zJOBNAME	CHAR	8	(IBM name: SMF60JNM) Job name. The job log identification consists of the job name, time, and date that the reader recognized the JOB card (for this job).

zRST	TSTMP	8	(IBM name: SMF60RST) Date/Time that the reader recognized the JOB card (for this job).
zUSERID	CHAR	8	(IBM name: SMF60UID) User-defined identification field (taken from common exit parameter area, not from USER=parameter on job statement).
zFNC	CHAR	1	(IBM name: SMF60FNC) Reserved.
zCNM	CHAR	44	(IBM name: SMF60CNM) Name of VSAM volume data set (VVDS) in which entry is made.

SMF060_VSAM_Volume_Dataset_Updated.Product_and_Data_Section.zTYP.<fieldname>

zTYP1	CHAR	1	(IBM name: N/A) Entry type identifier in char format.
zTYP2	HEX	1	(IBM name: N/A) Entry type identifier in hex format.
zTYP3	INT (ENUM)	1	Entry type identifier interpreted.

SMF060_VSAM_Volume_Dataset_Updated.Product_and_Data_Section.<fieldname>

zENM	CHAR	44	(IBM name: SMF60ENM) Entry name.
zNNM	CHAR	44	(IBM name: SMF60NNM) Reserved.
zCRL	INT	2	(IBM name: N/A) Length of VVR or NVR
zCRC	XVCHAR	0 1000	(IBM name: SMF60CRC) VVR or NVR (the length of the VVR or NVR is contained in zCRL).

SMF060_VSAM_Volume_Dataset_Updated.Product_and_Data_Section.zRT.<fieldname>

zReqTime	FIXED	8 (20,6)	(IBM name: N/A) If SMFVER=2, an 8-byte field is at the end of this record which contains the number of seconds needed to complete the VVDS request (ADD, DELETE, or INSERT). This field exists only for an SMF type 60 RECORD.
----------	-------	-------------	---

Record Type 61 - Integrated Catalog Facility Define Activity

SMF Record 61 (Integrated Catalog Facility Define Activity) is mapped by structure member "T061".

Primary Segment:

- [SMF061_Integrated_Catalog_Facility_Define_Activity](#)

Secondary Segment(s): 0

Primary segment: [SMF061_Integrated_Catalog_Facility_Define_Activity](#)

Field Name	Type	Len	Description
<i>SMF061_Integrated_Catalog_Facility_Define_Activity.<fieldname></i>			
<i>SMF061_Integrated_Catalog_Facility_Define_Activity.Header_Self_Defining_Section.<fieldname></i>			
zFLG	HEX	1	(IBM name: SMF61SYS) System indicator: Bit Meaning when set 0-2 Reserved 3-6 Version indicators 7 Reserved.
zRTY	INT	1	(IBM name: SMF61RTY) Record type 61 (X'3D').
zTME	TSTMP	8	(IBM name: SMF61TME) Date/Time that the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF61CPU) System identification (from the SID parameter).
zSBS	CHAR	4	(IBM name: SMF61SBS) Reserved.
zSUB	CHAR	2	(IBM name: SMF61SUB) The action taken on the catalog entry. valid values are: IN (INSERT) DE (DELETE) UP (UPDATE)
zPOF	INT	4	(IBM name: SMF61POF) Offset of product section from start of record, including record descriptor word (RDW).
zPLN	INT	2	(IBM name: SMF61PLN) Length of product section.
zPNO	INT	2	(IBM name: SMF61PNO) Number of product sections.
zDOF	INT	4	(IBM name: SMF61DOF) Offset of data section from start of record, including record descriptor word (RDW).
zDLN	INT	2	(IBM name: SMF61DLN) Length of data section.
zDNO	INT	2	(IBM name: SMF61DNO) Number of data sections. Product and Data Section:
<i>SMF061_Integrated_Catalog_Facility_Define_Activity.Product_and_Data_Section.<fieldname></i>			
zVER	CHAR	2	(IBM name: SMF61VER) Version of the type 61 RECORDS.
zPNM	CHAR	8	(IBM name: SMF61PNM) Catalog management product identifier.
zJOBNAME	CHAR	8	(IBM name: SMF61JNM) Job name. The job log identification consists of the job name, time, and date that the reader recognized for the JOB card (for this job). If a system task caused the record to be written, the job name and user identification fields contain blanks and the time and date fields contain zeros.
zRST	TSTMP	8	

			(IBM name: SMF61RST) Date/Time the reader recognized the JOB card (for this job).
zUSERID	CHAR	8	(IBM name: SMF61UID) User-defined identification field (taken from common exit parameter area, not from USER=parameter on job statement).
zFNC	CHAR	1	(IBM name: SMF61FNC) Reserved.
zCNM	CHAR	44	(IBM name: SMF61CNM) Name of catalog in which entry is defined.

SMF061_Integrated_Catalog_Facility_Define_Activity.Product_and_Data_Section.zTYP.<fieldname>			
zTYP1	CHAR	1	(IBM name: N/A) Entry type identifier in char format.
zTYP2	HEX	1	(IBM name: N/A) Entry type identifier in hex format.
zTYP3	INT (ENUM)	1	Entry type identifier interpreted.

SMF061_Integrated_Catalog_Facility_Define_Activity.Product_and_Data_Section.<fieldname>			
zENM	CHAR	44	(IBM name: SMF61ENM) Entry name.
zNNM	CHAR	44	(IBM name: SMF61NNM) Reserved.
zCRC	VCHAR	2 1002	(IBM name: SMF61CRC) New catalog record for defined entry (the length of this record is contained in the first two bytes of this field).

Record Type 62 - VSAM Component or Cluster Opened

SMF Record 62 (VSAM Component or Cluster Opened) is mapped by structure member "T062".

Primary Segment:

- [SMF062_VSAM_Component_or_Cluster_Opened](#)

Secondary Segment(s): 0

Primary segment: [SMF062_VSAM_Component_or_Cluster_Opened](#)

Field Name	Type	Len	Description
<i>SMF062_VSAM_Component_or_Cluster_Opened.<fieldname></i>			
<i>SMF062_VSAM_Component_or_Cluster_Opened.Header_Self_Defining_Section.<fieldname></i>			
zFLG	HEX	1	(IBM name: SMF62FLG) System indicator: Bit Meaning when set 0-2 Reserved 3-6 Version indicators 7 Reserved.
zRTY	INT	1	(IBM name: SMF62RTY) Record type 62 (X'3E').
zTME	TSTMP	8	(IBM name: SMF62TME) Date/Time that the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF62SID) System identification (from the SID parameter).
zJOBNAME	CHAR	8	(IBM name: SMF62JBN) Job name. The job name, time, and date that the reader recognized the JOB card (for this job) constitute the job log identification, or transaction name (for APPC output).
zRST	TSTMP	8	(IBM name: SMF62RST) Date/Time that the reader recognized the JOB card (for this job).
zUSERID	CHAR	8	(IBM name: SMF62UIF) User-defined identification field (taken from common exit parameter area, not from USER=parameter on job statement).

<i>SMF062_VSAM_Component_or_Cluster_Opened.Header_Self_Defining_Section.zIND.<fieldname></i>			
zOpened	BIT	1	Component or cluster was successfully opened
zSecurity	BIT	1	Security violation, that is, incorrect password
zCRA	BIT	1	Record is a catalog or catalog recovery area (CRA) record
zCatOpenedAsDataset	BIT	1	Record is for a VSAM volume data set (VVDS) or ICF catalog being opened or closed as a data set. If this bit is set, the catalog name field and the cluster name field may be set to zeroes.
zSMSInfo	BIT	1	SMS class information is included in the record
zEncrypted	BIT	1	Dataset is encrypted

<i>SMF062_VSAM_Component_or_Cluster_Opened.Header_Self_Defining_Section.<fieldname></i>			
zCNM	CHAR	44	(IBM name: SMF62CNM) Name of the catalog in which the component or cluster is defined.
zCVS	CHAR	6	(IBM name: SMF62CVS) Volume serial number of the volume containing the catalog.
zDNM	CHAR	44	(IBM name: SMF62DNM) Name of the component or cluster being opened.
zVCT	INT	2	(IBM name: SMF62VCT) Number of online volumes containing the component or cluster. (This field is also the number of ten-byte fields that list the volumes.) For each online

			volume, there is a ten-byte entry with the following format:
--	--	--	--

SMF062_VSAM_Component_or_Cluster_Opened.VolumelInfo.<fieldname>

zVSR	CHAR	6	(IBM name: SMF62VSR) Volume serial number of the volume containing the component or cluster.
zDTY	HEX	4	(IBM name: SMF62DTY) Unit type of the volume containing the component or cluster. After the volume entries, three fields define SMS class information:

SMF062_VSAM_Component_or_Cluster_Opened.SMS.<fieldname>

zMGT	CHAR	8	(IBM name: SMF62MGT) SMS management class.
zSTR	CHAR	8	(IBM name: SMF62STR) SMS storage class.
zDAT	CHAR	8	(IBM name: SMF62DAT) SMS data class. The following two fields define encryption information:

SMF062_VSAM_Component_or_Cluster_Opened.Encryption.<fieldname>

zDET	INT	2	(IBM name: SMF62DET) Encryption type
zDKL	CHAR	64	(IBM name: SMF62DKL) Data set key label

SMF062_VSAM_Component_or_Cluster_Opened.Statistics.<fieldname>

zTIM	TSTMP	8	(IBM name: SMF62TIM) Time data set was opened .
------	-------	---	--

SMF062_VSAM_Component_or_Cluster_Opened.Statistics.zMC1.<fieldname>

zByKey	BIT	1	Record is identified by a key
zByRBA	BIT	1	Record is identified by a relative byte address (RBA)
zCI	BIT	1	Control-Interval processing
zSeq	BIT	1	Sequential processing
zDirect	BIT	1	Direct processing
zInput	BIT	1	Input processing
zOutput	BIT	1	Output processing
zUserBufSp	BIT	1	User-supplied buffer space

SMF062_VSAM_Component_or_Cluster_Opened.Statistics.zMC2.<fieldname>

zJESOut	BIT	1	Defined only when output and JES format. The system is to ensure that the logical record length will be the same when the data is read. This bit is not defined for input.
zCC	BIT	1	Control character type
zBackupWhileOpen	BIT	1	Eligible for backup-while-open
zSkipSeq	BIT	1	Skip sequential processing
zVTAMLogon	BIT	1	VTAM LOGON indicator
zSetEmpty	BIT	1	Set data set to empty state
zSharedCB	BIT	1	Shared control blocks
zAIXofPath	BIT	1	Alternate index of the path

SMF062_VSAM_Component_or_Cluster_Opened.Statistics.zMC3.<fieldname>

zNoLSR	BIT	1	No LSR exclusive control
zLSR	BIT	1	Local shared resources

zGSR	BIT	1	Global shared resources
zImprovedCIProc	BIT	1	Improved control-interval processing
zDeferredWrite	BIT	1	Deferred write
zSeqInsert	BIT	1	Sequential insert strategy
zCBsInRealStg	BIT	1	Control blocks are fixed in real storage
zVSAM31IoBuf	BIT	1	VSAM 31-bit addressing mode I/O buffers

SMF062_VSAM_Component_or_Cluster_Opened.Statistics.zMC4.<fieldname>

zRLS	BIT	1	RLS Processing
zSNP	BIT	1	SNP Option

SMF062_VSAM_Component_or_Cluster_Opened.Statistics.<fieldname>

zDET	INT	2	(IBM name: SMF62DET) Encryption type
zDKL	CHAR	64	(IBM name: SMF62DKL) Data set key label
zJobID	CHAR	8	(IBM name: N/A) Job ID.
zSysplexName	CHAR	8	(IBM name: N/A) Sysplex Name.

Record Type 63 - VSAM Catalog Entry Defined

SMF Record 63 (VSAM Catalog Entry Defined) is mapped by structure member "T063".

Primary Segment:

- [SMF063_VSAM_Catalog_Entry_Defined](#)

Secondary Segment(s): 0

Primary segment: [SMF063_VSAM_Catalog_Entry_Defined](#)

Field Name	Type	Len	Description
<i>SMF063_VSAM_Catalog_Entry_Defined.<fieldname></i>			
<i>SMF063_VSAM_Catalog_Entry_Defined.Header_Self_Defining_Section.<fieldname></i>			
zFLG	HEX	1	(IBM name: SMF63FLG) System indicator: Bit Meaning when set 0-2 Reserved 3-6 Version indicators 7 Reserved.
zRTY	INT	1	(IBM name: SMF63RTY) Record type 63 (X'3F').
zTME	TSTMP	8	(IBM name: SMF63TME) Date/Time that the record was moved into the SMF buffer.
zSID	CHAR	2	(IBM name: SMF63SID) System identification (from the SID parameter).
zSMI	CHAR	2	(IBM name: SMF63SMI) System model identifier.
zJOBNAME	CHAR	8	(IBM name: SMF63JBN) Job name. If a system task caused the record to be written, the job name and user identification fields contain blanks and the time and date fields contain zeros. The job name, time, and date that the reader recognized the JOB card (for this job) constitute the job log identification, or transaction name (for APPC output).
zRST	TSTMP	8	(IBM name: SMF63RST) Date/Time that the reader recognized the JOB card (for this job).
zUSERID	CHAR	8	(IBM name: SMF63UIF) User-defined identification field (taken from common exit parameter area, not from USER=parameter on job statement).
zFDT	INT	1	Record creator/entry type indicator
zTYP	INT	1	(IBM name: SMF63TYP) Entry type indicator Bit Meaning when set 0 VSAM cluster 1 VSAM data component 2 VSAM index component 3 VSAM catalog 4 NON-VSAM data set 5 GENERATION data group 6 ALIAS 7 RESERVED.
zNSZ	INT	2	(IBM name: SMF63NSZ) Size of new catalog record. Include the contents of this field when estimating the additional storage required by SMF. A VSAM catalog record is contained in one or more physical catalog records. This field with offset 46 ARE the sums of the sizes of the physical catalog records that constitute the total logical VSAM catalog record.
zOSZ	INT	2	(IBM name: SMF63OSZ) Size of old catalog record. This field contains the size of the old records before they were altered. Include the contents of this field when estimating the additional storage required by SMF.
zCNM	CHAR	44	(IBM name: SMF63CNM) Name of catalog in which the entry is defined.
zENM	CHAR	44	(IBM name: SMF63ENM) Entry name.
zNCR	VCHAR		

		2 1002	(IBM name: SMF63NCR) New catalog record followed by old catalog record. For the new catalog record, the complete new entry is recorded. For the old catalog record, this field contains only those old records that were altered. it shows what these records were before they were altered.
--	--	-----------	---

Record Type 64 - VSAM Component or Cluster Status

SMF Record 64 (VSAM Component or Cluster Status) is mapped by structure member "T064".

Primary Segment:

- [SMF064_VSAM_Component_or_Cluster_Status](#)

Secondary Segment(s): 0

Primary segment: [SMF064_VSAM_Component_or_Cluster_Status](#)

Field Name	Type	Len	Description
<i>SMF064_VSAM_Component_or_Cluster_Status.<fieldname></i>			
<i>SMF064_VSAM_Component_or_Cluster_Status.Header_Self_Defining_Section.<fieldname></i>			
zFLG	HEX	1	(IBM name: SMF64FLG) System indicator: Bit Meaning when set 0-2 Reserved. 3-6 Version indicators. 7 Reserved.
zRTY	INT	1	(IBM name: SMF64RTY) Record type 64 (X'40').
zTME	TSTMP	8	(IBM name: SMF64TME) Date/Time that the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF64SID) System identification (from the SID parameter).
zJOBNAME	CHAR	8	(IBM name: SMF64JBN) Job name. The job name, time, and date that the reader recognized the JOB card (for this job) constitute the job log identification, or transaction name (for APPC output). Consists of the job name, time, and date that the reader recognized the JOB card (for this job).
zRST	TSTMP	8	(IBM name: SMF64RST) Date/Time that the reader recognized the JOB card (for this job).
zUSERID	CHAR	8	(IBM name: SMF64UIF) User-defined identification field (taken from common exit parameter area, not from USER=parameter on job statement).

<i>SMF064_VSAM_Component_or_Cluster_Status.Header_Self_Defining_Section.zRIN.<fieldname></i>			
zClosed	BIT	1	Component closed.
zVolSwch	BIT	1	Volume switched
zNoSpace	BIT	1	No space available.
zCatOrCRA	BIT	1	Record is a catalog or CRA record.
zClosed_T	BIT	1	Component closed, TYPE=T.
zAbend	BIT	1	Record written during ABEND processing.
zCatOpenedAsDataset	BIT	1	Record is for a VVDS or ICF catalog being opened or closed as a data set. If this bit is set, the catalog name field and the cluster name field can be set to zeros.

<i>SMF064_VSAM_Component_or_Cluster_Status.Header_Self_Defining_Section.zDTY.<fieldname></i>			
zDataset	BIT	1	Dataset.
zIX	BIT	1	Index
zExtFmt	BIT	1	Extended format.
zCompressed	BIT	1	Compressed
zRLS1	BIT	1	RLS is in effect.

zRLS2	BIT	1	RLS is in effect, measurement management facility disabled.
zExtAdd	BIT	1	Extended addressable data set.
zSecSpRedc	BIT	1	Secondary space reduction.

SMF064_VSAM_Component_or_Cluster_Status.Header_Self_Defining_Section.<fieldname>

zCNM	CHAR	44	(IBM name: SMF64CNM) Name of the catalog in which the component is defined.
zDNM	CHAR	44	(IBM name: SMF64DNM) Name of the component or cluster being processed. For a CRA record, this field does not contain meaningful information. For a catalog record, this field contains the catalog or cluster name.
zNTR	INT	2	(IBM name: SMF64NTR) Number of secondary tracks that were requested but could not be allocated.
zCHR	HEX	4	(IBM name: SMF64CHR) Highest used relative byte address (RBA) of the component. See also SMF64CHC.
zCHC	HEX	4	(IBM name: SMF64CHC) Highest used control interval (CI) of the component. CI is used in place of RBA for an extended format data set capable of extended addressability.
zESL	INT	2	(IBM name: SMF64ESL) Length of extent entry portion of record, excluding this field. (See note 1)

SMF064_VSAM_Component_or_Cluster_Status.Extent_Information_Section.<fieldname>

zFCC	HEX	4	(IBM name: SMF64FCC) Beginning cylinder and track, in the form CCHH where CC is the cylinder number and HH is the track number.
zTCC	HEX	4	(IBM name: SMF64TCC) Ending cylinder and track, in the form CCHH where CC is the cylinder number and HH is the track number.
zVSN	CHAR	6	(IBM name: SMF64VSN) Volume serial number of the volume containing the extent.
zCUU	HEX	2	(IBM name: SMF64CUU) Device number.
zIND	CHAR	2	(IBM name: SMF64IND) Spindle identification.
zUTY	HEX	4	(IBM name: SMF64UTY) Unit type.
zRV1	CHAR	4	(IBM name: SMF64RV1) Reserved.

SMF064_VSAM_Component_or_Cluster_Status.Statistics_Section_at_OPEN_Time.<fieldname>

zSLN	INT	4	(IBM name: SMF64SLN) Length of the statistics section, including this field.
zNIL	INT	4	(IBM name: SMF64NIL) Number of levels in the index.
zNEX	INT	4	(IBM name: SMF64NEX) Number of extents.
zNLR	INT	4	(IBM name: SMF64NLR) Number of logical records in the component.
zNDE	INT	4	(IBM name: SMF64NDE) Number of records that were deleted from the component.
zNIN	INT	4	(IBM name: SMF64NIN) Number of records that were inserted into the component.
zNUP	INT	4	(IBM name: SMF64NUP) Number of records that were updated in the component.
zNRE	INT	4	

			(IBM name: SMF64NRE) Number of records that were retrieved from the component.
zNFS	INT	4	(IBM name: SMF64NFS) Number of unused control intervals in the component. This value is multiplied by the control interval size when the component is not an extended addressable data set.
zNCS	INT	4	(IBM name: SMF64NCS) Number of control intervals that were split in the component.
zNAS	INT	4	(IBM name: SMF64NAS) Number of control areas that were split in the component.
zNEP	INT	4	(IBM name: SMF64NEP) Number of execute channel programs (EXCPs). When MACRF=RLS, this field contains the number of buffer manager requests. Change in Statistics from OPEN to time of EOVS and CLOSE: Note: The statistics might contain accumulated count among all concurrent users if the file is being opened by multiple ACBs or multiple JOBS.

SMF064_VSAM_Component_or_Cluster_Status.Statistics_Section_at_OPEN_Time.Change_From_OPEN_to_EOVS_and_CLOSE

zDIL	INT	4	(IBM name: SMF64DIL) Change in number of levels in the index.
zDEX	INT	4	(IBM name: SMF64DEX) Change in number of extents.
zDLR	INT	4	(IBM name: SMF64DLR) Change in number of logical records in the component. This field may be negative.
zDDE	INT	4	(IBM name: SMF64DDE) Change in number of records that were deleted from the component. When MACRF=RLS, this field contains the total number of deletes performed by this access-method control block.
zDIN	INT	4	(IBM name: SMF64DIN) Change in number of records that were inserted into the component. When MACRF=RLS, this field contains the total number of inserts performed by this access-method control block.
zDUP	INT	4	(IBM name: SMF64DUP) Change in number of records that were updated in the component. When MACRF=RLS, this field contains the total number of updates performed by this access-method control block.
zDRE	INT	4	(IBM name: SMF64DRE) Change in number of records that were retrieved from the component. When MACRF=RLS, this field contains the total number of retrieves performed by this access-method control block.
zDFS	INT	4	(IBM name: SMF64DFS) Change in number of unused control intervals in the component. This value is multiplied by the control interval size when the component is not an extended addressable data set. This value may be negative.
zDCS	INT	4	(IBM name: SMF64DCS) Change in number of control intervals that were split in the component. When MACRF=RLS, this field contains the total number of CI splits performed for this access-method control block.
zDAS	INT	4	(IBM name: SMF64DAS) Change in number of control areas that were split in the component. When MACRF=RLS, this field contains the total number of CA splits performed for this access-method control block.
zDEP	INT	4	(IBM name: SMF64DEP) Change in number of execute channel programs (EXCPs) for the data set. When MACRF=RLS, this field contains the total number of buffer manager calls performed for this access-method control block. Data Set Characteristics Section:

SMF064_VSAM_Component_or_Cluster_Status.Statistics_Section_at_OPEN_Time.Dataset_Characteristics.<fieldname>

zDBS	INT	4	(IBM name: SMF64DBS) Physical block size.
zDCI	INT	4	

			(IBM name: SMF64DCI) Control interval size.
zDLS	INT	4	(IBM name: SMF64DLS) Maximum logical record size.
zDKL	INT	2	(IBM name: SMF64DKL) Key length.
zDDN	CHAR	8	(IBM name: SMF64DDN) DD name. When the record is written for a VSAM catalog or catalog recovery area, this field may contain zeros. When the record is written for a volume switch or no space available condition, and the volume is associated with a concatenated TIOT entry, this field contains blanks.
zSTR	INT	1	(IBM name: SMF64STR) The number of strings requested by the user. This field may or may not contain the same number as SMF64PLH. It all depends on the data set activity (VSAM will dynamically add strings when necessary).
zBNO	INT	1	(IBM name: SMF64BNO) Actual number of buffers requested by the user. VSAM may override the number of data buffers requested by the user based on such things as the amount of buffer space specified at define time. This number may also vary based on whether the data set is using an LSR/GSR buffer pool, and whether or not separate data and index pools were established. When MACRF=RLS, this field is not applicable and it is set to 0.
zBSP	INT	4	(IBM name: SMF64BSP) Buffer space. When MACRF=RLS, this field is ignored.
zBFD	INT	2	(IBM name: SMF64BFD) The number of data buffers requested by the user. When MACRF=RLS, this field is ignored.
zBFI	INT	2	(IBM name: SMF64BFI) The number of index buffers requested by the user. When MACRF=RLS, this field is ignored.
zCLN	CHAR	44	(IBM name: SMF64CLN) Cluster name from JCL.
zPLH	INT	2	(IBM name: SMF64PLH) Actual number of concurrent strings (requested by the user) used. When MACRF=RLS, this field is set to 0.

SMF064_VSAM_Component_or_Cluster_Status.Statistics_Section_at_OPEN_Time.Dataset_Characteristics.zMAC.<fieldname>

SMF064_VSAM_Component_or_Cluster_Status.Statistics_Section_at_OPEN_Time.Dataset_Characteristics.zMAC.zMC1.<fieldname>

zIdKey	BIT	1	Record is identified by a key
zIdRBA	BIT	1	Record is identified by a relative byte address (RBA)
zCI	BIT	1	Control-Interval processing
zSeq	BIT	1	Sequential processing
zDirect	BIT	1	Direct processing
zInput	BIT	1	Input processing
zOutput	BIT	1	Output processing
zUserBufSp	BIT	1	User-supplied buffer space.

SMF064_VSAM_Component_or_Cluster_Status.Statistics_Section_at_OPEN_Time.Dataset_Characteristics.zMAC.zMC2.<fieldname>

zJESOut	BIT	1	Defined only when output and JES format. The system is to ensure that the logical record length will be the same when the data is read. This bit is not defined for input.
zCC	BIT	1	Control character type
zSKIP	BIT	1	Skip sequential processing
zVTAM	BIT	1	VTAM LOGON indicator
zEmpty	BIT	1	Set data set to empty state

zShrCB	BIT	1	Shared control blocks
zAIXOfPath	BIT	1	Alternate Index of the path.

SMF064_VSAM_Component_or_Cluster_Status.Statistics_Section_at_OPEN_Time.Dataset_Characteristics.zMAC.zMC3.<fieldname>			
zLSR	BIT	1	Local shared resource
zGSR	BIT	1	Global shared resource
zImprovedCI	BIT	1	Improved control-interval processing
zDeferWrite	BIT	1	Deferred write
zSeqIns	BIT	1	Sequential insert strategy
zCBReal	BIT	1	Control blocks are fixed in real storage
zVSAMA31	BIT	1	VSAM 31-bit addressing mode I/O buffers.

SMF064_VSAM_Component_or_Cluster_Status.Statistics_Section_at_OPEN_Time.Dataset_Characteristics.zMAC.zMC4.<fieldname>			
zRLS	BIT	1	RLS Processing
zSNP	BIT	1	SNP Option

SMF064_VSAM_Component_or_Cluster_Status.Statistics_Section_at_OPEN_Time.Dataset_Characteristics.zSMB.<fieldname>			
zAccBias	BIT	1	USER specified AMP ACCBIAS through JCL (ACCBIAS=DOISOIDWISW)
zAccBiasSMB	BIT	1	USER requested through JCL or DATACLAS that SMB is to determine ACCBIAS
zBIAS#D0	BIT	1	BIAS=D0 used
zBIAS#S0	BIT	1	BIAS=S0 used
zBIAS#SW	BIT	1	BIAS=SW used
zBIAS#DW	BIT	1	BIAS=DW used
zBIAS#C0	BIT	1	BIAS=C0 used
zBIAS#CR	BIT	1	BIAS=CR used

SMF064_VSAM_Component_or_Cluster_Status.Statistics_Section_at_OPEN_Time.Dataset_Characteristics.<fieldname>			
zRSC	INT	1	SMB Information

SMF064_VSAM_Component_or_Cluster_Status.Statistics_Section_at_OPEN_Time.Hyperbatch_IO.<fieldname>			
zSIO	INT	4	(IBM name: SMF64SIO) Number of requests for I/O issued by the access method for this data set for which Hiperbatch attempted to find the requested data in its buffers (see SMF64HIT and SMF64MIS). When MACRF=RLS, this field is not applicable and it is set to 0.
zHIT	INT	4	(IBM name: SMF64HIT) Number of requests for I/O issued by the access method for this data set satisfied by moving data from Hiperbatch buffers. When MACRF=RLS, this field is not applicable and it is set to 0.
zWTS	INT	4	(IBM name: SMF64WTS) Number of times Hiperbatch temporarily suspended this requester because another user was already reading some or all of the requested data. When MACRF=RLS, this field is not applicable and it is set to 0.
zMIS	INT	4	(IBM name: SMF64MIS) Number of requests for I/O issued by the access method for this data set satisfied by performing DASD I/O. Note that the sum of SMF64HIT and SMF64MIS should equal SMF64SIO. When MACRF=RLS, this field is not applicable and it is set to 0.
zIOS	INT	4	(IBM name: SMF64IOS) Number of DASD I/Os (as recorded in SMF64MIS) for which Hiperbatch copied the data into its buffers. Note that random reads from DASD do not populate the Hiperbatch buffers. When MACRF=RLS, this field is not applicable and it is set to 0. Compressed Data Statistics Section:

SMF064_VSAM_Component_or_Cluster_Status.Statistics_Section_at_OPEN_Time.Compressed_Data.<fieldname>			
zSDS	INT	8	(IBM name: SMF64SDS) Source data set size at open for compressed data set. Valid only if SMF64CMP (in SMF64DTY) is set on.
zCDS	INT	8	(IBM name: SMF64CDS) Compressed data set size at open. Valid only if SMF64CMP (in SMF64DTY) is set on.
zCSS	INT	8	(IBM name: SMF64CSS) Change in source data set size in this open for compressed data set. Valid only if SMF64CMP (in SMF64DTY) is set on.
zCCS	INT	8	(IBM name: SMF64CCS) Change in compressed data set size in this open. Valid only if SMF64CMP (in SMF64DTY) is set on.
zDTK	HEX	36	(IBM name: SMF64DTK) Dictionary token for compressed data set. Valid only if SMF64CMP (in SMF64DTY) is set on.
zTRK	INT	4	(IBM name: SMF64TRK) Number of tracks released during partial release processing.

SMF064_VSAM_Component_or_Cluster_Status.Statistics_Section_at_OPEN_Time.CF_Cache_Structure.<fieldname>			
zBMH	INT	4	(IBM name: SMF64BMH) Number of requests where the data was obtained from the local shared buffer pool.
zCFH	INT	4	(IBM name: SMF64CFH) Number of requests where the data was obtained from the DFSMS coupling facility cache structure.
zRIO	INT	4	(IBM name: SMF64RIO) Number of requests where the data was obtained from DASD.
zTIM	TSTMP	8	(IBM name: SMF64TIM) Time data set was opened .

SMF064_VSAM_Component_or_Cluster_Status.Statistics_Section_at_OPEN_Time.CF_Cache_Structure.zFG1.<fieldname>			
zCHKP	BIT	1	CHECKPOINT has been issued
zEOV	BIT	1	EOV diagnostic

SMF064_VSAM_Component_or_Cluster_Status.Statistics_Section_at_OPEN_Time.CF_Cache_Structure.<fieldname>			
zFD1	INT	1	(IBM name: SMF64FD1) EOV diagnostic field 1.
zFD2	INT	1	(IBM name: SMF64FD2) EOV diagnostic field 2.
zDAU	INT	4	(IBM name: SMF64DAU) Change in the number of CA-reclaimed control areas reused in the KSDS since the last EOVS or CLOSE.
zRLM	INT	4	(IBM name: SMF64RLM) Number of control areas reclaimed in the KSDS since the last EOVS or CLOSE.
zNTA	INT	4	(IBM name: SMF64NTA) DASD dataset key label.
zJobID	CHAR	8	(IBM name: N/A) Job ID.
zSysplexName	CHAR	8	(IBM name: N/A) Sysplex Name.

Record Type 65 - ICF Catalog Delete Activity

SMF Record 65 (ICF Catalog Delete Activity) is mapped by structure member "T065".

Primary Segment:

- [SMF065_ICF_Cat_Delete_Activity](#)

Secondary Segment(s): 0

Primary segment: [SMF065_ICF_Cat_Delete_Activity](#)

Field Name	Type	Len	Description
<i>SMF065_ICF_Cat_Delete_Activity.<fieldname></i>			
<i>SMF065_ICF_Cat_Delete_Activity.Header_Self_Defining_Section.<fieldname></i>			
zFLG	HEX	1	(IBM name: SMF65SYS) System indicator: Bit Meaning when set 0-2 Reserved 3-6 Version indicators 7 Reserved.
zRTY	INT	1	(IBM name: SMF65RTY) Record type 65 (X'41').
zTME	TSTMP	8	(IBM name: SMF65TME) Date/Time when the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF65CPU) System identification (from the SID parameter).
zSBS	CHAR	4	(IBM name: SMF65SBS) Reserved.
zSUB	CHAR	2	(IBM name: SMF65SUB) The action taken on the catalog entry. valid values are: IN (INSERT) DE (DELETE) UP (UPDATE)
zPOF	INT	4	(IBM name: SMF65POF) Offset of product section from start of record, including record descriptor word (RDW).
zPLN	INT	2	(IBM name: SMF65PLN) Length of product section.
zPNO	INT	2	(IBM name: SMF65PNO) Number of product sections.
zDOF	INT	4	(IBM name: SMF65DOF) Offset of data section from start of record, including record descriptor word (RDW).
zDLN	INT	2	(IBM name: SMF65DLN) Length of data section.
zDNO	INT	2	(IBM name: SMF65DNO) Number of data sections. Product and data section:

<i>SMF065_ICF_Cat_Delete_Activity.Product_and_Data.<fieldname></i>			
zVER	CHAR	2	(IBM name: SMF65VER) Version of the type 65 REC0RD.
zPNM	CHAR	8	(IBM name: SMF65PNM) Catalog management product identifier.
zJOBNAME	CHAR	8	(IBM name: SMF65JNM) Job name. The job log identification consists of the job name, time, and date that the reader recognized the JOB card (for this job). If a system task caused the record to be written, the job name and user identification fields contain blanks and the time and date fields contain zeros.
zRST	TSTMP	8	

			(IBM name: SMF65RST) Date/Time that the reader recognized the JOB card (for this job).
zUSERID	CHAR	8	(IBM name: SMF65UID) User-defined identification field (taken from common exit parameter area, not from USER=parameter on job statement).
zFNC	CHAR	1	(IBM name: SMF65FNC) Contains 'S' if a data set was scratched. 'U' if only catalog entries were modified.
zCNM	CHAR	44	(IBM name: SMF65CNM) Name of the catalog in which record was updated or deleted.

SMF065_ICF_Cat_Delete_Activity.Product_and_Data.zTYP.<fieldname>			
zTYP1	CHAR	1	(IBM name: N/A) Entry type identifier in char format.
zTYP2	HEX	1	(IBM name: N/A) Entry type identifier in hex format.
zTYP3	INT (ENUM)	1	Entry type identifier interpreted.

SMF065_ICF_Cat_Delete_Activity.Product_and_Data.<fieldname>			
zENM	CHAR	44	(IBM name: SMF65ENM) Entry name.
zNNM	CHAR	44	(IBM name: SMF65NNM) Reserved.
zCRC	VCHAR	2 1002	(IBM name: SMF65CRC) Catalog record for updated or deleted entry (the length of this record is contained in the first two bytes of this field).

Record Type 66 - ICF Catalog Alter Activity

SMF Record 66 (ICF Catalog Alter Activity) is mapped by structure member "T066".

Primary Segment:

- [SMF066_ICF_Cat_Alter_Activity](#)

Secondary Segment(s): 0

Primary segment: [SMF066_ICF_Cat_Alter_Activity](#)

Field Name	Type	Len	Description
<i>SMF066_ICF_Cat_Alter_Activity.<fieldname></i>			
<i>SMF066_ICF_Cat_Alter_Activity.Header_self_defining_section.<fieldname></i>			
zFLG	HEX	1	(IBM name: SMF66SYS) System indicator: Bit Meaning when set 0-2 Reserved 3-6 Version indicators 7 Reserved.
zRTY	INT	1	(IBM name: SMF66RTY) Record type 66 (X'42').
zTME	TSTMP	8	(IBM name: SMF66TME) Date/Time that the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF66CPU) System identification (from the SID parameter).
zSBS	CHAR	4	(IBM name: SMF66SBS) Reserved.
zSUB	CHAR	2	(IBM name: SMF66SUB) The action taken on the catalog entry. valid values are: IN (INSERT) DE (DELETE) UP (UPDATE)
zPOF	INT	4	(IBM name: SMF66POF) Offset of product section from start of record, including record descriptor word (RDW).
zPLN	INT	2	(IBM name: SMF66PLN) Length of product section.
zPNO	INT	2	(IBM name: SMF66PNO) Number of product sections.
zDOF	INT	4	(IBM name: SMF66DOF) Offset of data section from start of record, including record descriptor word (RDW).
zDLN	INT	2	(IBM name: SMF66DLN) Length of data section.
zDNO	INT	2	(IBM name: SMF66DNO) Number of data sections. Product and data section:
<i>SMF066_ICF_Cat_Alter_Activity.Product_and_Data.<fieldname></i>			
zVER	CHAR	2	(IBM name: SMF66VER) Version of the type 66 RECORD.
zPNM	CHAR	8	(IBM name: SMF66PNM) Catalog management product identifier.
zJOBNAME	CHAR	8	(IBM name: SMF66JNM) Job name. The job log identification consists of the job name, time, and date that the reader recognized the JOB card (for this job). If a system task caused the record to be written, the job name and user identification fields contain blanks and the time and date fields contain zeros.
zRST	TSTMP	8	

			(IBM name: SMF66RST) Date/Time that the reader recognized the JOB card (for this job).
zUSERID	CHAR	8	(IBM name: SMF66UID) User-defined identification field (taken from common exit parameter area, not from USER=parameter on job statement).
zFNC	CHAR	1	(IBM name: SMF66FNC) Contains 'R' if catalog entry is renamed.
zCNM	CHAR	44	(IBM name: SMF66CNM) Name of catalog in which record was updated or deleted.

SMF066_ICF_Cat_Alter_Activity.Product_and_Data.zTYP.<fieldname>			
zTYP1	CHAR	1	(IBM name: N/A) Entry type identifier in char format.
zTYP2	HEX	1	(IBM name: N/A) Entry type identifier in hex format.
zTYP3	INT (ENUM)	1	Entry type identifier interpreted.

SMF066_ICF_Cat_Alter_Activity.Product_and_Data.<fieldname>			
zENM	CHAR	44	(IBM name: SMF66ENM) Current entry name.
zNNM	CHAR	44	(IBM name: SMF66NNM) New entry name.
zCRC	VCHAR	2 1002	(IBM name: SMF66CRC) Catalog record for updated or deleted entry (the length of this record is contained in the first two bytes of this field).

Record Type 67 - VSAM Catalog Entry Deleted

SMF Record 67 (VSAM Catalog Entry Deleted) is mapped by structure member "T067".

Primary Segment:

- [SMF067_VSAM_Cat_Entry_Deleted](#)

Secondary Segment(s): 0

Primary segment: [SMF067_VSAM_Cat_Entry_Deleted](#)

Field Name	Type	Len	Description
<i>SMF067_VSAM_Cat_Entry_Deleted.<fieldname></i>			
<i>SMF067_VSAM_Cat_Entry_Deleted.Header_Self_defining_Section.<fieldname></i>			
zFLG	HEX	1	(IBM name: SMF67FLG) System indicator: Bit Meaning when set 0-2 Reserved 3-6 Version indicators 7 Reserved.
zRTY	INT	1	(IBM name: SMF67RTY) Record type 67 (X'43').
zTME	TSTMP	8	(IBM name: SMF67TME) Date/Time that the record was moved into the SMF buffer.
zSID	CHAR	2	(IBM name: SMF67SID) System identification (from the SID parameter).
zSMI	CHAR	2	(IBM name: SMF67SMI) System model identifier.
zJOBNAME	CHAR	8	(IBM name: SMF67JBN) Job name. If a system task caused the record to be written, the job name and user identification fields contain blanks and the time and date fields contain zeros. The job name, time, and date that the reader recognized the JOB card (for this job) constitute the job log identification, or transaction name (for APPC output).
zRST	TSTMP	8	(IBM name: SMF67RST) Date/Time that the reader recognized the JOB card (for this job).
zUSERID	CHAR	8	(IBM name: SMF67UIF) User-defined identification field (taken from common exit parameter area, not from USER=parameter on job statement).

<i>SMF067_VSAM_Cat_Entry_Deleted.Header_Self_defining_Section.zFDT.<fieldname></i>			
zUnCataloged	BIT	1	Uncataloged

<i>SMF067_VSAM_Cat_Entry_Deleted.Header_Self_defining_Section.zIOD.<fieldname></i>			
zCluster	BIT	1	VSAM cluster
zData	BIT	1	VSAM data component
zIndex	BIT	1	VSAM index component
zCatalog	BIT	1	VSAM catalog
zNonVSAM	BIT	1	Non-VSAM data set
zGDG	BIT	1	Generation Data Group
zAlias	BIT	1	Alias

SMF067_VSAM_Cat_Entry_Deleted.Header_Self_defining_Section.<fieldname>			
zCNM	CHAR	44	(IBM name: SMF67CNM) Name of catalog in which the entry was defined.
zDEN	CHAR	44	(IBM name: SMF67DEN) Entry name.
zRSZ	INT	2	(IBM name: SMF67RSZ) Size of catalog record that defined the entry. A VSAM catalog record is contained in one or more physical catalog records. Offset 132 IS the sum of the sizes of the physical catalog records that constitute the total logical VSAM catalog record.
zCRC	VCHAR	2 1002	(IBM name: SMF67CRC) Catalog record.

Record Type 68 - VSAM Catalog Entry Renamed

SMF Record 68 (VSAM Catalog Entry Renamed) is mapped by structure member "T068".

Primary Segment:

- SMF068_VSAM_Catalog_Entry_Renamed

Secondary Segment(s): 0

Primary segment: SMF068_VSAM_Catalog_Entry_Renamed

Field Name	Type	Len	Description
<i>SMF068_VSAM_Catalog_Entry_Renamed.<fieldname></i>			
SMF068_VSAM_Catalog_Entry_Renamed.Header_Self_defining_Section.<fieldname>			
zFLG	HEX	1	(IBM name: SMF68FLG) System indicator: Bit Meaning when set 0-2 Reserved 3-6 Version indicators 7 Reserved.
zRTY	INT	1	(IBM name: SMF68RTY) Record type 68 (X'44').
zTME	TSTMP	8	(IBM name: SMF68TME) Date/Time that the record was moved into SMF buffer.
zSID	CHAR	4	(IBM name: SMF68SID) System identification (from the SID parameter).
zJOBNAME	CHAR	8	(IBM name: SMF68JBN) Job name. If a system task caused the record to be written, the job name and user identification fields contain blanks and the time and date fields contain zeros. The job name, time, and date that the reader recognized the JOB card (for this job) constitute the job log identification, or transaction name (for APPC output).
zRST	TSTMP	8	(IBM name: SMF68RST) Date/Time that the reader recognized the JOB card (for this job).
zUSERID	CHAR	8	(IBM name: SMF68UIF) User-defined identification field (taken from common exit parameter area, not from USER=parameter on job statement).
zCNM	CHAR	44	(IBM name: SMF68CNM) Name of catalog in which the entry is defined.
zONM	CHAR	44	(IBM name: SMF68ONM) Old name of the entry (obtained from the ALTER command).
zNNM	CHAR	44	(IBM name: SMF68NNM) New name of the entry (obtained from the ALTER command).

Record Type 69 - VSAM DataSpace Defined, Extended or Deleted

SMF Record 69 (VSAM DataSpace Defined, Extended or Deleted) is mapped by structure member "T069".

Primary Segment:

- [SMF069_VSAM_DataSpace_Defined_Ext_Del](#)

Secondary Segment(s): 0

Primary segment: [SMF069_VSAM_DataSpace_Defined_Ext_Del](#)

Field Name	Type	Len	Description
<i>SMF069_VSAM_DataSpace_Defined_Ext_Del.<fieldname></i>			
<i>SMF069_VSAM_DataSpace_Defined_Ext_Del.Header_Self_defining_Section.<fieldname></i>			
zFLG	HEX	1	(IBM name: SMF69FLG) System indicator: Bit Meaning when set 0-2 Reserved 3-6 Version indicators 7 Reserved.
zRTY	INT	1	(IBM name: SMF69RTY) Record type 69 (X'45').
zTME	TSTMP	8	(IBM name: SMF69TME) Date/Time that the record was moved into SMF buffer.
zSID	CHAR	4	(IBM name: SMF69SID) System identification (from the SID parameter).
zJOBNAME	CHAR	8	(IBM name: SMF69JBN) Job name. If a system task caused the record to be written, the job name and user identification fields contain blanks and the time and date fields contain zeros. The job name, time, and date that the reader recognized the JOB card (for this job) constitute the job log identification, or transaction name (for APPC output).
zRST	TSTMP	8	(IBM name: SMF69RST) Date/Time that the reader recognized the JOB card (for this job).
zUSERID	CHAR	8	(IBM name: SMF69UIF) User-defined identification field (taken from common exit parameter area, not from USER=parameter on job statement).
zCUU	INT	2	(IBM name: SMF69CUU) Device number.
zIND	INT	2	(IBM name: SMF69IND) Spindle identification.
zNDS	INT	2	(IBM name: SMF69NDS) Number of free data space extents on the affected volume after the data space is defined, extended, or deleted.
zNUC	INT	2	(IBM name: SMF69NUC) Number of unallocated cylinders in all of the data spaces on the volume.
zNUT	INT	2	(IBM name: SMF69NUT) Number of unallocated tracks in all of the data spaces on the volume in addition to the number of unallocated cylinders.
zLNC	INT	2	(IBM name: SMF69LNC) Number of cylinders in the largest continuous unallocated area in any data space on the volume.
zLNT	INT	2	(IBM name: SMF69LNT) Number of tracks (in addition to the number of cylinders) in the largest continuous unallocated area in any data space on the volume.
zCNM	CHAR	44	(IBM name: SMF69CNM) Name of catalog in which the data space is defined.
zVSR	CHAR	6	

			(IBM name: SMF69VSR) Volume serial number of the volume on which the data space is defined.

Record Type 70 - RMF Processor Activity

SMF Record 70 (RMF Processor Activity) has a number of subtypes, each mapped by a structure member name of the format "T070STnn".

Record Type 70 Subtype 1 - CPU, PR/SM, and ICF Activity

Primary Segment:

- SMF070#01_RM_F_Processor_CPU_PRSM_ICF

Secondary Segment(s): 9 (in alphabetical order)

- SMF070#01_ASID_Data
- SMF070#01_CPU_Control
- SMF070#01_CPU_Data
- SMF070#01_CPU_Id
- SMF070#01_Logical_Core
- SMF070#01_Product
- SMF070#01_PRSM_Logical_Processor
- SMF070#01_PRSM_Partition
- SMF070#01_Tenant_Resource

Primary segment: SMF070#01_RM_F_Processor_CPU_PRSM_ICF

Field Name	Type	Len	Description
SMF070#01_RM_F_Processor_CPU_PRSM_ICF.<fieldname>			
SMF070#01_RM_F_Processor_CPU_PRSM_ICF.Header_Self_Defining_Section.<fieldname>			
zFLG	HEX	1	(IBM name: SMF70FLG) System indicator: Bit Meaning when set 0 New record format 1 Subtypes used 2 Reserved. 3-6 Version indicators 7 System is running in PR/SM mode.
zRTY	INT	1	(IBM name: SMF70RTY) Record type 70 (X'46').
zTME	TSTMP	8	(IBM name: SMF70TME) Date/Time that the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF70SID) System identification (from the SMFPRMxx SID parameter).
zSSI	CHAR	4	(IBM name: SMF70SSI) Subsystem identification ('RMF').
zSTY	INT	2	(IBM name: SMF70STF) Record SubType.
zTRN	INT	2	(IBM name: SMF70TRN) Number of triplets in this record. A triplet is a set of three SMF fields (offset/length/number values) that defines a section of the record. The offset is the offset from the RDW.
zPRS	INT	4	(IBM name: SMF70PRS) Offset to RMF product section from the RDW.
zPRL	INT	2	(IBM name: SMF70PRL) Length of RMF product section.
zPRN	INT	2	(IBM name: SMF70PRN) Number of RMF product sections. Individual header extension for SubType 1:
zCCS	INT	4	(IBM name: SMF70CCS) Offset to CPU control section from RDW.
zCCL	INT	2	

			(IBM name: SMF70CCL) Length of CPU control section.
zCCN	INT	2	(IBM name: SMF70CCN) Number of CPU control section.
zCPS	INT	4	(IBM name: SMF70CPS) Offset to CPU data section from RDW.
zCPL	INT	2	(IBM name: SMF70CPL) Length of CPU data section.
zCPN	INT	2	(IBM name: SMF70CPN) Number of CPU data sections in this record.
zASS	INT	4	(IBM name: SMF70ASS) Offset to ASID Data Area section from RDW.
zASL	INT	2	(IBM name: SMF70ASL) Length of ASID Data Area section.
zASN	INT	2	(IBM name: SMF70ASN) Number of ASID Data Area sections.
zBCS	INT	4	(IBM name: SMF70BCS) Offset to PR/SM Partition data section from RDW.
zBCL	INT	2	(IBM name: SMF70BCL) Length of PR/SM Partition data section.
zBCN	INT	2	(IBM name: SMF70BCN) Number of PR/SM Partition data sections.
zBVS	INT	4	(IBM name: SMF70BVS) Offset to PR/SM Logical Processor data section from RDW.
zBVL	INT	2	(IBM name: SMF70BVL) Length of PR/SM Logical Processor data section.
zBVN	INT	2	(IBM name: SMF70BVN) Number of PR/SM Logical Processor data sections.
zCNS	INT	4	(IBM name: SMF70CNS) Offset to CPU-identification name sections.
zCNL	INT	2	(IBM name: SMF70CNL) Length of CPU-identification name section.
zCNN	INT	2	(IBM name: SMF70CNN) Number of CPU-identification name sections.
zCOS	INT	4	(IBM name: SMF70COS) Offset to Logical Core data section from RDW.
zCOL	INT	2	(IBM name: SMF70COL) Length of Logical Core data section.
zCON	INT	2	(IBM name: SMF70CON) Number of Logical Core data sections.
zTNS	INT	4	(IBM name: SMF70TNS) Offset to Tenant Resource Group data section from RDW.
zTNL	INT	2	(IBM name: SMF70TNL) Length of Tenant Resource Group data section.
zTNN	INT	2	(IBM name: SMF70TNN) Number of Tenant Resource Group data sections. Individual header extension for SubType 2:

Secondary segment: **SMF070#01_Product**

Field Name	Type	Len	Description
<i>SMF070#01_Product.<fieldname></i>			
zMFV	DEC	2 (3,0)	(IBM name: SMF70MFV) RMF version number.

zPRD	CHAR	8	(IBM name: SMF70PRD) Product name ('RMF').
zIST	TIME	4	(IBM name: SMF70IST) Time that the RMF measurement interval started, in the form 0hhmmssF, where hh is the hours, mm is the minutes, ss is the seconds, and F is the sign.
zDAT	DATE	4	(IBM name: SMF70DAT) Date when the RMF measurement interval started, in the form 0cyydddF.
zINT	DEC	4 (7,0)	(IBM name: SMF70INT) Duration of the RMF measurement interval, in the form mmssttF where mm is the minutes, ss is the seconds, tt is the milliseconds, and F is the sign. (The end of the measurement interval is the sum of the recorded start time and this field.)
zSAM	INT	4	(IBM name: SMF70SAM) Number of RMF samples.

SMF070#01_Product.zFLA.<fieldname>

zSkip	BIT	1	Samples have been skipped
zMonIII	BIT	1	RECORD was written by RMF Monitor III
zSyncSMF	BIT	1	INTERVAL was synchronized with SMF
zIIPBoost	BIT	1	zIIP boost was active during entire interval.
zSpeedBoost	BIT	1	Speed boost was active during entire interval.
z_Boost_Class	BINT (ENUM)	3	

SMF070#01_Product.<fieldname>

zCYC	DEC	4 (7,0)	(IBM name: SMF70CYC) Sampling cycle length, in the form 000tttF, where ttt is the milliseconds and F is the sign (taken from CYCLE option). The range of values is 0.050 to 9.999 seconds.
zMVS	CHAR	8	(IBM name: SMF70MVS) z/OS software level (consists of an acronym and the version, release, and modification level - ZVvrrmm).
zIML	INT	1	(IBM name: SMF70IML) Indicates the type of processor complex on which data measurements were taken. Value Meaning 3 9672, zSeries

SMF070#01_Product.zPRF.<fieldname>

zExpStg	BIT	1	The system has expanded storage
zESCA	BIT	1	The processor is enabled for ES connection architecture (ESCA)
zESCdir	BIT	1	There is an ES connection director in the configuration
zZArc	BIT	1	System is running in z/Architecture® mode
zZAAP	BIT	1	At least one zAAP is currently installed
zZIIP	BIT	1	At least one zIIP is currently installed
zDAT	BIT	1	Enhanced DAT facility

SMF070#01_Product.<fieldname>

zPTN	INT	1	(IBM name: SMF70PTN) PR/SM partition number of the partition that wrote this record.
zSRL	INT	1	(IBM name: SMF70SRL) SMF record level change number (X'8E' for subtype 1 records or X'8F' for subtype 2 records for z/OS V2R4 RMF with RMF Data Gatherer APAR OA59330). This field enables processing of SMF record level changes in an existing release.
zIET	HEX	8	(IBM name: SMF70IET) Interval expiration time token. This token can be used to identify other than RMF records that belong to the same interval (if interval was synchronized

			with SMF).
zLGO	TIME	8	(IBM name: SMF70LGO) Offset GMT to local time (STCK format).
zRAO	INT	4	(IBM name: SMF70RAO) Offset to reassembly area relative to start of RMF product section.
zRAL	INT	2	(IBM name: SMF70RAL) Length of reassembly area. Area consists of a fixed header and a variable number of information blocks. Length depends on the record type/SubType, but is fixed for a specific type/SubType.
zRAN	INT	2	(IBM name: SMF70RAN) Reassembly area indicator. Value Meaning 0 RECORD is not broken. 1 RECORD is broken. Note: This field is used to indicate whether an SMF record is a broken record. Therefore, offset (SMF70RAO) and length (SMF70RAL) are only valid if SMF70RAN = 1. A reassembly area is only present in broken records.
zOIL	INT	2	(IBM name: SMF70OIL) Original interval length as defined in the session or by SMF (in seconds).
zSYN	INT	2	(IBM name: SMF70SYN) SYNC value in seconds.
zGIE	TSTMP	8	(IBM name: SMF70GIE) Projected gathering interval end (STCK format) GMT time.
zXNM	CHAR	8	(IBM name: SMF70XNM) Sysplex name as defined in parmlib member COUPLExx.
zSNM	CHAR	8	(IBM name: SMF70SNM) System name for current system as defined in parmlib member IEASYSxx SYSNAME parameter. Reassembly Area:

SMF070#01_Product.Reassembly_Area.<fieldname>

zRBR	INT	2	(IBM name: SMF70RBR) Total number of broken records built from the original large record.
zRSQ	INT	2	(IBM name: SMF70RSQ) Sequence number of this broken record. Every broken record built from the same large record must have a unique sequence number, it is in the range from 1 TO SMF70RBR.
zRIO	INT	4	(IBM name: SMF70RIO) Offset to first reassembly information block relative to start of reassembly area header.
zRIL	INT	2	(IBM name: SMF70RIL) Length of reassembly information block.
zRIN	INT	2	(IBM name: SMF70RIN) Number of reassembly information blocks (same value as SMF70TRN in header section).

SMF070#01_Product.Reassembly_Area.Reassembly_Info.<fieldname>

zRNN	INT	2	(IBM name: SMF70RNN) Total number of sections in the original large record. This field contains information of how many sections of a specific type were contained in the original SMF record. This field is a copy of the number field of the triplet in the original (non broken) record.
zRPP	INT	2	(IBM name: SMF70RPP) Position of the first of one or more consecutive sections described by this block as in the original record. Values in the range of 1 TO SMF70RNN are valid for correct processing. A value of 0 WILL skip processing of this information block. This field provides information where the sections that are part of this broken record were placed in the original record before the split took place. The actual number of consecutive sections contained in this record is available from the actual triplet in the header extension.

Secondary segment: **SMF070#01_CPU_Control**

Field Name	Type	Len	Description
<i>SMF070#01_CPU_Control.<fieldname></i>			
zMOD	INT	2	(IBM name: SMF70MOD) CPU processor family.
zVER	INT	1	(IBM name: SMF70VER) CPU version number - meaning varies with model number.
zBNP	INT	1	(IBM name: SMF70BNP) Number of physical processors assigned for use by PR/SM.

<i>SMF070#01_CPU_Control.zINB.<fieldname></i>			
zDiag204Fail	BIT	1	PR/SM diagnose X'204' failure.
zProcChg	BIT	1	Number of physical processors has changed.
zIntvlChg	BIT	1	Dispatch interval time has been changed.
zAddPtn	BIT	1	An additional partition, that is not included in the count of configured partitions, is presented with a name of 'PHYSICAL'. This partition includes all of the uncaptured time that was used by the LPAR management time support feature but could not be attributed to a specific logical partition.
zDiag204Ext	BIT	1	PR/SM - Diagnose X'204' extended data is supported.
zDiag204Simp	BIT	1	Simplified Diagnose X'204' data provided for system running as z/VM® guest. CPU consumption by z/VM itself provided with partition data section for logical partition named PHYSICAL.

<i>SMF070#01_CPU_Control.zSTF.<fieldname></i>			
zSTSI	BIT	1	The STSI facility is available for the CPC.
zCpuAdjChg	BIT	1	Physical CPU adjustment factor has been changed.
zSvcUnitChg	BIT	1	Service units available to MVS image have been changed.
zzLAC	BIT	1	SMF70LAC is provided for systems running in LPAR mode or as a z/VM guest. The value does no longer include CPU wait times.
zzMDL	BIT	1	SMF70MDL is the model-capacity identifier and SMF70HWM is the physical model. If this bit is OFF, SMF70MDL represents both model-capacity and physical model.
zTRPCTChg	BIT	1	OPT parameter BLWLTRPCT changed.
zINTHDChg	BIT	1	OPT parameter BLWLINTHD changed.
zzGAU	BIT	1	Field SMF70GAU is valid.

<i>SMF070#01_CPU_Control.<fieldname></i>			
zGTS	INT	2	(IBM name: SMF70GTS) Dispatch accumulated interval time in milliseconds. A zero value indicates that the dispatch interval was dynamically determined.
zMDL	CHAR	16	(IBM name: SMF70MDL) CPC model identifier. See bit 4 0F SMF70STF.
zDSA	INT	2	(IBM name: SMF70DSA) Number of Diagnose samples.
zIFA	INT	2	(IBM name: SMF70IFA) Number of zAAPs online at the end of the interval.
zCPA	INT	4	(IBM name: SMF70CPA) Physical CPU adjustment factor based on alternate CPU capability. This value is replaced by SMF70CPA_actual and SMF70CPA_scaling_factor.
zWLA	INT	4	(IBM name: SMF70WLA) Processor capacity available to MVS image measured in MSUs (millions of service units) per hour. The value takes into account whether or not the image has a defined capacity limit. (For systems

			running as VM guest, this is the VM capacity).
zLAC	INT	4	(IBM name: SMF70LAC) Long-term average of CPU service (millions of service units). Scope of the value depends on bit 3 OF SMF70STF.
zHOF	TIME	8	(IBM name: SMF70HOF) Hypervisor date/time offset in STCK format (aka Sysplex timer offset).
zHWM	CHAR	16	(IBM name: SMF70HWM) CPC physical model identifier. Valid if bit 4 OF SMF70STF is set.
zSUP	INT	2	(IBM name: SMF70SUP) Number of zIIPs online at the end of the interval.
zGJT	TSTMP	8	(IBM name: SMF70GJT) Time in STCK format when the partition that wrote this record has joined or left a capacity group (last change of group name). Also set at IPL time, when the partition is not a member of a capacity group.
zPOM	CHAR	4	(IBM name: SMF70POM) EBCDIC plant code that identifies the plant of manufacture for the configuration. The plant code is left-justified with trailing blank characters if necessary.
zCSC	CHAR	16	(IBM name: SMF70CSC) EBCDIC sequence code of the configuration. The sequence code is right-justified with leading EBCDIC zeroes if necessary.

SMF070#01_CPU_Control.zHHF.<fieldname>

zHIPERDISPATCHSupport	BIT	1	HIPERDISPATCH mode supported.
zHIPERDISPATCHActive	BIT	1	HIPERDISPATCH mode is active.
zHIPERDISPATCHChanged	BIT	1	HIPERDISPATCH mode changed during interval.
zFAILURE	BIT	1	FAILURE returned by HISMT service. Values in Logical Core data section and values provided in SMF70MCF, SMF70MCFS, SMF70MCFI, SMF70CF, SMF70CFS, SMF70CFI, SMF70ATD, SMF70ATDS, and SMF70ATDI are invalid.
zAbsoluteMSU	BIT	1	ABSOLUTE MSU capping is active for this partition.
zOS_PRTCTValid	BIT	1	SMF70OS_PRTCT is valid.

SMF070#01_CPU_Control.<fieldname>

zCR	INT	1	(IBM name: SMF70CR) ZEP field 0.
zPMI	INT	4	(IBM name: SMF70PMI) Accumulated number of blocked dispatchable units per second that may get promoted in their dispatch priority. To get the average promote event rate, divide SMF70PMI by SMF70SAM.
zPMU	INT	4	(IBM name: SMF70PMU) Number of blocked dispatchable units being promoted during the interval.
zPMW	INT	4	(IBM name: SMF70PMW) Accumulated number of address spaces and enclaves being blocked during the interval. To get the average number of waiters for promote, divide SMF70PMW by SMF70SAM.
zPMP	INT	4	(IBM name: SMF70PMP) Maximum number of address spaces and enclaves found being blocked during the interval.
zPMT	INT	2	(IBM name: SMF70PMT) 1/1000s of the CPU capacity for promote slices (OPT parameter BLWLTRPCT).
zPML	INT	2	(IBM name: SMF70PML) Swapped-in starvation threshold. When an address space or enclave has not received CPU service within this time interval although it has ready-to-run work, it is considered being blocked (OPT parameter BLWLINTHD).
zMPC	CHAR	16	(IBM name: SMF70MPC) CPC model identifier indicating the permanent capacity of the CPC,

			without the temporarily increased capacity and the temporarily available replacement capacity. The identifier is left justified with trailing blanks if necessary. This field is zero, if not supported by the hardware.
zMTC	CHAR	16	(IBM name: SMF70MTC) CPC model identifier indicating the temporary capacity of the CPC, which is the total of permanent capacity and temporarily increased capacity, without the temporarily available replacement capacity. The identifier is left justified with trailing blanks if necessary. This field is zero, if not supported by the hardware.
zMCR	INT	4	(IBM name: SMF70MCR) CPC model capacity rating associated with the model as identified by SMF70MDL. This field is zero, if not supported by the hardware.
zMPR	INT	4	(IBM name: SMF70MPR) CPC permanent model capacity rating associated with the model as identified by SMF70MPC. This field is zero, if not supported by the hardware.
zMTR	INT	4	(IBM name: SMF70MTR) CPC temporary model capacity rating associated with the model as identified by SMF70MTC. This field is zero, if not supported by the hardware.
zZEP	INT	4	(IBM name: SMF70ZEP) ZEP field 1.
zZER	HEX	8	(IBM name: SMF70ZER) ZEP field 2.
zZEE	HEX	8	(IBM name: SMF70ZEE) ZEP field 3.
zZEC	HEX	8	(IBM name: SMF70ZEC) ZEP field 4.
zNRM	INT	4	(IBM name: SMF70NRM) Normalization factor for zIIP. Multiply zIIP time by this value and divide by 256 T0 get the equivalent time on a CP.
zGAU	INT	4	(IBM name: SMF70GAU) Long-term average of CPU service in millions of service units which would be allowed by the limit of the capacity group but is not used by its members. If the value is negative, the group is capped. Valid if bit 7 0F SMF70STF is set.
zZEI	HEX	8	(IBM name: SMF70ZEI) ZEP field 5.
zNCR	INT	4	(IBM name: SMF70NCR) Nominal model-capacity rating in MSU/hour. When non-zero, this value is associated with the nominal model capacity as identified in field SMF70MDL. When field SMF70CAI contains a value of 100, this value equals the value in field SMF70MCR.
zNPR	INT	4	(IBM name: SMF70NPR) Nominal permanent model-capacity rating in MSU/hour. When non-zero, this value is associated with the nominal permanent model capacity as identified in field SMF70MPC. When field SMF70CAI contains a value of 100, this value equals the value in field SMF70MPR.
zNTR	INT	4	(IBM name: SMF70NTR) Nominal temporary model-capacity rating in MSU/hour. When non-zero, this value is associated with the nominal temporary model capacity as identified in field SMF70MTC. When field SMF70CAI contains a value of 100, this value equals the value in field SMF70MTR.
zCAI	INT	1	(IBM name: SMF70CAI) Capacity-adjustment indication. When zero, the indication is not reported. When in the range from 1 T0 99, some amount of reduction is indicated. When 100, the machine is operating at its normal capacity. Temporary capacity changes that affect machine performance (for example, CBU or OOC0D) are not included.
zCCR	INT	1	(IBM name: SMF70CCR) Capacity-change reason. Valid if SMF70CAI is non-zero. When 0, no capacity change took place. When 1, the capacity change is due to

			the setting of a manual control. When greater than 1, the capacity change is due to an internal machine condition or due to an external machine exception.
zMCP	INT	2	(IBM name: SMF70MCP) Maximum CPU ID available for this IPL.
zICP	INT	2	(IBM name: SMF70ICP) Highest CPU ID installed at IPL time.
zCCP	INT	2	(IBM name: SMF70CCP) Highest CPU ID currently installed. This number can increase upon dynamic CPU addition.
zCPA_actual	INT	4	(IBM name: SMF70CPA_actual) Physical CPU adjustment factor based on Model Capacity Rating (will be used for converting processor time to service units). This value together with SMF70CPA_scaling_factor replaces SMF70CPA.
zCPA_scaling_factor	INT	4	(IBM name: SMF70CPA_scaling_factor) Scaling factor for SMF70CPA_actual.
zMCF	INT	4	(IBM name: SMF70MCF) Multithreading maximum capacity numerator for general purpose processors. Divide this value by 1024 T0 get the multithreading maximum capacity factor for all general purpose processors that were configured ONLINE for the complete interval.
zMCF5	INT	4	(IBM name: SMF70MCF5) Multithreading maximum capacity numerator for zIIP. Divide this value by 1024 T0 get the multithreading maximum capacity factor for all zIIPs that were configured ONLINE for the complete interval. A zero value is reported if no zIIP is currently installed.
zMCFI	INT	4	(IBM name: SMF70MCFI) Multithreading maximum capacity numerator for zAAP. Divide this value by 1024 T0 get the multithreading maximum capacity factor for all zAAPs that were configured ONLINE for the complete interval. A zero value is reported if no zAAP is currently installed.
zCF	INT	4	(IBM name: SMF70CF) Multithreading capacity numerator for general purpose processors. Divide this value by 1024 T0 get the multithreading capacity factor for all general purpose processors that were configured ONLINE for the complete interval.
zCFS	INT	4	(IBM name: SMF70CFS) Multithreading capacity numerator for zIIP. Divide this value by 1024 T0 get the multithreading capacity factor for all zIIPs that were configured ONLINE for the complete interval. A zero value is reported if no zIIP is currently installed.
zCFI	INT	4	(IBM name: SMF70CFI) Multithreading capacity numerator for zAAP. Divide this value by 1024 T0 get the multithreading capacity factor for all zAAPs that were configured ONLINE for the complete interval. A zero value is reported if no zAAP is currently installed.
zATD	INT	4	(IBM name: SMF70ATD) Average Thread Density numerator for general purpose processors . Divide this value by 1024 T0 get the average number of active threads for all general purpose processors that were dispatched to physical hardware and configured ONLINE for the complete interval.
zATDS	INT	4	(IBM name: SMF70ATDS) Average Thread Density numerator for zIIP. Divide this value by 1024 T0 get the average number of active threads for all zIIPs that were dispatched to physical hardware and configured ONLINE for the complete interval. A zero value is reported if no zIIP is currently installed.
zATDI	INT	4	(IBM name: SMF70ATDI) Average Thread Density numerator for zAAP. Divide this value by 1024 T0 get the average number of active threads for all zAAPs that were dispatched to physical hardware and configured ONLINE for the complete interval. A zero value is reported if no zAAP is currently installed.
zLACM	INT	4	(IBM name: SMF70LACM) Long-term average of CPU service (millions of service units) consumed by transactions classified with reporting attribute MOBILE.

			If an address space or enclave is part of a tenant resource group, it will not contribute to SMF70LACM.
zLACA	INT	4	(IBM name: SMF70LACA) Long-term average of CPU service (millions of service units) consumed by transactions classified with reporting attribute CATEGORYA. If an address space or enclave is part of a tenant resource group, it will not contribute to SMF70LACA.
zLACB	INT	4	(IBM name: SMF70LACB) Long-term average of CPU service (millions of service units) consumed by transactions classified with reporting attribute CATEGORYB. If an address space or enclave is part of a tenant resource group, it will not contribute to SMF70LACB.
zADJ	INT	4	(IBM name: SMF70ADJ) Logical adjustment factor for CPU rate.
zLACCR	INT	4	(IBM name: SMF70LACCR) Long-term average of CPU service (millions of service units) consumed by DFSMS data set encryption. Valid only for IBM z14 and later CPCs.
zMaxPU	INT	2	(IBM name: SMF70MaxPU) When non-zero, this field indicates how many processor cores are physically available in this particular machine. When the value is 0, it is not defined for this model.
zOS_PRTCT	INT	1	(IBM name: SMF70OS_PRTCT) When non-zero, OSPROTECT system parameter with a value other than SYSTEM is in effect. X'01' indicates OSPROTECT=1.
zMDL_CBP	CHAR	16	(IBM name: SMF70MDL_CBP) Reserved
zMCR_CBP	INT	4	(IBM name: SMF70MCR_CBP) Reserved
zNCR_CBP	INT	4	(IBM name: SMF70NCR_CBP) Reserved
zLAC_CBP	INT	4	(IBM name: SMF70LAC_CBP) Reserved
zCPA_actual_CBP	INT	4	(IBM name: SMF70CPA_actual_CBP) Reserved
z_IPL_TIME	TIME	8	(IBM name: SMF70_IPL_TIME) IPL time of partition, in TOD format.
z_TRG_M_CNT	INT	4	(IBM name: SMF70_TRG_M_CNT) Number of times sampling of tenant resource group memory consumption happened.
zCRW	INT	4	(IBM name: SMF70CRW) Reserved.
zCPC_TYPE	INT	4	(IBM name: SMF70CPC_TYPE) CPC Type

Secondary segment: SMF070#01_CPU_Data

Field Name	Type	Len	Description
<i>SMF070#01_CPU_Data.<fieldname></i>			
zWAT	TIME	8	(IBM name: SMF70WAT) CPU wait time, where bit 51 = 1 MICROSEC0ND. That is, the amount of time that the CPU is not processing instructions (PSW wait state bit is on). Data could be incorrect if a SET CLOCK occurred during the RMF interval. SMF70WAT is used in RMF report calculations Note: This field is incorrect if MVS is running under VM.
zCID	HEX	2	(IBM name: SMF70CID) CPU identification

SMF070#01_CPU_Data.zCNF.<fieldname>			
zDATA	BIT	1	DATA available for complete interval.
zCPURPP	BIT	1	CPU reconfigured during post processor duration interval.
zCPURMI	BIT	1	CPU reconfigured during the measurement interval (data for this CPU is incorrect).
zCPUOn	BIT	1	CPU online at end of interval.

SMF070#01_CPU_Data.<fieldname>			
zSER	HEX	3	(IBM name: SMF70SER) CPU serial number (6 hexadecimal digits).
zTYP	INT (ENUM)	1	(IBM name: SMF70TYP) CPU type. (0 => GENERAL purpose CP, 1 => zAAP, 2 => zIIP)
zSLH	INT	4	(IBM name: SMF70SLH) Number of entries to the I/O SLIH. number of I/O interruptions that this processor handled by entry into the I/O interrupt handler.
zTPI	INT	4	(IBM name: SMF70TPI) Number of TPI (test pending interrupt) with CC=1. number of I/O interruptions that this processor handled from issuing the TPI instruction.
zVFS	INT	4	(IBM name: SMF70VFS) Number of samples when the vector bit in the PSA image was on, which is used to determine the percentage of time vector affinity was on.
zV	INT	1	(IBM name: SMF70V) Vector configuration Bit Meaning when set 0 VECT0R was online 1-7 Reserved.
zPAT	TIME	8	(IBM name: SMF70PAT) CPU parked time, where bit 51 = 1 MICROSECOND.
zTCB	INT	8	(IBM name: SMF70TCB) Number of TCB dispatches for this CPU.
zSRB	INT	8	(IBM name: SMF70SRB) Number of SRB dispatches for this CPU.
zNIO	INT	8	(IBM name: SMF70NIO) Number of I/Os for this CPU.
zSIG	INT	8	(IBM name: SMF70SIG) Total number of SIGPs done by this CPU.
zWTD	INT	8	(IBM name: SMF70WTD) Wait dispatch count for this CPU.
zWTS	INT	4	(IBM name: SMF70WTS) The number of times PR/SM issued a warning-track interruption to a logical processor and z/OS was able to return the logical processor within the grace period.
zWTU	INT	4	(IBM name: SMF70WTU) The number of times PR/SM issued a warning-track interruption to a logical processor and z/OS was unable to return the logical processor within the grace period.
zWTI	INT	4	(IBM name: SMF70WTI) Amount of time in milliseconds that a logical processor was yielded to PR/SM due to warning-track processing.

Secondary segment: **SMF070#01_ASID_Data**

Field Name	Type	Len	Description
SMF070#01_ASID_Data.<fieldname>			
zRMN	INT	2	(IBM name: SMF70RMN) Ready minimum value over interval.
zRMM	INT	2	

			(IBM name: SMF70RMM) Ready maximum value over interval.
zRTT	INT	4	(IBM name: SMF70RTT) Ready total value over interval.
zR00	INT	4	(IBM name: SMF70R00) Count of times ready value was zero.
zR01	INT	4	(IBM name: SMF70R01) Count of times ready value was 1.
zR02	INT	4	(IBM name: SMF70R02) Count of times ready value was 2.
zR03	INT	4	(IBM name: SMF70R03) Count of times ready value was 3.
zR04	INT	4	(IBM name: SMF70R04) Count of times ready value was 4.
zR05	INT	4	(IBM name: SMF70R05) Count of times ready value was 5.
zR06	INT	4	(IBM name: SMF70R06) Count of times ready value was 6.
zR07	INT	4	(IBM name: SMF70R07) Count of times ready value was 7.
zR08	INT	4	(IBM name: SMF70R08) Count of times ready value was 8.
zR09	INT	4	(IBM name: SMF70R09) Count of times ready value was 9.
zR10	INT	4	(IBM name: SMF70R10) Count of times ready value was 10.
zR11	INT	4	(IBM name: SMF70R11) Count of times ready value was 11.
zR12	INT	4	(IBM name: SMF70R12) Count of times ready value was 12.
zR13	INT	4	(IBM name: SMF70R13) Count of times ready value was 13.
zR14	INT	4	(IBM name: SMF70R14) Count of times ready value was 14.
zR15	INT	4	(IBM name: SMF70R15) Count of times ready value was 15 OR more.
zIMN	INT	2	(IBM name: SMF70IMN) IN users minimum over interval.
zIMM	INT	2	(IBM name: SMF70IMM) IN users maximum over interval.
zITT	INT	4	(IBM name: SMF70ITT) IN users total value over interval.
zI00	INT	4	(IBM name: SMF70I00) Count of times IN users was zero. 80 54 SMF70I01 4 BINARY Count of times IN users was 1 OR 2.
zI02	INT	4	(IBM name: SMF70I02) Count of times IN users was 3 OR 4.
zI03	INT	4	(IBM name: SMF70I03) Count of times IN users was 5 OR 6.
zI04	INT	4	(IBM name: SMF70I04) Count of times IN users was 7 OR 8.
zI05	INT	4	(IBM name: SMF70I05) Count of times IN users was 9 OR 10.
zI06	INT	4	(IBM name: SMF70I06) Count of times IN users was 11 - 15.
zI07	INT	4	

			(IBM name: SMF70I07) Count of times IN users was 16 - 20.
zI08	INT	4	(IBM name: SMF70I08) Count of times IN users was 21 - 25.
zI09	INT	4	(IBM name: SMF70I09) Count of times IN users was 26 - 30.
zI10	INT	4	(IBM name: SMF70I10) Count of times IN users was 31 - 35.
zI11	INT	4	(IBM name: SMF70I11) Count of times IN users was 36 OR more.
zOMN	INT	2	(IBM name: SMF70OMN) Out users minimum over interval.
zOMM	INT	2	(IBM name: SMF70OMM) Out users maximum over interval.
zOTT	INT	4	(IBM name: SMF70OTT) Out users total value over interval.
zO00	INT	4	(IBM name: SMF70O00) Count of times out users was zero.
zO01	INT	4	(IBM name: SMF70O01) Count of times out users was 1 OR 2.
zO02	INT	4	(IBM name: SMF70O02) Count of times out users was 3 OR 4.
zO03	INT	4	(IBM name: SMF70O03) Count of times out users was 5 OR 6.
zO04	INT	4	(IBM name: SMF70O04) Count of times out users was 7 OR 8.
zO05	INT	4	(IBM name: SMF70O05) Count of times out users was 9 OR 10.
zO06	INT	4	(IBM name: SMF70O06) Count of times out users was 11 - 15.
zO07	INT	4	(IBM name: SMF70O07) Count of times out users was 16 - 20.
zO08	INT	4	(IBM name: SMF70O08) Count of times out users was 21 - 25.
zO09	INT	4	(IBM name: SMF70O09) Count of times out users was 26 - 30.
zO10	INT	4	(IBM name: SMF70O10) Count of times out users was 31 - 35.
zO11	INT	4	(IBM name: SMF70O11) Count of times out users was 36 OR more.
zWMN	INT	2	(IBM name: SMF70WMN) Wait user minimum over interval.
zWMM	INT	2	(IBM name: SMF70WMM) Wait users maximum over interval.
zWTT	INT	4	(IBM name: SMF70WTT) Wait users total value over interval.
zW00	INT	4	(IBM name: SMF70W00) Count of times wait users was zero.
zW01	INT	4	(IBM name: SMF70W01) Count of times wait users was 1 OR 2.
zW02	INT	4	(IBM name: SMF70W02) Count of times wait users was 3 OR 4.
zW03	INT	4	(IBM name: SMF70W03) Count of times wait users was 5 OR 6.
zW04	INT	4	(IBM name: SMF70W04) Count of times wait users was 7 OR 8.

zW05	INT	4	(IBM name: SMF70W05) Count of times wait users was 9 OR 10.
zW06	INT	4	(IBM name: SMF70W06) Count of times wait users was 11 - 15.
zW07	INT	4	(IBM name: SMF70W07) Count of times wait users was 16 - 20.
zW08	INT	4	(IBM name: SMF70W08) Count of times wait users was 21 - 25.
zW09	INT	4	(IBM name: SMF70W09) Count of times wait users was 26 - 30.
zW10	INT	4	(IBM name: SMF70W10) Count of times wait users was 31 - 35.
zW11	INT	4	(IBM name: SMF70W11) Count of times wait users was 36 OR more.
zBMN	INT	2	(IBM name: SMF70BMN) Batch users minimum over interval.
zBMM	INT	2	(IBM name: SMF70BMM) Batch users maximum over interval.
zBTT	INT	4	(IBM name: SMF70BTT) Batch users total value over interval.
zB00	INT	4	(IBM name: SMF70B00) Count of times batch users was zero.
zB01	INT	4	(IBM name: SMF70B01) Count of times batch users was 1 OR 2.
zB02	INT	4	(IBM name: SMF70B02) Count of times batch users was 3 OR 4.
zB03	INT	4	(IBM name: SMF70B03) Count of times batch users was 5 OR 6.
zB04	INT	4	(IBM name: SMF70B04) Count of times batch users was 7 OR 8.
zB05	INT	4	(IBM name: SMF70B05) Count of times batch users was 9 OR 10
zB06	INT	4	(IBM name: SMF70B06) Count of times batch users was 11 - 15.
zB07	INT	4	(IBM name: SMF70B07) Count of times batch users was 16 - 20.
zB08	INT	4	(IBM name: SMF70B08) Count of times batch users was 21 - 25.
zB09	INT	4	(IBM name: SMF70B09) Count of times batch users was 26 - 30.
zB10	INT	4	(IBM name: SMF70B10) Count of times batch users was 31 - 35.
zB11	INT	4	(IBM name: SMF70B11) Count of times batch users was 36 OR more.
zSMN	INT	2	(IBM name: SMF70SMN) Started users minimum over interval.
zSMM	INT	2	(IBM name: SMF70SMM) Started users maximum over interval.
zSTT	INT	4	(IBM name: SMF70STT) Started users total value over interval.
zS00	INT	4	(IBM name: SMF70S00) Count of times users was zero.
zS01	INT	4	(IBM name: SMF70S01) Count of times users was 1 OR 2.
zS02	INT	4	(IBM name: SMF70S02) Count of times users was 3 OR 4.

zS03	INT	4	(IBM name: SMF70S03) Count of times users was 5 0R 6.
zS04	INT	4	(IBM name: SMF70S04) Count of times users was 7 0R 8.
zS05	INT	4	(IBM name: SMF70S05) Count of times users was 9 0R 10.
zS06	INT	4	(IBM name: SMF70S06) Count of times users was 11 - 15.
zS07	INT	4	(IBM name: SMF70S07) Count of times users was 16 - 20.
zS08	INT	4	(IBM name: SMF70S08) Count of times users was 21 - 25.
zS09	INT	4	(IBM name: SMF70S09) Count of times users was 26 - 30.
zS10	INT	4	(IBM name: SMF70S10) Count of times users was 31 - 35.
zS11	INT	4	(IBM name: SMF70S11) Count of times users was 36 0R more.
zTMN	INT	2	(IBM name: SMF70TMN) TSO/E users minimum over interval.
zTMM	INT	2	(IBM name: SMF70TMM) TSO/E users maximum over interval.
zTTT	INT	4	(IBM name: SMF70TTT) TSO/E users total value over interval.
zT00	INT	4	(IBM name: SMF70T00) Count of times TSO/E users was zero.
zT01	INT	4	(IBM name: SMF70T01) Count of times TSO/E users was 1 0R 2.
zT02	INT	4	(IBM name: SMF70T02) Count of times TSO/E users was 3 0R 4.
zT03	INT	4	(IBM name: SMF70T03) Count of times TSO/E users was 5 0R 6.
zT04	INT	4	(IBM name: SMF70T04) Count of times TSO/E users was 7 0R 8.
zT05	INT	4	(IBM name: SMF70T05) Count of times TSO/E users was 9 0R 10.
zT06	INT	4	(IBM name: SMF70T06) Count of times TSO/E users was 11 - 15.
zT07	INT	4	(IBM name: SMF70T07) Count of times TSO/E users was 16 - 20.
zT08	INT	4	(IBM name: SMF70T08) Count of times TSO/E users was 21 - 25.
zT09	INT	4	(IBM name: SMF70T09) Count of times TSO/E users was 26 - 30.
zT10	INT	4	(IBM name: SMF70T10) Count of times TSO/E users was 31 - 35.
zT11	INT	4	(IBM name: SMF70T11) Count of times TSO/E users was 36 0R more.
zLMN	INT	2	(IBM name: SMF70LMN) Logical ready users minimum over interval.
zLMM	INT	2	(IBM name: SMF70LMM) Logical ready users maximum over interval.
zLTT	INT	4	(IBM name: SMF70LTT) Logical ready users total value over interval.
zL00	INT	4	(IBM name: SMF70L00) Count of times the number of logical ready users was zero.

zL01	INT	4	(IBM name: SMF70L01) Count of times the number of logical ready users was 1 OR 2.
zL02	INT	4	(IBM name: SMF70L02) Count of times the number of logical ready users was 3 OR 4.
zL03	INT	4	(IBM name: SMF70L03) Count of times the number of logical ready users was 5 OR 6.
zL04	INT	4	(IBM name: SMF70L04) Count of times the number of logical ready users was 7 OR 8.
zL05	INT	4	(IBM name: SMF70L05) Count of times the number of logical ready users was 9 OR 10.
zL06	INT	4	(IBM name: SMF70L06) Count of times the number of logical ready users was 11 15.
zL07	INT	4	(IBM name: SMF70L07) Count of times the number of logical ready users was 16 20.
zL08	INT	4	(IBM name: SMF70L08) Count of times the number of logical ready users was 21 25.
zL09	INT	4	(IBM name: SMF70L09) Count of times the number of logical ready users was 26 30.
zL10	INT	4	(IBM name: SMF70L10) Count of times the number of logical ready users was 31 35.
zL11	INT	4	(IBM name: SMF70L11) Count of times the number of logical ready users was 36 OR more.
zAMN	INT	2	(IBM name: SMF70AMN) Logical wait users minimum over interval.
zAMM	INT	2	(IBM name: SMF70AMM) Logical wait users maximum over interval.
zATT	INT	4	(IBM name: SMF70ATT) Logical wait users total value over interval.
zA00	INT	4	(IBM name: SMF70A00) Count of times the number of logical wait users was zero.
zA01	INT	4	(IBM name: SMF70A01) Count of times the number of logical wait users was 1 OR 2.
zA02	INT	4	(IBM name: SMF70A02) Count of times the number of logical wait users was 3 OR 4.
zA03	INT	4	(IBM name: SMF70A03) Count of times the number of logical wait users was 5 OR 6.
zA04	INT	4	(IBM name: SMF70A04) Count of times the number of logical wait users was 7 OR 8.
zA05	INT	4	(IBM name: SMF70A05) Count of times the number of logical wait users was 9 OR 10.
zA06	INT	4	(IBM name: SMF70A06) Count of times the number of logical wait users was 11 - 15.
zA07	INT	4	(IBM name: SMF70A07) Count of times the number of logical wait users was 16 - 20.
zA08	INT	4	(IBM name: SMF70A08) Count of times the number of logical wait users was 21 - 25.
zA09	INT	4	(IBM name: SMF70A09) Count of times the number of logical wait users was 26 - 30.
zA10	INT	4	(IBM name: SMF70A10) Count of times the number of logical wait users was 31 - 35.
zA11	INT	4	(IBM name: SMF70A11) Count of times the number of logical wait users was 36 OR more.
zPMN	INT	2	(IBM name: SMF70PMN) Minimum number of ASCH address spaces. An ASCH address space is scheduled by the APPC/MVS transaction scheduler.
zPMM	INT	2	

			(IBM name: SMF70PMM) Maximum number of ASCH address spaces.
zPTT	INT	4	(IBM name: SMF70PTT) Total number of ASCH address spaces.
zP00	INT	4	(IBM name: SMF70P00) Number of times when 0 ASCH address spaces were found.
zP01	INT	4	(IBM name: SMF70P01) Number of times when 1 - 2 ASCH address spaces were found.
zP02	INT	4	(IBM name: SMF70P02) Number of times when 3 - 4 ASCH address spaces were found.
zP03	INT	4	(IBM name: SMF70P03) Number of times when 5 - 6 ASCH address spaces were found.
zP04	INT	4	(IBM name: SMF70P04) Number of times when 7 - 8 ASCH address spaces were found.
zP05	INT	4	(IBM name: SMF70P05) Number of times when 9 - 10 ASCH address spaces were found.
zP06	INT	4	(IBM name: SMF70P06) Number of times when 11 - 15 ASCH address spaces were found. 556 22A SMF70P07 4 BINARY Number of times when 16 - 20 ASCH address spaces were found.
zP08	INT	4	(IBM name: SMF70P08) Number of times when 21 - 25 ASCH address spaces were found.
zP09	INT	4	(IBM name: SMF70P09) Number of times when 26 - 30 ASCH address spaces were found.
zP10	INT	4	(IBM name: SMF70P10) Number of times when 31 - 35 ASCH address spaces were found. 572 23A SMF70P11 4 BINARY Number of times when 36 0R more ASCH address spaces were found.
zXMN	INT	2	(IBM name: SMF70XMN) Minimum number of OMVS address spaces.
zXMM	INT	2	(IBM name: SMF70XMM) Maximum number of OMVS address spaces.
zXTT	INT	4	(IBM name: SMF70XTT) Total number of OMVS address spaces.
zX00	INT	4	(IBM name: SMF70X00) Number of times when zero OMVS address spaces were found.
zX01	INT	4	(IBM name: SMF70X01) Number of times when 1 - 2 OMVS address spaces were found.
zX02	INT	4	(IBM name: SMF70X02) Number of times when 3 - 4 OMVS address spaces were found.
zX03	INT	4	(IBM name: SMF70X03) Number of times when 5 - 6 OMVS address spaces were found.
zX04	INT	4	(IBM name: SMF70X04) Number of times when 7 - 8 OMVS address spaces were found.
zX05	INT	4	(IBM name: SMF70X05) Number of times when 9 - 10 OMVS address spaces were found.
zX06	INT	4	(IBM name: SMF70X06) Number of times when 11 - 15 OMVS address spaces were found.
zX07	INT	4	(IBM name: SMF70X07) Number of times when 16 - 20 OMVS address spaces were found.
zX08	INT	4	(IBM name: SMF70X08) Number of times when 21 - 25 OMVS address spaces were found.
zX09	INT	4	(IBM name: SMF70X09) Number of times when 26 - 30 OMVS address spaces were found.
zX10	INT	4	(IBM name: SMF70X10) Number of times when 31 - 35 OMVS address spaces were found.
zX11	INT	4	

			(IBM name: SMF70X11) Number of times when 36 0R more OMVS address spaces were found. Fields SMF70Q00 to SMF70Q12 count the In Ready users based on the number N of logical processors being online when the sample was taken. With HiperDispatch mode active and an SMF record level SMF70SRL = X'55'(85), N is the number of logical processors being online and not parked when the sample was taken.
zQ00	INT	4	(IBM name: SMF70Q00) Count of times In Ready users was less or equal N.
zQ01	INT	4	(IBM name: SMF70Q01) Count of times In Ready users was N+1.
zQ02	INT	4	(IBM name: SMF70Q02) Count of times In Ready users was N+2.
zQ03	INT	4	(IBM name: SMF70Q03) Count of times In Ready users was N+3.
zQ04	INT	4	(IBM name: SMF70Q04) Count of times In Ready users was N+4 or N+5.
zQ05	INT	4	(IBM name: SMF70Q05) Count of times In Ready users was N+6 to N+10.
zQ06	INT	4	(IBM name: SMF70Q06) Count of times In Ready users was N+11 to N+15.
zQ07	INT	4	(IBM name: SMF70Q07) Count of times In Ready users was N+16 to N+20.
zQ08	INT	4	(IBM name: SMF70Q08) Count of times In Ready users was N+21 to N+30.
zQ09	INT	4	(IBM name: SMF70Q09) Count of times In Ready users was N+31 to N+40.
zQ10	INT	4	(IBM name: SMF70Q10) Count of times In Ready users was N+41 to N+60.
zQ11	INT	4	(IBM name: SMF70Q11) Count of times In Ready users was N+61 or N+80.
zQ12	INT	4	(IBM name: SMF70Q12) Count of times In Ready users was greater than N+80.
zSRM	INT	4	(IBM name: SMF70SRM) Number of samples taken by SRM
zCMN	INT	4	(IBM name: SMF70CMN) Minimum number of work units for general purpose processors over interval.
zCMM	INT	4	(IBM name: SMF70CMM) Maximum number of work units for general purpose processors over interval.
zCTT	INT	4	(IBM name: SMF70CTT) Total number of work units for general purpose processors over interval.
zDMN	INT	4	(IBM name: SMF70DMN) Minimum number of work units for zAAPs over interval.
zDMM	INT	4	(IBM name: SMF70DMM) Maximum number of work units for zAAPs over interval.
zDTT	INT	4	(IBM name: SMF70DTT) Total number of work units for zAAPs over interval.
zEMN	INT	4	(IBM name: SMF70EMN) Minimum number of work units for zIIPs over interval.
zEMM	INT	4	(IBM name: SMF70EMM) Maximum number of work units for zIIPs over interval.
zETT	INT	4	(IBM name: SMF70ETT) Total number of work units for zIIPs over interval. Fields SMF70U00 to SMF70U015 count the number of work units based on the number N of logical processors being online when the sample was taken. With HiperDispatch mode active, N is the number of logical processors being online and not parked when the sample was taken.

zU00	INT	4	(IBM name: SMF70U00) Count of times the number of work units was less or equal N.
zU01	INT	4	(IBM name: SMF70U01) Count of times the number of work units was N+1.
zU02	INT	4	(IBM name: SMF70U02) Count of times the number of work units was N+2.
zU03	INT	4	(IBM name: SMF70U03) Count of times the number of work units was N+3.
zU04	INT	4	(IBM name: SMF70U04) Count of times the number of work units was N+4 or N+5.
zU05	INT	4	(IBM name: SMF70U05) Count of times the number of work units was between N+6 and N+10.
zU06	INT	4	(IBM name: SMF70U06) Count of times the number of work units was between N+11 and N+15.
zU07	INT	4	(IBM name: SMF70U07) Count of times the number of work units was between N+16 and N+20.
zU08	INT	4	(IBM name: SMF70U08) Count of times the number of work units was between N+21 and N+30.
zU09	INT	4	(IBM name: SMF70U09) Count of times the number of work units was between N+31 and N+40.
zU10	INT	4	(IBM name: SMF70U10) Count of times the number of work units was between N+41 and N+60.
zU11	INT	4	(IBM name: SMF70U11) Count of times the number of work units was between N+61 and N+80.
zU12	INT	4	(IBM name: SMF70U12) Count of times the number of work units was between N+81 and N+100.
zU13	INT	4	(IBM name: SMF70U13) Count of times the number of work units was between N+101 and N+120.
zU14	INT	4	(IBM name: SMF70U14) Count of times the number of work units was between N+121 and N+150.
zU15	INT	4	(IBM name: SMF70U15) Count of times the number of work units was greater N+150.

Secondary segment: **SMF070#01_PRSM_Partition**

Field Name	Type	Len	Description
<i>SMF070#01_PRSM_Partition.<fieldname></i>			
zLPM	CHAR	8	(IBM name: SMF70LPM) Logical partition name.
zLPN	INT	1	(IBM name: SMF70LPN) Logical partition number.
zPFG	INT	1	(IBM name: SMF70PFG) Partition flags Bit Meaning when set 0 PARTITION has changed from activated to deactivated, or vice versa, during interval 1 NUMBER of logical processors in partition has changed 2 NUMBER of dedicated processors in partition has changed 3 NUMBER of shared processors in partition has changed 4 WLM LPAR management is active for this partition. 5 WAIT time field (SMF70WST) is defined. 6 DEFINED capacity limit has been changed. 7 RESERVED.
zBDN	INT	2	(IBM name: SMF70BDN) Number of logical CPUs assigned to this partition. This count matches the number of subsequent PR/SM Partition data sections. Starting with z900 processors, SMF70BDN has a different meaning if bit 4 OF SMF70INB is set. It then contains the maximum logical processors defined as shown at the HMC. Active logical processors have an online time SMF70ONT greater than zero.

zBDS	INT	4	(IBM name: SMF70BDS) The PR/SM logical processor data blocks for all partitions are grouped together in the record. PR/SM logical processor data blocks for a given partition are grouped together. To get to the first logical processor data block associated with this partition, skip over the number of logical processor data blocks specified by this field, starting at the first logical processor data block in the record.
zBDA	INT	4	(IBM name: SMF70BDA) Accumulated number of active logical processors at a WLM partition. This value is updated at each measurement cycle. It does not cover the logical processors for a non WLM managed partition. (A partition is WLM managed, if bit 4 0F SMF70PFG is set.) To get the average number of logical CPUs, this value has to be divided by the number of Diagnose samples (field SMF70DSA in the CPU control section).
zSPN	CHAR	8	(IBM name: SMF70SPN) LPAR cluster name. For z/OS, the LPAR cluster name is the sysplex name. For any other logical partition, the LPAR cluster name is the name provided in the HMC definition of this logical partition. Blank, if partition is not a cluster member.
zSTN	CHAR	8	(IBM name: SMF70STN) System name. Blank, if not provided or supported by the operating system in the logical partition.
zCSF	INT	4	(IBM name: SMF70CSF) Number of megabytes of central storage currently online to this partition.
zESF	INT	4	(IBM name: SMF70ESF) Number of megabytes of expanded storage currently online to this partition.
zMSU	INT	4	(IBM name: SMF70MSU) Defined capacity limit (in millions of service units).

SMF070#01_PRSM_Partition.zPFL.<fieldname>

zUPIValid	BIT	1	Content of zUPI is valid.
zGroup	BIT	1	Group flag. This partition is member of a capacity group.
zPolar	BIT	1	Polarization flag. This partition is vertically polarized. That is, HiperDispatch mode is active. The zPOW fields in the logical processor data section are valid for CPUs of this partition.
zIWeight	BIT	1	Initial weight instead of current weight should be used to project usage of the members in the capacity group.

SMF070#01_PRSM_Partition.<fieldname>

zUPI	INT	1	(IBM name: SMF70UPI) User partition ID. Valid if bit 0 0F SMF70PFL is set.
zMTID	INT	1	(IBM name: SMF70MTID) Maximum Thread Identification. A non-zero value indicates that PROCVIEW CORE is effective for this partition and the hardware supports multithreading.
zGNM	CHAR	8	(IBM name: SMF70GNM) Name of the capacity group to which this partition belongs. Valid if bit 1 0F SMF70PFL is set.
zGMU	INT	4	(IBM name: SMF70GMU) Maximum licensing units of a group. The maximum number of processor licensing units for the group of logical partitions of which this partition is a member, and which may be consumed per unit of time, on average. Valid if bit 1 0F SMF70PFL is set.
zHWGr_Name	CHAR	8	(IBM name: SMF70HWGr_Name) Name of the hardware group to which this partition belongs.

SMF070#01_PRSM_Partition.z_BoostInfo.<fieldname>

z_zIIP_Boost	BIT	1	zIIP boost was active at some point within the interval.
z_Speed_Boost	BIT	1	Speed boost was active at some point within the interval.

Secondary segment: SMF070#01_PRSM_Logical_Processor

Field Name	Type	Len	Description
<i>SMF070#01_PRSM_Logical_Processor.<fieldname></i>			
zPDT	TIME	4	(IBM name: SMF70PDT) Logical processor dispatch time, in seconds. This is the number of microseconds that were accumulated during the measurement interval (during which a physical CPU was assigned to this logical CPU). When associated with partition name PHYSICAL, this field contains the accumulated number of microseconds during which a physical CPU was busy, but the time could not be attributed to a specific logical partition. This time includes the time PR/SM was controlling the physical processor (LPAR management time), as well as any other time the processor was busy for any reason such as managing coupling facility traffic.
zVPA	INT	2	(IBM name: SMF70VPA) Logical processor address.
zBPS	INT	2	(IBM name: SMF70BPS) Partition processor resource weight factor. If the value is X'FFFF', then the partition has been assigned dedicated processors.
zVPF	INT	1	(IBM name: SMF70VPF) Logical processor flags Bit Meaning when set 0 WAIT completion is enabled 1 WAIT completion status has changed during interval 2 WEIGHT has changed during interval 3 'INITIAL Capping' was set to 'ON' on the Hardware Management Console 4 'INITIAL Capping' status has changed during the interval 5 LOGICAL processor varied online during the measurement interval 6 SMF70HW_CAP_LIMIT has changed during the interval 7 SMF70HWGR_NAME or SMF70HWGr_Cap_Limit has changed during the interval.
zPOF	INT	1	(IBM name: SMF70POF) Polarization flags Bit Meaning when set 0 - 1 Polarization indicator: 00 HORIZONTALLY polarized or polarization not indicated 01 VERTICALLY polarized with low entitlement 10 VERTICALLY polarized with medium entitlement 11 VERTICALLY polarized with high entitlement 2 POLARIZATION indication changed during interval 3-7 Reserved.
zCIX	INT	2	(IBM name: SMF70CIX) Index to the CPU-identification name section that contains the EBCDIC name corresponding to the CPU type of the logical processor. This field is zero if there is no information available.
zEDT	TIME	4	(IBM name: SMF70EDT) Logical processor effective dispatch time, in seconds. The number of microseconds that were accumulated during the measurement interval (excluding LPAR management time), during which a physical CPU was assigned to this logical CPU. When associated with partition name PHYSICAL, this field contains the accumulated number of microseconds during which a physical CPU was busy, but the time could not be attributed to a specific logical partition or to LPAR management of the physical processor. One example is time used for managing coupling facility traffic. This field is zero, if not supported by the hardware. LPAR management time is the time from SMF70PDT associated with partition name PHYSICAL minus the contents of this field.
zACS	INT	4	(IBM name: SMF70ACS) Accumulated processor actual share. To get the average processor actual share, this value has to be divided by the number of Diagnose samples (field SMF70DSA in the CPU control section).
zMIS	INT	2	(IBM name: SMF70MIS) Processor minimum share.
zMAS	INT	2	(IBM name: SMF70MAS) Processor maximum share.
zNSI	INT	4	(IBM name: SMF70NSI) Number of samples within 10% of the specified minimum.
zNSA	INT	4	(IBM name: SMF70NSA) Number of samples within 10% of the specified maximum.
zONT	TIME	4	(IBM name: SMF70ONT) Logical processor online time.

zWST	TIME	4	(IBM name: SMF70WST) Logical processor wait state time. SMF70WST is used only for internal purposes.
zPMA	INT	4	(IBM name: SMF70PMA) Average adjustment weight for pricing management. This value may be negative.
zNSW	INT	4	(IBM name: SMF70NSW) Number of diagnose samples where WLM considers to cap the set of logical CPUs of type SMF70CIX within the logical partition (see also SMF70NCA).
zPOW	INT	4	(IBM name: SMF70POW) Polarization weight for the logical CPU when HiperDispatch mode is active. See bit 2 OF SMF70PFL. Multiplied by a factor of 4096 FOR more granularity. The value may be the same or different for all shared CPUs of type SMF70CIX. This is an accumulated value. Divide by the number of Diagnose samples SMF70DSA to get average weight value for the interval.
zNCA	INT	4	(IBM name: SMF70NCA) Number of diagnose samples where capping actually limited the usage of processor resources for the set of logical CPUs of type SMF70CIX within the logical partition.
zHW_Cap_Limit	INT	4	(IBM name: SMF70HW_Cap_Limit) If not zero, absolute limit on partition usage of all CPUs of the type indicated in SMF70CIX in terms of a number specified in hundredths of a CPU. For example, a value of 250 INDICATES that the partition is limited to using 2.5 CPUs.
zHWGr_Cap_Limit	INT	4	(IBM name: SMF70HWGr_Cap_Limit) If not zero, absolute limit on partition usage of all CPUs of the type indicated in SMF70CIX that are members of the same hardware group, in terms of a number specified in hundredths of a CPU. For example, a value of 250 INDICATES that the hardware group is limited to using 2.5 CPUs.
zMTIT	TIME	4	(IBM name: SMF70MTIT) Multithreading Idle Time in seconds accumulated for all threads of a dispatched core. This field is only valid if SMF70MTID is not zero for this partition.

Secondary segment: SMF070#01_CPU_Id

Field Name	Type	Len	Description
SMF070#01_CPU_Id.<fieldname>			
zCIN	CHAR	16	(IBM name: SMF70CIN) CPU-identification name.
zCTN	INT	2	(IBM name: SMF70CTN) Number of physical CPUs of this type at interval end.
zCAN	INT	4	(IBM name: SMF70CAN) Accumulated number of physical CPUs. Divide by SMF70DSA to get the average number of physical CPUs of this type applicable during the interval.

Secondary segment: SMF070#01_Logical_Core

Field Name	Type	Len	Description
SMF070#01_Logical_Core.<fieldname>			
z_CORE_ID	INT	2	(IBM name: SMF70_CORE_ID) Core identification.
z_CORE_FLG	INT	1	(IBM name: SMF70_CORE_FLG) Logical Core Information Bit Meaning when set 0 CORE LPAR Busy time is valid. 1-7 Reserved.

z_CPU_SKIP	INT	2	(IBM name: SMF70_CPU_SKIP) The CPU data sections for this core are grouped together in the record. To get to the first CPU data section associated with this logical core, skip over the number of CPU data sections specified by this field, starting at the first CPU data section in the record.
z_CPU_NUM	INT	2	(IBM name: SMF70_CPU_NUM) Number of CPU data sections for this core. This value represents the number of threads that are active on this core.
z_PROD	INT	4	(IBM name: SMF70_PROD) Multithreading core productivity numerator. Divide this value by 1024 TO get the multithreading core productivity. A zero value is reported if the core was not configured ONLINE for the complete interval. If SMF70_CPU_NUM is greater than 1, the core productivity represents the percentage of how much work the core resources accomplished while dispatched to physical hardware over the maximum amount of work the core resources could have accomplished while dispatched to physical hardware.
z_LPAR_BUSY	INT	4	(IBM name: SMF70_LPAR_BUSY) Multithreading core LPAR Busy Time in milliseconds. This field is valid if bit 0 OF SMF70_CORE_FLG is set.

Secondary segment: SMF070#01_Tenant_Resource

Field Name	Type	Len	Description
<i>SMF070#01_Tenant_Resource.<fieldname></i>			
z_TRG_NAME	CHAR	8	(IBM name: SMF70_TRG_NAME) Tenant resource group name.
z_TRG_DESC	CHAR	32	(IBM name: SMF70_TRG_DESC) Tenant resource group description.
z_TRG_TNTID	CHAR	8	(IBM name: SMF70_TRG_TNTID) Tenant identifier.
z_TRG_TNTNAME	CHAR	32	(IBM name: SMF70_TRG_TNTNAME) Tenant name.
z_TRG_SBID	CHAR	64	(IBM name: SMF70_TRG_SBID) Solution ID.
z_TRG_SUCP	INT	8	(IBM name: SMF70_TRG_SUCP) Service units on CPs consumed by tenant resource group.
z_TRG_SUIFA	INT	8	(IBM name: SMF70_TRG_SUIFA) Service units on zAAPs consumed by tenant resource group.
z_TRG_SUSUP	INT	8	(IBM name: SMF70_TRG_SUSUP) Service units on zIIPs consumed by tenant resource group.
z_TRG_LAC	INT	4	(IBM name: SMF70_TRG_LAC) Long-term average service on general purpose processors in millions of service units per hour consumed by tenant resource group.
z_TRG_LAC_CBP	INT	4	(IBM name: SMF70_TRG_LAC_CBP) Reserved for future use.
z_TRG_FLAGS	INT	2	(IBM name: SMF70_TRG_FLAGS) Reserved for future use.
z_TRG_MEM	INT	8	(IBM name: SMF70_TRG_MEM) Memory consumption of tenant resource group in units of 4K frames.

Record Type 70 Subtype 2 - Cryptographic Hardware Activity

Primary Segment:

- SMF070#02_RMF_Processor_Crypto

Secondary Segment(s): 5 (in alphabetical order)

- SMF070#02_Accelerator
- SMF070#02_CCA_Coprocessor
- SMF070#02_ICSF_Services
- SMF070#02_Product
- SMF070#02_PKCS11_Coprocessor

Primary segment: SMF070#02_RMF_Processor_Crypto

Field Name	Type	Len	Description
SMF070#02_RMF_Processor_Crypto.<fieldname>			
SMF070#02_RMF_Processor_Crypto.Header_Self_Defining_Section.<fieldname>			
zFLG	HEX	1	(IBM name: SMF70FLG) System indicator: Bit Meaning when set 0 New record format 1 Subtypes used 2 Reserved. 3-6 Version indicators 7 System is running in PR/SM mode.
zRTY	INT	1	(IBM name: SMF70RTY) Record type 70 (X'46').
zTME	TSTMP	8	(IBM name: SMF70TME) Date/Time that the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF70SID) System identification (from the SMFPRMxx SID parameter).
zSSI	CHAR	4	(IBM name: SMF70SSI) Subsystem identification ('RMF').
zSTY	INT	2	(IBM name: SMF70STY) Record SubType.
zTRN	INT	2	(IBM name: SMF70TRN) Number of triplets in this record. A triplet is a set of three SMF fields (offset/length/number values) that defines a section of the record. The offset is the offset from the RDW.
zPRS	INT	4	(IBM name: SMF70PRS) Offset to RMF product section from the RDW.
zPRL	INT	2	(IBM name: SMF70PRL) Length of RMF product section.
zPRN	INT	2	(IBM name: SMF70PRN) Number of RMF product sections. Individual header extension for SubType 1:
z23S	INT	4	(IBM name: SMF7023S) Offset to Cryptographic CCA Coprocessor data section.
z23L	INT	2	(IBM name: SMF7023L) Length of Cryptographic CCA Coprocessor data section.
z23N	INT	2	(IBM name: SMF7023N) Number of Cryptographic CCA Coprocessor data sections.
z24S	INT	4	(IBM name: SMF7024S) Offset to Cryptographic Accelerator data section.
z24L	INT	2	(IBM name: SMF7024L) Length of Cryptographic Accelerator data section.
z24N	INT	2	(IBM name: SMF7024N) Number of Cryptographic Accelerator data sections.

z2CS	INT	4	(IBM name: SMF702CS) Offset to ICSF Services data section.
z2CL	INT	2	(IBM name: SMF702CL) Length of ICSF Services data section.
z2CN	INT	2	(IBM name: SMF702CN) Number of ICSF Services data sections.
z25S	INT	4	(IBM name: SMF7025S) Offset to Cryptographic PKCS11 Coprocessor data section.
z25L	INT	2	(IBM name: SMF7025L) Length of Cryptographic PKCS11 Coprocessor data section.
z25N	INT	2	(IBM name: SMF7025N) Number of Cryptographic PKCS11 Coprocessor data sections.

Secondary segment: **SMF070#02_Product**

Field Name	Type	Len	Description
<i>SMF070#02_Product.<fieldname></i>			
zMFV	DEC	2 (3,0)	(IBM name: SMF70MFV) RMF version number.
zPRD	CHAR	8	(IBM name: SMF70PRD) Product name ('RMF').
zIST	TIME	4	(IBM name: SMF70IST) Time that the RMF measurement interval started, in the form 0hhmmssF, where hh is the hours, mm is the minutes, ss is the seconds, and F is the sign.
zDAT	DATE	4	(IBM name: SMF70DAT) Date when the RMF measurement interval started, in the form 0cyydddF.
zINT	DEC	4 (7,0)	(IBM name: SMF70INT) Duration of the RMF measurement interval, in the form mmssttF where mm is the minutes, ss is the seconds, tt is the milliseconds, and F is the sign. (The end of the measurement interval is the sum of the recorded start time and this field.)
zSAM	INT	4	(IBM name: SMF70SAM) Number of RMF samples.

SMF070#02_Product.zFLA.<fieldname>

zSkip	BIT	1	Samples have been skipped
zMonIII	BIT	1	RECORD was written by RMF Monitor III
zSyncSMF	BIT	1	INTERVAL was synchronized with SMF
zIIPBoost	BIT	1	zIIP boost was active during entire interval.
zSpeedBoost	BIT	1	Speed boost was active during entire interval.
z_Boost_Class	BINT (ENUM)	3	

SMF070#02_Product.<fieldname>

zCYC	DEC	4 (7,0)	(IBM name: SMF70CYC) Sampling cycle length, in the form 000tttF, where tttt is the milliseconds and F is the sign (taken from CYCLE option). The range of values is 0.050 to 9.999 seconds.
zMVS	CHAR	8	(IBM name: SMF70MVS) z/OS software level (consists of an acronym and the version, release, and modification level - ZVvrrmm).
zIML	INT	1	(IBM name: SMF70IML) Indicates the type of processor complex on which data measurements were taken. Value Meaning 3 9672, zSeries

SMF070#02_Product.zPRF.<fieldname>			
zExpStg	BIT	1	The system has expanded storage
zESCA	BIT	1	The processor is enabled for ES connection architecture (ESCA)
zESCdir	BIT	1	There is an ES connection director in the configuration
zzArc	BIT	1	System is running in z/Architecture® mode
zZAAP	BIT	1	At least one zAAP is currently installed
zZIIP	BIT	1	At least one zIIP is currently installed
zDAT	BIT	1	Enhanced DAT facility

SMF070#02_Product.<fieldname>			
zPTN	INT	1	(IBM name: SMF70PTN) PR/SM partition number of the partition that wrote this record.
zSRL	INT	1	(IBM name: SMF70SRL) SMF record level change number (X'8E' for subtype 1 records or X'8F' for subtype 2 records for z/OS V2R4 RMF with RMF Data Gatherer APAR OA59330). This field enables processing of SMF record level changes in an existing release.
zIET	HEX	8	(IBM name: SMF70IET) Interval expiration time token. This token can be used to identify other than RMF records that belong to the same interval (if interval was synchronized with SMF).
zLGO	TIME	8	(IBM name: SMF70LGO) Offset GMT to local time (STCK format).
zRAO	INT	4	(IBM name: SMF70RAO) Offset to reassembly area relative to start of RMF product section.
zRAL	INT	2	(IBM name: SMF70RAL) Length of reassembly area. Area consists of a fixed header and a variable number of information blocks. Length depends on the record type/SubType, but is fixed for a specific type/SubType.
zRAN	INT	2	(IBM name: SMF70RAN) Reassembly area indicator. Value Meaning 0 RECORD is not broken. 1 RECORD is broken. Note: This field is used to indicate whether an SMF record is a broken record. Therefore, offset (SMF70RAO) and length (SMF70RAL) are only valid if SMF70RAN = 1. A reassembly area is only present in broken records.
zOIL	INT	2	(IBM name: SMF70OIL) Original interval length as defined in the session or by SMF (in seconds).
zSYN	INT	2	(IBM name: SMF70SYN) SYNC value in seconds.
zGIE	TSTMP	8	(IBM name: SMF70GIE) Projected gathering interval end (STCK format) GMT time.
zXNM	CHAR	8	(IBM name: SMF70XNM) Sysplex name as defined in parmlib member COUPLExx.
zSNM	CHAR	8	(IBM name: SMF70SNM) System name for current system as defined in parmlib member IEASYSxx SYSNAME parameter. Reassembly Area:

SMF070#02_Product.Reassembly_Area.<fieldname>			
zRBR	INT	2	(IBM name: SMF70RBR) Total number of broken records built from the original large record.
zRSQ	INT	2	(IBM name: SMF70RSQ) Sequence number of this broken record. Every broken record built from the same large record must have a unique sequence number, it is in the range from 1 TO SMF70RBR.
zRIO	INT	4	(IBM name: SMF70RIO) Offset to first reassembly information block relative to start of reassembly area header.

zRIL	INT	2	(IBM name: SMF70RIL) Length of reassembly information block.
zRIN	INT	2	(IBM name: SMF70RIN) Number of reassembly information blocks (same value as SMF70TRN in header section).

SMF070#02_Product.Reassembly_Area.Reassembly_Info.<fieldname>			
zRNN	INT	2	(IBM name: SMF70RNN) Total number of sections in the original large record. This field contains information of how many sections of a specific type were contained in the original SMF record. This field is a copy of the number field of the triplet in the original (non broken) record.
zRPP	INT	2	(IBM name: SMF70RPP) Position of the first of one or more consecutive sections described by this block as in the original record. Values in the range of 1 TO SMF70RNN are valid for correct processing. A value of 0 WILL skip processing of this information block. This field provides information where the sections that are part of this broken record were placed in the original record before the split took place. The actual number of consecutive sections contained in this record is available from the actual triplet in the header extension.

Secondary segment: **SMF070#02_CCA_Coprocessor**

Field Name	Type	Len	Description
<i>SMF070#02_CCA_Coprocessor.<fieldname></i>			
R7023AX	INT	1	Crypto processor index.
R7023CT	INT	1	Crypto processor type. 3=PCICC, 5=PCIXCC, 7=CEX2C, 9=CEX3C, 10=CEX4C, 11=CEX5C, 12=CEX6C, 13=CEX7C
R7023CTe	INT (ENUM)	1	Crypto processor type.
R7023MSK	INT	1	Validity bit mask. Each bit position represents the validity of a timer-counter pair that measures the execution time and number of operations on a cryptographic coprocessor card. Bit Meaning when set 0 VALID data for all operations 1 VALID data for RSA-key-generation operations 2-7 Reserved. Valid with SMF70SRL = X'61'(97).
R7023MT	INT	1	Reserved for diagnostic purposes.
R7023SF	FLOAT	8	Scaling factor for this cryptographic coprocessor. Execution times in this data section have to be multiplied by this scaling factor to achieve a value in seconds.
R7023T0	FLOAT	8	Execution time of all operations on the specified cryptographic coprocessor.
R7023C0	FLOAT	8	Number of all operations on the specified cryptographic coprocessor.
R7023C1	FLOAT	8	Number of all RSA-key-generation operations.
R7023SCOPE	INT	1	Specifies the scope of the cryptographic CCA coprocessor data section. Value Meaning 0=Data with CPC scope 1=Data with System scope
R7023SCOPEe	INT (ENUM)	1	Specifies the scope of the cryptographic CCA coprocessor data section.
R7023DID	INT	1	Domain ID

Secondary segment: **SMF070#02_Accelerator**

Field Name	Type	Len	Description
<i>SMF070#02_Accelerator.<fieldname></i>			

R7024AX	INT	1	Crypto processor index.
R7024CT	INT	1	Crypto processor type: Value Meaning 6=CEX2A 8=CEX3A 10=CEX4A 11=CEX5A 12=CEX6A 13=CEX7A
R7024CTe	INT (ENUM)	1	Crypto processor type.
R7024MSK	INT	1	Validity bit mask. Each bit position represents the validity of a timer-counter pair that measures the execution time and number of operations on a cryptographic accelerator card for a certain type of RSA operations. Bit Meaning when set 0 VALID data for 1024-bit ME-format RSA operations 1 VALID data for 2048-bit ME-format RSA operations 2 VALID data for 1024-bit CRT-format RSA operations 3 VALID data for 2048-bit CRT-format RSA operations 4 VALID data for 4096-bit ME-format RSA operations 5 VALID data for 4096-bit CRT-format RSA operations 6-7 Reserved Valid with SMF70SRL = X'5B'(91).
R7024MT	INT	1	Reserved for diagnostic purposes.
R7024EN	INT	4	Number of engines on the Crypto accelerator card. Specifies the number of valid entries in the R7024TC array.
R7024SF	FLOAT	8	Scaling factor for this cryptographic accelerator. Execution times in this data section have to be multiplied by this scaling factor to achieve a value in seconds. The following block of data (R7024TC) exists five times for up to five engines of a cryptographic accelerator. Unused blocks are allocated with values set to 0.
R7021MET	FLOAT	8	Execution time for all operations in 1024-bit-ME format.
R7021MEC	FLOAT	8	Number of all operations in 1024-bit-ME format.
R7022MET	FLOAT	8	Execution time for all operations in 2048-bit-ME format.
R7022MEC	FLOAT	8	Number of all operations in 2048-bit-ME format.
R7021CRT	FLOAT	8	Execution time for all operations in 1024-bit-CRT format.
R7021CRC	FLOAT	8	Number of all operations in 1024-bit-CRT format.
R7022CRT	FLOAT	8	Execution time for all operations in 2048-bit-CRT format.
R7022CRC	FLOAT	8	Number of all operations in 2048-bit-CRT format. End of five instances of the R7024TC data block.
R7023MET	FLOAT	8	Execution time for all operations in 4096-bit ME-format.
R7023MEC	FLOAT	8	Number of all operations in 4096-bit ME-format.
R7023CRT	FLOAT	8	Execution time for all operations in 4096-bit CRT-format.
R7023CRC	FLOAT	8	Number of all operations in 4096-bit CRT-format.
R7024SCOPE	INT	1	Specifies the scope of the cryptographic accelerator data section. Value Meaning 0=Data with CPC scope 1=Data with System scope
R7024SCOPEe	INT (ENUM)	1	Specifies the scope of the cryptographic accelerator data section.
R7024DID	INT	1	Domain ID

Secondary segment: **SMF070#02_ICSF_Services**

Field Name	Type	Len	Description
<i>SMF070#02_ICSF_Services.<fieldname></i>			
R702SNEC	FLOAT	8	Single DES: Number of calls to encipher the data.
R702SNEB	FLOAT	8	Single DES: Number of bytes of data enciphered.
R702SNEI	FLOAT	8	Single DES: Number of instructions used to encipher the data.
R702TNEC	FLOAT	8	Triple DES: Number of calls to encipher the data.
R702TNEB	FLOAT	8	Triple DES: Number of bytes of data enciphered.

R702TNEI	FLOAT	8	Triple DES: Number of instructions used to encipher the data.
R702SNDC	FLOAT	8	Single DES: Number of calls to decipher the data.
R702SNDB	FLOAT	8	Single DES: Number of bytes of data deciphered.
R702SNDI	FLOAT	8	Single DES: Number of instructions used to decipher the data.
R702TNDC	FLOAT	8	Triple DES: Number of calls to decipher the data.
R702TNDB	FLOAT	8	Triple DES: Number of bytes of data deciphered.
R702TNDI	FLOAT	8	Triple DES: Number of instructions used to decipher the data.
R702NMGC	FLOAT	8	Number of calls to generate the message authentication code (MAC).
R702NMGB	FLOAT	8	Number of bytes of data for which the MAC was generated.
R702NMGI	FLOAT	8	Number of PCMF instructions used to generate the MAC.
R702NMVC	FLOAT	8	Number of calls to verify the MAC.
R702NMVB	FLOAT	8	Number of bytes of data for which the MAC was verified.
R702NMVI	FLOAT	8	Number of PCMF instructions used to verify the MAC.
R702NHAC	FLOAT	8	For SHA-1 hashing: Number of calls to hash the data.
R702NHAB	FLOAT	8	For SHA-1 hashing: Number of bytes of data which was hashed.
R702NHAI	FLOAT	8	For SHA-1 hashing: Number of PCMF instructions used to hash the data.
R702NPTC	FLOAT	8	Number of calls to translate the PIN.
R702NPVC	FLOAT	8	Number of calls to verify the PIN.
R702NH2C	FLOAT	8	For SHA-224 and SHA-256 hashing: Number of calls to hash the data.
R702NH2B	FLOAT	8	For SHA-224 and SHA-256 hashing: Number of bytes of data which was hashed.
R702NH2I	FLOAT	8	For SHA-224 and SHA-256 hashing: Number of PCMF instructions used to hash the data.
R702NH5C	FLOAT	8	For SHA-384 and SHA-512 hashing: Number of calls to hash the data.
R702NH5B	FLOAT	8	For SHA-384 and SHA-512 hashing: Number of bytes of data which was hashed.
R702NH5I	FLOAT	8	For SHA-384 and SHA-512 hashing: Number of PCMF instructions used to hash the data.
R702CDLV	INT	4	ICSF data level. AES measurements. Fields are valid only if R702CDLV is greater than 11.
R702AESC	FLOAT	8	Number of AES encipher calls sent to a coprocessor.
R702AESB	FLOAT	8	Number of bytes processed by the AES encipher services handled by a coprocessor.
R702AESI	FLOAT	8	Number of operations required to complete the AES encipher service calls to a coprocessor.
R702ASDC	FLOAT	8	Number of AES decipher calls sent to a coprocessor.
R702ASDB	FLOAT	8	Number of bytes processed by the AES decipher services handled by a coprocessor.
R702ASDI	FLOAT	8	Number of operations required to complete the AES decipher service calls to a coprocessor. Digital Signatures measurements. Fields are valid only if R702CDLV is greater than 13.
R702DRGC	FLOAT	8	Number of calls to generate the RSA digital signatures.
R702DRVC	FLOAT	8	Number of calls to verify the RSA digital signatures.
R702DEGC	FLOAT	8	Number of calls to generate the ECC digital signatures.
R702DEVC	FLOAT	8	Number of calls to verify the ECC digital signatures.
R702AMGC	FLOAT	8	Number of calls to generate the AES MACs.
R702AMGB	FLOAT	8	Number of bytes of data for which the AES MACs were generated.

R702AMGI	FLOAT	8	Number of instructions used to generate the AES MACs.
R702AMVC	FLOAT	8	Number of calls to verify the AES MACs.
R702AMVB	FLOAT	8	Number of bytes of data for which the AES MACs were verified.
R702AMVI	FLOAT	8	Number of instructions used to verify the AES MACs. FPE measurements. Fields are valid only if R702CDLV is greater than 19
R702FPEC	FLOAT	8	Number of calls to encipher data using FPE.
R702FPEB	FLOAT	8	Number of bytes of data enciphered using FPE.
R702FPEI	FLOAT	8	Number of instructions used to encipher the data using FPE.
R702FPDC	FLOAT	8	Number of calls to decipher data using FPE.
R702FPDB	FLOAT	8	Number of bytes of data deciphered using FPE.
R702FPDI	FLOAT	8	Number of instructions used to decipher the data using FPE.
R702FPTC	FLOAT	8	Number of calls to translate data using FPE.
R702FPTB	FLOAT	8	Number of bytes of data translated using FPE.
R702FPTI	FLOAT	8	Number of instructions used to translate the data using FPE.
R702FXEC	FLOAT	8	(IBM name: R702FXEC) Number of calls to encipher data using FFX
R702FXEB	FLOAT	8	(IBM name: R702FXEB) Number of bytes of data enciphered using FFX
R702FXEI	FLOAT	8	(IBM name: R702FXEI) Number of instructions used to encipher the data using FFX
R702FXDC	FLOAT	8	(IBM name: R702FXDC) Number of calls to decipher data using FFX
R702FXDB	FLOAT	8	(IBM name: R702FXDB) Number of bytes of data deciphered using FFX
R702FXDI	FLOAT	8	(IBM name: R702FXDI) Number of instructions used to decipher the data using FFX
R702FXTC	FLOAT	8	(IBM name: R702FXTC) Number of calls to translate data using FFX
R702FXTB	FLOAT	8	(IBM name: R702FXTB) Number of bytes of data translated using FFX
R702FXTI	FLOAT	8	(IBM name: R702FXTI) Number of instructions used to translate the data using FFX
R702DQGC	FLOAT	8	(IBM name: R702DQGC) Number of calls to generate the QSA digital signatures.
R702DQVC	FLOAT	8	(IBM name: R702DQVC) Number of calls to verify the QSA digital signatures.

Secondary segment: SMF070#02_PKCS11_Coprocessor

Field Name	Type	Len	Description
SMF070#02_PKCS11_Coprocessor.<fieldname>			
R7025AX	INT	1	Crypto processor index.
R7025CT	INT	1	Crypto processor type: Value Meaning 10=CEX4P 11=CEX5P 12=CEX6P 13=CEX7P
R7025CTe	INT (ENUM)	1	Crypto processor type.
R7025MSK	INT	1	Validity bit mask. Each bit position represents the validity of a timer-counter pair that measures the execution time and number of operations by functions on a cryptographic PKCS11 coprocessor. Bit Meaning when set 0 VALID data for operations by slow asymmetric-key functions 1 VALID data

			for operations by fast asymmetric-key functions 2 VALID data for operations by symmetric-key functions (partial or incremental results) 3 VALID data for operations by symmetric-key functions (complete or final result) 4 VALID data for operations by asymmetric-key generation functions 5-7 Reserved
R7025MT	INT	1	Reserved for diagnostic purposes.
R7025SF	FLOAT	8	Scaling factor for this cryptographic PKCS11 coprocessor. Execution times in this data section have to be multiplied by this scaling factor to achieve a value in seconds.
R7025SAT	FLOAT	8	Aggregate execution time of operations by slow asymmetric-key functions.
R7025SAC	FLOAT	8	Number of operations by slow asymmetric-key functions.
R7025FAT	FLOAT	8	Aggregate execution time of operations by fast asymmetric-key functions.
R7025FAC	FLOAT	8	Number of operations by fast asymmetric-key functions.
R7025SPT	FLOAT	8	Aggregate execution time of operations by symmetric-key functions that return partial or incremental results.
R7025SPC	FLOAT	8	Number of operations by symmetric-key functions that return partial or incremental results.
R7025SCT	FLOAT	8	Aggregate execution time of operations by symmetric-key functions that return a complete or final result.
R7025SCC	FLOAT	8	Number of operations by symmetric-key functions that return a complete or final result.
R7025AGT	FLOAT	8	Aggregate execution time of operations by asymmetric-key generation function.
R7025AGC	FLOAT	8	Number of operations by asymmetric-key generation function.
R7025SCOPE	INT	1	Specifies the scope of the cryptographic PKCS11 coprocessor data section. Value Meaning 0=Data with CPC scope 1=Data with System scope
R7025SCOPEe	INT (ENUM)	1	Specifies the scope of the cryptographic PKCS11 coprocessor data section.
R7025DID	INT	1	Domain ID

Record Type 71 - RMF Paging Activity

SMF Record 71 (RMF Paging Activity) is mapped by structure member "T071".

Primary Segment:

- SMF071_RMF_Paging

Secondary Segment(s): 3 (in alphabetical order)

- SMF071_Paging
- SMF071_Product
- SMF071_Swap_Placement

Primary segment: SMF071_RMF_Paging

Field Name	Type	Len	Description
<i>SMF071_RMF_Paging.<fieldname></i>			
SMF071_RMF_Paging.Header_Self_Defining_Section.<fieldname>			
zFLG	HEX	1	(IBM name: SMF71FLG) System indicator: Bit Meaning when set 0 New record format 1 Subtypes used 2 Reserved. 3-6 Version indicators 7 System is running in PR/SM mode.
zRTY	INT	1	(IBM name: SMF71RTY) Record type 71 (X'47').
zTME	TSTMP	8	(IBM name: SMF71TME) Date/Time when the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF71SID) System identification (from the SMFPRMxx SID parameter).
zSSI	CHAR	4	(IBM name: SMF71SSI) Subsystem identification ("RMF").
zSTY	INT	2	(IBM name: SMF71STY) Record SubType=1.
zTRN	INT	2	(IBM name: SMF71TRN) Number of triplets in this record. A triplet is a set of three SMF fields (offset/length/number values) that defines a section of the record.
zPRS	INT	4	(IBM name: SMF71PRS) Offset to RMF product section.
zPRL	INT	2	(IBM name: SMF71PRL) Length of RMF product section.
zPRN	INT	2	(IBM name: SMF71PRN) Number of RMF product sections.
zPDS	INT	4	(IBM name: SMF71PDS) Offset to Paging data sections.
zPDL	INT	2	(IBM name: SMF71PDL) Length of Paging data section.
zPDN	INT	2	(IBM name: SMF71PDN) Number of Paging data section.
zSWS	INT	4	(IBM name: SMF71SWS) Offset to Swap Placement section.
zSWL	INT	2	(IBM name: SMF71SWL) Length of Swap Placement section.
zSWN	INT	2	(IBM name: SMF71SWN) Number of Swap Placement sections.

Secondary segment: **SMF071_Product**

Field Name	Type	Len	Description
<i>SMF071_Product.<fieldname></i>			
zMFV	DEC	2 (3,0)	(IBM name: SMF71MFV) RMF version number.
zPRD	CHAR	8	(IBM name: SMF71PRD) Product name ('RMF').
zIST	DEC	4 (7,0)	(IBM name: SMF71IST) Time that the RMF measurement interval started, in the form 0hhmmssF, where hh is the hours, mm is the minutes, ss is the seconds, and F is the sign.
zDAT	DATE	4	(IBM name: SMF71DAT) Date when the RMF measurement interval started, in the form 0ccyddF.
zINT	DEC	4 (7,0)	(IBM name: SMF71INT) Duration of RMF measurement interval, in the form mmssttF where mm is the minutes, ss is the seconds, tt is the milliseconds, and F is the sign. The end of the measurement interval is the sum of the record start time (and this field).
zSAM	INT	4	(IBM name: SMF71SAM) Number of RMF samples.

<i>SMF071_Product.zFLA.<fieldname></i>			
zSkip	BIT	1	Samples have been skipped
zMonIII	BIT	1	RECORD was written by RMF Monitor III
zSyncSMF	BIT	1	INTERVAL was synchronized with SMF

<i>SMF071_Product.<fieldname></i>			
zCYC	DEC	4 (7,0)	(IBM name: SMF71CYC) Sampling cycle length, in the form 000tttF, where ttt is the milliseconds and F is the sign (taken from CYCLE option). The range of values is 0.050 to 9.999 seconds.
zMVS	CHAR	8	(IBM name: SMF71MVS) z/OS software level (consists of an acronym and the version, release, and modification level - ZVvrrmm).
zIML	INT	1	(IBM name: SMF71IML) Indicates the type of processor complex on which data measurements were taken. Value Meaning 3 9672, zSeries

<i>SMF071_Product.zPRF.<fieldname></i>			
zExpStg	BIT	1	The system has expanded storage
zESCA	BIT	1	The processor is enabled for ES connection architecture (ESCA)
zESCdir	BIT	1	There is an ES connection director in the configuration
zzArc	BIT	1	System is running in z/Architecture® mode
zZAAP	BIT	1	At least one zAAP is currently installed
zZIIP	BIT	1	At least one zIIP is currently installed
zDAT	BIT	1	Enhanced DAT facility

<i>SMF071_Product.<fieldname></i>			
zPTN	INT	1	(IBM name: SMF71PTN) PR/SM partition number of the partition that wrote this record.
zSRL	INT	1	(IBM name: SMF71SRL) SMF record level change number (X'8E' for z/OS V2R4 RMF with RMF Data Gatherer APAR OA59330). This field enables processing of SMF record level changes in an existing release.

zIET	HEX	8	(IBM name: SMF71IET) Interval expiration time token. This token can be used to identify other than RMF records that belong to the same interval (if interval was synchronized with SMF).
zLGO	TIME	8	(IBM name: SMF71LGO) Offset GMT to local time (STCK format).
zRAO	INT	4	(IBM name: SMF71RAO) Offset to reassembly area relative to start of RMF product section.
zRAL	INT	2	(IBM name: SMF71RAL) Length of reassembly area. Area consists of a fixed header and a variable number of information blocks. Length depends on the record type/SubType, but is fixed for a specific type/SubType.
zRAN	INT	2	(IBM name: SMF71RAN) Reassembly area indicator. Value Meaning 0 RECORD is not broken. 1 RECORD is broken. Note: This field is used to indicate whether an SMF record is a broken record. Therefore, offset (SMF71RAO) and length (SMF71RAL) are only valid if SMF71RAN = 1. A reassembly area is only present in broken records.
zOIL	INT	2	(IBM name: SMF71OIL) Original interval length as defined in the session or by SMF (in seconds).
zSYN	INT	2	(IBM name: SMF71SYN) SYNC value in seconds.
zGIE	TSTMP	8	(IBM name: SMF71GIE) Projected gathering interval end (STCK format) GMT time.
zXNM	CHAR	8	(IBM name: SMF71XNM) Sysplex name as defined in parmlib member COUPLExx.
zSNM	CHAR	8	(IBM name: SMF71SNM) System name for current system as defined in parmlib member IEASYSxx SYSNAME parameter. Reassembly Area:

SMF071_Product.Reassembly_Area.<fieldname>

zRBR	INT	2	(IBM name: SMF71RBR) Total number of broken records built from the original large record.
zRSQ	INT	2	(IBM name: SMF71RSQ) Sequence number of this broken record. Every broken record built from the same large record must have a unique sequence number, it is in the range from 1 TO SMF70RBR.
zRIO	INT	4	(IBM name: SMF71RIO) Offset to first reassembly information block relative to start of reassembly area header.
zRIL	INT	2	(IBM name: SMF71RIL) Length of reassembly information block.
zRIN	INT	2	(IBM name: SMF71RIN) Number of reassembly information blocks (same value as SMF70TRN in header section).

SMF071_Product.Reassembly_Area.Reassembly_Info.<fieldname>

zRNN	INT	2	(IBM name: SMF71RNN) Total number of sections in the original large record. This field contains information of how many sections of a specific type were contained in the original SMF record. This field is a copy of the number field of the triplet in the original (non broken) record.
zRPP	INT	2	(IBM name: SMF71RPP) Position of the first of one or more consecutive sections described by this block as in the original record. Values in the range of 1 TO SMF70RNN are valid for correct processing. A value of 0 WILL skip processing of this information block. This field provides information where the sections that are part of this broken record were placed in the original record before the split took place. The actual number of consecutive sections contained in this record is available from the actual triplet in the header extension.

Secondary segment: SMF071_Paging

Field Name	Type	Len	Description
<i>SMF071_Paging.<fieldname></i>			
zPIN	INT	4	(IBM name: SMF71PIN) Number of non-VIO page-ins from auxiliary to central storage. This field includes page-ins required through page faults, specific page requests, and page fixes. It does not include page reclaims or page-ins for VIO data sets.
zPOT	INT	4	(IBM name: SMF71POT) Number of non-VIO page-outs from central to auxiliary storage. This field includes page-outs required through specific page requests as well as those pages stolen by the paging supervisor through infrequent use. It does not include page-outs for VIO data sets.
zSSQ	INT	4	(IBM name: SMF71SSQ) Number of address space swap sequences. (A swap sequence consists of an address space swap-out and swap-in.)
zSIN	INT	4	(IBM name: SMF71SIN) Number of pages swapped in. This field includes: LSQA, fixed pages, and those pages that the real storage manager determined to be active when the address space was swapped in. It does not include page reclaims.
zSOT	INT	4	(IBM name: SMF71SOT) Number of pages swapped out. This field includes: LSQA, private area fixed pages, and private area non-fixed changed pages.
zVIN	INT	4	(IBM name: SMF71VIN) Number of VIO page-ins from auxiliary to central storage. This field includes page-ins resulting from page faults or specific page requests on a VIO window. It does not include VIO swap-ins or page-ins for the common area.
zVOT	INT	4	(IBM name: SMF71VOT) Number of VIO page-outs from central to auxiliary storage. This field includes page-outs resulting from specific page requests on a VIO window as well as those pages stolen by the paging supervisor through infrequent use. It does not include VIO swap-outs or page-outs for the common area.
zSNI	INT	4	(IBM name: SMF71SNI) Number of non-VIO page-ins (from auxiliary to central storage) performed in common area (LPA/CSA).
zSNO	INT	4	(IBM name: SMF71SNO) Number of non-VIO page-outs (from central to auxiliary storage) performed in common area (LPA/CSA).
zLNI	INT	4	(IBM name: SMF71LNI) Number of non-VIO page-ins performed in LPA.
zAFC	INT	4	(IBM name: SMF71AFC) End-of-interval snapshot value of the number of unused central storage page frames.
zTFC	INT	4	(IBM name: SMF71TFC) Number of page frames defined in central storage. (This field does not include frames occupied by the nucleus, frames marked as bad or offline, or frames used by HSA or PR/SM.)
zTSC	INT	4	(IBM name: SMF71TSC) Total number of local page data set slots.
zDSC	INT	4	(IBM name: SMF71DSC) Number of local page data set slots allocated to VIO private area pages.
zVSC	INT	4	(IBM name: SMF71VSC) Number of local page data set slots allocated to non-VIO private area pages.
zNSC	INT	4	(IBM name: SMF71NSC) Number of usable local page data set slots that have not been allocated.
zFIN	INT	4	(IBM name: SMF71FIN) Number of central storage frames in nucleus.
zMNF	INT	4	(IBM name: SMF71MNF) Minimum number of unused central storage page frames.
zMXF	INT	4	

			(IBM name: SMF71MXF) Maximum number of unused central storage page frames.
zAVF	INT	4	(IBM name: SMF71AVF) Average number of unused central storage page frames.
zMNP	INT	4	(IBM name: SMF71MNP) Minimum number of CSA central storage frames used including restricted use common service area (RUCSA).
zMXP	INT	4	(IBM name: SMF71MXP) Maximum number of CSA central storage frames used including restricted use common service area (RUCSA).
zAVP	INT	4	(IBM name: SMF71AVP) Average number of CSA central storage frames used including restricted use common service area (RUCSA).
zMNS	INT	4	(IBM name: SMF71MNS) Minimum number of pageable address space central storage frames in the private address space.
zMXS	INT	4	(IBM name: SMF71MXS) Maximum number of pageable address space central storage frames in the private address space.
zAVS	INT	4	(IBM name: SMF71AVS) Average number of pageable address space central storage frames in the private address space.
zMNT	INT	4	(IBM name: SMF71MNT) Minimum total number of central storage frames used.
zMXT	INT	4	(IBM name: SMF71MXT) Maximum total number of central storage frames used.
zAVT	INT	4	(IBM name: SMF71AVT) Average total number of central storage frames used.
zMNQ	INT	4	(IBM name: SMF71MNQ) Minimum number of SQA fixed frames in central storage.
zMXQ	INT	4	(IBM name: SMF71MXQ) Maximum number of SQA fixed frames in central storage.
zAVQ	INT	4	(IBM name: SMF71AVQ) Average number of SQA fixed frames in central storage.
zMNC	INT	4	(IBM name: SMF71MNC) Minimum number of CSA fixed frames in central storage including restricted use common service area (RUCSA).
zMXC	INT	4	(IBM name: SMF71MXC) Maximum number of CSA fixed frames in central storage including restricted use common service area (RUCSA).
zAVC	INT	4	(IBM name: SMF71AVC) Average number of CSA fixed frames in central storage including restricted use common service area (RUCSA).
zMNR	INT	4	(IBM name: SMF71MNR) Minimum number of non-LSQA fixed central storage frames in the private address space.
zMXR	INT	4	(IBM name: SMF71MXR) Maximum number of non-LSQA fixed central storage frames in the private address space.
zAVR	INT	4	(IBM name: SMF71AVR) Average number of non-LSQA fixed central storage frames in the private address space.
zMNX	INT	4	(IBM name: SMF71MNX) Minimum total number of fixed central storage frames used.
zMXX	INT	4	(IBM name: SMF71MXX) Maximum total number of fixed central storage frames used.
zAVX	INT	4	(IBM name: SMF71AVX) Average total number of fixed central storage frames used.
zMNU	INT	4	

			(IBM name: SMF71MNU) Minimum number of usable local page data set slots that have not been allocated.
zMXU	INT	4	(IBM name: SMF71MXU) Maximum number of usable local page data set slots that have not been allocated.
zAVU	INT	4	(IBM name: SMF71AVU) Average number of usable local page data set slots that have not been allocated.
zMNV	INT	4	(IBM name: SMF71MNV) Minimum number of local page data set slots allocated to VIO private area pages.
zMXV	INT	4	(IBM name: SMF71MXV) Maximum number of local page data set slots allocated to VIO private area pages.
zAVV	INT	4	(IBM name: SMF71AVV) Average number of local page data set slots allocated to VIO private area pages.
zMNM	INT	4	(IBM name: SMF71MNM) Minimum number of local page data set slots allocated to non-VIO private area pages.
zMXM	INT	4	(IBM name: SMF71MXM) Maximum number of local page data set slots allocated to non-VIO private area pages.
zAVM	INT	4	(IBM name: SMF71AVM) Average number of local page data set slots allocated to non-VIO private area pages.
zMNB	INT	4	(IBM name: SMF71MNB) Minimum number of unusable local page data set slots.
zMXB	INT	4	(IBM name: SMF71MXB) Maximum number of unusable local page data set slots.
zAVB	INT	4	(IBM name: SMF71AVB) Average number of unusable local page data set slots.
zMNA	INT	4	(IBM name: SMF71MNA) Minimum total number of local page data set slots.
zMXA	INT	4	(IBM name: SMF71MXA) Maximum total number of local page data set slots.
zIS1	INT	2	(IBM name: SMF71IS1) Number of samples skipped due to invalid fixed frame counts. Fields affected are SMF71MNC, MXC, AVC, MNR, MXR and AVR.
zIS2	INT	2	(IBM name: SMF71IS2) Number of incorrect samples resulting from negative calculations. Fields affected are the same as SMF71IS1.
zNLP	INT	4	(IBM name: SMF71NLP) Minimum number of LPA frames in central storage.
zXLP	INT	4	(IBM name: SMF71XLP) Maximum number of LPA frames in central storage.
zALP	INT	4	(IBM name: SMF71ALP) Average number of LPA frames in central storage.
zNLF	INT	4	(IBM name: SMF71NLF) Minimum number of LPA fixed frames in central storage.
zXLF	INT	4	(IBM name: SMF71XLF) Maximum number of LPA fixed frames in central storage.
zALF	INT	4	(IBM name: SMF71ALF) Average number of LPA fixed frames in central storage.
zNLS	INT	4	(IBM name: SMF71NLS) Minimum number of LSQA fixed frames in central storage.
zXLS	INT	4	(IBM name: SMF71XLS) Maximum number of LSQA fixed frames in central storage.

zALS	INT	4	(IBM name: SMF71ALS) Average number of LSQA fixed frames in central storage.
zMNL	INT	4	(IBM name: SMF71MNL) Minimum number of fixed frames in central storage (less than 16 MEGABYTES).
zMXL	INT	4	(IBM name: SMF71MXL) Maximum number of fixed frames in central storage (less than 16 MEGABYTES).
zAVL	INT	4	(IBM name: SMF71AVL) Average number of fixed frames in central storage (less than 16 MEGABYTES).
zPMV	INT	4	(IBM name: SMF71PMV) Total number of pages moved within central storage.
zOPT	CHAR	8	(IBM name: SMF71OPT) SRM opt member name.
zLIC	INT	4	(IBM name: SMF71LIC) Minimum high UIC. A value from 0 TO 2540 THAT indicates the age (in seconds) of the oldest unreferenced frame in central storage.
zHIC	INT	4	(IBM name: SMF71HIC) Maximum high UIC. A value from 0 TO 2540 THAT indicates the age (in seconds) of the oldest unreferenced frame in central storage.
zACA	INT	4	(IBM name: SMF71ACA) Average high UIC (scale factor= -1). Scale factor -1 means the field has been multiplied by 10 TO give a result in tenths and must be multiplied by 10 -1 to get the correct value.
zMSR	INT	4	(IBM name: SMF71MSR) Minimum number SQA pages in central storage.
zXSR	INT	4	(IBM name: SMF71XSR) Maximum number SQA pages in central storage.
zASR	INT	4	(IBM name: SMF71ASR) Average number of SQA pages in central storage.
zMLR	INT	4	(IBM name: SMF71MLR) Minimum number of LSQA pages in central storage.
zXLR	INT	4	(IBM name: SMF71XLR) Maximum number of LSQA pages in central storage.
zALR	INT	4	(IBM name: SMF71ALR) Average number of LSQA pages in central storage.
zISC	INT	4	(IBM name: SMF71ISC) Number of incorrect samples returned from collector service.
zHOT	INT	4	(IBM name: SMF71HOT) Number of hiperspace page-outs from central to auxiliary storage.
zHIN	INT	4	(IBM name: SMF71HIN) Number of hiperspace page-ins from auxiliary to central storage.
zBLP	INT	4	(IBM name: SMF71BLP) Number of blocked pages paged in (this does not include VIO or hiperspace pages).
zBLK	INT	4	(IBM name: SMF71BLK) Number of blocks paged in.
zPMT	INT	8	(IBM name: SMF71PMT) Steal timer - the elapsed time spent in a preferred steal in CPU-timer units. The interval of CPU time needed to steal the page includes the time to move the contents of the stolen page and any time spent in frame steal processing of any type. Some examples of the types of steal routines whose CPU time get included in SMF71PMT are non-preferred above, non-preferred below, preferred above, preferred below, storage buffer frame queue, bottom double frame queue, and V=R waiting frame. No matter what type of steal processing occurs, the steal module records it all, and it gets included in this field. Note that SMF71PMT does not include the time to move the new contents into the page.
zSBI	INT	4	(IBM name: SMF71SBI) Number of system pageable areas block page ins.

zLBI	INT	4	(IBM name: SMF71LBI) Number of LPA block page ins.
zASI	FLOAT	8	(IBM name: SMF71ASI) Number of page-ins from auxiliary storage for shared pages.
zASO	FLOAT	8	(IBM name: SMF71ASO) Number of page-outs to auxiliary storage for shared pages.
zMGT	FLOAT	8	(IBM name: SMF71MGT) Minimum number of shared pages in the system.
zXGT	FLOAT	8	(IBM name: SMF71XGT) Maximum number of shared pages in the system.
zAGT	FLOAT	8	(IBM name: SMF71AGT) Average number of shared pages in the system.
zMGC	FLOAT	8	(IBM name: SMF71MGC) Minimum number of shared pages in the central storage.
zXGC	FLOAT	8	(IBM name: SMF71XGC) Maximum number of shared pages in the central storage.
zAGC	FLOAT	8	(IBM name: SMF71AGC) Average number of shared pages in the central storage.
zMGA	FLOAT	8	(IBM name: SMF71MGA) Minimum number of auxiliary slots in use for shared page groups.
zXGA	FLOAT	8	(IBM name: SMF71XGA) Maximum number of auxiliary slots in use for shared page groups.
zAGA	FLOAT	8	(IBM name: SMF71AGA) Average number of auxiliary slots in use for shared page groups.
zMGF	FLOAT	8	(IBM name: SMF71MGF) Minimum number of shared pages fixed in the system.
zXGF	FLOAT	8	(IBM name: SMF71XGF) Maximum number of shared pages fixed in the system.
zAGF	FLOAT	8	(IBM name: SMF71AGF) Average number of shared pages fixed in the system.
zMGB	FLOAT	8	(IBM name: SMF71MGB) Minimum number of shared pages fixed below 16 MB in the system.
zXGB	FLOAT	8	(IBM name: SMF71XGB) Maximum number of shared pages fixed below 16 MB in the system.
zAGB	FLOAT	8	(IBM name: SMF71AGB) Average number of shared pages fixed below 16 MB in the system.
zCAM	FLOAT	8	(IBM name: SMF71CAM) Minimum number of available central storage frames.
zCAX	FLOAT	8	(IBM name: SMF71CAX) Maximum number of available central storage frames.
zCAA	FLOAT	8	(IBM name: SMF71CAA) Average number of available central storage frames.
zCLM	FLOAT	8	(IBM name: SMF71CLM) Minimum number of low-impact central storage frames.
zCLX	FLOAT	8	(IBM name: SMF71CLX) Maximum number of low-impact central storage frames.
zCLA	FLOAT	8	(IBM name: SMF71CLA) Average number of low-impact central storage frames.
zCMM	FLOAT	8	(IBM name: SMF71CMM) Minimum number of medium-impact central storage frames.
zCMX	FLOAT	8	(IBM name: SMF71CMX) Maximum number of medium-impact central storage frames.
zCMA	FLOAT	8	(IBM name: SMF71CMA) Average number of medium-impact central storage frames.
zCHM	FLOAT	8	(IBM name: SMF71CHM) Minimum number of high-impact central storage frames.

zCHX	FLOAT	8	(IBM name: SMF71CHX) Maximum number of high-impact central storage frames.
zCHA	FLOAT	8	(IBM name: SMF71CHA) Average number of high-impact central storage frames.
zMVI	FLOAT	8	(IBM name: SMF71MVI) Minimum number of VIO pages in central storage.
zXVI	FLOAT	8	(IBM name: SMF71XVI) Maximum number of VIO pages in central storage.
zAVI	FLOAT	8	(IBM name: SMF71AVI) Average number of VIO pages in central storage.
zMHI	FLOAT	8	(IBM name: SMF71MHI) Minimum number of hiperspace pages in central storage.
zXHI	FLOAT	8	(IBM name: SMF71XHI) Maximum number of hiperspace pages in central storage.
zAHI	FLOAT	8	(IBM name: SMF71AHI) Average number of hiperspace pages in central storage.
zVWS	FLOAT	8	(IBM name: SMF71VWS) Number of VIO pages written to central storage.
zVRS	FLOAT	8	(IBM name: SMF71VRS) Number of VIO pages read from central storage.
zHWS	FLOAT	8	(IBM name: SMF71HWS) Number of hiperspace pages written to central storage.
zHRS	FLOAT	8	(IBM name: SMF71HRS) Number of hiperspace pages read from central storage.
zMFB	FLOAT	8	(IBM name: SMF71MFB) Minimum number of pages fixed between 16M and 2G.
zXFB	FLOAT	8	(IBM name: SMF71XFB) Maximum number of pages fixed between 16M and 2G.
zAFB	FLOAT	8	(IBM name: SMF71AFB) Average number of pages fixed between 16M and 2G.
zPTH	FLOAT	8	(IBM name: SMF71PTH) Average number of pages in the system use by shared memory objects.
zPCH	FLOAT	8	(IBM name: SMF71PCH) Average number of shared pages in central storage (with virtual storage address above the bar including high virtual DAT).
zPAH	FLOAT	8	(IBM name: SMF71PAH) Average number of shared pages in auxiliary storage (with virtual storage address above the bar).
zBLG	FLOAT	8	(IBM name: SMF71BLG) Maximum number of shared bytes from large virtual memory in a memory object for the entire system.
zPIH	FLOAT	8	(IBM name: SMF71PIH) Number of page-ins from auxiliary storage for shared pages.
zPOH	FLOAT	8	(IBM name: SMF71POH) Number of page-outs to auxiliary storage for shared pages (with virtual storage address above the bar).
zULM	INT	4	(IBM name: SMF71ULM) Lowest minimum system UIC during the interval (from MCTMinSystemUIC).
zULC	INT	4	(IBM name: SMF71ULC) Lowest current system UIC during the interval (from MCTCurSystemUIC).
zUHC	INT	4	(IBM name: SMF71UHC) Highest current system UIC during the interval (from MCTCurSystemUIC).
zUHX	INT	4	(IBM name: SMF71UHX) Highest maximum system UIC during the interval (from MCTMaxSystemUIC).
zUAM	INT	4	(IBM name: SMF71UAM) Average minimum system UIC during the interval (from

			MCTMinSystemUIC).
zUAC	INT	4	(IBM name: SMF71UAC) Average current system UIC during the interval (from MCTCurSystemUIC).
zUAX	INT	4	(IBM name: SMF71UAX) Average maximum system UIC during the interval (from MCTMaxSystemUIC).
zLOM	FLOAT	8	(IBM name: SMF71LOM) Minimum number of fixed memory objects that are allocated in the system and can be backed in 1 MB frames.
zLOX	FLOAT	8	(IBM name: SMF71LOX) Maximum number of fixed memory objects that are allocated in the system and can be backed in 1 MB frames.
zLOA	FLOAT	8	(IBM name: SMF71LOA) Average number of fixed memory objects that are allocated in the system and can be backed in 1 MB frames.
zLRM	FLOAT	8	(IBM name: SMF71LRM) Minimum number of 1 MB pages fixed in central storage.
zLRX	FLOAT	8	(IBM name: SMF71LRX) Maximum number of 1 MB pages fixed in central storage.
zLRA	FLOAT	8	(IBM name: SMF71LRA) Average number of 1 MB pages fixed in central storage.
zCOM	FLOAT	8	(IBM name: SMF71COM) Minimum number of memory objects allocated in the high virtual common storage of the system.
zCOX	FLOAT	8	(IBM name: SMF71COX) Maximum number of memory objects allocated in the high virtual common storage of the system.
zCOA	FLOAT	8	(IBM name: SMF71COA) Average number of memory objects allocated in the high virtual common storage of the system.
zCRM	FLOAT	8	(IBM name: SMF71CRM) Minimum number of pages from high virtual common storage that are backed in central storage (in units of 4 KB).
zCRX	FLOAT	8	(IBM name: SMF71CRX) Maximum number of pages from high virtual common storage that are backed in central storage (in units of 4 KB).
zCRA	FLOAT	8	(IBM name: SMF71CRA) Average number of pages from high virtual common storage that are backed in central storage (in units of 4 KB).
zCFM	FLOAT	8	(IBM name: SMF71CFM) Minimum number of fixed pages from high virtual common storage that are backed in central storage (in units of 4 KB).
zCFX	FLOAT	8	(IBM name: SMF71CFX) Maximum number of fixed pages from high virtual common storage that are backed in central storage (in units of 4 KB).
zCFA	FLOAT	8	(IBM name: SMF71CFA) Average number of fixed pages from high virtual common storage that are backed in central storage (in units of 4 KB).
zCSM	FLOAT	8	(IBM name: SMF71CSM) Minimum number of auxiliary storage slots used for high virtual common pages that are backed on DASD.
zCSX	FLOAT	8	(IBM name: SMF71CSX) Maximum number of auxiliary storage slots used for high virtual common pages that are backed on DASD.
zCSA	FLOAT	8	(IBM name: SMF71CSA) Average number of auxiliary storage slots used for high virtual common pages that are backed on DASD.
zSOM	FLOAT	8	(IBM name: SMF71SOM) Minimum number of memory objects allocated in the high virtual shared storage of the system.

zSOX	FLOAT	8	(IBM name: SMF71SOX) Maximum number of memory objects allocated in the high virtual shared storage of the system.
zSOA	FLOAT	8	(IBM name: SMF71SOA) Average number of memory objects allocated in the high virtual shared storage of the system.
zSRM	FLOAT	8	(IBM name: SMF71SRM) Minimum number of pages from high virtual shared storage that are backed in central storage (in units of 4 KB).
zSRX	FLOAT	8	(IBM name: SMF71SRX) Maximum number of pages from high virtual shared storage that are backed in central storage (in units of 4 KB).
zSRA	FLOAT	8	(IBM name: SMF71SRA) Average number of pages from high virtual shared storage that are backed in central storage (in units of 4 KB).
zGRN	INT	4	(IBM name: SMF71GRN) Number of GETMAIN requests that have been issued.
zFBN	INT	4	(IBM name: SMF71FBN) Number of pages backed during GETMAIN requests that have been issued.
zFRN	INT	4	(IBM name: SMF71FRN) Number of fix requests that have been issued for storage (address spaces only) below 2 GB.
zFFN	INT	4	(IBM name: SMF71FFN) Number of pages that were requested to be fixed for storage (address spaces only) below 2 GB.
z1RN	INT	4	(IBM name: SMF711RN) Number of first reference faults taken.
zNRN	INT	4	(IBM name: SMF71NRN) Number of non-first reference faults taken.

SMF071_Paging.zRFL.<fieldname>

zSCM	BIT	1	SCM support enabled
zPAGEABLE	BIT	1	PAGEABLE large pages support enabled

SMF071_Paging.<fieldname>

zLFA	FLOAT	8	(IBM name: SMF71LFA) The maximum number of fixed 1 MB pages that can be allocated as specified in the LFAREA parameter.
zL1M	FLOAT	8	(IBM name: SMF71L1M) Lowest maximum number of 1 MB frames that can be used by fixed 1 MB pages.
zL1X	FLOAT	8	(IBM name: SMF71L1X) Highest maximum number of 1 MB frames that can be used by fixed 1 MB pages.
zL1A	FLOAT	8	(IBM name: SMF71L1A) Average maximum number of 1 MB frames that can be used by fixed 1 MB pages.
zL3M	FLOAT	8	(IBM name: SMF71L3M) Minimum number of 1 MB frames that are in-use and are no longer available for fixed 1 MB pages.
zL3X	FLOAT	8	(IBM name: SMF71L3X) Maximum number of 1 MB frames that are in-use and are no longer available for fixed 1 MB pages.
zL3A	FLOAT	8	(IBM name: SMF71L3A) Average number of 1 MB frames that are in-use and are no longer available for fixed 1 MB pages.
zL7M	FLOAT	8	(IBM name: SMF71L7M) Minimum number of available 1 MB frames that can be used by fixed 1 MB pages. Same as SMF71L2M.

zL7X	FLOAT	8	(IBM name: SMF71L7X) Maximum number of available 1 MB frames that can be used by fixed 1 MB pages. Same as SMF71L2X.
zL7A	FLOAT	8	(IBM name: SMF71L7A) Average number of available 1 MB frames that can be used by fixed 1 MB pages. Same as SMF71L2A.
zS1M	FLOAT	8	(IBM name: SMF71S1M) Minimum total number of high virtual shared memory pages (in units of 4 KB).
zS1X	FLOAT	8	(IBM name: SMF71S1X) Maximum total number of high virtual shared memory pages (in units of 4 KB).
zS1A	FLOAT	8	(IBM name: SMF71S1A) Average total number of high virtual shared memory pages (in units of 4 KB).
zS2M	FLOAT	8	(IBM name: SMF71S2M) Minimum number of shared memory objects that are allocated in the system and can be backed in 1 MB frames
zS2X	FLOAT	8	(IBM name: SMF71S2X) Maximum number of shared memory objects that are allocated in the system and can be backed in 1 MB frames
zS2A	FLOAT	8	(IBM name: SMF71S2A) Average number of shared memory objects that are allocated in the system and can be backed in 1 MB frames
zS3M	FLOAT	8	(IBM name: SMF71S3M) Minimum number of frames in use for shared high virtual 4K pages
zS3X	FLOAT	8	(IBM name: SMF71S3X) Maximum number of frames in use for shared high virtual 4K pages
zS3A	FLOAT	8	(IBM name: SMF71S3A) Average number of frames in use for shared high virtual 4K pages
zS4M	FLOAT	8	(IBM name: SMF71S4M) Minimum number of 1 MB pages used for shared memory objects backed in central storage
zS4X	FLOAT	8	(IBM name: SMF71S4X) Maximum number of 1 MB pages used for shared memory objects backed in central storage
zS4A	FLOAT	8	(IBM name: SMF71S4A) Average number of 1 MB pages used for shared memory objects backed in central storage
zS5M	FLOAT	8	(IBM name: SMF71S5M) Minimum number of auxiliary storage slots used for high virtual shared memory pages backed on DASD.
zS5X	FLOAT	8	(IBM name: SMF71S5X) Maximum number of auxiliary storage slots used for high virtual shared memory pages backed on DASD.
zS5A	FLOAT	8	(IBM name: SMF71S5A) Average number of auxiliary storage slots used for high virtual shared memory pages backed on DASD.
zS6M	FLOAT	8	(IBM name: SMF71S6M) Minimum number of high virtual shared memory pages backed on SCM storage.
zS6X	FLOAT	8	(IBM name: SMF71S6X) Maximum number of high virtual shared memory pages backed on SCM storage.
zS6A	FLOAT	8	(IBM name: SMF71S6A) Average number of high virtual shared memory pages backed on SCM storage.
zC1M	FLOAT	8	(IBM name: SMF71C1M) Minimum total number of high virtual common memory pages (in units of 4 KB).
zC1X	FLOAT	8	

			(IBM name: SMF71C1X) Maximum total number of high virtual common memory pages (in units of 4 KB).
zC1A	FLOAT	8	(IBM name: SMF71C1A) Average total number of high virtual common memory pages (in units of 4 KB).
zC2M	FLOAT	8	(IBM name: SMF71C2M) Minimum number of high virtual common memory 1 MB fixed pages
zC2X	FLOAT	8	(IBM name: SMF71C2X) Maximum number of high virtual common memory 1 MB fixed pages
zC2A	FLOAT	8	(IBM name: SMF71C2A) Average number of high virtual common memory 1 MB fixed pages
zC3M	FLOAT	8	(IBM name: SMF71C3M) Minimum number of high virtual common memory 1 MB pages backed in central storage
zC3X	FLOAT	8	(IBM name: SMF71C3X) Maximum number of high virtual common memory 1 MB pages backed in central storage
zC3A	FLOAT	8	(IBM name: SMF71C3A) Average number of high virtual common memory 1 MB pages backed in central storage
zC4M	FLOAT	8	(IBM name: SMF71C4M) Minimum number of high virtual common memory pages backed on SCM storage
zC4X	FLOAT	8	(IBM name: SMF71C4X) Maximum number of high virtual common memory pages backed on SCM storage.
zC4A	FLOAT	8	(IBM name: SMF71C4A) Average number of high virtual common memory pages backed on SCM storage.
zTSM	FLOAT	8	(IBM name: SMF71TSM) Minimum total number of 4K SCM blocks available to ASM.
zTSX	FLOAT	8	(IBM name: SMF71TSX) Maximum total number of 4K SCM blocks available to ASM.
zTSA	FLOAT	8	(IBM name: SMF71TSA) Average total number of 4K SCM blocks available to ASM.
zASM	FLOAT	8	(IBM name: SMF71ASM) Minimum number of available (not in-use) SCM blocks.
zASX	FLOAT	8	(IBM name: SMF71ASX) Maximum number of available (not in-use) SCM blocks.
zASV	FLOAT	8	(IBM name: SMF71ASV) Average number of available (not in-use) SCM blocks.
zBSM	FLOAT	8	(IBM name: SMF71BSM) Minimum number of bad SCM blocks.
zBSX	FLOAT	8	(IBM name: SMF71BSX) Maximum number of bad SCM blocks.
zBSA	FLOAT	8	(IBM name: SMF71BSA) Average number of bad SCM blocks.
zUSM	FLOAT	8	(IBM name: SMF71USM) Minimum number of SCM blocks in-use.
zUSX	FLOAT	8	(IBM name: SMF71USX) Maximum number of SCM blocks in-use.
zUSA	FLOAT	8	(IBM name: SMF71USA) Average number of SCM blocks in-use.
zTLS	INT	4	(IBM name: SMF71TLS) Total number of logical swaps.
zS7M	FLOAT	8	(IBM name: SMF71S7M) Minimum number of shared page groups backed on SCM storage.

zS7X	FLOAT	8	(IBM name: SMF71S7X) Maximum number of shared page groups backed on SCM storage.
zS7A	FLOAT	8	(IBM name: SMF71S7A) Average number of shared page groups backed on SCM storage.
zLVF	FLOAT	8	(IBM name: SMF71LVF) Average number of unused central storage page frames. Same as SMF71AVF, but long floating point format.
zLVS	FLOAT	8	(IBM name: SMF71LVS) Average number of pageable address space central storage frames in the private address space. Same as SMF71AVS, but long floating point format.
zLVT	FLOAT	8	(IBM name: SMF71LVT) Average total number of central storage frames used. Same as SMF71AVT, but long floating point format.
zLVR	FLOAT	8	(IBM name: SMF71LVR) Average number of non-LSQA fixed central storage frames in the private address space. Same as SMF71AVR, but long floating point format.
zLVX	FLOAT	8	(IBM name: SMF71LVX) Average total number of fixed central storage frames used. Same as SMF71AVX, but long floating point format.
zLVU	FLOAT	8	(IBM name: SMF71LVU) Average number of usable local page data set slots that have not been allocated. Same as SMF71AVU, but long floating point format.
zLVV	FLOAT	8	(IBM name: SMF71LVV) Average number of local page data set slots allocated to VIO private area pages. Same as SMF71AVV, but long floating point format.
zLVM	FLOAT	8	(IBM name: SMF71LVM) Average number of local page data set slots allocated to non-VIO private area pages. Same as SMF71AVM, but long floating point format.
zLVB	FLOAT	8	(IBM name: SMF71LVB) Average number of unusable local page data set slots. Same as SMF71AVB, but long floating point format.
zMCF	INT	4	(IBM name: SMF71MCF) Multithreading maximum capacity numerator for general purpose processors. Divide this value by 1024 to get the multithreading maximum capacity factor for all general purpose processors that were configured ONLINE for the complete interval.
zCPM	FLOAT	8	(IBM name: SMF71CPM) Minimum number of high virtual common pages in-use
zCPX	FLOAT	8	(IBM name: SMF71CPX) Maximum number of high virtual common pages in-use
zCPA	FLOAT	8	(IBM name: SMF71CPA) Average number of high virtual common pages in-use
zPLM	FLOAT	8	(IBM name: SMF71PLM) Minimum number of 1 MB frames that are in-use by pageable 1 MB pages.
zPLX	FLOAT	8	(IBM name: SMF71PLX) Maximum number of 1 MB frames that are in-use by pageable 1 MB pages.
zPLA	FLOAT	8	(IBM name: SMF71PLA) Average number of 1 MB frames that are in-use by pageable 1 MB pages.
zGOM	FLOAT	8	(IBM name: SMF71GOM) Minimum number of fixed 2 GB memory objects allocated in the system
zGOX	FLOAT	8	(IBM name: SMF71GOX) Maximum number of fixed 2 GB memory objects allocated in the system
zGOA	FLOAT	8	(IBM name: SMF71GOA) Average number of fixed 2 GB memory objects allocated in the system
zGRM	FLOAT	8	(IBM name: SMF71GRM) Minimum number of 2 GB pages fixed in central storage (same as SMF71GUM)
zGRX	FLOAT	8	(IBM name: SMF71GRX) Maximum number of 2 GB pages fixed in central storage (same as

			SMF71GUX)
zGRA	FLOAT	8	(IBM name: SMF71GRA) Average number of 2 GB pages fixed in central storage (same as SMF71GUA)
zGUM	FLOAT	8	(IBM name: SMF71GUM) Minimum number of 2 GB frames in the Large Frame Area that are in-use by fixed memory objects (same as SMF71GRM)
zGUX	FLOAT	8	(IBM name: SMF71GUX) Maximum number of 2 GB frames in the Large Frame Area that are in-use by fixed memory objects (same as SMF71GRX)
zGUA	FLOAT	8	(IBM name: SMF71GUA) Average number of 2 GB frames in the Large Frame Area that are in-use by fixed memory objects (same as SMF71GRA)
zGUH	FLOAT	8	(IBM name: SMF71GUH) High water mark for the number of 2 GB frames that are used by the system
zGAM	FLOAT	8	(IBM name: SMF71GAM) Minimum number of 2 GB frames in the Large Frame Area that are not in-use
zGAX	FLOAT	8	(IBM name: SMF71GAX) Maximum number of 2 GB frames in the Large Frame Area that are not in-use
zGAA	FLOAT	8	(IBM name: SMF71GAA) Average number of 2 GB frames in the Large Frame Area that are not in-use
zGFM	FLOAT	8	(IBM name: SMF71GFM) Lowest maximum number of 2 GB frames that can be used by fixed 2 GB pages.
zGFX	FLOAT	8	(IBM name: SMF71GFX) Highest maximum number of 2 GB frames that can be used by fixed 2 GB pages.
zGFA	FLOAT	8	(IBM name: SMF71GFA) Average maximum number of 2 GB frames that can be used by fixed 2 GB pages.
zNNF	FLOAT	8	(IBM name: SMF71NNF) Average number of non-nucleus frames comprising permanent storage.
zLSI	FLOAT	8	(IBM name: SMF71LSI) Average number of system-initiated demotions from pageable large frame groups to 4K page frames.
zLRI	FLOAT	8	(IBM name: SMF71LRI) Average number of request-initiated demotions from pageable large frame groups to 4K page frames.
zMHW	FLOAT	8	(IBM name: SMF71MHW) High water mark of the number of 1 MB frames that were used to satisfy fixed 1 MB page requests.
zPIS	FLOAT	8	(IBM name: SMF71PIS) Average total number of page-ins of 4 KB pages from SCM.
zPOS	FLOAT	8	(IBM name: SMF71POS) Average total number of page-outs of 4 KB pages to SCM.
zPI1	FLOAT	8	(IBM name: SMF71PI1) Average total number of page-ins of 1 MB pages from SCM.
zPO1	FLOAT	8	(IBM name: SMF71PO1) Average total number of page-outs of 1 MB pages to SCM.
zL8M	FLOAT	8	(IBM name: SMF71L8M) Minimum total number of 1 MB frames in central storage.
zL8X	FLOAT	8	(IBM name: SMF71L8X) Maximum total number of 1 MB frames in central storage.
zL8A	FLOAT	8	(IBM name: SMF71L8A) Average total number of 1 MB frames in central storage.

zL9M	FLOAT	8	(IBM name: SMF71L9M) Minimum number of available 1 MB frames in central storage.
zL9X	FLOAT	8	(IBM name: SMF71L9X) Maximum number of available 1 MB frames in central storage.
zL9A	FLOAT	8	(IBM name: SMF71L9A) Average number of available 1 MB frames in central storage.
zL10M	FLOAT	8	(IBM name: SMF71L10M) Minimum number of 1 MB frames that are in-use by memory objects.
zL10X	FLOAT	8	(IBM name: SMF71L10X) Maximum number of 1 MB frames that are in-use by memory objects.
zL10A	FLOAT	8	(IBM name: SMF71L10A) Average number of 1 MB frames that are in-use by memory objects.
zM6C	FLOAT	8	(IBM name: SMF71M6C) Minimum number of frames backing 64-bit shared page groups.
zX6C	FLOAT	8	(IBM name: SMF71X6C) Maximum number of frames backing 64-bit shared page groups.
zA6C	FLOAT	8	(IBM name: SMF71A6C) Average number of frames backing 64-bit shared page groups.
zM6F	FLOAT	8	(IBM name: SMF71M6F) Minimum number of fixed frames backing 64-bit shared page groups.
zX6F	FLOAT	8	(IBM name: SMF71X6F) Maximum number of fixed frames backing 64-bit shared page groups.
zA6F	FLOAT	8	(IBM name: SMF71A6F) Average number of fixed frames backing 64-bit shared page groups.
zM6B	FLOAT	8	(IBM name: SMF71M6B) Minimum number of 24-bit frames backing 64-bit shared page groups.
zX6B	FLOAT	8	(IBM name: SMF71X6B) Maximum number of 24-bit frames backing 64-bit shared page groups.
zA6B	FLOAT	8	(IBM name: SMF71A6B) Average number of 24-bit frames backing 64-bit shared page groups.
zM6A	FLOAT	8	(IBM name: SMF71M6A) Minimum number of auxiliary DASD slots used to back 64-bit shared page groups.
zX6A	FLOAT	8	(IBM name: SMF71X6A) Maximum number of auxiliary DASD slots used to back 64-bit shared page groups.
zA6A	FLOAT	8	(IBM name: SMF71A6A) Average number of auxiliary DASD slots used to back 64-bit shared page groups.
zM6S	FLOAT	8	(IBM name: SMF71M6S) Minimum number of SCM blocks used to back 64-bit shared page groups.
zX6S	FLOAT	8	(IBM name: SMF71X6S) Maximum number of SCM blocks used to back 64-bit shared page groups.
zA6S	FLOAT	8	(IBM name: SMF71A6S) Average number of SCM blocks used to back 64-bit shared page groups.
zM6T	FLOAT	8	(IBM name: SMF71M6T) Minimum number of 64-bit shared page groups in the system.
zX6T	FLOAT	8	(IBM name: SMF71X6T) Maximum number of 64-bit shared page groups in the system.
zA6T	FLOAT	8	(IBM name: SMF71A6T) Average number of 64-bit shared page groups in the system.

Secondary segment: SMF071_Swap_Placement

Field Name	Type	Len	Description
<i>SMF071_Swap_Placement.<fieldname></i>			
zTOT	INT	4	(IBM name: N/A) Total number of swap candidates.
zAXD	INT	4	(IBM name: N/A) Number of physical swaps directed to auxiliary storage from central storage.
zLES	CHAR	4	(IBM name: N/A) Number of logical swaps to expanded storage after failing a logical swap.
zLAX	INT	4	(IBM name: N/A) Number of logical swaps to auxiliary storage after failing a logical swap.
zESD	INT	4	(IBM name: N/A) Number of physical swaps directed to expanded storage from central storage.
zMIG	INT	4	(IBM name: N/A) Total number of physical swaps that migrated from expanded storage to auxiliary storage.

Record Type 72 - Workload Activity, Storage Data, and Serialization Delay

SMF Record 72 (Workload Activity, Storage Data, and Serialization Delay) has a number of subtypes, each mapped by a structure member name of the format "T072STnn".

Record Type 72 Subtype 3 - Workload Activity

Primary Segment:

- SMF072#03_RMF_Workload

Secondary Segment(s): 10 (in alphabetical order)

- SMF072#03_Product
- SMF072#03_Reassembly_Area
- SMF072#03_Reassembly_Area_Info
- SMF072#03_Resource_Delay_Type
- SMF072#03_Resource_Group
- SMF072#03_Response_Time_Distribution
- SMF072#03_Service_Class_Served
- SMF072#03_Service_Report_Class_Period
- SMF072#03_Work_Resource_State
- SMF072#03_WorkMgr_Ctl

Primary segment: SMF072#03_RMF_Workload

Field Name	Type	Len	Description
SMF072#03_RMF_Workload.<fieldname>			
SMF072#03_RMF_Workload.Header_self_defining_section.<fieldname>			
zFLG	HEX	1	(IBM name: SMF72FLG) System indicator: Bit Meaning when set 0 New SMF record format 1 Subtypes used 2 Reserved. 3-6 Version indicators 7 System is running in PR/SM mode.
zRTY	INT	1	(IBM name: SMF72RTY) Record type 72('X'48').
zTME	TSTMP	8	(IBM name: SMF72TME) Date/Time that the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF72SID) System identification (from the SMFPRMxx SID parameter).
zSSI	CHAR	4	(IBM name: SMF72SSI) Subsystem identification (RMF).
zSTY	INT	2	(IBM name: SMF72STY) Record SubType.
zTRN	INT	2	(IBM name: SMF72TRN) Number of triplets in this record. A triplet is a set of three SMF fields (offset/length/number values) that defines a section of the record. The offset is the offset from the RDW.
zPRS	INT	4	(IBM name: SMF72PRS) Offset to RMF Product section from RDW.
zPRL	INT	2	(IBM name: SMF72PRL) Length of RMF Product section.
zPRN	INT	2	(IBM name: SMF72PRN) Number of RMF Product sections. Individual header extension for SubType 3:
zWMS	INT	4	(IBM name: SMF72WMS) Offset to Workload Manager control section.

zWML	INT	2	(IBM name: SMF72WML) Length of Workload Manager control section.
zWMN	INT	2	(IBM name: SMF72WMN) Number of Workload Manager control sections.
zSSS	INT	4	(IBM name: SMF72SSS) Offset to Service Class Served data section.
zSSL	INT	2	(IBM name: SMF72SSL) Length of Service Class Served data section.
zSSN	INT	2	(IBM name: SMF72SSN) Number of Service Class Served data sections.
zRGS	INT	4	(IBM name: SMF72RGS) Offset to Resource Group data section.
zRGL	INT	2	(IBM name: SMF72RGL) Length of Resource Group data section.
zRGN	INT	2	(IBM name: SMF72RGN) Number of Resource Group data sections.
zSCS	INT	4	(IBM name: SMF72SCS) Offset to Service/Report Class Period data section.
zSCL	INT	2	(IBM name: SMF72SCL) Length of Service/Report Class Period data section.
zSCN	INT	2	(IBM name: SMF72SCN) Number of Service/Report Class Period data sections.
zRTS	INT	4	(IBM name: SMF72RTS) Offset to Response Time Distribution data section.
zRTL	INT	2	(IBM name: SMF72RTL) Length of Response Time Distribution data section.
zRTN	INT	2	(IBM name: SMF72RTN) Number of Response Time Distribution data sections.
zWRS	INT	4	(IBM name: SMF72WRS) Offset to Work/Resource Manager State section.
zWRL	INT	2	(IBM name: SMF72WRL) Length of Work/Resource Manager State section.
zWRN	INT	2	(IBM name: SMF72WRN) Number of Work/Resource Manager State sections.
zDNS	INT	4	(IBM name: SMF72DNS) Offset to Resource Delay Type Names sections.
zDNL	INT	2	(IBM name: SMF72DNL) Length of Resource Delay Type Names sections.
zDNN	INT	2	(IBM name: SMF72DNN) Number of Resource Delay Type Names sections. Individual header extension for SubType 4:

Secondary segment: SMF072#03_Product

Field Name	Type	Len	Description
SMF072#03_Product.<fieldname>			
zMFV	DEC	2 (3,0)	(IBM name: SMF72MFV) RMF version number.
zPRD	CHAR	8	(IBM name: SMF72PRD) Product name ('RMF').
zIST	DEC	4 (7,0)	(IBM name: SMF72IST) Time that the RMF measurement interval started, in the form 0hhmmssF, where hh is the hours, mm is the minutes, ss is the seconds, and F is the sign.

zDAT	DATE	4	(IBM name: SMF72DAT) Date when the RMF measurement interval started, in the form 0cyydddF.
zINT	DEC	4 (7,0)	(IBM name: SMF72INT) Duration of the RMF measurement interval, in the form mmsstttF where mm is the minutes, ss is the seconds, ttt is the milliseconds, and F is the sign. (The end of the measurement interval is the sum of the recorded start time and this field.)
zSAM	INT	4	(IBM name: SMF72SAM) Number of RMF samples.

SMF072#03_Product.zFLA.<fieldname>

zSkip	BIT	1	Samples have been skipped
zMonIII	BIT	1	RECORD was written by RMF Monitor III
zSyncSMF	BIT	1	INTERVAL was synchronized with SMF
zzIIPBoost	BIT	1	zIIP boost was active during entire interval.
zSpeedBoost	BIT	1	Speed boost was active during entire interval.
z_Boost_Class	BINT (ENUM)	3	

SMF072#03_Product.<fieldname>

zCYC	DEC	4 (7,0)	(IBM name: SMF72CYC) Sampling cycle length, in the form 000ttttF, where tttt is the milliseconds and F is the sign (taken from CYCLE option). The range of values is 0.050 to 9.999 seconds.
zMVS	CHAR	8	(IBM name: SMF72MVS) z/OS software level (consists of an acronym and the version, release, and modification level - ZVvrrmm).
zIML	INT	1	(IBM name: SMF72IML) Indicates the type of processor complex on which data measurements were taken. Value Meaning 3 9672, zSeries

SMF072#03_Product.zPRF.<fieldname>

zExpStg	BIT	1	The system has expanded storage
zESCA	BIT	1	The processor is enabled for ES connection architecture (ESCA)
zESCdir	BIT	1	There is an ES connection director in the configuration
zzArc	BIT	1	System is running in z/Architecture® mode
zZAAP	BIT	1	At least one zAAP is currently installed
zZIIP	BIT	1	At least one zIIP is currently installed
zDAT	BIT	1	Enhanced DAT facility

SMF072#03_Product.<fieldname>

zPTN	INT	1	(IBM name: SMF72PTN) PR/SM partition number of the partition that wrote this record.
zSRL	INT	1	(IBM name: SMF72SRL) SMF record level change number (X'8E' for subtype 1 records or X'8F' for subtype 2 records for z/OS V2R4 RMF with RMF Data Gatherer APAR OA59330). This field enables processing of SMF record level changes in an existing release.
zIET	HEX	8	(IBM name: SMF72IET) Interval expiration time token. This token can be used to identify other than RMF records that belong to the same interval (if interval was synchronized with SMF).
zLGO	TIME	8	(IBM name: SMF72LGO) Offset GMT to local time (STCK format).
zRAO	INT	4	(IBM name: SMF72RAO) Offset to reassembly area relative to start of RMF product section.

zRAL	INT	2	(IBM name: SMF72RAL) Length of reassembly area. Area consists of a fixed header and a variable number of information blocks. Length depends on the record type/SubType, but is fixed for a specific type/SubType.
zRAN	INT	2	(IBM name: SMF72RAN) Reassembly area indicator. Value Meaning 0 RECORD is not broken. 1 RECORD is broken. Note: This field is used to indicate whether an SMF record is a broken record. Therefore, offset (SMF70RAO) and length (SMF70RAL) are only valid if SMF70RAN = 1. A reassembly area is only present in broken records.
zOIL	INT	2	(IBM name: SMF72OIL) Original interval length as defined in the session or by SMF (in seconds).
zSYN	INT	2	(IBM name: SMF72SYN) SYNC value in seconds.
zGIE	TIME	8	(IBM name: SMF72GIE) Projected gathering interval end (STCK format) GMT time.
zXNM	CHAR	8	(IBM name: SMF72XNM) Sysplex name as defined in parmlib member COUPLExx.
zSNM	CHAR	8	(IBM name: SMF72SNM) System name for current system as defined in parmlib member IEASYSxx SYSNAME parameter. Reassembly Area:

Secondary segment: **SMF072#03_Reassembly_Area**

Field Name	Type	Len	Description
<i>SMF072#03_Reassembly_Area.<fieldname></i>			
zRBR	INT	2	(IBM name: SMF72RBR) Total number of broken records built from the original large record.
zRSQ	INT	2	(IBM name: SMF72RSQ) Sequence number of this broken record. Every broken record built from the same large record must have a unique sequence number, it is in the range from 1 TO SMF70RBR.
zRIO	INT	4	(IBM name: SMF72RIO) Offset to first reassembly information block relative to start of reassembly area header.
zRIL	INT	2	(IBM name: SMF72RIL) Length of reassembly information block.
zRIN	INT	2	(IBM name: SMF72RIN) Number of reassembly information blocks (same value as SMF70TRN in header section).

Secondary segment: **SMF072#03_Reassembly_Area_Info**

Field Name	Type	Len	Description
<i>SMF072#03_Reassembly_Area_Info.<fieldname></i>			
zRNN	INT	2	(IBM name: SMF72RNN) Total number of sections in the original large record. This field contains information of how many sections of a specific type were contained in the original SMF record. This field is a copy of the number field of the triplet in the original (non broken) record.
zRPP	INT	2	(IBM name: SMF72RPP) Position of the first of one or more consecutive sections described by this block as in the original record. Values in the range of 1 TO SMF70RNN are valid for correct processing. A value of 0 WILL skip processing of this information block. This field provides information where the sections that are part of this broken record were placed in the original record before the split took place. The actual number of consecutive sections contained in

			this record is available from the actual triplet in the header extension.
--	--	--	---

Secondary segment: **SMF072#03_WorkMngr_Ctl**

Field Name	Type	Len	Description
<i>SMF072#03_WorkMngr_Ctl.<fieldname></i>			
SMF072#03_WorkMngr_Ctl.zMSCF.<fieldname>			
zRClass	BIT	1	Indicator for a report class
zNoActvty	BIT	1	Workload activity data not available
zNoPolicy	BIT	1	Policy data not available
zDelays	BIT	1	Execution velocity includes I/O delays
zCpuProt	BIT	1	Indicator for CPU protection
zStgProt	BIT	1	Indicator for storage protection
zDynAliTun	BIT	1	Indicator for dynamic alias tuning
zloPriHi	BIT	1	Indicator for I/O priority group HIGH

SMF072#03_WorkMngr_Ctl.zMFLG.<fieldname>			
zZaapCross	BIT	1	Indicator for zAAP crossover
zZaapHonPri	BIT	1	Indicator for zAAP honor priority
zZiipHonPri	BIT	1	Indicator for zIIP honor priority
zFailHISMT	BIT	1	Failure returned by HISMT service. Multithreading maximum capacity numerator values are invalid.
zNoHonPri	BIT	1	Indicator that service class is not eligible for honor priority processing. When on, specialty engine eligible work in this service class will not be offloaded to CPs for help processing.
zTenant	BIT	1	Indicator for a tenant report class
zExDiscGoal	BIT	1	Service class and tenant report class periods that are associated with a resource group and have assigned a discretionary goal are excluded from workload management.

SMF072#03_WorkMngr_Ctl.<fieldname>			
zMNSP	CHAR	8	(IBM name: R723MNSP) Policy name.
zMDSP	CHAR	32	(IBM name: R723MDSP) Policy description.
zMTPA	TSTMP	8	(IBM name: R723MTPA) Local time/date of policy activation (STCK format).
zMCPU	INT	4	(IBM name: R723MCP) CPU service coefficient * 10,000
zMIOC	INT	4	(IBM name: R723MIOC) I/O service coefficient * 10,000
zMMSO	INT	4	(IBM name: R723MMSO) Storage service coefficient * 10,000. When being used in calculations, apply the following scaling: zMMSO / 10000 * 4096 / 50 + 1 For details see z/OS MVS Planning: Workload Management, Defining Service Coefficients and Options.
zMSRB	INT	4	(IBM name: R723MSRB) SRB service coefficient * 10,000
zMTVL	INT	4	(IBM name: R723MTVL) WLM sample interval (in milliseconds).
zMTV#	INT	4	

			(IBM name: R723MTV#) Number of times when WLM sampling code ran.
zMOPT	CHAR	2	(IBM name: R723MOPT) Suffix of the IEAOPTxx parmlib member.
zMWNM	CHAR	8	(IBM name: R723MWNM) Workload name.
zMWDE	CHAR	32	(IBM name: R723MWDE) Workload description.
zMCNM	CHAR	8	(IBM name: R723MCNM) Service/Report class name.
zMCDE	CHAR	32	(IBM name: R723MCDE) Service/Report class description.
zMCPG	INT	2	(IBM name: R723MCPG) Number of periods belonging to this service or report class.
zMSUB	INT	1	(IBM name: R723MSUB) Number of entries in the work/resource manager state section belonging to a subsystem.
zMERF	CHAR	6	(IBM name: R723MERF) Enqueue residency CPU service factor.
zMADJ	INT	4	(IBM name: R723MADJ) Adjustment factor for CPU rate.
zMIDN	CHAR	8	(IBM name: R723MIDN) Service definition name.
zMIDD	CHAR	32	(IBM name: R723MIDD) Service definition description.
zMTDI	TSTMP	8	(IBM name: R723MTDI) Local time/date the service definition was installed (STCK format).
zMIDU	CHAR	8	(IBM name: R723MIDU) Userid that installed the service definition.
zCLSC	CHAR	8	(IBM name: R723CLSC) Service class that last contributed to this report class. Blank if this is a service class.
zNFFI	INT	4	(IBM name: R723NFFI) Normalization factor for zAAP. Multiply zAAP service times or service units with this value and divide by 256 T0 calculate the CP equivalent value.
zNFFS	INT	4	(IBM name: R723NFFS) Normalization factor for zIIP. Multiply zIIP service units with this value and divide by 256 T0 calculate the CP equivalent value.
zNADJ	INT	4	(IBM name: R723NADJ) Nominal adjustment factor for CPU rate.
zCECA	INT	4	(IBM name: R723CECA) CEC adjustment factor.
zMCF	INT	4	(IBM name: R723MCF) Multithreading maximum capacity numerator for general purpose processors. Divide this value by 1024 T0 get the MT maximum capacity factor for all general purpose processors that were configured ONLINE for the complete interval.
zMCFS	INT	4	(IBM name: R723MCFS) Multithreading maximum capacity numerator for zIIP. Divide this value by 1024 T0 get the multithreading maximum capacity factor for all zIIPs that were configured ONLINE for the complete interval. A zero value is reported if no zIIP is currently installed.
zMCFI	INT	4	(IBM name: R723MCFI) Multithreading maximum capacity numerator for zAAP. Divide this value by 1024 T0 get the multithreading maximum capacity factor for all zAAPs that were configured ONLINE for the complete interval. A zero value is reported if no zAAP is currently installed.
zCPA_actual	INT	4	(IBM name: R723CPA_actual) Physical CPU adjustment factor based on Model Capacity Rating.

zCPA_scaling_factor	INT	4	(IBM name: R723CPA_scaling_factor) Scaling factor for zCPA_actual.
---------------------	-----	---	---

Secondary segment: SMF072#03_Service_Class_Served

Field Name	Type	Len	Description
<i>SMF072#03_Service_Class_Served.<fieldname></i>			
zSCSN	CHAR	8	(IBM name: R723SCSN) Name of service class being served (by one or more address spaces in service class zMCNM).
zSCS#	INT	4	(IBM name: R723SCS#) Number of times an address space running in service class zMCNM was observed serving the served service class zSCSN.

Secondary segment: SMF072#03_Resource_Group

Field Name	Type	Len	Description
<i>SMF072#03_Resource_Group.<fieldname></i>			
zGGNM	CHAR	8	(IBM name: R723GGNM) Resource group name.
zGGDE	CHAR	32	(IBM name: R723GGDE) Resource group description.

<i>SMF072#03_Resource_Group.zGGLT.<fieldname></i>			
zMaxCap	BIT	1	MAXIMUM capacity was specified.
zMinCap	BIT	1	MINIMUM capacity was specified.
zLPARpct	BIT	1	SPECIFICATI0N of zGGMN and zGGMX is in percentage of the LPAR share rather than in service units. In addition, the scope of the resource group is system-wide rather than sysplex-wide.
zSingleCP	BIT	1	SPECIFICATI0N of zGGMN and zGGMX is in percentage of a single processor capacity rather than in service units. In addition, the scope of the resource group is system-wide rather than sysplex-wide.
zMemLimit	BIT	1	MEMORY limit was specified.
zMSUh	BIT	1	SPECIFICATI0N of zGGMN and zGGMX is in MSU/h rather than in service units.
zSpeciality	BIT	1	SPECIALTY processor consumption is included into the WLM capping algorithms, i.e. zGGMN and zGGMX limit the combined general purpose and speciality processor consumption.

<i>SMF072#03_Resource_Group.zGGTF.<fieldname></i>			
zTenant	BIT	1	Indicator for a tenant resource group.

<i>SMF072#03_Resource_Group.<fieldname></i>			
zGGMN	INT	4	(IBM name: R723GGMN) If bit 1 0F zGGLT is ON, minimum capacity of the resource group. If bit 2, bit 3, and bit 5 0F zGGLT are OFF, this value is in unweighted CPU service units per second. In addition, the scope of the resource group is sysplex-wide. If bit 2, bit 3, or bit 5 0F zGGLT is ON, see the description of zGGLT.
zGGMX	INT	4	(IBM name: R723GGMX) If bit 0 0F zGGLT is ON, maximum capacity of the resource group. If bit 2, bit 3, and bit 5 0F zGGLT are OFF, this value is in unweighted CPU service units per second. In addition, the scope of the resource group is sysplex-wide. If bit 2, bit 3, or bit 5 0F zGGLT is ON, see the description of

			zGGLT.
zGGML	INT	4	(IBM name: R723GGML) If bit 4 0F zGGLT is ON, memory limit (in GB) of the resource group. The scope of the resource group is system-wide.
zGGTI	CHAR	8	(IBM name: R723GGTI) Tenant identifier. Only valid if bit 0 0F zGGTF is ON.
zGGTN	CHAR	32	(IBM name: R723GGTN) Tenant name. Only valid if bit 0 0F zGGTF is ON.
zGGKY	CHAR	64	(IBM name: R723GGKY) Solution ID. Only valid if bit 0 0F zGGTF is ON.

Secondary segment: **SMF072#03_Service_Report_Class_Period**

Field Name	Type	Len	Description
<i>SMF072#03_Service_Report_Class_Period.<fieldname></i>			
zCRTX	INT	2	(IBM name: R723CRTX) Index into the response time distribution count table in the Response Time Distribution data section. These buckets exist only for periods with a response time goal.
zCWMX	INT	2	(IBM name: R723CWMX) Index into the work/resource manager states area.
zCWMN	INT	2	(IBM name: R723CWMN) Number of entries in the work/resource manager states area associated with this period (zCWMX points to the first entry).

SMF072#03_Service_Report_Class_Period.zCRS1.<fieldname>

zCPHetero	BIT	1	This report class period is heterogeneous.
-----------	-----	---	--

SMF072#03_Service_Report_Class_Period.<fieldname>

zCADF	INT	1	(IBM name: R723CADF) Data flags - they indicate the availability of actual measured data in one of the subsections being a part of this section. Bit Meaning when set 0 RESOURCE consumption data available 1 RESPONSE time data available 2 GENERAL execution delay data available 3-7 Reserved. Goals: For a report class period, these are the goals of the service class period that last contributed to this report class period. For a homogeneous report class period, this goal must be used to format the response time distribution.
zCPER	INT	1	(IBM name: R723CPER) Service or report class period number.

SMF072#03_Service_Report_Class_Period.zCRTF.<fieldname>

zMilli	BIT	1	Response time specified in milliseconds.
zSec	BIT	1	Response time specified in seconds.
zMin	BIT	1	Response time specified in minutes.
zHours	BIT	1	Response time specified in hours.

SMF072#03_Service_Report_Class_Period.zCRGF.<fieldname>

zPercentile	BIT	1	Percentile response time goal.
zAverage	BIT	1	Average response time goal.
zExecution	BIT	1	Execution velocity goal.
zDiscretionary	BIT	1	Discretionary goal.
zSystem	BIT	1	System specified goal.

SMF072#03_Service_Report_Class_Period.<fieldname>

zCVAL	INT	4	(IBM name: R723CVAL) Response time or execution velocity goal - or zero if discretionary or system goal. Units are defined in zCRTF.
zCPCT	INT	2	(IBM name: R723CPCT) Goal percentile value (in percentage).
zCIMP	INT	2	(IBM name: R723CIMP) Importance of the goal to be achieved for this period (1=highest, 5=lowest). The value is zero for a discretionary or system goal.
zCDUR	INT	4	(IBM name: R723CDUR) Period duration in weighted service units, or zero for the last period. Resource Consumption Data - Actual measured values: All service units are weighted by the coefficients in the active service policy.
zCSRV	FLOAT	8	(IBM name: R723CSRV) Total service units.
zCCPU	FLOAT	8	(IBM name: R723CCPU) Total TCB service units. This value includes SUs on general purpose CPs and normalized SUs on zIIPs and zAAPs.
zCIOC	FLOAT	8	(IBM name: R723CIOC) Total IOC service units.
zCMSO	FLOAT	8	(IBM name: R723CMSO) Total central storage service units.
zCSRB	FLOAT	8	(IBM name: R723CSRB) Total SRB service units. This value includes SUs on general purpose CPs and normalized SUs on zIIPs and zAAPs.
zCPIR	FLOAT	8	(IBM name: R723CPIR) Total page-in count.
zCHPI	FLOAT	8	(IBM name: R723CHPI) Total hiperspace page-in count. This value includes only those hiperspace pages that were moved by the Real Storage Manager and not by the MVPG instruction.
zCBPI	FLOAT	8	(IBM name: R723CBPI) Total block page-in from auxiliary count.
zCPIE	FLOAT	8	(IBM name: R723CPIE) Total page-in from expanded count.
zCBPE	FLOAT	8	(IBM name: R723CBPE) Total block page-in from expanded count.
zCBKA	FLOAT	8	(IBM name: R723CBKA) Total auxiliary blocks paged in.
zCBKE	FLOAT	8	(IBM name: R723CBKE) Total expanded blocks paged in.
zCPRS	FLOAT	8	(IBM name: R723CPRS) Total page residency time (1024-microsecond units).
zCERS	FLOAT	8	(IBM name: R723CERS) Total expanded page residency time (1024-microsecond units).
zCTRR	FLOAT	8	(IBM name: R723CTRR) Total in storage residency time (1024-microsecond units).
zCTAT	FLOAT	8	(IBM name: R723CTAT) Total transaction active time (1024-microsecond units).
zCRCT	FLOAT	8	(IBM name: R723CRCT) Total RCT time (microseconds).
zCIIT	FLOAT	8	(IBM name: R723CIIT) Total I/O interrupt time (microseconds).
zCHST	FLOAT	8	(IBM name: R723CHST) Total hiperspace service time (microseconds).
zCSWC	INT	4	(IBM name: R723CSWC) Total swap count.
zCCRM	INT	4	(IBM name: R723CCRM) Total hiperspace ESO read miss count. Response Time Data - Actual measured values:

zCRCP	INT	4	(IBM name: R723CRCP) Count of transaction completions for this period. This field includes transaction completions reported by subsystem work managers by way of the IWMRPT service.
zCARC	INT	4	(IBM name: R723CARC) Count of transactions that completed abnormally as reported by subsystem work manager. This value is not part of zCRCP and should not be used for response time calculations.
zCNCP	INT	4	(IBM name: R723CNCP) Count of transactions that completed their execution phase as reported by subsystem work managers by way of the IWMNTFY service.
zCANC	INT	4	(IBM name: R723CANC) Count of transactions that completed their execution phase abnormally as reported by subsystem work Manager. This value is not part of zCNCP and should not be used for execution response time calculations.
zCTET	FLOAT	8	(IBM name: R723CTET) Total transaction elapsed time (1024-microsecond units).
zCXET	FLOAT	8	(IBM name: R723CXET) Total transaction execution time (1024-microsecond units).
zCETS	FLOAT	8	(IBM name: R723CETS) Sum of transaction elapsed times squared (1024-microsecond units). General Execution Delay Data - Actual measured values:
zCCUS	INT	4	(IBM name: R723CCUS) CPU using samples. These are included in zCTOU.
zCTOT	INT	4	(IBM name: R723CTOT) Total general execution delay samples used in WLM's execution velocity calculation. For the velocity formula, see z/OS MVS Planning: Workload Management. The following categories of samples represent general execution delays that are included in zCTOT. Each counter was incremented by one every time the WLM sampler found the appropriate condition.
zCCDE	INT	4	(IBM name: R723CCDE) CPU delay. A TCB or SRB is waiting to be dispatched or a TCB is waiting for local lock.
zCCCA	INT	4	(IBM name: R723CCCA) CPU capping delay. A TCB or SRB is marked non-dispatchable because a resource group maximum is being enforced. Note that zCCCA is NOT a subset of zCCDE.
zCSWI	INT	4	(IBM name: R723CSWI) Swap-in delay. Swap-in has started, but not completed.
zCMPL	INT	4	(IBM name: R723CMPL) MPL delay. Ready but swap-in has not started.
zCAPR	INT	4	(IBM name: R723CAPR) Auxiliary page from private.
zCACO	INT	4	(IBM name: R723CACO) Auxiliary page from common.
zCAXM	INT	4	(IBM name: R723CAXM) Auxiliary page from cross memory.
zCVIO	INT	4	(IBM name: R723CVIO) Auxiliary page from VIO.
zCHSP	INT	4	(IBM name: R723CHSP) Auxiliary page from standard hiperspaces.
zCCHS	INT	4	(IBM name: R723CCHS) Auxiliary page from ESO hiperspaces. The following categories of samples are not included in zCTOT:
zCUNK	INT	4	(IBM name: R723CUNK) Unknown. Address space or enclave is waiting, but none of the general execution delays (listed earlier) apply.
zCIDL	INT	4	(IBM name: R723CIDL) Idle. Address space or enclave is in STIMER wait, TSO terminal wait, APPC wait, or an initiator waiting for work.

zCPDE	INT	4	(IBM name: R723CPDE) Resource group capping count. Group maximum is being enforced for work in this class.
zCPQU	INT	4	(IBM name: R723CPQU) Quiesce count. Some work in this service class has been reset by way of the RESET xxx, QUIESCE command. Additional General Execution Delay Data - Actuals:
zCSAC	INT	4	(IBM name: R723CSAC) Sampled address space count. Number of address spaces that contributed delay and using samples to this class.
zCSRS	FLOAT	8	(IBM name: R723CSRS) Total shared page residency time in 1024-microsecond units.
zCSPA	FLOAT	8	(IBM name: R723CSPA) Total shared page-ins from auxiliary storage.
zCSPE	FLOAT	8	(IBM name: R723CSPE) Total shared page-ins from expanded storage. Additional Resource Consumption Data:
zCICT	FLOAT	8	(IBM name: R723CICT) Total non-paging DASD connect time in 128-microsecond units.
zCIWT	FLOAT	8	(IBM name: R723CIWT) Total non-paging DASD wait time (queue time + pending time) in 128-microsecond units.
zCIDT	FLOAT	8	(IBM name: R723CIDT) Total non-paging DASD disconnect time in 128-microsecond units. This does not include IOS queue time.
zCIRC	INT	4	(IBM name: R723CIRC) Total non-paging DASD I/O start subchannel count. This can be used with fields zCICT, zCIWT, and zCIDT to determine the average DASD response time for the period. Additional General Execution Delay Data - Actuals:
zCTOU	INT	4	(IBM name: R723CTOU) Total using samples. For the velocity formula, see z/OS MVS Planning: Workload Management.
zCIOU	INT	4	(IBM name: R723CIOU) DASD using samples. Only non-paging DASD I/O can contribute to I/O using samples. The following categories of samples represent general execution delays. Each counter was incremented by one every time the WLM sampler found the appropriate condition.
zCIOD	INT	4	(IBM name: R723CIOD) DASD delay samples.
zCQ	INT	4	(IBM name: R723CQ) Queue delay samples, work is waiting for a server.
zCSPV	INT	4	(IBM name: R723CSPV) Server private area paging delay samples.
zCSVI	INT	4	(IBM name: R723CSVI) Server space VIO paging delay samples.
zCSHS	INT	4	(IBM name: R723CSHS) Server hiperspace paging delay samples.
zCSMP	INT	4	(IBM name: R723CSMP) Server MPL delay samples.
zCSSW	INT	4	(IBM name: R723CSSW) Server swap-in delay samples. Non-DASD I/O Using or Delay Samples:
zCNDI	INT	4	(IBM name: R723CNDI) Non-DASD I/O using or delay samples.
zCTDQ	INT	4	(IBM name: R723CTDQ) Total delay samples always including batch queue delay. For service classes that contain batch jobs that were not run in WLM managed initiators the batch queue delay samples are derived from the measured batch queue delay time. For service classes that contain jobs that ran in WLM managed initiators this value is the same as RCAETOTD. RCAETOTDQ can be used as a migration aid to determine what a batch service class period's velocity will be if its jobs are run in WLM managed initiators.

zCTSA	FLOAT	8	(IBM name: R723CTSA) Total execution samples. It is the sum of RCAETOTU, RCAETOTD, RCAEUNKN, RCAEIDLE.
zCIOT	FLOAT	8	(IBM name: R723CIOT) Total DASD IOS queue time in 128-microsecond units.
zCQDT	FLOAT	8	(IBM name: R723CQDT) Total queue delay time in 1024-microsecond units. For batch jobs, this is the time jobs spent on the job queue while eligible to run on some system. It represents the time the jobs spent waiting for an initiator. For TSO users, this time can be a portion of the LOGON process. For APPC, this is the time an APPC request spent on an APPC queue. The following three values only apply to batch jobs, they are zero for other work types:
zCADT	FLOAT	8	(IBM name: R723CADT) Total time (in 1024-microsecond units) batch jobs were ineligible to run because a resource that the job had affinity to was unavailable.
zCCVT	FLOAT	8	(IBM name: R723CCVT) Total time (in 1024-microsecond units) batch jobs spent in JCL conversion.
zCIQT	FLOAT	8	(IBM name: R723CIQT) Total time (in 1024-microsecond units) batch jobs spent on job queue (after JCL conversion) while ineligible to run on any system for reasons other than resource affinities.
zCIEA	FLOAT	8	(IBM name: R723CIEA) Independent enclave total transaction active time (in 1024-microsecond units) for enclaves that originated on this system.
zCXEA	FLOAT	8	(IBM name: R723CXEA) Exported enclave total transaction active time (in 1024-microsecond units).
zCFEA	FLOAT	8	(IBM name: R723CFEA) Foreign enclave total transaction active time (in 1024-microsecond units). Crypto Using and Delay Samples:
zCAMU	INT	4	(IBM name: R723CAMU) No longer used.
zCAMD	INT	4	(IBM name: R723CAMD) No longer used.
zAPU	INT	4	(IBM name: R723APU) AP crypto using samples: a TCB was found executing on a cryptographic assist processor.
zAPD	INT	4	(IBM name: R723APD) AP crypto delay samples: a TCB was found waiting for a cryptographic assist processor.
zFQD	INT	4	(IBM name: R723FQD) Feature queue delay samples: a TCB was found waiting on a processor feature queue associated with a CPU. This is a subset of zCCDE. Note: zCCUS includes feature queue using samples.
zPLSC	CHAR	8	(IBM name: R723PLSC) Service class that last contributed to this report class period during this interval. Blank if this is a service class period.
zRCOD	INT	4	(IBM name: R723RCOD) Contention delay sample count. One sample is accumulated for each held resource which is reported to WLM by the resource manager by way of IWMCNTN.
zRCOU	INT	4	(IBM name: R723RCOU) Contention using sample count. One sample is accumulated for each resource in use which is reported to WLM by the resource manager by way of IWMCNTN.
zECTC	FLOAT	8	(IBM name: R723ECTC) CPU time consumed while dispatching priority was temporarily raised by enqueue management because the work unit held a resource that other work needed (in 1024 MICROSECOND units).
zIFAU	INT	4	(IBM name: R723IFAU) zAAP using samples.
zIFCU	INT	4	(IBM name: R723IFCU) zAAP on CP using samples. These samples are included in zCCUS.

zIFAD	INT	4	(IBM name: R723IFAD) zAAP delay samples.
zIFAT	FLOAT	8	(IBM name: R723IFAT) Reserved. Use zCIFA to calculate zAAP (IFA) service times.
zIFCT	FLOAT	8	(IBM name: R723IFCT) Reserved
zSUPU	INT	4	(IBM name: R723SUPU) zIIP using samples.
zSUCU	INT	4	(IBM name: R723SUCU) zIIP on CP using samples.
zSUPD	INT	4	(IBM name: R723SUPD) zIIP delay samples.
zCSUP	FLOAT	8	(IBM name: R723CSUP) Total service units on zIIPs. Multiply with zNFFS and divide by 256 T0 calculate the CP equivalent value.
zCSUC	FLOAT	8	(IBM name: R723CSUC) Total service units on CPs spent by zIIP eligible work.
zCIFA	FLOAT	8	(IBM name: R723CIFA) Total service units on zAAPs. Multiply with zNFFI and divide by 256 T0 calculate the CP equivalent value.
zCIFC	FLOAT	8	(IBM name: R723CIFC) Total service units on CPs spent by zAAP eligible work.
zTPDP	FLOAT	8	(IBM name: R723TPDP) CPU time consumed while dispatching priority of work with low importance was temporarily raised to help blocked workloads (in 1024 MICROSECOND units).
zCPDP	FLOAT	8	(IBM name: R723CPDP) CPU time consumed while dispatching priority was temporarily raised by chronic resource contention management because the work unit held a resource that other work needed (in 1024 MICROSECOND units).
zLPDP	FLOAT	8	(IBM name: R723LPDP) CPU time consumed while dispatching priority was temporarily raised to shorten the lock hold time of a local suspend lock held by the work unit (in 1024 MICROSECOND units). Only valid if HiperDispatch is active.
zSPDP	FLOAT	8	(IBM name: R723SPDP) CPU time consumed while dispatching priority for a work unit was temporarily raised by the z/OS supervisor to a higher dispatching priority than assigned by WLM (in 1024-microsecond units).
zRTDM	INT	4	(IBM name: R723RTDM) Midpoint of all response times that were collected in the response time distribution buckets in milliseconds. For response time goals, the midpoint is always the response time goal. For execution velocity goals, it is the average of all response times that were collected in the response time distribution buckets.
zRTDC	INT	4	(IBM name: R723RTDC) Number of midpoint changes that occurred during the interval. Number equals zero for response time goals.
zRTDT	TSTMP	8	(IBM name: R723RTDT) Timestamp in STCK format, showing the latest point in time when a midpoint change occurred in zRTDM. Transaction Resource Consumption Data When transaction processor usage is reported to WLM through IWM4RPT or IWM4MNTF services, the consumed service units are accounted to the transaction service or report classes, and deducted from the region's service and report classes. If the number of transactions is very small and a single transaction reports high processor times, it can occur that processor times become negative. The corresponding SMF fields will report a negative value to allow for correct aggregation across intervals.
zTSUCP	FLOAT	8	(IBM name: R723TSUCP) Total Service units consumed by transactions, executed on general purpose processors.
zTSUSP	FLOAT	8	(IBM name: R723TSUSP) Total Service units consumed by transactions, executed on specialty processors.

zTSUOCP	FLOAT	8	(IBM name: R723TSUOCP) Total Service units consumed by transactions, eligible to run on specialty processors, but executed on general purpose processors.
zMSUCP	FLOAT	8	(IBM name: R723MSUCP) Service units consumed by transactions, classified with reporting attribute MOBILE, executed on general purpose processors.
zMSUSP	FLOAT	8	(IBM name: R723MSUSP) Service units consumed by transactions, classified with reporting attribute MOBILE, executed on specialty processors.
zMSUOCP	FLOAT	8	(IBM name: R723MSUOCP) Service units consumed by transactions, classified with reporting attribute MOBILE, eligible to run on specialty processors, but executed on general purpose processors.
zASUCP	FLOAT	8	(IBM name: R723ASUCP) Service units consumed by transactions, classified with reporting attribute CATEGORYA, executed on general purpose processors.
zASUSP	FLOAT	8	(IBM name: R723ASUSP) Service units consumed by transactions, classified with reporting attribute CATEGORYA, executed on specialty processors.
zASUOCP	FLOAT	8	(IBM name: R723ASUOCP) Service units consumed by transactions, classified with reporting attribute CATEGORYA, eligible to run on specialty processors, but executed on general purpose processors.
zBSUCP	FLOAT	8	(IBM name: R723BSUCP) Service units consumed by transactions, classified with reporting attribute CATEGORYB, executed on general purpose processors.
zBSUSP	FLOAT	8	(IBM name: R723BSUSP) Service units consumed by transactions, classified with reporting attribute CATEGORYB, executed on specialty processors.
zBSUOCP	FLOAT	8	(IBM name: R723BSUOCP) Service units consumed by transactions, classified with reporting attribute CATEGORYB, eligible to run on specialty processors, but executed on general purpose processors.
zCTETX	FLOAT	8	(IBM name: R723CTETX) Total transaction elapsed time. Same as zCTET, but in microseconds.
zCXETX	FLOAT	8	(IBM name: R723CXETX) Total transaction execution time. Same as zCXET, but in microseconds.
zCETSX	FLOAT	8	(IBM name: R723CETSX) Sum of transaction elapsed times squared. Same as zCETS, but in microseconds.
zCQDTX	FLOAT	8	(IBM name: R723CQDTX) Total queue delay time. Same as zCQDT, but in microseconds.
zCADTX	FLOAT	8	(IBM name: R723CADTX) Total time batch jobs were ineligible to run because a resource that the job had affinity to was unavailable. Same as zCADT, but in microseconds.
zCCVTX	FLOAT	8	(IBM name: R723CCVTX) Total time batch jobs spent in JCL conversion. Same as zCCVT, but in microseconds.
zCIQTX	FLOAT	8	(IBM name: R723CIQTX) Total time batch jobs spent on job queue (after JCL conversion) while ineligible to run on any system for reasons other than resource affinities. Same as zCIQT, but in microseconds.

Secondary segment: SMF072#03_Response_Time_Distribution

Field Name	Type	Len	Description
SMF072#03_Response_Time_Distribution.<fieldname>			
zTRDB050	INT	4	(IBM name: N/A) 50 - EACH map entry defines a maximum percentage of the midpoint that

			was calculated for the response time distribution. When used in conjunction with an entry in the response time distribution count table, it shows the number of transactions that completed in a percentage of the midpoint.
zTRDB060	INT	4	(IBM name: N/A) 60 - THIS value means: 60% of the goal response time.
zTRDB070	INT	4	(IBM name: N/A) 70 - THIS value means: 70% of the goal response time.
zTRDB080	INT	4	(IBM name: N/A) 80 - THIS value means: 80% of the goal response time.
zTRDB090	INT	4	(IBM name: N/A) 90 - THIS value means: 90% of the goal response time.
zTRDB100	INT	4	(IBM name: N/A) 100 - THIS value means: 100% of the goal response time.
zTRDB110	INT	4	(IBM name: N/A) 110 - THIS value means: 110% of the goal response time.
zTRDB120	INT	4	(IBM name: N/A) 120 - THIS value means: 120% of the goal response time.
zTRDB130	INT	4	(IBM name: N/A) 130 - THIS value means: 130% of the goal response time.
zTRDB140	INT	4	(IBM name: N/A) 140 - THIS value means: 140% of the goal response time.
zTRDB150	INT	4	(IBM name: N/A) 150 - THIS value means: 150% of the goal response time.
zTRDB200	INT	4	(IBM name: N/A) 200 - THIS value means: 200% of the goal response time.
zTRDB400	INT	4	(IBM name: N/A) 400 - THIS value means: 400% of the goal response time.
zTRDBHI	INT	4	(IBM name: N/A) X'FFFFFFFF' - last entry : >400% of the goal response time.

SMF072#03_Response_Time_Distribution.Response_Time_Distribution_Counts.<fieldname>			
zTRDC050	INT	4	(IBM name: N/A) Count of completed transactions with: Response time = 50% of the goal.
zTRDC060	INT	4	(IBM name: N/A) Count of completed transactions with: Response time > 50% of the goal. Response time = 60% of the goal.
zTRDC070	INT	4	(IBM name: N/A) Count of completed transactions with: Response time > 60% of the goal. Response time = 70% of the goal.
zTRDC080	INT	4	(IBM name: N/A) Count of completed transactions with: Response time > 70% of the goal. Response time = 80% of the goal.
zTRDC090	INT	4	(IBM name: N/A) Count of completed transactions with: Response time > 80% of the goal. Response time = 90% of the goal.
zTRDC100	INT	4	(IBM name: N/A) Count of completed transactions with: Response time > 90% of the goal. Response time = 100% of the goal.
zTRDC110	INT	4	(IBM name: N/A) Count of completed transactions with: Response time > 100% of the goal. Response time = 110% of the goal.
zTRDC120	INT	4	(IBM name: N/A) Count of completed transactions with: Response time > 110% of the goal. Response time = 120% of the goal.
zTRDC130	INT	4	(IBM name: N/A) Count of completed transactions with: Response time > 120% of the goal. Response time = 130% of the goal.
zTRDC140	INT	4	

			(IBM name: N/A) Count of completed transactions with: Response time > 130% of the goal. Response time = 140% of the goal.
zTRDC150	INT	4	(IBM name: N/A) Count of completed transactions with: Response time > 140% of the goal. Response time = 150% of the goal.
zTRDC200	INT	4	(IBM name: N/A) Count of completed transactions with: Response time > 150% of the goal. Response time = 200% of the goal.
zTRDC400	INT	4	(IBM name: N/A) Count of completed transactions with: Response time > 200% of the goal. Response time = 400% of the goal.
zTRDCHI	INT	4	(IBM name: N/A) Count of completed transactions with: Response time > 400% of the goal.

Secondary segment: **SMF072#03_Work_Resource_State**

Field Name	Type	Len	Description
<i>SMF072#03_Work_Resource_State.<fieldname></i>			
<i>SMF072#03_Work_Resource_State.Delay_Per_service_Class.<fieldname></i>			
zRTYP	CHAR	4	(IBM name: R723RTYP) Subsystem type, as used in the classification rules specified in the WLM administrative application. The subsystem's documentation should explain the meaning that the product attributes to the various states.
<i>SMF072#03_Work_Resource_State.Delay_Per_service_Class.zRFLG.<fieldname></i>			
zStatBegToEnd	BIT	1	States sampled in the begin_to_end phase of a transaction.
zStatExecution	BIT	1	States sampled in the execution phase of a transaction.
<i>SMF072#03_Work_Resource_State.Delay_Per_service_Class.<fieldname></i>			
zRESS	INT	4	(IBM name: R723RESS) Total number of transaction states sampled in the phase specified by zRFLG.
zRACT	INT	4	(IBM name: R723RACT) Total number of active state samples. Active indicates that there is a program executing on behalf of the work request, from the perspective of the work manager. This does not mean that the program is active from the base control program's perspective.
zRRDY	INT	4	(IBM name: R723RRDY) Total number of ready state samples. Ready indicates that there is a program ready to execute on behalf of the work request described by the monitoring environment, but the work manager has given priority to another work request.
zRIDL	INT	4	(IBM name: R723RIDL) Total number of idle state samples. Idle indicates that no work request is available to the work manager that is allowed to run.
zRWLO	INT	4	(IBM name: R723RWLO) Total number of waiting for lock state samples.
zRWIO	INT	4	(IBM name: R723RWIO) Total number of waiting for I/O state samples. Waiting for I/O indicates that the work manager is waiting for an activity related to an I/O request. This may be an actual I/O operation or some other function associated with the I/O request.
zRWCO	INT	4	(IBM name: R723RWCO) Total number of waiting for conversation state samples. Waiting for conversation may have been used in conjunction with the WLM service IWMMSWCH to identify where the recipient of the conversation is located. In this case, only the switched state will be recorded.

zRWDS	INT	4	(IBM name: R723RWDS) Total number of waiting for distributed request state samples. Waiting for distributed request indicates a high level that some function or data must be routed prior to resumption of the work request. This is to be contrasted with waiting for conversation, which is a low level view of the precise resource that is needed. A distributed request could involve waiting on a conversation as part of its processing.
zRWSL	INT	4	(IBM name: R723RWSL) Total number of waiting for a session to be established locally samples. Waiting for a session to be established locally, i.e. on the current MVS image.
zRWSN	INT	4	(IBM name: R723RWSN) Total number of waiting for a session to be established somewhere in the network samples.
zRWSS	INT	4	(IBM name: R723RWSS) Total number of waiting for a session to be established somewhere in the sysplex samples.
zRWTM	INT	4	(IBM name: R723RWTM) Total number of waiting for a timer samples.
zRWO	INT	4	(IBM name: R723RWO) Total number of waiting for another product samples.
zRWMS	INT	4	(IBM name: R723RWMS) Total number of waiting for unidentified resource samples. Waiting for unidentified resource, possibly among another more specific category, but which may not be readily determined.
zRSSL	INT	4	(IBM name: R723RSSL) Number of states representing transactions for which there are logical continuations on this MVS image. Subsystem work managers might set this state when they function ship a transaction to another component within the same MVS image.
zRSSS	INT	4	(IBM name: R723RSSS) Number of states representing transactions for which there are logical continuations on another MVS image in the sysplex. Subsystem work managers might set this state when they function ship a transaction to another component on another MVS image within the sysplex.
zRSSN	INT	4	(IBM name: R723RSSN) Number of states representing transactions for which there are logical continuations somewhere within the network. Subsystem work managers might set this state when they function ship a transaction to another component within the network.
zRWST	INT	4	(IBM name: R723RWST) Total number of waiting for SSL thread samples.
zRWRT	INT	4	(IBM name: R723RWRT) Total number of waiting for regular thread samples.
zRWWR	INT	4	(IBM name: R723RWWR) Total number of waiting for work table registration samples.
zRAPP	INT	4	(IBM name: R723RAPP) Total number of active application state samples.
zRWNL	INT	4	(IBM name: R723RWNL) Total number of state samples reflecting waiting for new latch.
zRW01	INT	4	(IBM name: R723RW01) Total number of samples waiting for resource type 1.
zRW02	INT	4	(IBM name: R723RW02) Total number of samples waiting for resource type 2.
zRW03	INT	4	(IBM name: R723RW03) Total number of samples waiting for resource type 3.
zRW04	INT	4	(IBM name: R723RW04) Total number of samples waiting for resource type 4.
zRW05	INT	4	(IBM name: R723RW05) Total number of samples waiting for resource type 5.
zRW06	INT	4	(IBM name: R723RW06) Total number of samples waiting for resource type 6.

zRW07	INT	4	(IBM name: R723RW07) Total number of samples waiting for resource type 7.
zRW08	INT	4	(IBM name: R723RW08) Total number of samples waiting for resource type 8.
zRW09	INT	4	(IBM name: R723RW09) Total number of samples waiting for resource type 9.
zRW10	INT	4	(IBM name: R723RW10) Total number of samples waiting for resource type 10.
zRW11	INT	4	(IBM name: R723RW11) Total number of samples waiting for resource type 11.
zRW12	INT	4	(IBM name: R723RW12) Total number of samples waiting for resource type 12.
zRW13	INT	4	(IBM name: R723RW13) Total number of samples waiting for resource type 13.
zRW14	INT	4	(IBM name: R723RW14) Total number of samples waiting for resource type 14.
zRW15	INT	4	(IBM name: R723RW15) Total number of samples waiting for resource type 15.
zRBPM	INT	4	(IBM name: R723RBPM) Number of state samples representing buffer pool misses that resulted in I/O.
zRDNX	INT	2	(IBM name: R723RDNX) Index into resource delay type names table.
zRDNN	INT	2	(IBM name: R723RDNN) Number of entries in resource delay type names table.

Secondary segment: SMF072#03_Resource_Delay_Type

Field Name	Type	Len	Description
<i>SMF072#03_Resource_Delay_Type.<fieldname></i>			
zDNST	CHAR	4	(IBM name: R723DNST) Subsystem type as used in the classification rules specified in the WLM administrative application.
zDNNU	INT	2	(IBM name: R723DNNU) Number of the resource delay type. Values 1 ... 15 ARE related to zRW01 ... zRW15 respectively.
zDNDE	CHAR	16	(IBM name: R723DNDE) Resource delay description.

Record Type 72 Subtype 4 - Storage Data

Primary Segment:

- SMF072#04_RMF_Storage_Data

Secondary Segment(s): 5 (in alphabetical order)

- SMF072#04_Product
- SMF072#04_Reassembly_Area
- SMF072#04_Reassembly_Area_Info
- SMF072#04_Service_Class_Period
- SMF072#04_Swap_Reason

Primary segment: SMF072#04_RMF_Storage_Data

Field Name	Type	Len	Description
SMF072#04_RMF_Storage_Data.<fieldname>			
SMF072#04_RMF_Storage_Data.Header_self_defining_section.<fieldname>			
zFLG	HEX	1	(IBM name: SMF72FLG) System indicator: Bit Meaning when set 0 New SMF record format 1 Subtypes used 2 Reserved. 3-6 Version indicators 7 System is running in PR/SM mode.
zRTY	INT	1	(IBM name: SMF72RTY) Record type 72('X'48).
zTME	TSTMP	8	(IBM name: SMF72TME) Date/Time that the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF72SID) System identification (from the SMFPRMxx SID parameter).
zSSI	CHAR	4	(IBM name: SMF72SSI) Subsystem identification (RMF).
zSTY	INT	2	(IBM name: SMF72STY) Record SubType.
zTRN	INT	2	(IBM name: SMF72TRN) Number of triplets in this record. A triplet is a set of three SMF fields (offset/length/number values) that defines a section of the record. The offset is the offset from the RDW.
zPRS	INT	4	(IBM name: SMF72PRS) Offset to RMF Product section from RDW.
zPRL	INT	2	(IBM name: SMF72PRL) Length of RMF Product section.
zPRN	INT	2	(IBM name: SMF72PRN) Number of RMF Product sections. Individual header extension for SubType 3:
zCPS	INT	4	(IBM name: SMF72CPS) Offset to Service Class Period data section.
zCPL	INT	2	(IBM name: SMF72CPL) Length of Service Class Period data section.
zCPN	INT	2	(IBM name: SMF72CPN) Number of Service Class Period data sections.
zSPS	INT	4	(IBM name: SMF72SPS) Offset to Swap Reason data section.
zSPL	INT	2	(IBM name: SMF72SPL) Length of Swap Reason data section.
zSPN	INT	2	(IBM name: SMF72SPN) Number of Swap Reason data sections. Individual header extension for SubType 5:

Secondary segment: **SMF072#04_Product**

Field Name	Type	Len	Description
<i>SMF072#04_Product.<fieldname></i>			
zMFV	DEC	2 (3,0)	(IBM name: SMF72MFV) RMF version number.
zPRD	CHAR	8	(IBM name: SMF72PRD) Product name ('RMF').
zIST	DEC	4 (7,0)	(IBM name: SMF72IST) Time that the RMF measurement interval started, in the form 0hhmmssF, where hh is the hours, mm is the minutes, ss is the seconds, and F is the sign.
zDAT	DATE	4	(IBM name: SMF72DAT) Date when the RMF measurement interval started, in the form 0ccyddF.
zINT	DEC	4 (7,0)	(IBM name: SMF72INT) Duration of the RMF measurement interval, in the form mmsstttF where mm is the minutes, ss is the seconds, ttt is the milliseconds, and F is the sign. (The end of the measurement interval is the sum of the recorded start time and this field.)
zSAM	INT	4	(IBM name: SMF72SAM) Number of RMF samples.

<i>SMF072#04_Product.zFLA.<fieldname></i>			
zSkip	BIT	1	Samples have been skipped
zMonIII	BIT	1	RECORD was written by RMF Monitor III
zSyncSMF	BIT	1	INTERVAL was synchronized with SMF
zzIIPBoost	BIT	1	zIIP boost was active during entire interval.
zSpeedBoost	BIT	1	Speed boost was active during entire interval.
z_Boost_Class	BINT (ENUM)	3	

<i>SMF072#04_Product.<fieldname></i>			
zCYC	DEC	4 (7,0)	(IBM name: SMF72CYC) Sampling cycle length, in the form 000ttttF, where tttt is the milliseconds and F is the sign (taken from CYCLE option). The range of values is 0.050 to 9.999 seconds.
zMVS	CHAR	8	(IBM name: SMF72MVS) z/OS software level (consists of an acronym and the version, release, and modification level - ZVvrrmm).
zIML	INT	1	(IBM name: SMF72IML) Indicates the type of processor complex on which data measurements were taken. Value Meaning 3 9672, zSeries

<i>SMF072#04_Product.zPRF.<fieldname></i>			
zExpStg	BIT	1	The system has expanded storage
zESCA	BIT	1	The processor is enabled for ES connection architecture (ESCA)
zESCdir	BIT	1	There is an ES connection director in the configuration
zzArc	BIT	1	System is running in z/Architecture® mode
zZAAP	BIT	1	At least one zAAP is currently installed
zZIIP	BIT	1	At least one zIIP is currently installed
zDAT	BIT	1	Enhanced DAT facility

SMF072#04_Product.<fieldname>			
zPTN	INT	1	(IBM name: SMF72PTN) PR/SM partition number of the partition that wrote this record.
zSRL	INT	1	(IBM name: SMF72SRL) SMF record level change number (X'8E' for subtype 1 records or X'8F' for subtype 2 records for z/OS V2R4 RMF with RMF Data Gatherer APAR OA59330). This field enables processing of SMF record level changes in an existing release.
zIET	HEX	8	(IBM name: SMF72IET) Interval expiration time token. This token can be used to identify other than RMF records that belong to the same interval (if interval was synchronized with SMF).
zLGO	TIME	8	(IBM name: SMF72LGO) Offset GMT to local time (STCK format).
zRAO	INT	4	(IBM name: SMF72RAO) Offset to reassembly area relative to start of RMF product section.
zRAL	INT	2	(IBM name: SMF72RAL) Length of reassembly area. Area consists of a fixed header and a variable number of information blocks. Length depends on the record type/SubType, but is fixed for a specific type/SubType.
zRAN	INT	2	(IBM name: SMF72RAN) Reassembly area indicator. Value Meaning 0 RECORD is not broken. 1 RECORD is broken. Note: This field is used to indicate whether an SMF record is a broken record. Therefore, offset (SMF70RAO) and length (SMF70RAL) are only valid if SMF70RAN = 1. A reassembly area is only present in broken records.
zOIL	INT	2	(IBM name: SMF72OIL) Original interval length as defined in the session or by SMF (in seconds).
zSYN	INT	2	(IBM name: SMF72SYN) SYNC value in seconds.
zGIE	TIME	8	(IBM name: SMF72GIE) Projected gathering interval end (STCK format) GMT time.
zXNM	CHAR	8	(IBM name: SMF72XNM) Sysplex name as defined in parmlib member COUPLExx.
zSNM	CHAR	8	(IBM name: SMF72SNM) System name for current system as defined in parmlib member IEASYSxx SYSNAME parameter. Reassembly Area:

Secondary segment: **SMF072#04_Reassembly_Area**

Field Name	Type	Len	Description
SMF072#04_Reassembly_Area.<fieldname>			
zRBR	INT	2	(IBM name: SMF72RBR) Total number of broken records built from the original large record.
zRSQ	INT	2	(IBM name: SMF72RSQ) Sequence number of this broken record. Every broken record built from the same large record must have a unique sequence number, it is in the range from 1 TO SMF70RBR.
zRIO	INT	4	(IBM name: SMF72RIO) Offset to first reassembly information block relative to start of reassembly area header.
zRIL	INT	2	(IBM name: SMF72RIL) Length of reassembly information block.
zRIN	INT	2	(IBM name: SMF72RIN) Number of reassembly information blocks (same value as SMF70TRN in header section).

Secondary segment: SMF072#04_Reassembly_Area_Info

Field Name	Type	Len	Description
<i>SMF072#04_Reassembly_Area_Info.<fieldname></i>			
zRNN	INT	2	(IBM name: SMF72RNN) Total number of sections in the original large record. This field contains information of how many sections of a specific type were contained in the original SMF record. This field is a copy of the number field of the triplet in the original (non broken) record.
zRPP	INT	2	(IBM name: SMF72RPP) Position of the first of one or more consecutive sections described by this block as in the original record. Values in the range of 1 TO SMF70RNN are valid for correct processing. A value of 0 WILL skip processing of this information block. This field provides information where the sections that are part of this broken record were placed in the original record before the split took place. The actual number of consecutive sections contained in this record is available from the actual triplet in the header extension.

Secondary segment: SMF072#04_Service_Class_Period

Field Name	Type	Len	Description
<i>SMF072#04_Service_Class_Period.<fieldname></i>			
zPNAM	CHAR	8	(IBM name: R724PNAM) Name of active service policy.
zPTM	TSTMP	8	(IBM name: R724PTM) Local time/date of policy activation (STCK format).
zLCNM	CHAR	8	(IBM name: R724LCNM) Service class name.
zPER#	INT	1	(IBM name: R724PER#) Service class period number.
zUSER	INT	4	(IBM name: R724USER) Number of users found.
zACTV	INT	4	(IBM name: R724ACTV) Number of active users found.
zACTS	INT	4	(IBM name: R724ACTS) Number of active samples (except OUTR).
zIDLS	INT	4	(IBM name: R724IDLS) Number of idle samples.
zPAGE	INT	4	(IBM name: R724PAGE) Number of users delayed for paging at all samples.
zSWAP	INT	4	(IBM name: R724SWAP) Number of users delayed for swapping at all samples.
zOUTR	INT	4	(IBM name: R724OUTR) Number of out and ready users at all samples.
zPGIN	INT	4	(IBM name: R724PGIN) Number of page-ins.
zDIVS	INT	4	(IBM name: R724DIVS) Number of DIV samples.
zLSSA	INT	4	(IBM name: R724LSSA) Total logically swapped samples for the group.
zPSSA	INT	4	(IBM name: R724PSSA) Total swapped samples for the group (except logical).
zUPRO	INT	4	(IBM name: R724UPRO) Total processor using samples for the group.

zUDEV	INT	4	(IBM name: R724UDEV) Total device using samples for the group.
zDPRO	INT	4	(IBM name: R724DPRO) Total processor delay samples for the group.
zDDEV	INT	4	(IBM name: R724DDEV) Total device delay samples for the group.
zDSTO	INT	4	(IBM name: R724DSTO) Total storage delay samples for the group.
zDJES	INT	4	(IBM name: R724DJES) Total JES delay samples for the group.
zDHSM	INT	4	(IBM name: R724DHSM) Total HSM delay samples for the group.
zDXCF	INT	4	(IBM name: R724DXCF) Total XCF delay samples for the group.
zDENQ	INT	4	(IBM name: R724DENQ) Total ENQ delay samples for the group.
zDMNT	INT	4	(IBM name: R724DMNT) Total mount delay samples for the group.
zDMSG	INT	4	(IBM name: R724DMSG) Total message delay samples for the group.
zUNKN	INT	4	(IBM name: R724UNKN) Total unknown state samples for the group.
zVALD	INT	4	(IBM name: R724VALD) Total valid samples for the group (single state sum of all using, delay, idle, and unknown).
zLSCT	INT	4	(IBM name: R724LSCT) Count of 'long' logical swaps for the group.
zESCT	INT	4	(IBM name: R724ESCT) Count of 'long' swaps to expanded storage for the group.
zPSCT	INT	4	(IBM name: R724PSCT) Count of 'long' physical swaps for the group.
zACTF	FLOAT	8	(IBM name: R724ACTF) Number of active frames.
zIDLE	FLOAT	8	(IBM name: R724IDLE) Number of idle frames.
zSLOT	FLOAT	8	(IBM name: R724SLOT) Number of slots used.
zDIV	FLOAT	8	(IBM name: R724DIV) Number of DIV frames.
zFIX	FLOAT	8	(IBM name: R724FIX) Number of fixed frames.
zLSCF	FLOAT	8	(IBM name: R724LSCF) Number of central frames for all logically swapped users at all samples.
zLSEF	FLOAT	8	(IBM name: R724LSEF) Number of expanded frames for all logically swapped users at all samples.
zPSEF	FLOAT	8	(IBM name: R724PSEF) Number of expanded frames for all swapped users (except logical) at all samples.
zVECT	FLOAT	8	(IBM name: R724VECT) Total vector utilization time for the group (microseconds).
zET	FLOAT	8	(IBM name: R724ET) Total execution time for all transactions that ended in the group (1024-microsecond units). Does not include queued time.
zQT	FLOAT	8	(IBM name: R724QT) Total time spent on JES or APPC queues by all transactions that ended in the group (1024-microsecond units).
zEND	FLOAT	8	

			(IBM name: R724END) Number of transactions that ended in the group .
zTSV	FLOAT	8	(IBM name: R724TSV) Sum of shared page views.
zVIN	FLOAT	8	(IBM name: R724VIN) Sum of shared pages in central storage that are valid.
zVLC	FLOAT	8	(IBM name: R724VLC) Sum of shared page validations.
zGPI	FLOAT	8	(IBM name: R724GPI) Sum of shared page-ins from auxiliary storage.
zETX	FLOAT	8	(IBM name: R724ETX) Total execution time for all transactions that ended in the group. Same as zET, but in microseconds.
zQTX	FLOAT	8	(IBM name: R724QTX) Total time spent on JES or APPC queues by all transactions that ended in the group. Same as zQT, but in microseconds.

Secondary segment: **SMF072#04_Swap_Reason**

Field Name	Type	Len	Description
<i>SMF072#04_Swap_Reason.<fieldname></i>			
zOR1	INT	4	(IBM name: R724OR1) STOR/OUTR delay samples for swap reason 1: Terminal output wait.
zOR2	INT	4	(IBM name: R724OR2) STOR/OUTR delay samples for swap reason 2: Terminal input wait.
zOR3	INT	4	(IBM name: R724OR3) STOR/OUTR delay samples for swap reason 3: Long wait.
zOR4	INT	4	(IBM name: R724OR4) STOR/OUTR delay samples for swap reason 4: Auxiliary storage shortage.
zOR5	INT	4	(IBM name: R724OR5) STOR/OUTR delay samples for swap reason 5: Real storage shortage.
zOR6	INT	4	(IBM name: R724OR6) STOR/OUTR delay samples for swap reason 6: Detected long wait.
zOR7	INT	4	(IBM name: R724OR7) STOR/OUTR delay samples for swap reason 7: Requested swap. No longer used - refer to zOR7A.
zOR8	INT	4	(IBM name: R724OR8) STOR/OUTR delay samples for swap reason 8: Enqueue exchange swap.
zOR9	INT	4	(IBM name: R724OR9) STOR/OUTR delay samples for swap reason 9: Exchange swap.
zOR10	INT	4	(IBM name: R724OR10) STOR/OUTR delay samples for swap reason 10: Unilateral swap.
zOR11	INT	4	(IBM name: R724OR11) STOR/OUTR delay samples for swap reason 11: Transition swap.
zOR12	INT	4	(IBM name: R724OR12) STOR/OUTR delay samples for swap reason 12: Improve central storage usage.
zOR13	INT	4	(IBM name: R724OR13) STOR/OUTR delay samples for swap reason 13: Improve system paging rate.
zOR14	INT	4	(IBM name: R724OR14) STOR/OUTR delay samples for swap reason 14: Make room for an out too long user.
zOR15	INT	4	(IBM name: R724OR15) STOR/OUTR delay samples for swap reason 15: APPC wait.

zOR16	INT	4	(IBM name: R724OR16) STOR/OUTR delay samples for swap reason 16: OMVS input wait.
zOR17	INT	4	(IBM name: R724OR17) STOR/OUTR delay samples for swap reason 17: OMVS output wait.
zOR18	INT	4	(IBM name: R724OR18) STOR/OUTR delay samples for swap reason 18: In-real swap.
zOR7A	INT	4	(IBM name: R724OR7A) STOR/OUTR delay samples for swap reason 7: Memory pool shortage

Record Type 72 Subtype 5 - Serialization Delay

Primary segment: SMF072#05_RMF_Serialization_Delay

Field Name	Type	Len	Description
SMF072#05_RMF_Serialization_Delay.<fieldname>			
SMF072#05_RMF_Serialization_Delay.Header_self_defining_section.<fieldname>			
zFLG	HEX	1	(IBM name: SMF72FLG) System indicator: Bit Meaning when set 0 New SMF record format 1 Subtypes used 2 Reserved. 3-6 Version indicators 7 System is running in PR/SM mode.
zRTY	INT	1	(IBM name: SMF72RTY) Record type 72(X'48').
zTME	TSTMP	8	(IBM name: SMF72TME) Date/Time that the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF72SID) System identification (from the SMFPRMxx SID parameter).
zSSI	CHAR	4	(IBM name: SMF72SSI) Subsystem identification (RMF).
zSTY	INT	2	(IBM name: SMF72STY) Record SubType.
zTRN	INT	2	(IBM name: SMF72TRN) Number of triplets in this record. A triplet is a set of three SMF fields (offset/length/number values) that defines a section of the record. The offset is the offset from the RDW.
zPRS	INT	4	(IBM name: SMF72PRS) Offset to RMF Product section from RDW.
zPRL	INT	2	(IBM name: SMF72PRL) Length of RMF Product section.
zPRN	INT	2	(IBM name: SMF72PRN) Number of RMF Product sections. Individual header extension for SubType 3:
zSES	INT	4	(IBM name: SMF72SES) Offset to Serialization control section.
zSEL	INT	2	(IBM name: SMF72SEL) Length of Serialization control section.
zSEN	INT	2	(IBM name: SMF72SEN) Number of Serialization control sections. System suspend lock data sections:
zCMS	INT	4	(IBM name: SMF72CMS) Offset to CMS lock data section.

zCML	INT	2	(IBM name: SMF72CML) Length of CMS lock data section.
zCMN	INT	2	(IBM name: SMF72CMN) Number of CMS lock data sections.
zEDS	INT	4	(IBM name: SMF72EDS) Offset to CMS EnqueueDequeue lock data section.
zEDL	INT	2	(IBM name: SMF72EDL) Length of CMS EnqueueDequeue lock data section.
zEDN	INT	2	(IBM name: SMF72EDN) Number of CMS EnqueueDequeue lock data sections.
zLAS	INT	4	(IBM name: SMF72LAS) Offset to CMS latch lock data section.
zLAL	INT	2	(IBM name: SMF72LAL) Length of CMS latch lock data section.
zLAN	INT	2	(IBM name: SMF72LAN) Number of CMS latch lock data sections.
zSMS	INT	4	(IBM name: SMF72SMS) Offset to CMS SMF lock data section.
zSML	INT	2	(IBM name: SMF72SML) Length of CMS SMF lock data section.
zSMN	INT	2	(IBM name: SMF72SMN) Number of CMS SMF lock data sections.
zLOS	INT	4	(IBM name: SMF72LOS) Offset to local lock data section.
zLOL	INT	2	(IBM name: SMF72LOL) Length of local lock data section.
zLON	INT	2	(IBM name: SMF72LON) Number of local lock data sections.
zCOS	INT	4	(IBM name: SMF72COS) Offset to CML lock owner data section.
zCOL	INT	2	(IBM name: SMF72COL) Length of CML lock owner data section.
zCON	INT	2	(IBM name: SMF72CON) Number of CML lock owner data sections.
zCRS	INT	4	(IBM name: SMF72CRS) Offset to CML lock requestor data section.
zCRL	INT	2	(IBM name: SMF72CRL) Length of CML lock requestor data section.
zCRN	INT	2	(IBM name: SMF72CRN) Number of CML lock requestor data sections. GRS data sections:
zLCS	INT	4	(IBM name: SMF72LCS) Offset to GRS latch set creator data section.
zLCL	INT	2	(IBM name: SMF72LCL) Length of GRS latch set creator data section.
zLCN	INT	2	(IBM name: SMF72LCN) Number of GRS latch set creator data sections.
zLRS	INT	4	(IBM name: SMF72LRS) Offset to GRS latch set requestor data section.
zLRL	INT	2	(IBM name: SMF72LRL) Length of GRS latch set requestor data section.
zLRN	INT	2	(IBM name: SMF72LRN) Number of GRS latch set requestor data sections.
zTDS	INT	4	(IBM name: SMF72TDS) Offset to GRS ENQ SCOPE=STEP data section.
zTDL	INT	2	(IBM name: SMF72TDL) Length of GRS ENQ SCOPE=STEP data section.

zTDN	INT	2	(IBM name: SMF72TDN) Number of GRS ENQ SCOPE=STEP data sections.
zYDS	INT	4	(IBM name: SMF72YDS) Offset to GRS ENQ SCOPE=SYSTEM data section.
zYDL	INT	2	(IBM name: SMF72YDL) Length of GRS ENQ SCOPE=SYSTEM data section.
zYDN	INT	2	(IBM name: SMF72YDN) Number of GRS ENQ SCOPE=SYSTEM data sections. 132 82 SMF72SDS 4 BINARY Offset to GRS ENQ SCOPE=SYSTEMS data section.
zSDL	INT	2	(IBM name: SMF72SDL) Length of GRS ENQ SCOPE=SYSTEMS data section.
zSDN	INT	2	(IBM name: SMF72SDN) Number of GRS ENQ SCOPE=SYSTEMS data sections.
zQSS	INT	4	(IBM name: SMF72QSS) Offset to GRS QScan statistics data section.
zQSL	INT	2	(IBM name: SMF72QSL) Length of GRS QScan statistics data section.
zQSN	INT	2	(IBM name: SMF72QSN) Number of GRS QScan statistics data sections.

Secondary segment: **SMF072#05_Product**

Field Name	Type	Len	Description
<i>SMF072#05_Product.<fieldname></i>			
zMFV	DEC	2 (3,0)	(IBM name: SMF72MFV) RMF version number.
zPRD	CHAR	8	(IBM name: SMF72PRD) Product name ('RMF').
zIST	DEC	4 (7,0)	(IBM name: SMF72IST) Time that the RMF measurement interval started, in the form 0hhmmssF, where hh is the hours, mm is the minutes, ss is the seconds, and F is the sign.
zDAT	DATE	4	(IBM name: SMF72DAT) Date when the RMF measurement interval started, in the form 0cyydddF.
zINT	DEC	4 (7,0)	(IBM name: SMF72INT) Duration of the RMF measurement interval, in the form mmssttF where mm is the minutes, ss is the seconds, tt is the milliseconds, and F is the sign. (The end of the measurement interval is the sum of the recorded start time and this field.)
zSAM	INT	4	(IBM name: SMF72SAM) Number of RMF samples.

SMF072#05_Product.zFLA.<fieldname>			
zSkip	BIT	1	Samples have been skipped
zMonIII	BIT	1	RECORD was written by RMF Monitor III
zSyncSMF	BIT	1	INTERVAL was synchronized with SMF
zIIPBoost	BIT	1	zIIP boost was active during entire interval.
zSpeedBoost	BIT	1	Speed boost was active during entire interval.
z_Boost_Class	BINT (ENUM)	3	

SMF072#05_Product.<fieldname>			
zCYC	DEC		

		4 (7,0)	(IBM name: SMF72CYC) Sampling cycle length, in the form 000ttttF, where tttt is the milliseconds and F is the sign (taken from CYCLE option). The range of values is 0.050 to 9.999 seconds.
zMVS	CHAR	8	(IBM name: SMF72MVS) z/OS software level (consists of an acronym and the version, release, and modification level - ZVvrrmm).
zIML	INT	1	(IBM name: SMF72IML) Indicates the type of processor complex on which data measurements were taken. Value Meaning 3 9672, zSeries

SMF072#05_Product.zPRF.<fieldname>

zExpStg	BIT	1	The system has expanded storage
zESCA	BIT	1	The processor is enabled for ES connection architecture (ESCA)
zESCdir	BIT	1	There is an ES connection director in the configuration
zzArc	BIT	1	System is running in z/Architecture® mode
zZAAP	BIT	1	At least one zAAP is currently installed
zZIIP	BIT	1	At least one zIIP is currently installed
zDAT	BIT	1	Enhanced DAT facility

SMF072#05_Product.<fieldname>

zPTN	INT	1	(IBM name: SMF72PTN) PR/SM partition number of the partition that wrote this record.
zSRL	INT	1	(IBM name: SMF72SRL) SMF record level change number (X'8E' for subtype 1 records or X'8F' for subtype 2 records for z/OS V2R4 RMF with RMF Data Gatherer APAR OA59330). This field enables processing of SMF record level changes in an existing release.
zIET	HEX	8	(IBM name: SMF72IET) Interval expiration time token. This token can be used to identify other than RMF records that belong to the same interval (if interval was synchronized with SMF).
zLGO	TIME	8	(IBM name: SMF72LGO) Offset GMT to local time (STCK format).
zRAO	INT	4	(IBM name: SMF72RAO) Offset to reassembly area relative to start of RMF product section.
zRAL	INT	2	(IBM name: SMF72RAL) Length of reassembly area. Area consists of a fixed header and a variable number of information blocks. Length depends on the record type/SubType, but is fixed for a specific type/SubType.
zRAN	INT	2	(IBM name: SMF72RAN) Reassembly area indicator. Value Meaning 0 RECORD is not broken. 1 RECORD is broken. Note: This field is used to indicate whether an SMF record is a broken record. Therefore, offset (SMF70RAO) and length (SMF70RAL) are only valid if SMF70RAN = 1. A reassembly area is only present in broken records.
zOIL	INT	2	(IBM name: SMF72OIL) Original interval length as defined in the session or by SMF (in seconds).
zSYN	INT	2	(IBM name: SMF72SYN) SYNC value in seconds.
zGIE	TIME	8	(IBM name: SMF72GIE) Projected gathering interval end (STCK format) GMT time.
zXNM	CHAR	8	(IBM name: SMF72XNM) Sysplex name as defined in parmlib member COUPLExx.
zSNM	CHAR	8	(IBM name: SMF72SNM) System name for current system as defined in parmlib member IEASYSxx SYSNAME parameter. Reassembly Area:

Secondary segment: **SMF072#05_Reassembly_Area**

Field Name	Type	Len	Description
<i>SMF072#05_Reassembly_Area.<fieldname></i>			
zRBR	INT	2	(IBM name: SMF72RBR) Total number of broken records built from the original large record.
zRSQ	INT	2	(IBM name: SMF72RSQ) Sequence number of this broken record. Every broken record built from the same large record must have a unique sequence number, it is in the range from 1 TO SMF70RBR.
zRIO	INT	4	(IBM name: SMF72RIO) Offset to first reassembly information block relative to start of reassembly area header.
zRIL	INT	2	(IBM name: SMF72RIL) Length of reassembly information block.
zRIN	INT	2	(IBM name: SMF72RIN) Number of reassembly information blocks (same value as SMF70TRN in header section).

Secondary segment: **SMF072#05_Reassembly_Area_Info**

Field Name	Type	Len	Description
<i>SMF072#05_Reassembly_Area_Info.<fieldname></i>			
zRNN	INT	2	(IBM name: SMF72RNN) Total number of sections in the original large record. This field contains information of how many sections of a specific type were contained in the original SMF record. This field is a copy of the number field of the triplet in the original (non broken) record.
zRPP	INT	2	(IBM name: SMF72RPP) Position of the first of one or more consecutive sections described by this block as in the original record. Values in the range of 1 TO SMF70RNN are valid for correct processing. A value of 0 WILL skip processing of this information block. This field provides information where the sections that are part of this broken record were placed in the original record before the split took place. The actual number of consecutive sections contained in this record is available from the actual triplet in the header extension.

Secondary segment: **SMF072#05_Serialization_Control**

Field Name	Type	Len	Description
<i>SMF072#05_Serialization_Control.<fieldname></i>			
zSGMO	INT	1	(IBM name: R725SGMO) GRS mode. Value Meaning 0 NONE 1 RING 2 STAR
<i>SMF072#05_Serialization_Control.CMS_Lock.<fieldname></i>			
zSCMS	INT	8	(IBM name: R725SCMS) Total number of times that a unit of work was suspended on a CMS lock.
zSCMA	INT	8	(IBM name: R725SCMA) Total number of times that a unit of work was suspended on a CMS lock when there was already at least one other unit of work suspended for the lock.
zSCMT	INT	8	(IBM name: R725SCMT) Total amount of time in milliseconds that a unit of work was suspended on a CMS lock.

SMF072#05_Serialization_Control.CMS_Enq_Deq.<fieldname>			
zSEDS	INT	8	(IBM name: R725SEDS) Total number of times that a unit of work was suspended on a CMS Enqueue/Dequeue lock.
zSEDA	INT	8	(IBM name: R725SEDA) Total number of times that a unit of work was suspended on a CMS Enqueue/Dequeue lock when there was already at least one other unit of work suspended for the lock.
zSEDT	INT	8	(IBM name: R725SEDT) Total amount of time in milliseconds that a unit of work was suspended on a CMS Enqueue/Dequeue lock.

SMF072#05_Serialization_Control.CMS_Latch_Lock.<fieldname>			
zSLAS	INT	8	(IBM name: R725SLAS) Total number of times that a unit of work was suspended on a CMS Latch lock.
zSLAA	INT	8	(IBM name: R725SLAA) Total number of times that a unit of work was suspended on a CMS Latch lock when there was already at least one other unit of work suspended for the lock.
zSLAT	INT	8	(IBM name: R725SLAT) Total amount of time in milliseconds that a unit of work was suspended on a CMS Latch lock.

SMF072#05_Serialization_Control.CMS_SMF_Lock.<fieldname>			
zSSMS	INT	8	(IBM name: R725SSMS) Total number of times that a unit of work was suspended on a CMS SMF lock.
zSSMA	INT	8	(IBM name: R725SSMA) Total number of times that a unit of work was suspended on a CMS SMF lock when there was already at least one other unit of work suspended for the lock.
zSSMT	INT	8	(IBM name: R725SSMT) Total amount of time in milliseconds that a unit of work was suspended on a CMS SMF lock.

SMF072#05_Serialization_Control.CMS_Local_Lock.<fieldname>			
zSLOS	INT	8	(IBM name: R725SLOS) Total number of times that a unit of work was suspended on a local lock.
zSLOA	INT	8	(IBM name: R725SLOA) Total number of times that a unit of work was suspended on a local lock when there was already at least one other unit of work suspended for the lock.
zSLOT	INT	8	(IBM name: R725SLOT) Total amount of time in milliseconds that a unit of work was suspended on a local lock.

SMF072#05_Serialization_Control.CML_Lock_Owner.<fieldname>			
zSCLS	INT	8	(IBM name: R725SCLS) Total number of times that a unit of work from another address space was suspended when requesting the local lock of an address space.
zSCLA	INT	8	(IBM name: R725SCLA) Total number of times that a unit of work from another address space was suspended when requesting the local lock of an address space and there was already at least one other unit of work suspended for the lock.
zSCLT	INT	8	(IBM name: R725SCLT) Total amount of time in milliseconds that a unit of work from another address space was suspended when requesting the local lock of an address space.

SMF072#05_Serialization_Control.GRS_Latch_Obtain.<fieldname>			
---	--	--	--

zSLRS	INT	8	(IBM name: R725SLRS) Total number of suspended latch obtain requests.
zSLRT	INT	8	(IBM name: R725SLRT) Total amount of time in milliseconds that latch obtain requests were suspended.
zSLRQ	HEX	16	(IBM name: R725SLRQ) Total sum of squares of time in milliseconds that latch obtain requests were suspended. GRS ENQ SCOPE=STEP Summary - system wide data for all address spaces.

SMF072#05_Serialization_Control.GRS_ENQ_SCOPE_STEP.<fieldname>

zSSTR	INT	8	(IBM name: R725SSTR) Total number of ENQ SCOPE=STEP requests.
zSSTS	INT	8	(IBM name: R725SSTS) Total number of ENQ SCOPE=STEP requests that were suspended.
zSSTT	INT	8	(IBM name: R725SSTT) Total amount of contention time in milliseconds caused by ENQ SCOPE=STEP requests.
zSSTQ	HEX	16	(IBM name: R725SSTQ) Total sum of squares of contention time in milliseconds caused by ENQ SCOPE=STEP requests. GRS ENQ SCOPE=SYSTEM Summary - system wide data for all address spaces.

SMF072#05_Serialization_Control.GRS_ENQ_SCOPE_SYSTEM.<fieldname>

zSSYR	INT	8	(IBM name: R725SSYR) Total number of ENQ SCOPE=SYSTEM requests.
zSSYS	INT	8	(IBM name: R725SSYS) Total number of ENQ SCOPE=SYSTEM requests that were suspended.
zSSYT	INT	8	(IBM name: R725SSYT) Total amount of contention time in milliseconds caused by ENQ SCOPE=SYSTEM requests.
zSSYQ	HEX	16	(IBM name: R725SSYQ) Total sum of squares of contention time in milliseconds caused by ENQ SCOPE=SYSTEM requests. GRS ENQ SCOPE=SYSTEMS Summary - system wide data for all address spaces.
zSSSR	INT	8	(IBM name: R725SSSR) Total number of ENQ SCOPE= SYSTEMS requests.
zSSSS	INT	8	(IBM name: R725SSSS) Total number of ENQ SCOPE= SYSTEMS requests that were suspended.
zSSST	INT	8	(IBM name: R725SSST) Total amount of contention time in milliseconds caused by ENQ SCOPE= SYSTEMS requests.
zSSSQ	HEX	16	(IBM name: R725SSSQ) Total sum of squares of contention time in milliseconds caused by ENQ SCOPE=SYSTEMS requests.

Secondary segment: SMF072#05_CMS_Lock

Field Name	Type	Len	Description
<i>SMF072#05_CMS_Lock.<fieldname></i>			
zCMJN	CHAR	8	(IBM name: R725CMJN) Name of the job.
zCMSP	INT	1	(IBM name: R725CMSP) Service class period.
zCMAS	INT	2	(IBM name: R725CMAS) Address space ID.
zCMST	HEX	8	

			(IBM name: R725CMST) Address space SToken.
zCMSN	CHAR	8	(IBM name: R725CMSN) Service class name.
zCMTY	INT	1	(IBM name: R725CMTY) Lock type: Value Meaning 1 CMS lock 2 CMS Enqueue/Dequeue lock 3 CMS Latch lock 4 CMS SMF lock
zCMSU	INT	8	(IBM name: R725CMSU) Number of times that a unit of work of this address space was suspended on the CMS lock type as specified in zCMTY.
zCMAL	INT	8	(IBM name: R725CMAL) Number of times that a unit of work of this address space was suspended on the CMS lock type as specified in zCMTY when there was already at least one other unit of work suspended for this lock.
zCMTI	INT	8	(IBM name: R725CMTI) Total amount of time in milliseconds that a unit of work of this address space was suspended on the CMS lock type as specified in zCMTY.

Secondary segment: SMF072#05_Local_Lock

Field Name	Type	Len	Description
<i>SMF072#05_Local_Lock.<fieldname></i>			
zLOJN	CHAR	8	(IBM name: R725LOJN) Name of the job.
zLOSP	INT	1	(IBM name: R725LOSP) Service class period.
zLOAS	INT	2	(IBM name: R725LOAS) Address space ID.
zLOST	HEX	8	(IBM name: R725LOST) Address space SToken.
zLOSN	CHAR	8	(IBM name: R725LOSN) Service class name.
zLOSU	INT	8	(IBM name: R725LOSU) Number of times that a unit of work of this address space was suspended on a local lock.
zLOAL	INT	8	(IBM name: R725LOAL) Number of times that a unit of work of this address space was suspended on a local lock when there was already at least one other unit of work suspended.
zLOTI	INT	8	(IBM name: R725LOTI) Total amount of time in milliseconds that a unit of work of this address space was suspended on a local lock.
zLCSU	INT	8	(IBM name: R725LCSU) Number of times that a unit of work from another address space was suspended when requesting the local lock of this address space.
zLCAL	INT	8	(IBM name: R725LCAL) Number of times that a unit of work from another address space was suspended when requesting the local lock of this address space and there was already at least one other unit of work waiting for that lock.
zLCTI	INT	8	(IBM name: R725LCTI) Total amount of time in milliseconds that a unit of work was suspended when requesting the local lock of this address space.

Secondary segment: **SMF072#05_CML_Lock_Owner**

Field Name	Type	Len	Description
<i>SMF072#05_CML_Lock_Owner.<fieldname></i>			
zCOJN	CHAR	8	(IBM name: R725COJN) Name of the job.
zCOSP	INT	1	(IBM name: R725COSP) Service class period.
zCOAS	INT	2	(IBM name: R725COAS) Address space ID.
zCOST	HEX	8	(IBM name: R725COST) Address space SToken.
zCOSN	CHAR	8	(IBM name: R725COSN) Service class name.
zCOSU	INT	8	(IBM name: R725COSU) Number of times that a unit of work from another address space was suspended when requesting the local lock of this address space.
zCOAL	INT	8	(IBM name: R725COAL) Number of times that a unit of work from another address space was suspended when requesting the local lock of this address space and there was already at least one other unit of work waiting for that lock.
zCOTI	INT	8	(IBM name: R725COTI) Total amount of time in milliseconds that a unit of work was suspended when requesting the local lock of this address space. Local lock data
zCLSU	INT	8	(IBM name: R725CLSU) Number of times that a unit of work of this address space was suspended on a local lock.
zCLAL	INT	8	(IBM name: R725CLAL) Number of times that a unit of work of this address space was suspended on a local lock when there was already at least one other unit of work suspended.
zCLTI	INT	8	(IBM name: R725CLTI) Total amount of time in milliseconds that a unit of work of this address space was suspended on a local lock.

Secondary segment: **SMF072#05_CML_Lock_Requestor**

Field Name	Type	Len	Description
<i>SMF072#05_CML_Lock_Requestor.<fieldname></i>			
zCRJN	CHAR	8	(IBM name: R725CRJN) Name of the job.
zCRSP	INT	1	(IBM name: R725CRSP) Service class period.
zCRAS	INT	2	(IBM name: R725CRAS) Address space ID.
zCRST	HEX	8	(IBM name: R725CRST) Address space SToken.
zCRSN	CHAR	8	(IBM name: R725CRSN) Service class name.
zCRSU	INT	8	(IBM name: R725CRSU) Number of times that a unit of work from this address space was suspended when requesting the local lock of another address space.
zCRAL	INT	8	(IBM name: R725CRAL) Number of times that a unit of work from this address space was suspended when requesting the local lock of another address space and there was already at least one other unit of work waiting for that lock.

zCRTI	INT	8	(IBM name: R725CRTI) Total amount of time in milliseconds that a unit of work was suspended when requesting the local lock of another address space.
-------	-----	---	---

Secondary segment: **SMF072#05_GRS_Latch**

Field Name	Type	Len	Description
<i>SMF072#05_GRS_Latch.<fieldname></i>			
zLAJN	CHAR	8	(IBM name: R725LAJN) Name of the job.
zLASP	INT	1	(IBM name: R725LASP) Service class period.
zLAAS	INT	2	(IBM name: R725LAAS) Address space ID.
zLAST	HEX	8	(IBM name: R725LAST) Address space SToken.
zLASN	CHAR	8	(IBM name: R725LASN) Service class name.
zLATY	INT	1	(IBM name: R725LATY) Request type: Value Meaning 1 LATCH obtain requests against a latch set created by this address space 2 LATCH obtain requests from this address space
zLASU	INT	8	(IBM name: R725LASU) Number of times a latch obtain request was suspended for the request type as specified in zLATY.
zLATI	INT	8	(IBM name: R725LATI) Total amount of suspend time in milliseconds that was caused by latch obtain requests for the request type as specified in zLATY.
zLASQ	HEX	16	(IBM name: R725LASQ) Sum of squares of the individual suspend times in milliseconds that was caused by latch obtain requests for the request type as specified in zLATY.

Secondary segment: **SMF072#05_GRS_Enqueue**

Field Name	Type	Len	Description
<i>SMF072#05_GRS_Enqueue.<fieldname></i>			
zENJN	CHAR	8	(IBM name: R725ENJN) Name of the job.
zENSP	INT	1	(IBM name: R725ENSP) Service class period.
zENAS	INT	2	(IBM name: R725ENAS) Address space ID.
zENST	HEX	8	(IBM name: R725ENST) Address space SToken.
zENSN	CHAR	8	(IBM name: R725ENSN) Service class name.
zENSC	INT	1	(IBM name: R725ENSC) Enqueue scope type: Value Meaning 1 SC0PE = Step 2 SC0PE = System 3 SC0PE = Systems
zENRC	INT	8	(IBM name: R725ENRC) Number of GRS ENQ requests with the scope as specified in zENSC for this address space.
zENSU	INT	8	

			(IBM name: R725ENSU) Number of GRS ENQ requests with the scope as specified in zENSC that were suspended for this address space.
zENTI	INT	8	(IBM name: R725ENTI) Total amount of suspend time in milliseconds that was caused by GRS ENQ requests with the scope as specified in zENSC for this address space.
zENSQ	HEX	16	(IBM name: R725ENSQ) Sum of squares of the individual suspend times in milliseconds.

Secondary segment: SMF072#05_GRS_QScan

Field Name	Type	Len	Description
<i>SMF072#05_GRS_QScan.<fieldname></i>			
zQSJN	CHAR	8	(IBM name: R725QSJN) Name of the job.
zQSSP	INT	1	(IBM name: R725QSSP) Service class period.
zQSAS	INT	2	(IBM name: R725QSAS) Address space ID.
zQSST	HEX	8	(IBM name: R725QSST) Address space SToken.
zQSSN	CHAR	8	(IBM name: R725QSSN) Service class name.
zQSRC	INT	8	(IBM name: R725QSRC) Number of requests including START and RESUME requests, but not QUIT requests.
zQSSC	INT	8	(IBM name: R725QSSC) Number of specific requests that are either GQSCAN requests specified by QNAME and RNAME, or ISGQUERY requests specifying a search by ENQTOKEN.
zQSRR	INT	8	(IBM name: R725QSRR) Total number of resources returned for these requests.
zQSRQ	HEX	16	(IBM name: R725QSRQ) Sum of squares of number of resources returned for these requests.
zQSTI	TIME	8	(IBM name: R725QSTI) Total amount of execution times within GRS for these requests in microseconds.
zQSTQ	HEX	16	(IBM name: R725QSTQ) Sum of squares of individual request execution times in microseconds.

Record Type 73 - RMF Channel Path Activity

SMF Record 73 (RMF Channel Path Activity) is mapped by structure member "T073".

Primary Segment:

- SMF073_RMF_Channel_Path

Secondary Segment(s): 8 (in alphabetical order)

- SMF073_CP_Control
- SMF073_CP_Data
- SMF073_CPMF_Channel_Measurement_1
- SMF073_CPMF_Channel_Measurement_2
- SMF073_CPMF_Channel_Measurement_3
- SMF073_CPMF_Extended_Channel_Measurement_2
- SMF073_Extended_CP
- SMF073_Product

Primary segment: SMF073_RMF_Channel_Path

Field Name	Type	Len	Description
<i>SMF073_RMF_Channel_Path.<fieldname></i>			
<i>SMF073_RMF_Channel_Path.Header_Self_Defining_Section.<fieldname></i>			
zFLG	HEX	1	(IBM name: SMF73FLG) System indicator: Bit Meaning when set 0 New SMF record format 1 Subtypes used 2 Reserved. 3-6 Version indicators 7 System is running in PR/SM mode.
zRTY	INT	1	(IBM name: SMF73RTY) Record type 73 (X'49').
zTME	TSTMP	8	(IBM name: SMF73TME) Date/Time when the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF73SID) System identification (from the SMFPRMxx SID parameter).
zSSI	CHAR	4	(IBM name: SMF73SSI) Subsystem identification ('RMF').
zSTY	INT	2	(IBM name: SMF73STY) Record SubType=1.
zTRN	INT	2	(IBM name: SMF73TRN) Number of triplets in this record. A triplet is a set of three SMF fields (offset/length/number values) that defines a section of the record. The offset is the offset from the RDW.
zPRS	INT	4	(IBM name: SMF73PRS) Offset to RMF product section from RDW.
zPRL	INT	2	(IBM name: SMF73PRL) Length of RMF product section.
zPRN	INT	2	(IBM name: SMF73PRN) Number of RMF product sections.
zHIS	INT	4	(IBM name: SMF73HIS) Offset to channel path control section from RDW.
zHIL	INT	2	(IBM name: SMF73HIL) Length of channel path control section.
zHIN	INT	2	(IBM name: SMF73HIN) Number of channel path control sections.
zHPS	INT	4	(IBM name: SMF73HPS) Offset to Channel Path data section from RDW.
zHPL	INT	2	(IBM name: SMF73HPL) Length of Channel Path data section.

zHPN	INT	2	(IBM name: SMF73HPN) Number of Channel Path data sections.
zHES	INT	4	(IBM name: SMF73HES) Offset to Extended Channel Path data section from RDW.
zHEL	INT	2	(IBM name: SMF73HEL) Length of Extended Channel Path data section.
zHEN	INT	2	(IBM name: SMF73HEN) Number of Extended Channel Path data sections.

Secondary segment: SMF073_Product

Field Name	Type	Len	Description
<i>SMF073_Product.<fieldname></i>			
zMFV	DEC	2 (3,0)	(IBM name: SMF73MFV) RMF version number.
zPRD	CHAR	8	(IBM name: SMF73PRD) Product name ('RMF').
zIST	DEC	4 (7,0)	(IBM name: SMF73IST) Time that the RMF measurement interval started, in the form 0hhmmssF, where hh is the hours, mm is the minutes, ss is the seconds, and F is the sign.
zDAT	DATE	4	(IBM name: SMF73DAT) Date when the RMF measurement interval started, in the form 0cyyddF.
zINT	DEC	4 (7,0)	(IBM name: SMF73INT) Duration of RMF measurement interval, in the form mmssttF where mm is the minutes, ss is the seconds, tt is the milliseconds, and F is the sign. The end of the measurement interval is the sum of the record start time (and this field).
zSAM	INT	4	(IBM name: SMF73SAM) Number of RMF samples.

SMF073_Product.zFLA.<fieldname>

zSkip	BIT	1	Samples have been skipped
zMonIII	BIT	1	RECORD was written by RMF Monitor III
zSyncSMF	BIT	1	INTERVAL was synchronized with SMF

SMF073_Product.<fieldname>

zCYC	DEC	4 (7,0)	(IBM name: SMF73CYC) Sampling cycle length, in the form 000tttF, where ttt is the milliseconds and F is the sign (taken from CYCLE option). The range of values is 0.050 to 9.999 seconds.
zMVS	CHAR	8	(IBM name: SMF73MVS) z/OS software level (consists of an acronym and the version, release, and modification level - ZVvrrmm).
zIML	INT	1	(IBM name: SMF73IML) Indicates the type of processor complex on which data measurements were taken. Value Meaning 3 9672, zSeries

SMF073_Product.zPRF.<fieldname>

zExpStg	BIT	1	The system has expanded storage
zESCA	BIT	1	The processor is enabled for ES connection architecture (ESCA)
zESCdir	BIT	1	There is an ES connection director in the configuration
zzArc	BIT	1	System is running in z/Architecture® mode
zZAAP	BIT	1	At least one zAAP is currently installed

zZIIP	BIT	1	At least one zIIP is currently installed
zDAT	BIT	1	Enhanced DAT facility

SMF073_Product.<fieldname>			
zPTN	INT	1	(IBM name: SMF73PTN) PR/SM partition number of the partition that wrote this record.
zSRL	INT	1	(IBM name: SMF73SRL) SMF record level change number (X'8E' for subtype 1 records or X'8F' for subtype 2 records for z/OS V2R4 RMF with RMF Data Gatherer APAR OA59330). This field enables processing of SMF record level changes in an existing release.
zIET	HEX	8	(IBM name: SMF73IET) Interval expiration time token. This token can be used to identify other than RMF records that belong to the same interval (if interval was synchronized with SMF).
zLGO	TIME	8	(IBM name: SMF73LGO) Offset GMT to local time (STCK format).
zRAO	INT	4	(IBM name: SMF73RAO) Offset to reassembly area relative to start of RMF product section.
zRAL	INT	2	(IBM name: SMF73RAL) Length of reassembly area. Area consists of a fixed header and a variable number of information blocks. Length depends on the record type/SubType, but is fixed for a specific type/SubType.
zRAN	INT	2	(IBM name: SMF73RAN) Reassembly area indicator. Value Meaning 0 RECORD is not broken. 1 RECORD is broken. Note: This field is used to indicate whether an SMF record is a broken record. Therefore, offset (SMF71RAO) and length (SMF71RAL) are only valid if SMF71RAN = 1. A reassembly area is only present in broken records.
zOIL	INT	2	(IBM name: SMF73OIL) Original interval length as defined in the session or by SMF (in seconds).
zSYN	INT	2	(IBM name: SMF73SYN) SYNC value in seconds.
zGIE	TSTMP	8	(IBM name: SMF73GIE) Projected gathering interval end (STCK format) GMT time.
zXNM	CHAR	8	(IBM name: SMF73XNM) Sysplex name as defined in parmlib member COUPLExx.
zSNM	CHAR	8	(IBM name: SMF73SNM) System name for current system as defined in parmlib member IEASYSxx SYSNAME parameter. Reassembly Area:

SMF073_Product.Reassembly_Area.<fieldname>			
zRBR	INT	2	(IBM name: SMF73RBR) Total number of broken records built from the original large record.
zRSQ	INT	2	(IBM name: SMF73RSQ) Sequence number of this broken record. Every broken record built from the same large record must have a unique sequence number, it is in the range from 1 TO SMF70RBR.
zRIO	INT	4	(IBM name: SMF73RIO) Offset to first reassembly information block relative to start of reassembly area header.
zRIL	INT	2	(IBM name: SMF73RIL) Length of reassembly information block.
zRIN	INT	2	(IBM name: SMF73RIN) Number of reassembly information blocks (same value as SMF70TRN in header section).

SMF073_Product.Reassembly_Area.Reassembly_Info.<fieldname>			
zRNN	INT	2	(IBM name: SMF73RNN) Total number of sections in the original large record. This field contains information of how many sections of a specific type were contained in the

			original SMF record. This field is a copy of the number field of the triplet in the original (non broken) record.
zRPP	INT	2	(IBM name: SMF73RPP) Position of the first of one or more consecutive sections described by this block as in the original record. Values in the range of 1 TO SMF70RNN are valid for correct processing. A value of 0 WILL skip processing of this information block. This field provides information where the sections that are part of this broken record were placed in the original record before the split took place. The actual number of consecutive sections contained in this record is available from the actual triplet in the header extension.

Secondary segment: SMF073_CP_Control

Field Name	Type	Len	Description
<i>SMF073_CP_Control.<fieldname></i>			
zSMP	INT	4	(IBM name: SMF73SMP) This field contains the number of samples while the busy count is stored in field SMF73BSY. Only valid if bit 2 0F SMF73SFL is not set.

<i>SMF073_CP_Control.zCFL.<fieldname></i>			
zChg	BIT	1	Configuration changed. Used to decide whether to provide the text 'POR' or 'ACTIVATE' on reports. Also used to check whether data can be combined in a duration report.
zSincePOR	BIT	1	Configuration change since power-on-reset (POR).
zIODF	BIT	1	POR using IODF data set that supports dynamic configuration change (contains I/O token).
zIOTokValid	BIT	1	I/O token is valid.
zInvalData	BIT	1	Record may include data sections that are not valid.
zCPMFavail	BIT	1	CPMF (channel path measurement facility) available.
zCPMFmode	BIT	1	CPMF mode has changed.

<i>SMF073_CP_Control.zSFL.<fieldname></i>			
zDCM	BIT	1	DCM supported by hardware.
zDCMchann	BIT	1	Configuration contains DCM managed channels.
zMLCS	BIT	1	Hardware allows multiple logical channel subsystems.
zECMF	BIT	1	Enhanced channel measurement facility available.

<i>SMF073_CP_Control.<fieldname></i>			
zTNM	CHAR	44	(IBM name: SMF73TNM) IODF name.
zTSF	CHAR	2	(IBM name: SMF73TSF) IODF name suffix.
zTDT	CHAR	8	(IBM name: SMF73TDT) IODF creation date, in the form mm/dd/yy.
zTTM	CHAR	8	(IBM name: SMF73TTM) IODF creation time, in the form hh.mm.ss.
zCRC	INT	4	(IBM name: SMF73CRC) CPMF (channel path measurement facility) restart count
zCSC	INT	4	(IBM name: SMF73CSC) Last CPMF (channel path measurement facility) sample count
zTDY	CHAR	10	(IBM name: SMF73TDY) IODF creation date, in the form mm/dd/yyyy.
zCMI		1	

	INT (ENUM)		(IBM name: SMF73CMI) CPMF mode.
zCSS	CHAR	1	(IBM name: SMF73CSS) Channel subsystem ID. Only valid if bit 2 0F SMF73SFL is set.

Secondary segment: **SMF073_CP_Data**

Field Name	Type	Len	Description
<i>SMF073_CP_Data.<fieldname></i>			
zPID	INT	1	(IBM name: SMF73PID) Channel path identification. The range of values is X'0' to X'FF'. Support for dynamic I/O. There are always X'FF' path data sections in record type 73, even though there might not be X'FF' CHPIDs defined in the system. These dummy data sections in the SMF records only contain the channel path ID. The rest is filled with hexadecimal zeroes.

<i>SMF073_CP_Data.zFG2.<fieldname></i>			
zBlockMP	BIT	1	Block multiplexor
zByteMP	BIT	1	Byte multiplexor
zPartial	BIT	1	Only partial statistics available
zReconfigured	BIT	1	Data recorded is incorrect because channel path was reconfigured during interval
zOnline	BIT	1	Channel path is currently online.

<i>SMF073_CP_Data.zFG3.<fieldname></i>			
zES	BIT	1	ES connection channel
zESdir	BIT	1	ES connection director attached to channel path
zESconv	BIT	1	ES connection converter attached to this channel
zCPMod	BIT	1	Channel path modified
zCPDel	BIT	1	Channel path deleted
zCPAdd	BIT	1	Channel path added
zCPVal	BIT	1	Valid path
zCPShr	BIT	1	Channel path is shared between logical partitions

<i>SMF073_CP_Data.zFG4.<fieldname></i>			
zCPMBInval	BIT	1	CPMB (channel path measurement block) entry not valid
zCTC	BIT	1	Channel path is CTC defined
zCv3090	BIT	1	Channel conversion 3090
zDCM	BIT	1	Channel path is DCM managed
zChgIntvl	BIT	1	Channel characteristics changed during interval
zCPExt	BIT	1	Extended channel path measurements are supported
zPNID	BIT	1	Physical-network identifiers SMF73NT1 and SMF73NT2 are valid.

<i>SMF073_CP_Data.<fieldname></i>			
zBSY	INT	4	(IBM name: SMF73BSY) Count of store channel path status (STCPS) samples taken by SRM in which the channel path related to this entry was found busy. This count is normalized (broken down into the simplest expression).
zPBY	INT	4	(IBM name: SMF73PBY) Partition's channel-path-busy-time since last RMF interval, in units of 1024

			MICROSECONDS.
zPTI	INT	4	(IBM name: SMF73PTI) Partition's channel-path measurement interval, in units of 1024 MICROSECONDS.
zCPD	INT	1	(IBM name: SMF73CPD) Channel path description. For an explanation, you can issue the command D M=CHP.
zACR	CHAR	5	(IBM name: SMF73ACR) Channel path acronym.
zCMG	INT	1	(IBM name: SMF73CMG) CPMF Channel measurement group.
zFG5	BIT	8	CPMF validation flags - each bit (if on) indicates that the corresponding measurement data is available and valid. This refers to the first five words of the channel measurement data in field SMF73CCM. Bit Measurement Data 0 CHANNEL measurement data - word
zCCM	HEX	48	(IBM name: SMF73CCM) CPMF Channel measurement data (extended mode). The contents of this field is different for each measurement group, as described in the following tables.
zCPP	INT	1	(IBM name: SMF73CPP) Channel path parameter.
zGEN	INT	1	(IBM name: SMF73GEN) Channel type generation.
zEIX	INT	2	(IBM name: SMF73EIX) Index to Extended Channel Path data section. Only valid if bit 6 OF SMF73FG4 is set.
zSPD	INT	2	(IBM name: SMF73SPD) Channel path speed at the end of interval. If channel path power (bits 4-7 of SMF73MSC) is zero, the channel path speed is in units of 100 MEGABITS per second. Otherwise, this value must be multiplied by 10**Power to get the speed in units of bits per second.
zMSC	INT	1	(IBM name: SMF73MSC) Miscellaneous 0 - 3 Reserved. 4 - 7 Channel path power at the end of interval. If non-zero, this value can be used to calculate the channel path speed (SMF73SPD * 10**Power).
zNT1	CHAR	16	(IBM name: SMF73NT1) Physical-network identifier (PNET ID) of an Ethernet network that is accessible from the first port of the channel path. Only valid for OSD and IQD channel path types.
zNT2	CHAR	16	(IBM name: SMF73NT2) Physical-network identifier (PNET ID) of an Ethernet network that is accessible from the second port of the channel path. Only valid for OSD channel path type.

Secondary segment: SMF073_CPMF_Channel_Measurement_1

Field Name	Type	Len	Description
SMF073_CPMF_Channel_Measurement_1.<fieldname>			
zTUT	FLOAT	4	(IBM name: SMF73TUT) Total channel path busy time (in units of 128 MICROSECONDS).
zPUT	FLOAT	4	(IBM name: SMF73PUT) LPAR channel path busy time (in units of 128 MICROSECONDS).

Secondary segment: SMF073_CPMF_Channel_Measurement_2

Field Name	Type	Len	Description
<i>SMF073_CPMF_Channel_Measurement_2.<fieldname></i>			
zMBC	FLOAT	4	(IBM name: SMF73MBC) Maximum bus cycles per second - word 1.
zMCU	FLOAT	4	(IBM name: SMF73MCU) Maximum channel work units per second - word 2.
zMWU	FLOAT	4	(IBM name: SMF73MWU) Maximum WRITE data units per second - word 3.
zMRU	FLOAT	4	(IBM name: SMF73MRU) Maximum READ data units per second - word 4.
zUS	FLOAT	4	(IBM name: SMF73US) Data unit size (in bytes) - word 5.
zTBC	FLOAT	4	(IBM name: SMF73TBC) Total bus cycles count.
zTUC	FLOAT	4	(IBM name: SMF73TUC) Total channel work unit count.
zPUC	FLOAT	4	(IBM name: SMF73PUC) LPAR channel work units count.
zTWU	FLOAT	4	(IBM name: SMF73TWU) Total WRITE data units count.
zPWU	FLOAT	4	(IBM name: SMF73PWU) LPAR WRITE data units count.
zTRU	FLOAT	4	(IBM name: SMF73TRU) Total READ data units count.
zPRU	FLOAT	4	(IBM name: SMF73PRU) LPAR READ data units count.

Secondary segment: SMF073_CPMF_Channel_Measurement_3

Field Name	Type	Len	Description
<i>SMF073_CPMF_Channel_Measurement_3.<fieldname></i>			
zPDU	FLOAT	4	(IBM name: SMF73PDU) LPAR data unit size (in bytes) - word 1.
zTDU	FLOAT	4	(IBM name: SMF73TDU) Total data unit size (in bytes) - word 2.
zPUM	FLOAT	4	(IBM name: SMF73PUM) LPAR message sent unit size (in bytes) - word 3.
zTUM	FLOAT	4	(IBM name: SMF73TUM) Total message sent unit size (in bytes) - word 4.
zPMS	FLOAT	4	(IBM name: SMF73PMS) LPAR count of message sent units.
zTMS	FLOAT	4	(IBM name: SMF73TMS) Total count of message sent units.
zPUS	FLOAT	4	(IBM name: SMF73PUS) LPAR count of unsuccessful attempts to send messages.
zPUB	FLOAT	4	(IBM name: SMF73PUB) LPAR count of unsuccessful attempts to receive messages due to unavailable buffers.
zTUB	FLOAT	4	(IBM name: SMF73TUB) Total count of unsuccessful attempts to receive messages due to unavailable buffers.

zPDS	FLOAT	4	(IBM name: SMF73PDS) LPAR count of data units sent.
zTDS	FLOAT	4	(IBM name: SMF73TDS) Total count of data units sent.

Secondary segment: **SMF073_Extended_CP**

Field Name	Type	Len	Description
<i>SMF073_Extended_CP.<fieldname></i>			
zECP	INT	1	(IBM name: SMF73ECP) Channel path identification
zEDT	HEX	32	(IBM name: SMF73EDT) CPMF extended channel path measurement data. This field is only available for measurement group 2. See 'SMF73EDT - CPMF Extended Channel Measurement Data (Measurement Group 2)' for the contents of the field.

Secondary segment: **SMF073_CPMF_Extended_Channel_Measurement_2**

Field Name	Type	Len	Description
<i>SMF073_CPMF_Extended_Channel_Measurement_2.<fieldname></i>			
zEOC	FLOAT	4	(IBM name: SMF73EOC) Total number of FICON command-mode operations (CPC) that have been attempted by the channel.
zEOD	FLOAT	4	(IBM name: SMF73EOD) Total number of FICON command-mode operations (CPC) that could not be initiated by the channel because of a lack of available resources.
zEOS	FLOAT	8	(IBM name: SMF73EOS) Summation count of FICON command-mode operations (CPC). Each time the number of FICON command-mode operations is incremented, the number of FICON command-mode operations active at the channel, including the one being initiated, is added to this field.
zETC	FLOAT	4	(IBM name: SMF73ETC) Total number of FICON transport-mode operations (CPC) that have been attempted by the channel. Zero when zHPF is not available.
zETD	FLOAT	4	(IBM name: SMF73ETD) Total number of FICON transport-mode operations (CPC) that could not be initiated by the channel because of a lack of available resources. Zero when zHPF is not available.
zETS	FLOAT	8	(IBM name: SMF73ETS) Summation count of FICON transport-mode operations (CPC). Each time the number of FICON transport-mode operations is incremented, the number of transport-mode operations active at the channel, including the one being initiated, is added to this field. Zero when zHPF is not available.

Record Type 74 - RMF Activity of Several Resources

SMF Record 74 (RMF Activity of Several Resources) has a number of subtypes, each mapped by a structure member name of the format "T074STnn".

Record Type 74 Subtype 1 - Device Activity

Primary Segment:

- SMF074#01_RMF_Device

Secondary Segment(s): 3 (in alphabetical order)

- SMF074#01_Device_Control
- SMF074#01_Device_Data
- SMF074#01_Product

Primary segment: SMF074#01_RMF_Device

Field Name	Type	Len	Description
<i>SMF074#01_RMF_Device.<fieldname></i>			
SMF074#01_RMF_Device.Header_Self_Defining_Section.<fieldname>			
zFLG	HEX	1	(IBM name: SMF74FLG) System indicator: Bit Meaning when set 0 New SMF record format 1 Subtypes used 2 Reserved. 3-6 Version indicators 7 System is running in PR/SM mode.
zRTY	INT	1	(IBM name: SMF74RTY) Record type 74 (X'4A').
zTME	TSTMP	8	(IBM name: SMF74TME) Date/Time that the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF74SID) System identification (from the SMFPRMxx SID parameter).
zSSI	CHAR	4	(IBM name: SMF74SSI) Subsystem identification ('RMF').
zSTY	INT	2	(IBM name: SMF74SUB) Record SubType.
zTRN	INT	2	(IBM name: SMF74TRN) Number of triplets in this record. A triplet is a set of three SMF fields (offset/length/number values) that defines a section of the record. The offset is the offset from the RDW.
zPRS	INT	4	(IBM name: SMF74PRS) Offset to RMF Product section from RDW.
zPRL	INT	2	(IBM name: SMF74PRL) Length of RMF Product section.
zPRN	INT	2	(IBM name: SMF74PRN) Number of RMF Product sections. Individual header extension for SubType 1:
zDCS	INT	4	(IBM name: SMF74DCS) Offset to Device Control data section from RDW.
zDCL	INT	2	(IBM name: SMF74DCL) Length of Device Control data section.
zDCN	INT	2	(IBM name: SMF74DCN) Number of Device Control data sections.
zDDS	INT	4	

			(IBM name: SMF74DDS) Offset to Device data section from RDW.
zDDL	INT	2	(IBM name: SMF74DDL) Length of Device data section.
zDDN	INT	2	(IBM name: SMF74DDN) Number of Device data sections. Individual header extension for SubType 2:

Secondary segment: **SMF074#01_Product**

Field Name	Type	Len	Description
<i>SMF074#01_Product.<fieldname></i>			
zMFV	DEC	2 (3,0)	(IBM name: SMF74MFV) RMF version number.
zPRD	CHAR	8	(IBM name: SMF74PRD) Product name ('RMF').
zIST	DEC	4 (7,0)	(IBM name: SMF74IST) Time that the RMF measurement interval started, in the form 0hhmmssF, where hh is the hours, mm is the minutes, ss is the seconds, and F is the sign.
zDAT	DATE	4	(IBM name: SMF74DAT) Date when the RMF measurement interval started, in the form 0cyydddF.
zINT	DEC	4 (7,0)	(IBM name: SMF74INT) Duration of the RMF measurement interval, in the form mmsstttF where mm is the minutes, ss is the seconds, ttt is the milliseconds, and F is the sign. (The end of the measurement interval is the sum of the recorded start time and this field.)
zSAM	INT	4	(IBM name: SMF74SAM) Number of RMF samples.

<i>SMF074#01_Product.zFLA.<fieldname></i>			
zSkip	BIT	1	Samples have been skipped
zMonIII	BIT	1	RECORD was written by RMF Monitor III
zSyncSMF	BIT	1	INTERVAL was synchronized with SMF

<i>SMF074#01_Product.<fieldname></i>			
zCYC	DEC	4 (7,0)	(IBM name: SMF74CYC) Sampling cycle length, in the form 000ttttF, where tttt is the milliseconds and F is the sign (taken from CYCLE option). The range of values is 0.050 to 9.999 seconds.
zMVS	CHAR	8	(IBM name: SMF74MVS) z/OS software level (consists of an acronym and the version, release, and modification level - ZVvrrmm).
zIML	INT	1	(IBM name: SMF74IML) Indicates the type of processor complex on which data measurements were taken. Value Meaning 3 9672, zSeries

<i>SMF074#01_Product.zPRF.<fieldname></i>			
zExpStg	BIT	1	The system has expanded storage
zESCA	BIT	1	The processor is enabled for ES connection architecture (ESCA)
zESCdir	BIT	1	There is an ES connection director in the configuration
zzArc	BIT	1	System is running in z/Architecture® mode
zZAAP	BIT	1	At least one zAAP is currently installed
zZIIP	BIT	1	At least one zIIP is currently installed

zDAT	BIT	1	Enhanced DAT facility
SMF074#01_Product.<fieldname>			
zPTN	INT	1	(IBM name: SMF74PTN) PR/SM partition number of the partition that wrote this record.
zSRL	INT	1	(IBM name: SMF74SRL) SMF record level change number (X'8E' for subtype 1 records or X'8F' for subtype 2 records for z/OS V2R4 RMF with RMF Data Gatherer APAR OA59330). This field enables processing of SMF record level changes in an existing release.
zIET	HEX	8	(IBM name: SMF74IET) Interval expiration time token. This token can be used to identify other than RMF records that belong to the same interval (if interval was synchronized with SMF).
zLGO	TIME	8	(IBM name: SMF74LGO) Offset GMT to local time (STCK format).
zRAO	INT	4	(IBM name: SMF74RAO) Offset to reassembly area relative to start of RMF product section.
zRAL	INT	2	(IBM name: SMF74RAL) Length of reassembly area. Area consists of a fixed header and a variable number of information blocks. Length depends on the record type/SubType, but is fixed for a specific type/SubType.
zRAN	INT	2	(IBM name: SMF74RAN) Reassembly area indicator. Value Meaning 0 RECORD is not broken. 1 RECORD is broken. Note: This field is used to indicate whether an SMF record is a broken record. Therefore, offset (SMF70RAO) and length (SMF70RAL) are only valid if SMF70RAN = 1. A reassembly area is only present in broken records.
zOIL	INT	2	(IBM name: SMF74OIL) Original interval length as defined in the session or by SMF (in seconds).
zSYN	INT	2	(IBM name: SMF74SYN) SYNC value in seconds.
zGIE	TIME	8	(IBM name: SMF74GIE) Projected gathering interval end (STCK format) GMT time.
zXNM	CHAR	8	(IBM name: SMF74XNM) Sysplex name as defined in parmlib member COUPLExx.
zSNM	CHAR	8	(IBM name: SMF74SNM) System name for current system as defined in parmlib member IEASYSxx SYSNAME parameter. Reassembly Area:

SMF074#01_Product.Reassembly_Area.<fieldname>			
zRBR	INT	2	(IBM name: SMF74RBR) Total number of broken records built from the original large record.
zRSQ	INT	2	(IBM name: SMF74RSQ) Sequence number of this broken record. Every broken record built from the same large record must have a unique sequence number, it is in the range from 1 TO SMF70RBR.
zRIO	INT	4	(IBM name: SMF74RIO) Offset to first reassembly information block relative to start of reassembly area header.
zRIL	INT	2	(IBM name: SMF74RIL) Length of reassembly information block.
zRIN	INT	2	(IBM name: SMF74RIN) Number of reassembly information blocks (same value as SMF70TRN in header section).

SMF074#01_Product.Reassembly_Area.Reassembly_Info.<fieldname>			
zRNN	INT	2	(IBM name: SMF74RNN) Total number of sections in the original large record. This field contains information of how many sections of a specific type were contained in the original SMF record. This field is a copy of the number field of the triplet in the original (non broken) record.

zRPP	INT	2	(IBM name: SMF74RPP) Position of the first of one or more consecutive sections described by this block as in the original record. Values in the range of 1 TO SMF70RNN are valid for correct processing. A value of 0 WILL skip processing of this information block. This field provides information where the sections that are part of this broken record were placed in the original record before the split took place. The actual number of consecutive sections contained in this record is available from the actual triplet in the header extension.
------	-----	---	--

Secondary segment: SMF074#01_Device_Control

Field Name	Type	Len	Description
SMF074#01_Device_Control.<fieldname>			
zNXT	INT	2	(IBM name: SMF74NXT) Number of Device data sections in following broken records for this logical device class record.
zTOT	INT	2	(IBM name: SMF74TOT) Total number of Device data sections in all records for this logical device class record.
zGEN	INT	2	(IBM name: SMF74GEN) Total number of devices specified for all classes at system installation.
zSUB	INT	2	(IBM name: SMF74SUB) Device class code: Bit Configuration Meaning '0080'X Magnetic tape device '0040'X Communication equipment '0020'X Direct access devices '0010'X Graphics devices '0008'X Unit record devices '0004'X Character reader devices.
zDCF	INT	1	(IBM name: SMF74DCF) Flags for DASD class Bit Meaning when set 0 BOTH sections of report requested 1 SORT by storage group 2-7 Reserved.
zDMS	INT	1	(IBM name: SMF74DMS) Message flag Bit Meaning when set 0 MESSAGE issued that SMS not available 1 SMS interface error 2-7 Reserved.
zENF	INT	1	(IBM name: SMF74ENF) Flags for environment. Bit Meaning when set 0 EXTENDED CMB 1 MODEL-DEPENDENT data not available by STSCH 2 INITIAL command response time valid (SMF74CMR) 3 INTERRUPT-DELAY-TIME facility is provided by channel subsystem 4-7 Reserved
zSMF	INT	1	(IBM name: SMF74SMF) Logical SMF record flag Bit Meaning when set 0 THERE are more logical SMF records for this device class 1-7 Reserved.
zS15	INT	4	(IBM name: SMF74S15) Contents of register 15 AFTER SMS interface call, zero if normal return.
zSRC	INT	4	(IBM name: SMF74SRC) Return code from SMS interface, zero if normal return.
zSRS	INT	4	(IBM name: SMF74SRS) Reason code from SMS interface, zero if normal return.
zTSR	INT	2	(IBM name: SMF74TSR) Total number of small SMF records.
zCFL	INT	1	(IBM name: SMF74CFL) Configuration change flags Bit Meaning when set 0 CONFIGURATION changed. Used to decide whether to provide the text 'POR' or 'ACTIVATE' on reports. Also used to check whether data can be combined in a duration report. 1 CONFIGURATION change since power-on-reset (POR). 2 POR using IOC data set that contains a token. 3 CONFIGURATION token is valid. 4-7 Reserved.
zLSN	INT	1	(IBM name: SMF74LSN) Logical SMF record sequence number within a device class. This number can be used by SMF record assembly programs to recognize conditions where logical SMF records of a device class are not sorted in chronological order.
zTNM	CHAR	44	

			(IBM name: SMF74TNM) IODF name suffix.
zTSF	CHAR	2	(IBM name: SMF74TSF) IODF name suffix.
zTDT	CHAR	8	(IBM name: SMF74TDT) IODF creation date, in the form mm/dd/yy.
zTTM	CHAR	8	(IBM name: SMF74TTM) IODF creation time, in the form hh.mm.ss.
zMCT	INT	4	(IBM name: SMF74MCT) Maximum number of allocated tape devices. This field is zero for devices other than tape.
zTDY	CHAR	10	(IBM name: SMF74TDY) IODF creation date, in the form mm/dd/yyyy.

Secondary segment: SMF074#01_Device_Data

Field Name	Type	Len	Description
<i>SMF074#01_Device_Data.<fieldname></i>			
zNUM	INT	2	(IBM name: SMF74NUM) Device number, in the range X'0000' to X'FFFF'.
zLCU	INT	2	(IBM name: SMF74LCU) Logical control unit number, in the range X'0000' to X'FFFF'.
zCNF	INT	1	(IBM name: SMF74CNF) Device indicator Bit Meaning when set 0 IOS queue length is incorrect 1 NO logical control unit information 2 DATA contained in fields SMF74SSC through SMF74DIS is incorrect 3 DEVICE has been deleted 4 ONLY partial statistics are available 5 RESERVED. 6 DATA recorded is incorrect because device was configured during interval 7 DEVICE is currently online.
zSER	CHAR	6	(IBM name: SMF74SER) Volume serial of the volume mounted on this device (tape or direct access device only).
zTYP	INT	4	(IBM name: SMF74TYP) Unit type.
zNUX	INT	4	(IBM name: SMF74NUX) Number of unit control blocks (UCBs) for a parallel access volume. For HyperPAV base devices (bit 6 OF SMF74CNX is set), this is the accumulated number of HyperPAV aliases.
zSSC	INT	4	(IBM name: SMF74SSC) Start subchannel count. This is the number of physical requests to the device and includes SSCH and RSSCH instructions.
zMEC	INT	4	(IBM name: SMF74MEC) Measurement event count (number of SSCH instructions for which connect, pending, and active times were stored).
zCNN	INT	4	(IBM name: SMF74CNN) Device connect time (in 128-microsecond units).
zPEN	INT	4	(IBM name: SMF74PEN) Device pending time (in 128-microsecond units).
zATV	INT	4	(IBM name: SMF74ATV) Device active time (in 128-microsecond units).
zDIS	INT	4	(IBM name: SMF74DIS) Device disconnect time (in 128-microsecond units).
zQUE	INT	4	(IBM name: SMF74QUE) Number of requests queued in IOS for this device.
zUTL	INT	4	(IBM name: SMF74UTL) Number of samples when the device was reserved but an SSCH instruction had not been issued to the device.

zRSV	INT	4	(IBM name: SMF74RSV) Number of samples taken when the device was reserved.
zALC	INT	4	(IBM name: SMF74ALC) Number of samples taken that indicated that the device was allocated.
zMTP	INT	4	(IBM name: SMF74MTP) Number of samples taken that indicated a mount pending condition.
zNRD	INT	4	(IBM name: SMF74NRD) Number of samples taken that indicated that the device was not ready.
zCOF	INT	2	(IBM name: SMF74COF) Number of requests that had hardware timer overflow for connect time measurement.
zICT	INT	2	(IBM name: SMF74ICT) Number of incorrect samples.
zDVB	INT	4	(IBM name: SMF74DVB) Device busy delay time, from subchannel information block (SCHIB) (in 128-microsecond units).
zCLF	INT	1	(IBM name: SMF74CLF) DASD report control flag Bit Meaning when set 0 NUMBER option active indicator 1 STORAGE group option active indicator 2 STORAGE group name changed during the interval 3 MOUNT pending condition exists at the start of the interval 4 MOUNT pending condition exists at end of the interval 5 RESERVED 6 CTC with special protocol 7 RESERVED.
zSGN	CHAR	8	(IBM name: SMF74SGN) Storage group name as defined by DFSMS.
zNDA	INT	4	(IBM name: SMF74NDA) Total number of allocations in effect for the device.
zDEV	CHAR	8	(IBM name: SMF74DEV) Device model name. This field is blank if device name cannot be determined.
zCU	CHAR	8	(IBM name: SMF74CU) Control unit name. Blank if control unit name cannot be determined.
zCNX	INT	1	(IBM name: SMF74CNX) Device flag extensions: Bit Meaning when set 0 DEVICE dynamically changed 1 DEVICE disconnect time is not valid 2 BASE exposure of a parallel access volume 3 NUMBER of alias exposures has changed 4 TIMING facility not active 5 DEVICE connect time is invalid 6 HYPERPAV base device 7 DEVICE connected to FICON.
zCN2	INT	1	(IBM name: SMF74CN2) Device flag extension 2 BIT Meaning when set 0 HYPERWRITE requested 1 DEVICE in SuperPAV mode 2 DEVICE is capable of performing synchronous I/O read requests 3 DEVICE is capable of performing synchronous I/O write requests 4-7 Reserved.
zMTC	INT	2	(IBM name: SMF74MTC) Number of tape mounts detected against the device during the interval.
zDTS	INT	1	(IBM name: SMF74DTS) Shared Device report control flag Bit Meaning when set 0 VALID node descriptor ID retrieved 1 NO valid node descriptor ID retrieved 2 RESERVED 3 SMF74SHR is valid 4 DEVICE is shared/assigned to multiple systems 5-7 Reserved.
zDCT	CHAR	28	(IBM name: SMF74DCT) Node descriptor ID for selfdescribing devices (if bit 0 0F SMF74SRD on). 4-byte device number in EBCDIC format left justified with trailing blanks (if bit 1 0F SMF74DTS is on).
zHPC	INT	1	(IBM name: SMF74HPC) Number of HyperPAV aliases configured for that LSS.
zNSS	INT	2	(IBM name: SMF74NSS) Number of skipped samples caused by too large delta values.
zPSM	INT	4	(IBM name: SMF74PSM) Number of successful PAV samples.
zPCT	INT	4	(IBM name: SMF74PCT) Number of unsuccessful PAV counts.

zCMR	INT	4	(IBM name: SMF74CMR) Command response time in units of 128 MICROSECONDS.
zCAP	INT	4	(IBM name: SMF74CAP) DASD volume capacity (specified by the number of available cylinders).
zIDT	INT	4	(IBM name: SMF74IDT) Interrupt delay time in units of 128 MICROSECONDS. This field is zero if not supported by the hardware.
zCUQ	INT	4	(IBM name: SMF74CUQ) Control Unit Queuing Time.
zSCS	INT	1	(IBM name: SMF74SCS) Subchannel set ID.
zNM2	INT	2	(IBM name: SMF74NM2) Device number (same as SMF74NUM).
zATD	INT	4	(IBM name: SMF74ATD) Number of times I/Os were subjected to imposed delays due to PAV alias throttling.
zAGC	INT	1	(IBM name: SMF74AGC) The alias management group number defined on the physical controller for this device. This number is valid if the device belongs to a DASD subsystem that supports alias management groups and bit 1 OF SMF74CN2 is set.
zAGS	INT	4	(IBM name: SMF74AGS) The alias management group number assigned by z/OS for this device on this system. This number is valid if the device belongs to a DASD subsystem that supports alias management groups and bit 1 OF SMF74CN2 is set.
zSBR	FLOAT	8	(IBM name: SMF74SBR) Number of synchronous I/O read bytes transferred.
zSBW	FLOAT	8	(IBM name: SMF74SBW) Number of synchronous I/O write bytes transferred.
zSQR	FLOAT	8	(IBM name: SMF74SQR) Number of successfully completed synchronous I/O read requests.
zSQW	FLOAT	8	(IBM name: SMF74SQW) Number of successfully completed synchronous I/O write requests.
zSPR	FLOAT	8	(IBM name: SMF74SPR) Processing time (in 0.5 microsecond units) for synchronous I/O read requests.
zSPW	FLOAT	8	(IBM name: SMF74SPW) Processing time (in 0.5 microsecond units) for synchronous I/O write requests.
SMF75SFTR	FLOAT	8	Elapsed time (in 0.5 microsecond units) for unsuccessful synchronous I/O read requests.
SMF75SFTW	FLOAT	8	Elapsed time (in 0.5 microsecond units) for unsuccessful synchronous I/O write requests.
zSLBR	FLOAT	4	(IBM name: SMF74SLBR) Number of synchronous I/O read link busy conditions.
zSLBW	FLOAT	4	(IBM name: SMF74SLBW) Number of synchronous I/O write link busy conditions.
zSCMR	FLOAT	4	(IBM name: SMF74SCMR) Number of cache miss conditions for synchronous I/O read requests.
zSNIS	FLOAT	4	(IBM name: SMF74SNIS) Number of synchronous I/O write requests where the write data could not be immediately stored.
zSTOR	FLOAT	4	(IBM name: SMF74STOR) Number of synchronous I/O read timeout conditions.
zSTOW	FLOAT	4	(IBM name: SMF74STOW) Number of synchronous I/O write timeout conditions.
zSOR	FLOAT	4	(IBM name: SMF74SOR) Number of synchronous I/O read requests rejected for reasons other than

			link busy, read cache miss or timeout conditions.
zSOW	FLOAT	4	(IBM name: SMF74SOW) Number of synchronous I/O write requests rejected for reasons other than link busy, timeout or deferred write conditions.
zIOS	FLOAT	4	(IBM name: SMF74IOS) IOS Queue time in microseconds

Record Type 74 Subtype 2 - XCF Activity

Secondary Segment(s): 5 (in alphabetical order)

- SMF074#02_Control
- SMF074#02_Member
- SMF074#02_Path
- SMF074#02_Product
- SMF074#02_System

Primary segment: SMF074#02_RMF_XCF

Field Name	Type	Len	Description
SMF074#02_RMF_XCF.<fieldname>			
SMF074#02_RMF_XCF.Header_Self_Defining_Section.<fieldname>			
zFLG	HEX	1	(IBM name: SMF74FLG) System indicator: Bit Meaning when set 0 New SMF record format 1 Subtypes used 2 Reserved. 3-6 Version indicators 7 System is running in PR/SM mode.
zRTY	INT	1	(IBM name: SMF74RTY) Record type 74 (X'4A').
zTME	TSTMP	8	(IBM name: SMF74TME) Date/Time that the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF74SID) System identification (from the SMFPRMxx SID parameter).
zSSI	CHAR	4	(IBM name: SMF74SSI) Subsystem identification ('RMF').
zSTY	INT	2	(IBM name: SMF74STY) Record SubType.
zTRN	INT	2	(IBM name: SMF74TRN) Number of triplets in this record. A triplet is a set of three SMF fields (offset/length/number values) that defines a section of the record. The offset is the offset from the RDW.
zPRS	INT	4	(IBM name: SMF74PRS) Offset to RMF Product section from RDW.
zPRL	INT	2	(IBM name: SMF74PRL) Length of RMF Product section.
zPRN	INT	2	(IBM name: SMF74PRN) Number of RMF Product sections. Individual header extension for SubType 1:
z2CO	INT	4	(IBM name: SMF742CO) Offset to Control data section from RDW.
z2CL	INT	2	(IBM name: SMF742CL) Length of Control data section.
z2CN	INT	2	(IBM name: SMF742CN) Number of Control data sections.
z2SO	INT	4	(IBM name: SMF742SO) Offset to System data section from RDW.
z2SL	INT	2	(IBM name: SMF742SL) Length of System data section.
z2SN	INT	2	(IBM name: SMF742SN) Number of System data sections.

z2PO	INT	4	(IBM name: SMF742PO) Offset to Path data section.
z2PL	INT	2	(IBM name: SMF742PL) Length of Path data section.
z2PN	INT	2	(IBM name: SMF742PN) Number of Path data sections.
z2MO	INT	4	(IBM name: SMF742MO) Offset to Member data section from RDW.
z2ML	INT	2	(IBM name: SMF742ML) Length of Member data section.
z2MN	INT	2	(IBM name: SMF742MN) Number of Member data sections. Individual header extension for SubType 3:

Secondary segment: SMF074#02_Product

Field Name	Type	Len	Description
<i>SMF074#02_Product.<fieldname></i>			
zMFV	DEC	2 (3,0)	(IBM name: SMF74MFV) RMF version number.
zPRD	CHAR	8	(IBM name: SMF74PRD) Product name ('RMF').
zIST	DEC	4 (7,0)	(IBM name: SMF74IST) Time that the RMF measurement interval started, in the form 0hhmmssF, where hh is the hours, mm is the minutes, ss is the seconds, and F is the sign.
zDAT	DATE	4	(IBM name: SMF74DAT) Date when the RMF measurement interval started, in the form 0cydddF.
zINT	DEC	4 (7,0)	(IBM name: SMF74INT) Duration of the RMF measurement interval, in the form mmsstttF where mm is the minutes, ss is the seconds, ttt is the milliseconds, and F is the sign. (The end of the measurement interval is the sum of the recorded start time and this field.)
zSAM	INT	4	(IBM name: SMF74SAM) Number of RMF samples.

SMF074#02_Product.zFLA.<fieldname>

zSkip	BIT	1	Samples have been skipped
zMonIII	BIT	1	RECORD was written by RMF Monitor III
zSyncSMF	BIT	1	INTERVAL was synchronized with SMF

SMF074#02_Product.<fieldname>

zCYC	DEC	4 (7,0)	(IBM name: SMF74CYC) Sampling cycle length, in the form 000ttttF, where tttt is the milliseconds and F is the sign (taken from CYCLE option). The range of values is 0.050 to 9.999 seconds.
zMVS	CHAR	8	(IBM name: SMF74MVS) z/OS software level (consists of an acronym and the version, release, and modification level - ZVvrrmm).
zIML	INT	1	(IBM name: SMF74IML) Indicates the type of processor complex on which data measurements were taken. Value Meaning 3 9672, zSeries

SMF074#02_Product.zPRF.<fieldname>

zExpStg	BIT	1	The system has expanded storage

zDAT	BIT	1	Enhanced DAT facility

SMF074#02_Product.<fieldname>

zPTN	INT	1	(IBM name: SMF74PTN) PR/SM partition number of the partition that wrote this record.
zSRL	INT	1	(IBM name: SMF74SRL) SMF record level change number (X'8E' for subtype 1 records or X'8F' for subtype 2 records for z/OS V2R4 RMF with RMF Data Gatherer APAR OA59330). This field enables processing of SMF record level changes in an existing release.
zIET	HEX	8	(IBM name: SMF74IET) Interval expiration time token. This token can be used to identify other than RMF records that belong to the same interval (if interval was synchronized with SMF).
zLGO	TIME	8	(IBM name: SMF74LGO) Offset GMT to local time (STCK format).
zRAO	INT	4	(IBM name: SMF74RAO) Offset to reassembly area relative to start of RMF product section.
zRAL	INT	2	(IBM name: SMF74RAL) Length of reassembly area. Area consists of a fixed header and a variable number of information blocks. Length depends on the record type/SubType, but is fixed for a specific type/SubType.
zRAN	INT	2	(IBM name: SMF74RAN) Reassembly area indicator. Value Meaning 0 RECORD is not broken. 1 RECORD is broken. Note: This field is used to indicate whether an SMF record is a broken record. Therefore, offset (SMF70RAO) and length (SMF70RAL) are only valid if SMF70RAN = 1. A reassembly area is only present in broken records.
zOIL	INT	2	(IBM name: SMF74OIL) Original interval length as defined in the session or by SMF (in seconds).
zSYN	INT	2	(IBM name: SMF74SYN) SYNC value in seconds.
zGIE	TIME	8	(IBM name: SMF74GIE) Projected gathering interval end (STCK format) GMT time.
zXNM	CHAR	8	(IBM name: SMF74XNM) Sysplex name as defined in parmlib member COUPLExx.
zSNM	CHAR	8	(IBM name: SMF74SNM) System name for current system as defined in parmlib member IEASYSxx SYSNAME parameter. Reassembly Area:

SMF074#02_Product.Reassembly_Area.<fieldname>

zRBR	INT	2	(IBM name: SMF74RBR) Total number of broken records built from the original large record.
zRSQ	INT	2	(IBM name: SMF74RSQ) Sequence number of this broken record. Every broken record built from the same large record must have a unique sequence number, it is in the range from 1 TO SMF70RBR.
zRIO	INT	4	(IBM name: SMF74RIO) Offset to first reassembly information block relative to start of reassembly area header.
zRIL	INT	2	(IBM name: SMF74RIL) Length of reassembly information block.
zRIN	INT	2	(IBM name: SMF74RIN) Number of reassembly information blocks (same value as SMF70TRN in

			header section).
SMF074#02_Product.Reassembly_Area.Reassembly_Info.<fieldname>			
zRNN	INT	2	(IBM name: SMF74RNN) Total number of sections in the original large record. This field contains information of how many sections of a specific type were contained in the original SMF record. This field is a copy of the number field of the triplet in the original (non broken) record.
zRPP	INT	2	(IBM name: SMF74RPP) Position of the first of one or more consecutive sections described by this block as in the original record. Values in the range of 1 TO SMF70RNN are valid for correct processing. A value of 0 WILL skip processing of this information block. This field provides information where the sections that are part of this broken record were placed in the original record before the split took place. The actual number of consecutive sections contained in this record is available from the actual triplet in the header extension.

Secondary segment: **SMF074#02_Control**

Field Name	Type	Len	Description
SMF074#02_Control.<fieldname>			
zTSR	INT	2	(IBM name: R742TSR) Total number of type 74 SubType 2 RECORDS written during this interval.
zSTOT	INT	4	(IBM name: R742STOT) Total number of System data sections in all SMF records.
zSNXT	INT	4	(IBM name: R742SNXT) Number of System data sections in records written after this record.
zPTOT	INT	4	(IBM name: R742PTOT) Total number of Path data sections in all SMF records.
zPNXT	INT	4	(IBM name: R742PNXT) Number of Path data sections in records written after this record.
zMTOT	INT	4	(IBM name: R742MTOT) Total number of Member data sections in all SMF records.
zMNXT	INT	4	(IBM name: R742MNXT) Number of Member data sections in records written after this record.

Secondary segment: **SMF074#02_System**

Field Name	Type	Len	Description
SMF074#02_System.<fieldname>			
zSNME	CHAR	8	(IBM name: R742SNME) System name as defined in parmlib member IEASYSxx SYSNAME parameter.
zSSTF	INT	1	(IBM name: R742SSTF) Status flags Bit Meaning when set 0 SYSTEM became active during this interval 1 SYSTEM became inactive during this interval 2 COUNTS reset by XCF during this interval 3 PARTIALLY not active during RMF Postprocessor interval. 4-7 Reserved.
zSDIR	INT	1	(IBM name: R742SDIR) Direction of the message traffic Bit Meaning when set 0 INBOUND. The zSNME system sent messages to the local system. 1 OUTBOUND. The zSNME system receives messages from the local system. 2 LOCAL. This means that the message traffic is within the local system. 3-7 Reserved.
zSPTH	INT	4	(IBM name: R742SPTH) Current number of signalling paths in service (zero for local entry). If outbound entry, count is for the indicated transport class.

zSBSY	INT	4	(IBM name: R742SBSY) Number of no buffer conditions. For local or outbound entry, count is for the indicated transport class.
zSNOP	INT	4	(IBM name: R742SNOP) Number of no path conditions (zero for local entry). For outbound entry, count is for the indicated transport class.
zSMXB	INT	4	(IBM name: R742SMXB) Maximum 1K blocks of message buffer space. For local or outbound entry, count is for the indicated transport class.
zSBIG	INT	4	(IBM name: R742SBIG) Number of big message conditions (zero for inbound entry).
zSFIT	INT	4	(IBM name: R742SFIT) Number of message fit conditions (zero for inbound entry).
zSSML	INT	4	(IBM name: R742SSML) Number of small message conditions (zero for inbound entry).
zSOVR	INT	4	(IBM name: R742SOVR) Number of big messages that exceeded the message length for which XCF was optimized (zero for inbound entry).
zSTCL	INT	4	(IBM name: R742STCL) Message length for transport class (zero for inbound entry).
zSTCN	CHAR	8	(IBM name: R742STCN) Transport class name (blanks for inbound entry).

Secondary segment: **SMF074#02_Path**

Field Name	Type	Len	Description
<i>SMF074#02_Path.<fieldname></i>			
zPNME	CHAR	8	(IBM name: R742PNME) System name as defined in parmlib member IEASYSxx SYSNAME parameter.
zPDEV	CHAR	4	(IBM name: R742PDEV) Device number.
zPSTF	INT	1	(IBM name: R742PSTF) Status flags Bit Meaning when set 0 PATH became active during this interval 1 PATH became inactive during this interval. 2 COUNTS reset by XCF during this interval. 3-7 Reserved.
zPDIR	INT	1	(IBM name: R742PDIR) Direction path Bit Meaning when set 0 INBOUND path 1 OUTBOUND path 2-7 Reserved.
zPTYP	INT	1	(IBM name: R742PTYP) Path type indicator. Value Meaning 1 CTC 3 LIST structure.
zPONA	CHAR	8	(IBM name: R742PONA) Name of system on other end if known, otherwise blanks.
zPODV	CHAR	4	(IBM name: R742PODV) Device number on other end if known, otherwise blanks.
zPSTA	INT	1	(IBM name: R742PSTA) Path status Bit Meaning when set 0 STARTING 1 RESTARTING 2 WORKING 3 STOPPING 4 WAITING for completion of communication link 5 NOT operational. Path defined to XCF, but not usable until hardware and/or definition problems are resolved. 6 STOP failed 7 REBUILDING.
zPSTM	INT	1	(IBM name: R742PSTM) More path status flags: Bit Meaning when set 0 QUIESCING 1 QUIESCED 2-7 Reserved.
zPRET	INT	4	(IBM name: R742PRET) Path retry limit.
zPRST	INT	4	(IBM name: R742PRST) Number of restarts.

zPMXM	INT	4	(IBM name: R742PMXM) Maximum number of 1K blocks of message buffer space.
zPSIG	INT	4	(IBM name: R742PSIG) Number of outbound (inbound) signals sent (received) over path.
zPQLN	INT	4	(IBM name: R742PQLN) Number of outbound signals pending transfer on path.
zPIBR	INT	4	(IBM name: R742PIBR) Number of inbound signals refused due to maximum message limit.
zPSUS	INT	4	(IBM name: R742PSUS) Number of times this signalling path was not busy when it was selected to transfer a message.
zPAPP	INT	4	(IBM name: R742PAPP) Number of times this signalling path was busy when it was selected to transfer a message.
zPTCN	CHAR	8	(IBM name: R742PTCN) Transport class name. For an outbound path, the class to which the path is assigned. For an inbound path, the class to which the outbound side of the path is assigned, blanks if not known.
zPSTR	CHAR	16	(IBM name: R742PSTR) Name of XES list structure being used as a path, blank for CTCs.
zPIOT	INT	4	(IBM name: R742PIOT) For inbound paths: Average I/O transfer time (microseconds) for the observed in the last minute of the RMF reporting interval, or X'FFFFFFFF' (if time > 35 MINUTES). For outbound paths, the field is zero.
zPRCT	INT	4	(IBM name: R742PRCT) Path retry count.
zPPND	INT	4	(IBM name: R742PPND) The current number of signals pending for transfer on the path (outbound only).
zPUSE	INT	4	(IBM name: R742PUSE) The current number of 1KB blocks of message buffer space in use by this path.
zPLIN	INT	4	(IBM name: R742PLIN) List number within structure.

SMF074#02_Path.zPUsage.<fieldname>

zPUSG_TimeSum	INT	8	(IBM name: R742PUSG_TimeSum) Time (in microseconds) this path was in use at the indicated percent utilization.
zPUSG_TimeSsq	INT	8	(IBM name: R742PUSG_TimeSsq) Squared microseconds this path was in use at the indicated percent utilization.
zPUSG_Time#	INT	4	(IBM name: R742PUSG_Time#) Number of times this path was in use at the indicated percent utilization.
zPUSG_SigCnt	INT	4	(IBM name: R742PUSG_SigCnt) Number of signals sent for this usage entry.
zPUSG_Percent	INT	4	(IBM name: R742PUSG_Percent) Percent utilization that this entry represents.

SMF074#02_Path.<fieldname>

zPNIB_TimeSum	INT	4	(IBM name: R742PNIB_TimeSum) Total time (in microseconds) this path had a no-inbound-buffer impact condition.
zPNIB_TimeSsq	INT	4	(IBM name: R742PNIB_TimeSsq) Squared microseconds for each no-inbound-buffer impact condition.
zPNIB_Time#	INT	4	(IBM name: R742PNIB_Time#) Number of times this path was impacted by a no-inbound-buffer condition.

Secondary segment: **SMF074#02_Member**

Field Name	Type	Len	Description
SMF074#02_Member.<fieldname>			
zMSYS	CHAR	8	(IBM name: R742MSYS) System name (as defined in parmlib member IEASYSxx SYSNAME parameter) where the member resides.
zMGRP	CHAR	8	(IBM name: R742MGRP) Group name.
zMMEM	CHAR	16	(IBM name: R742MMEM) Member name.
zMSTF	INT	1	(IBM name: R742MSTF) Status flags Bit Meaning when set 0 MEMBER became active during this interval 1 MEMBER became inactive during this interval 2 COUNTS reset by XCF during this interval 3 PARTIALLY not active during RMF Postprocessor interval. 4 NO information returned from IXCQUERY. 5-7 Reserved.
zMST1	INT	1	(IBM name: R742MST1) Extended member state (1): 2=CREATED 3=ACTIVE 4=QUIESCED 5=FAILED
zMST2	INT	1	(IBM name: R742MST2) Extended member state (2): Bit Meaning when set 0 SYSTEM status update missing 1 SYSTEM termination started 2 RESERVED 3 STATUS update missing (confirmed) 4 STATUS update missing (not confirmed) 5 RESERVED 6 MONITORING has been removed 7 RESERVED.
zMSNT	INT	4	(IBM name: R742MSNT) Number of signals sent by member.
zMRCV	INT	4	(IBM name: R742MRCV) Number of signals received by member.
zMINT	INT	4	(IBM name: R742MINT) Status checking interval.
zMJOB	CHAR	8	(IBM name: R742MJOB) Job name that joined the member.

Record Type 74 Subtype 3 - OMVS Kernel Activity

Primary Segment:

- SMF074#03_RMF_OMVS_Kernel

Secondary Segment(s): 2 (in alphabetical order)

- SMF074#03_Control
- SMF074#03_Product

Primary segment: SMF074#03_RMF_OMVS_Kernel

Field Name	Type	Len	Description
SMF074#03_RMF_OMVS_Kernel.<fieldname>			
SMF074#03_RMF_OMVS_Kernel.Header_Self_Defining_Section.<fieldname>			
zFLG	HEX	1	(IBM name: SMF74FLG) System indicator: Bit Meaning when set 0 New SMF record format 1 Subtypes used 2 Reserved. 3-6 Version indicators 7 System is running in PR/SM mode.
zRTY	INT	1	(IBM name: SMF74RTY) Record type 74 (X'4A').
zTME	TSTMP	8	(IBM name: SMF74TME) Date/Time that the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF74SID) System identification (from the SMFPRMxx SID parameter).
zSSI	CHAR	4	(IBM name: SMF74SSI) Subsystem identification ('RMF').
zSTY	INT	2	(IBM name: SMF74STY) Record SubType.
zTRN	INT	2	(IBM name: SMF74TRN) Number of triplets in this record. A triplet is a set of three SMF fields (offset/length/number values) that defines a section of the record. The offset is the offset from the RDW.
zPRS	INT	4	(IBM name: SMF74PRS) Offset to RMF Product section from RDW.
zPRL	INT	2	(IBM name: SMF74PRL) Length of RMF Product section.
zPRN	INT	2	(IBM name: SMF74PRN) Number of RMF Product sections. Individual header extension for SubType 1:
z3PO	INT	4	(IBM name: SMF743PO) Offset to OMVS control data section.
z3PL	INT	2	(IBM name: SMF743PL) Length of OMVS control data section.
z3PN	INT	2	(IBM name: SMF743PN) Number of OMVS control data sections. Individual header extension for SubType 4:

Secondary segment: SMF074#03_Product

Field Name	Type	Len	Description
SMF074#03_Product.<fieldname>			

zMFV	DEC	2 (3,0)	(IBM name: SMF74MFV) RMF version number.
zPRD	CHAR	8	(IBM name: SMF74PRD) Product name ('RMF').
zIST	DEC	4 (7,0)	(IBM name: SMF74IST) Time that the RMF measurement interval started, in the form 0hhmmssF, where hh is the hours, mm is the minutes, ss is the seconds, and F is the sign.
zDAT	DATE	4	(IBM name: SMF74DAT) Date when the RMF measurement interval started, in the form 0ccyddF.
zINT	DEC	4 (7,0)	(IBM name: SMF74INT) Duration of the RMF measurement interval, in the form mmsstttF where mm is the minutes, ss is the seconds, tt is the milliseconds, and F is the sign. (The end of the measurement interval is the sum of the recorded start time and this field.)
zSAM	INT	4	(IBM name: SMF74SAM) Number of RMF samples.

SMF074#03_Product.zFLA.<fieldname>

zSkip	BIT	1	Samples have been skipped
zMonIII	BIT	1	RECORD was written by RMF Monitor III
zSyncSMF	BIT	1	INTERVAL was synchronized with SMF

SMF074#03_Product.<fieldname>

zCYC	DEC	4 (7,0)	(IBM name: SMF74CYC) Sampling cycle length, in the form 000ttttF, where tttt is the milliseconds and F is the sign (taken from CYCLE option). The range of values is 0.050 to 9.999 seconds.
zMVS	CHAR	8	(IBM name: SMF74MVS) z/OS software level (consists of an acronym and the version, release, and modification level - ZVvrrmm).
zIML	INT	1	(IBM name: SMF74IML) Indicates the type of processor complex on which data measurements were taken. Value Meaning 3 9672, zSeries

SMF074#03_Product.zPRF.<fieldname>

zExpStg	BIT	1	The system has expanded storage
zESCA	BIT	1	The processor is enabled for ES connection architecture (ESCA)
zESCdir	BIT	1	There is an ES connection director in the configuration
zzArc	BIT	1	System is running in z/Architecture® mode
zZAAP	BIT	1	At least one zAAP is currently installed
zZIIP	BIT	1	At least one zIIP is currently installed
zDAT	BIT	1	Enhanced DAT facility

SMF074#03_Product.<fieldname>

zPTN	INT	1	(IBM name: SMF74PTN) PR/SM partition number of the partition that wrote this record.
zSRL	INT	1	(IBM name: SMF74SRL) SMF record level change number (X'8E' for subtype 1 records or X'8F' for subtype 2 records for z/OS V2R4 RMF with RMF Data Gatherer APAR OA59330). This field enables processing of SMF record level changes in an existing release.
zIET	HEX	8	(IBM name: SMF74IET) Interval expiration time token. This token can be used to identify other than RMF records that belong to the same interval (if interval was synchronized with SMF).
zLGO	TIME	8	

			(IBM name: SMF74LGO) Offset GMT to local time (STCK format).
zRAO	INT	4	(IBM name: SMF74RAO) Offset to reassembly area relative to start of RMF product section.
zRAL	INT	2	(IBM name: SMF74RAL) Length of reassembly area. Area consists of a fixed header and a variable number of information blocks. Length depends on the record type/SubType, but is fixed for a specific type/SubType.
zRAN	INT	2	(IBM name: SMF74RAN) Reassembly area indicator. Value Meaning 0 RECORD is not broken. 1 RECORD is broken. Note: This field is used to indicate whether an SMF record is a broken record. Therefore, offset (SMF70RAO) and length (SMF70RAL) are only valid if SMF70RAN = 1. A reassembly area is only present in broken records.
zOIL	INT	2	(IBM name: SMF74OIL) Original interval length as defined in the session or by SMF (in seconds).
zSYN	INT	2	(IBM name: SMF74SYN) SYNC value in seconds.
zGIE	TIME	8	(IBM name: SMF74GIE) Projected gathering interval end (STCK format) GMT time.
zXNM	CHAR	8	(IBM name: SMF74XNM) Sysplex name as defined in parmlib member COUPLExx.
zSNM	CHAR	8	(IBM name: SMF74SNM) System name for current system as defined in parmlib member IEASYSxx SYSNAME parameter. Reassembly Area:

SMF074#03_Product.Reassembly_Area.<fieldname>

zRBR	INT	2	(IBM name: SMF74RBR) Total number of broken records built from the original large record.
zRSQ	INT	2	(IBM name: SMF74RSQ) Sequence number of this broken record. Every broken record built from the same large record must have a unique sequence number, it is in the range from 1 TO SMF70RBR.
zRIO	INT	4	(IBM name: SMF74RIO) Offset to first reassembly information block relative to start of reassembly area header.
zRIL	INT	2	(IBM name: SMF74RIL) Length of reassembly information block.
zRIN	INT	2	(IBM name: SMF74RIN) Number of reassembly information blocks (same value as SMF70TRN in header section).

SMF074#03_Product.Reassembly_Area.Reassembly_Info.<fieldname>

zRNN	INT	2	(IBM name: SMF74RNN) Total number of sections in the original large record. This field contains information of how many sections of a specific type were contained in the original SMF record. This field is a copy of the number field of the triplet in the original (non broken) record.
zRPP	INT	2	(IBM name: SMF74RPP) Position of the first of one or more consecutive sections described by this block as in the original record. Values in the range of 1 TO SMF70RNN are valid for correct processing. A value of 0 WILL skip processing of this information block. This field provides information where the sections that are part of this broken record were placed in the original record before the split took place. The actual number of consecutive sections contained in this record is available from the actual triplet in the header extension.

Secondary segment: **SMF074#03_Control**

Field Name	Type	Len	Description
------------	------	-----	-------------

SMF074#03_Control.<fieldname>			
zCYCU	INT	4	(IBM name: R743CYCU) The number of cycle units elapsed between first and last measured sample.
zCYCT	INT	4	(IBM name: R743CYCT) The cycle time value obtained from Monitor III options (in milliseconds).
zFLG	INT	4	(IBM name: SMF74FLG) Processing Flags Bit Meaning when set 0 KERNEL address space is terminated or reinstated this interval. 1 MAXIMUM number of processes changed during reporting interval. 2 MAXIMUM number of users changed during reporting interval. 3 MAXIMUM number of processes per user changed during reporting interval. 4 MAXIMUM number of message queue ids changed during reporting interval when set. 5 MAXIMUM number of semaphore ids changed during reporting interval when set. 6 MAXIMUM number of shared memory ids changed during reporting interval when set. 7 MAXIMUM number of shared memory pages changed during reporting interval when set. 8 MAXIMUM number of memory map storage pages changed during reporting interval when set. 9 MAXIMUM number of shared storage pages changed during reporting interval when set. 10 MAXIMUM size of shared library region changed during reporting interval when set. 11 MAXIMUM number of queued signals per process changed during reporting interval when set. 12-31 Reserved.
zSYSC	FLOAT	4	(IBM name: R743SYSC) The total number of kernel callable services invoked during the interval.
zSCMN	INT	4	(IBM name: R743SCMN) The minimum number of kernel callable services invoked during one cycle.
zSCMX	INT	4	(IBM name: R743SCMX) The maximum number of kernel callable services invoked during one cycle.
zCPU	FLOAT	4	(IBM name: R743CPU) Total CPU time spent processing callable services in the kernel address space during the interval (in 10-millisecond units).
zCTMN	INT	4	(IBM name: R743CTMN) Minimum CPU time spent processing callable services in the kernel address space during one cycle (in 10-millisecond units).
zCTMX	INT	4	(IBM name: R743CTMX) Maximum CPU time spent processing callable services in the kernel address space during one cycle (in 10-millisecond units).
zOPR	FLOAT	4	(IBM name: R743OPR) Count of times fork() or dub failed because the maximum number of processes was exceeded during the interval.
zOPMN	INT	4	(IBM name: R743OPMN) Minimum number of times fork() or dub failed because the maximum number of processes was exceeded during one cycle.
zOPMX	INT	4	(IBM name: R743OPMX) Maximum number of times fork() or dub failed because the maximum number of processes was exceeded during one cycle.
zOUS	FLOAT	4	(IBM name: R743OUS) Count of times fork() or dub failed because the maximum number of users was exceeded during the interval.
zOUMN	INT	4	(IBM name: R743OUMN) Minimum number of times fork() or dub failed because the maximum number of users was exceeded during one cycle.
zOUMX	INT	4	(IBM name: R743OUMX) Maximum number of times fork() or dub failed because the maximum number of users was exceeded during one cycle.
zOPRU	FLOAT	4	(IBM name: R743OPRU) Count of times fork() or dub failed because the maximum number of processes per user was exceeded during the interval.
zORMN	INT	4	(IBM name: R743ORMN) Minimum number of times fork() or dub failed because the maximum number of processes per user was exceeded during one cycle.
zORMX	INT	4	(IBM name: R743ORMX) Maximum number of times fork() or dub failed because the maximum number of processes per user was exceeded during one cycle.

zMAXP	INT	2	(IBM name: R743MAXP) Maximum number of processes.
zMAXU	INT	2	(IBM name: R743MAXU) Maximum number of users.
zMXPU	INT	2	(IBM name: R743MXPU) Maximum number of processes per user.
zRSV1	INT	2	(IBM name: R743RSV1) Reserved.
zCURP	FLOAT	4	(IBM name: R743CURP) Accumulated number of processes during the interval.
zCPMN	INT	2	(IBM name: R743CPMN) Minimum number of processes during one cycle.
zCPMX	INT	2	(IBM name: R743CPMX) Maximum number of processes during one cycle.
zCURU	FLOAT	4	(IBM name: R743CURU) Accumulated number of users during the interval.
zCUMN	INT	2	(IBM name: R743CUMN) Minimum number of users during one cycle.
zCUMX	INT	2	(IBM name: R743CUMX) Maximum number of users during one cycle.
zMMSG	INT	4	(IBM name: R743MMSG) Maximum number of message queue IDs (constant).
zMSEM	INT	4	(IBM name: R743MSEM) Maximum number of semaphore IDs (constant).
zMSHM	INT	4	(IBM name: R743MSHM) Maximum number of shared memory IDs (constant).
zMSPG	INT	4	(IBM name: R743MSPG) Maximum number of shared memory pages (constant).
zCMMSG	FLOAT	4	(IBM name: R743CMMSG) Accumulated number of message queue IDs during one interval.
zCMMN	INT	4	(IBM name: R743CMMN) Minimum number of message queue IDs per cycle.
zCMMX	INT	4	(IBM name: R743CMMX) Maximum number of message queue IDs per cycle.
zCSEM	FLOAT	4	(IBM name: R743CSEM) Accumulated number of semaphore IDs during one interval.
zCSMN	INT	4	(IBM name: R743CSMN) Minimum number of semaphore IDs per cycle.
zCSMX	INT	4	(IBM name: R743CSMX) Maximum number of semaphore IDs per cycle.
zCSHM	FLOAT	4	(IBM name: R743CSHM) Accumulated number of shared memory IDs during one interval.
zCHMN	INT	4	(IBM name: R743CHMN) Minimum number of shared memory IDs per cycle.
zCHMX	INT	4	(IBM name: R743CHMX) Maximum number of shared memory IDs per cycle.
zCSPG	FLOAT	4	(IBM name: R743CSPG) Accumulated number of shared memory pages during one interval.
zCGMN	INT	4	(IBM name: R743CGMN) Minimum number of shared memory pages per cycle.
zCGMX	INT	4	(IBM name: R743CGMX) Maximum number of shared memory pages per cycle.
zOMSG	FLOAT	4	(IBM name: R743OMSG) Accumulated number of attempts to exceed maximum number of message queue IDs during one interval.
zOMMN	INT	4	

			(IBM name: R743OMMN) Minimum number of attempts to exceed maximum number of message queue IDs per cycle.
zOMMX	INT	4	(IBM name: R743OMMX) Maximum number of attempts to exceed maximum number of message queue IDs per cycle.
zOSEM	FLOAT	4	(IBM name: R743OSEM) Accumulated number of attempts to exceed maximum number of semaphore IDs during one interval.
zOSMN	INT	4	(IBM name: R743OSMN) Minimum number of attempts to exceed maximum number of semaphore IDs per cycle.
zOSMX	INT	4	(IBM name: R743OSMX) Maximum number of attempts to exceed maximum number of semaphore IDs per cycle.
zOSHM	FLOAT	4	(IBM name: R743OSHM) Accumulated number of attempts to exceed maximum number of shared memory IDs during one interval.
zOHMN	INT	4	(IBM name: R743OHMN) Minimum number of attempts to exceed maximum number of shared memory IDs per cycle.
zOHMX	INT	4	(IBM name: R743OHMX) Maximum number of attempts to exceed maximum number of shared memory IDs per cycle.
zOSPG	FLOAT	4	(IBM name: R743OSPG) Accumulated number of attempts to exceed maximum number of shared memory pages during one interval.
zOGMN	INT	4	(IBM name: R743OGMN) Minimum number of attempts to exceed maximum number of shared memory pages per cycle.
zOGMX	INT	4	(IBM name: R743OGMX) Maximum number of attempts to exceed maximum number of shared memory pages per cycle.
zMMAP	INT	4	(IBM name: R743MMAP) Maximum number of memory map storage pages (constant).
zCMAP	FLOAT	4	(IBM name: R743CMAP) Accumulated number of memory map storage pages during one interval.
zCAMN	INT	4	(IBM name: R743CAMN) Minimum number of memory map storage pages per cycle.
zCAMX	INT	4	(IBM name: R743CAMX) Maximum number of memory map storage pages per cycle.
zOMAP	FLOAT	4	(IBM name: R743OMAP) Accumulated number of attempts to exceed maximum number of memory map storage pages during one interval.
zOAMN	INT	4	(IBM name: R743OAMN) Minimum number of attempts to exceed maximum number of memory map storage pages per cycle.
zOAMX	INT	4	(IBM name: R743OAMX) Maximum number of attempts to exceed maximum number of memory map storage pages per cycle.
zMPAG	INT	4	(IBM name: R743MPAG) Maximum number of shared storage pages (constant).
zCPAG	FLOAT	4	(IBM name: R743CPAG) Accumulated number of shared storage pages during one interval.
zCXMN	INT	4	(IBM name: R743CXMN) Minimum number of shared storage pages per cycle.
zCXMN	INT	4	(IBM name: R743CXMN) Maximum number of shared storage pages per cycle.
zOPAG	FLOAT	4	(IBM name: R743OPAG) Accumulated number of attempts to exceed maximum number of shared

			storage pages during one interval.
zOXMN	INT	4	(IBM name: R743OXMN) Minimum number of attempts to exceed maximum number of shared storage pages per cycle.
zOXMN	INT	4	(IBM name: R743OXMN) Maximum number of attempts to exceed maximum number of shared storage pages per cycle.
zMSLR	INT	4	(IBM name: R743MSLR) Maximum amount of storage (MB) available for shared library region.
zCSLR	FLOAT	4	(IBM name: R743CSLR) Accumulated amount of shared library storage (MB) allocated in one interval.
zCLMN	INT	4	(IBM name: R743CLMN) Minimum amount of shared library storage (MB) allocated per cycle.
zCLMX	INT	4	(IBM name: R743CLMX) Maximum number of shared library storage (MB) allocated per cycle.
zOSLR	FLOAT	4	(IBM name: R743OSLR) Accumulated number of attempts to exceed maximum amount of shared library region size during one interval.
zOLMN	INT	4	(IBM name: R743OLMN) Minimum number of attempts to exceed maximum amount of shared library region per cycle.
zOLMX	INT	4	(IBM name: R743OLMX) Maximum number of attempts to exceed maximum amount of shared library region per cycle.
zMQDS	INT	4	(IBM name: R743MQDS) Maximum amount of queued signals allowed per process.
zOQDS	FLOAT	4	(IBM name: R743OQDS) Accumulated number of attempts to exceed maximum amount of queued signals per interval.
zOQMN	INT	4	(IBM name: R743OQMN) Minimum number of attempts to exceed maximum amount of queued signals per cycle.
zOQMX	INT	4	(IBM name: R743OQMX) Maximum number of attempts to exceed maximum amount of queued signals per cycle.

Record Type 74 Subtype 4 - Coupling Facility Activity

Primary Segment:

- SMF074#04_RMF_Coupling_Facility

Secondary Segment(s): 12 (in alphabetical order)

- SMF074#04_Asynch_CF_Duplexing
- SMF074#04_Cache
- SMF074#04_Channel_Path
- SMF074#04_Connectivity
- SMF074#04_Local_Coupling_Facility
- SMF074#04_Processor_Utilization
- SMF074#04_Product
- SMF074#04_Remote_Facility
- SMF074#04_Request
- SMF074#04_Storage
- SMF074#04_Storage_Class_Memory
- SMF074#04_Structure

Primary segment: SMF074#04_RMF_Coupling_Facility

Field Name	Type	Len	Description
SMF074#04_RMF_Coupling_Facility.<fieldname>			
SMF074#04_RMF_Coupling_Facility.Header_Self_Defining_Section.<fieldname>			
zFLG	HEX	1	(IBM name: SMF74FLG) System indicator: Bit Meaning when set 0 New SMF record format 1 Subtypes used 2 Reserved. 3-6 Version indicators 7 System is running in PR/SM mode.
zRTY	INT	1	(IBM name: SMF74RTY) Record type 74 (X'4A').
zTME	TSTMP	8	(IBM name: SMF74TME) Date/Time that the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF74SID) System identification (from the SMFPRMxx SID parameter).
zSSI	CHAR	4	(IBM name: SMF74SSI) Subsystem identification ('RMF').
zSTY	INT	2	(IBM name: SMF74STY) Record SubType.
zTRN	INT	2	(IBM name: SMF74TRN) Number of triplets in this record. A triplet is a set of three SMF fields (offset/length/number values) that defines a section of the record. The offset is the offset from the RDW.
zPRS	INT	4	(IBM name: SMF74PRS) Offset to RMF Product section from RDW.
zPRL	INT	2	(IBM name: SMF74PRL) Length of RMF Product section.
zPRN	INT	2	(IBM name: SMF74PRN) Number of RMF Product sections. Individual header extension for SubType 1:
z4FO	INT	4	(IBM name: SMF744FO) Offset to Local Coupling Facility data section.
z4FL	INT	2	(IBM name: SMF744FL) Length of Local Coupling Facility data section.
z4FN	INT	2	(IBM name: SMF744FN) Number of Local Coupling Facility data sections.
z4XO	INT	4	(IBM name: SMF744XO) Offset to Connectivity data section.

z4XL	INT	2	(IBM name: SMF744XL) Length of Connectivity data section.
z4XN	INT	2	(IBM name: SMF744XN) Number of Connectivity data sections.
z4GO	INT	4	(IBM name: SMF744GO) Offset to Storage data section.
z4GL	INT	2	(IBM name: SMF744GL) Length of Storage data section.
z4GN	INT	2	(IBM name: SMF744GN) Number of Storage data sections.
z4QO	INT	4	(IBM name: SMF744QO) Offset to Structure data section.
z4QL	INT	2	(IBM name: SMF744QL) Length of Structure data section.
z4QN	INT	2	(IBM name: SMF744QN) Number of Structure data sections.
z4SO	INT	4	(IBM name: SMF744SO) Offset to Request data section.
z4SL	INT	2	(IBM name: SMF744SL) Length of Request data section.
z4SN	INT	2	(IBM name: SMF744SN) Number of Request data sections.
z4PO	INT	4	(IBM name: SMF744PO) Offset to Processor data section.
z4PL	INT	2	(IBM name: SMF744PL) Length of Processor data section.
z4PN	INT	2	(IBM name: SMF744PN) Number of Processor data sections.
z4CO	INT	4	(IBM name: SMF744CO) Offset to Cache data section.
z4CL	INT	2	(IBM name: SMF744CL) Length of Cache data section.
z4CN	INT	2	(IBM name: SMF744CN) Number of Cache data sections.
z4RO	INT	4	(IBM name: SMF744RO) Offset to Remote Facility data section.
z4RL	INT	2	(IBM name: SMF744RL) Length of Remote Facility data section.
z4RN	INT	2	(IBM name: SMF744RN) Number of Remote Facility data sections.
z4HO	INT	4	(IBM name: SMF744HO) Offset to Channel Path data section.
z4HL	INT	2	(IBM name: SMF744HL) Length of Channel Path data section.
z4HN	INT	2	(IBM name: SMF744HN) Number of Channel Path data sections.
z4MO	INT	4	(IBM name: SMF744MO) Offset to SCM data section.
z4ML	INT	2	(IBM name: SMF744ML) Length of SCM data section.
z4MN	INT	2	(IBM name: SMF744MN) Number of SCM data sections.
z4AO	INT	4	(IBM name: SMF744AO) Offset to Asynchronous CF Duplexing data section.
z4AL	INT	2	(IBM name: SMF744AL) Length of Asynchronous CF Duplexing data section.

z4AN	INT	2	(IBM name: SMF744AN) Number of Asynchronous CF Duplexing data sections. Individual header extension for SubType 5:
------	-----	---	---

Secondary segment: **SMF074#04_Product**

Field Name	Type	Len	Description
<i>SMF074#04_Product.<fieldname></i>			
zMFV	DEC	2 (3,0)	(IBM name: SMF74MFV) RMF version number.
zPRD	CHAR	8	(IBM name: SMF74PRD) Product name ('RMF').
zIST	DEC	4 (7,0)	(IBM name: SMF74IST) Time that the RMF measurement interval started, in the form 0hhmmssF, where hh is the hours, mm is the minutes, ss is the seconds, and F is the sign.
zDAT	DATE	4	(IBM name: SMF74DAT) Date when the RMF measurement interval started, in the form 0cyydddF.
zINT	DEC	4 (7,0)	(IBM name: SMF74INT) Duration of the RMF measurement interval, in the form mmssttF where mm is the minutes, ss is the seconds, tt is the milliseconds, and F is the sign. (The end of the measurement interval is the sum of the recorded start time and this field.)
zSAM	INT	4	(IBM name: SMF74SAM) Number of RMF samples.

SMF074#04_Product.zFLA.<fieldname>

zSkip	BIT	1	Samples have been skipped
zMonIII	BIT	1	RECORD was written by RMF Monitor III
zSyncSMF	BIT	1	INTERVAL was synchronized with SMF

SMF074#04_Product.<fieldname>

zCYC	DEC	4 (7,0)	(IBM name: SMF74CYC) Sampling cycle length, in the form 000tttF, where ttt is the milliseconds and F is the sign (taken from CYCLE option). The range of values is 0.050 to 9.999 seconds.
zMVS	CHAR	8	(IBM name: SMF74MVS) z/OS software level (consists of an acronym and the version, release, and modification level - ZVvrrmm).
zIML	INT	1	(IBM name: SMF74IML) Indicates the type of processor complex on which data measurements were taken. Value Meaning 3 9672, zSeries

SMF074#04_Product.zPRF.<fieldname>

zExpStg	BIT	1	The system has expanded storage
zESCA	BIT	1	The processor is enabled for ES connection architecture (ESCA)
zESCdir	BIT	1	There is an ES connection director in the configuration
zzArc	BIT	1	System is running in z/Architecture® mode
zZAAP	BIT	1	At least one zAAP is currently installed
zZIIP	BIT	1	At least one zIIP is currently installed
zDAT	BIT	1	Enhanced DAT facility

SMF074#04_Product.<fieldname>

zPTN	INT	1	(IBM name: SMF74PTN) PR/SM partition number of the partition that wrote this record.
zSRL	INT	1	(IBM name: SMF74SRL) SMF record level change number (X'8E' for subtype 1 records or X'8F' for subtype 2 records for z/OS V2R4 RMF with RMF Data Gatherer APAR OA59330). This field enables processing of SMF record level changes in an existing release.
zIET	HEX	8	(IBM name: SMF74IET) Interval expiration time token. This token can be used to identify other than RMF records that belong to the same interval (if interval was synchronized with SMF).
zLGO	TIME	8	(IBM name: SMF74LGO) Offset GMT to local time (STCK format).
zRAO	INT	4	(IBM name: SMF74RAO) Offset to reassembly area relative to start of RMF product section.
zRAL	INT	2	(IBM name: SMF74RAL) Length of reassembly area. Area consists of a fixed header and a variable number of information blocks. Length depends on the record type/SubType, but is fixed for a specific type/SubType.
zRAN	INT	2	(IBM name: SMF74RAN) Reassembly area indicator. Value Meaning 0 RECORD is not broken. 1 RECORD is broken. Note: This field is used to indicate whether an SMF record is a broken record. Therefore, offset (SMF70RAO) and length (SMF70RAL) are only valid if SMF70RAN = 1. A reassembly area is only present in broken records.
zOIL	INT	2	(IBM name: SMF74OIL) Original interval length as defined in the session or by SMF (in seconds).
zSYN	INT	2	(IBM name: SMF74SYN) SYNC value in seconds.
zGIE	TIME	8	(IBM name: SMF74GIE) Projected gathering interval end (STCK format) GMT time.
zXNM	CHAR	8	(IBM name: SMF74XNM) Sysplex name as defined in parmlib member COUPLExx.
zSNM	CHAR	8	(IBM name: SMF74SNM) System name for current system as defined in parmlib member IEASYSxx SYSNAME parameter. Reassembly Area:

SMF074#04_Product.Reassembly_Area.<fieldname>

zRBR	INT	2	(IBM name: SMF74RBR) Total number of broken records built from the original large record.
zRSQ	INT	2	(IBM name: SMF74RSQ) Sequence number of this broken record. Every broken record built from the same large record must have a unique sequence number, it is in the range from 1 TO SMF70RBR.
zRIO	INT	4	(IBM name: SMF74RIO) Offset to first reassembly information block relative to start of reassembly area header.
zRIL	INT	2	(IBM name: SMF74RIL) Length of reassembly information block.
zRIN	INT	2	(IBM name: SMF74RIN) Number of reassembly information blocks (same value as SMF70TRN in header section).

SMF074#04_Product.Reassembly_Area.Reassembly_Info.<fieldname>

zRNN	INT	2	(IBM name: SMF74RNN) Total number of sections in the original large record. This field contains information of how many sections of a specific type were contained in the original SMF record. This field is a copy of the number field of the triplet in the original (non broken) record.
zRPP	INT	2	(IBM name: SMF74RPP) Position of the first of one or more consecutive sections described by this block as in the original record. Values in the range of 1 TO SMF70RNN are

			valid for correct processing. A value of 0 WILL skip processing of this information block. This field provides information where the sections that are part of this broken record were placed in the original record before the split took place. The actual number of consecutive sections contained in this record is available from the actual triplet in the header extension.
--	--	--	--

Secondary segment: **SMF074#04_Local_Coupling_Facility**

Field Name	Type	Len	Description
<i>SMF074#04_Local_Coupling_Facility.<fieldname></i>			
zFNAM	CHAR	8	(IBM name: R744FNAM) Name of coupling facility as defined in parmlib member COUPLExx.
zFSYS	CHAR	8	(IBM name: R744FSYS) Name of this system (from IEASYSxx parmlib member, SYSNAME parameter).

<i>SMF074#04_Local_Coupling_Facility.zFFLG.<fieldname></i>			
zEndOfIntvl	BIT	1	Coupling facility was connected to the system at the end of the interval
zDuringIntvl	BIT	1	Coupling facility became active during the interval
zPermErr	BIT	1	Permanent error in cycle gatherer during the complete interval
zDynDispatch	BIT	1	Dynamic dispatching is active. Valid if zFLVL >
zThin	BIT	1	Thin interrupts are enabled. Valid if zFLVL >

<i>SMF074#04_Local_Coupling_Facility.zFFLC.<fieldname></i>			
zCHPIDs	BIT	1	CHPIDs set offline during the interval

<i>SMF074#04_Local_Coupling_Facility.<fieldname></i>			
zFAMV	INT	1	(IBM name: R744FAMV) IXLYAMDA Version.
zFPAM	INT	4	(IBM name: R744FPAM) Number of paths available to the coupling facility.
zFPBC	FLOAT	8	(IBM name: R744FPBC) Number of times coupling facility requests fail due to path busy.
zFSCG	INT	4	(IBM name: R744FSCG) Number of subchannels defined.
zFSCU	INT	4	(IBM name: R744FSCU) Number of subchannels currently in use.
zFSCL	INT	4	(IBM name: R744FSCL) Number of subchannels that can be used (limit).
zFSCC	FLOAT	8	(IBM name: R744FSCC) Subchannel contention count (all subchannel busy).
zFTOR	FLOAT	8	(IBM name: R744FTOR) Total number of requests from this system.
zFAIL	FLOAT	8	(IBM name: R744FAIL) Number of unsuccessful requests from this system.
zFTIM	INT	8	(IBM name: R744FTIM) Total service time for unsuccessful requests in microseconds.
zFSQU	INT	8	(IBM name: R744FSQU) Total squares of service time for unsuccessful requests (in square-microseconds).
zFCTM	INT	8	(IBM name: R744FCTM) Total contention time (microseconds) for waiting for subchannels to become free for synchronous immediate operations.

zFCSQ	INT	8	(IBM name: R744FCSQ) Total squares of contention time for waiting for subchannels to become free for synchronous immediate operations.
zFMOD	CHAR	6	(IBM name: R744FMOD) Coupling facility type. The type is right aligned with leading blanks if necessary.
zFVER	CHAR	3	(IBM name: R744FVER) Coupling facility model.
zFMPC	CHAR	2	(IBM name: R744FMPC) Manufacturer plant code of the coupling facility.
zFLPN	INT	1	(IBM name: R744FLPN) Partition identifier of CF. Valid with SMF74SRL = X'55'(85) and RMF version number SMF74MFV = 718F
zFLVL	INT	4	(IBM name: R744FLVL) Coupling facility level.
zFPAS	INT	1	(IBM name: R744FPAS) Path-available mask for CF links.
zFPIS	INT	1	(IBM name: R744FPIS) Path-installed mask for CF links.
zFPCM	INT	1	(IBM name: R744FPCM) Composite-path mask: paths that have a physical or logical connection to the facility or that are connected to the facility in the active policy.
zFTAP	CHAR	5	(IBM name: R744FTAP) Channel path type acronym.
zFSEQ	CHAR	12	(IBM name: R744FSEQ) Sequence number of this coupling facility.
zFPSN	INT	2	(IBM name: R744FPSN) Number of shared processors. Valid if zFLVL > 14.
zFPDN	INT	2	(IBM name: R744FPDN) Number of dedicated processors. Valid if zFLVL > 14. The following field is available eight times for eight possible channel paths.
zFIDP	INT	1	(IBM name: R744FIDP) Channel path identifier. The range of values is X'00' to X'FF'.
zFCPI	INT	2	(IBM name: R744FCPI) Index to first channel path data section associated with this coupling facility.
zFCPN	INT	2	(IBM name: R744FCPN) Number of channel path data sections for channel paths of type CIB, CFP, CL5, or CS5 connected to this coupling facility. This count matches the number of subsequent channel path data sections.

Secondary segment: SMF074#04_Connectivity

Field Name	Type	Len	Description
SMF074#04_Connectivity.<fieldname>			
zXSYS	CHAR	8	(IBM name: R744XSYS) Name of remote system also reporting on this coupling facility (from IEASYSxx parmlib member, SYSNAME parameter).

Secondary segment: SMF074#04_Storage

Field Name	Type	Len	Description
SMF074#04_Storage.<fieldname>			

zGCSD	INT	4	(IBM name: R744GCSD) Total amount of control storage defined (4K-block units).
zGCSF	INT	4	(IBM name: R744GCSF) Amount of free control storage (4K-block units).
zGTSD	INT	4	(IBM name: R744GTSD) Total amount of coupling facility storage defined (4K-block units).
zGTSF	INT	4	(IBM name: R744GTSF) Amount of free coupling facility storage (4K-block units).
zGDSA	INT	4	(IBM name: R744GDSA) Amount of dump space allocated (4K-block units).
zGDSF	INT	4	(IBM name: R744GDSF) Amount of free dump space (4K-block units).
zGDSR	INT	4	(IBM name: R744GDSR) Maximum amount of dump space requested (4K-block units).
zGTSC	INT	8	(IBM name: R744GTSC) Total amount of coupling facility storage class memory (4K-block units) which may be concurrently used as structure extensions.
zGFSC	INT	8	(IBM name: R744GFSC) Amount of free coupling facility storage class memory (4K-block units).
zGISC	INT	2	(IBM name: R744GISC) Amount of storage class memory increment. This is the number of 4K blocks that are assigned to a single storage class memory segment.

Secondary segment: **SMF074#04_Structure**

Field Name	Type	Len	Description
<i>SMF074#04_Structure.<fieldname></i>			
zQSTR	CHAR	16	(IBM name: R744QSTR) Name of structure allocated in this coupling facility.
zQSIZ	INT	4	(IBM name: R744QSIZ) Structure size requested to be allocated (4K-block units).
zQVER	HEX	8	(IBM name: R744QVER) Structure version number.
<i>SMF074#04_Structure.zQFLG.<fieldname></i>			
zActive	BIT	1	Active instance of structure (normal case).
zNew	BIT	1	New instance during rebuild.
zOld	BIT	1	Old instance during rebuild.
zTrans	BIT	1	Instance is just being added or deleted (in transition).
zHold	BIT	1	Instance in hold, deletion could not be finished.
zDump	BIT	1	Dump was initiated for this structure.
zRebuild	BIT	1	Structure rebuild in progress.
zDuplex	BIT	1	The in-progress rebuild is a duplexing rebuild.
<i>SMF074#04_Structure.<fieldname></i>			
zQFL1	INT	1	(IBM name: R744QFL1) Status Flags 0 DUPLEXING is active using system-managed asynchronous duplexing. 1-7 Reserved

Secondary segment: **SMF074#04_Request**

Field Name	Type	Len	Description
<i>SMF074#04_Request.<fieldname></i>			
zSNAM	CHAR	16	(IBM name: R744SNAM) Name of connected structure in this coupling facility.
zSVER	HEX	8	(IBM name: R744SVER) Structure version number.
zSTYP	INT	1	(IBM name: R744STYP) Structure type identifier. Value Meaning 1 UNSERIALIZED List structure 2 SERIALIZED List structure 3 LOCK structure 4 CACHE structure

<i>SMF074#04_Request.zSFLG.<fieldname></i>			
zEndOfIntvl	BIT	1	Structure was connected to the system at the end of the interval.
zDuringIntvl	BIT	1	Structure became active during the interval.
zASync	BIT	1	Structure is capable to participate in asynchronous duplexing.
zDuplex	BIT	1	Structure is in the duplexing active state.
zPri	BIT	1	Structure is primary instance of an asynchronously duplexed structure.
zSec	BIT	1	Structure is secondary instance of an asynchronously duplexed structure.
zEncrypt	BIT	1	Structure is encrypted.

<i>SMF074#04_Request.<fieldname></i>			
zSLEC	INT	1	(IBM name: R744SLEC) Lock structure only: lock table entry characteristic.
zSLEL	INT	4	(IBM name: R744SLEL) List structure: limit on number of list entries. The estimated maximum number of list entries that may reside in storage class memory is not included. Lock structure: limit on number of data elements.
zSLEM	INT	4	(IBM name: R744SLEM) List structure: current number of list entries in use. The number of list entries that currently reside in storage class memory is not included. Lock structure: current number of data elements in use.
zSLTL	INT	4	(IBM name: R744SLTL) Lock structure only: limit on number of lock table entries.
zSLTM	INT	4	(IBM name: R744SLTM) Lock structure only: Current number of lock table entries in use.
zSSTA	FLOAT	8	(IBM name: R744SSTA) The number of list, lock, or cache requests that were to be executed synchronously at the coupling facility, but which were changed to an asynchronous operation due to lack of resources.
zSTRC	FLOAT	8	(IBM name: R744STRC) The total number of IXLLIST, IXLCACHE, or IXLLOCK requests made. This field will not necessarily equal the sum of zSSRC, zSARC, and zSSTA due to internal processing. Use of the batch unlock function can produce large discrepancies because zSTRC is incremented for each lock being released, but only one coupling facility operation is executed.
zSTAC	FLOAT	8	(IBM name: R744STAC) The total number of IXLLOCK requests that could not be satisfied immediately because of lock contention.
zSARC	FLOAT	8	(IBM name: R744SARC) The total number of operations executed asynchronously at the coupling facility.
zSATM	INT	8	(IBM name: R744SATM) Summed service time for asynchronous requests in microseconds.
zSASQ	INT	8	(IBM name: R744SASQ) Summed squares of service time for asynchronous requests.
zSSRC	FLOAT	8	(IBM name: R744SSRC) Count of number of times for synchronous requests.

zSSTM	INT	8	(IBM name: R744SSTM) Summed service time for synchronous requests in microseconds.
zSSSQ	INT	8	(IBM name: R744SSSQ) Summed squares of service time for synchronous requests.
zSQRC	FLOAT	8	(IBM name: R744SQRC) Count of number of times for queued requests.
zSQTM	INT	8	(IBM name: R744SQTM) Summed queue delay time in microseconds.
zSQSQ	INT	8	(IBM name: R744SQSQ) Summed squares of delay time for queued requests.
zSDRC	FLOAT	8	(IBM name: R744SDRC) Number of times a request was found delayed in case of dump serialization.
zSDTM	INT	8	(IBM name: R744SDTM) Summed dump delay time in microseconds.
zSDSQ	INT	8	(IBM name: R744SDSQ) Summed squares of dump delay time.
zSDMP	FLOAT	8	(IBM name: R744SDMP) Number of times dump serialization was found for this structure (list and cache structures only).
zSHTO	FLOAT	8	(IBM name: R744SHTO) Total number of requests waiting on the high priority queue.
zSHMN	INT	4	(IBM name: R744SHMN) Minimum number of requests waiting on the high priority queue during this interval.
zSHMX	INT	4	(IBM name: R744SHMX) Maximum number of requests waiting on the high priority queue during this interval.
zSLTO	FLOAT	8	(IBM name: R744SLTO) Total number of requests waiting on the low priority queue.
zSLMN	INT	4	(IBM name: R744SLMN) Minimum number of requests waiting on the low priority queue during this interval.
zSLMX	INT	4	(IBM name: R744SLMX) Maximum number of requests waiting on the low priority queue during this interval.
zSDTO	FLOAT	8	(IBM name: R744SDTO) Total number of requests delayed because dump serialization is in progress.
zSDMN	INT	4	(IBM name: R744SDMN) Minimum number of requests delayed because dump serialization is in progress during this interval.
zSDMX	INT	4	(IBM name: R744SDMX) Maximum number of requests delayed because dump serialization is in progress during this interval.
zSCN	FLOAT	8	(IBM name: R744SCN) Lock structure only: number of times any request encountered lock contention.
zSFCN	FLOAT	8	(IBM name: R744SFCN) Lock structure only: number of times any request encountered false lock contention (storage contention within the structure).
zSSIZ	INT	4	(IBM name: R744SSIZ) Allocated size of structure (units = 4K byte blocks).
zSMAS	INT	4	(IBM name: R744SMAS) Maximum structure size.
zSMIS	INT	4	(IBM name: R744SMIS) Minimum structure size.
zSDEC	INT	4	(IBM name: R744SDEC) Cache structure only: Total directory entry count.

zSDEL	INT	4	(IBM name: R744SDEL) Cache structure only: Total data element count.
zSNLH	INT	4	(IBM name: R744SNLH) List structure only: Number of list headers.
zSMAE	INT	4	(IBM name: R744SMAE) List structure only: maximum number of elements. The estimated maximum number of list elements that may reside in storage class memory is not included.
zSCUE	INT	4	(IBM name: R744SCUE) List structure only: current number of elements in use. The number of list elements that currently reside in storage class memory is not included.
zCDSI	INT	2	(IBM name: R744CDSI) Index to first Cache data section.
zCDNE	INT	2	(IBM name: R744CDNE) Number of Cache data section entries.
zSPLN	FLOAT	8	(IBM name: R744SPLN) Count of peer-link-not-available conditions.
zSPES	FLOAT	8	(IBM name: R744SPES) Count of execution-suppressed conditions.
zSPTC	FLOAT	8	(IBM name: R744SPTC) Count of waiting-for-peer-subchannel conditions.
zSPST	INT	8	(IBM name: R744SPST) Total peer-subchannel-wait time (microseconds).
zSPSS	INT	8	(IBM name: R744SPSS) Square of total peer-subchannel-wait time (microseconds squared).
zSRTC	FLOAT	8	(IBM name: R744SRTC) Count of condition 'waiting for peer subchannel with reserve held'.
zSRST	INT	8	(IBM name: R744SRST) Total peer-subchannel-wait-with-reserve time (microseconds).
zSRSS	INT	8	(IBM name: R744SRSS) Square of total peer-subchannel-wait-with-reserve time (microseconds squared).
zSCTC	FLOAT	8	(IBM name: R744SCTC) Count of condition 'waiting for peer completion'.
zSCST	INT	8	(IBM name: R744SCST) Total waiting-for-peer-completion time (microseconds).
zSCSS	INT	8	(IBM name: R744SCSS) Square of total waiting-for-peer-completion time (microseconds squared).
zSLSV	HEX	8	(IBM name: R744SLSV) Logical structure version number.
zSETM	FLOAT	8	(IBM name: R744SETM) Structure execution time (microseconds). Valid if zFLVL > 14.
zSISC	INT	2	(IBM name: R744SISC) Index to Storage Class Memory data section. This field is zero if there is no SCM information available.
zSNSC	INT	2	(IBM name: R744SNSC) Number of Storage Class Memory data sections.
zSSAC	INT	4	(IBM name: R744SSAC) Count of Storage Class Memory Access Required conditions that require the request to be restarted.
zSOSA	INT	4	(IBM name: R744SOSA) Count of successful operations to the coupling facility that encountered an SCM Access Required condition.
zSIAD	INT	2	(IBM name: R744SIAD) Index to Asynchronous CF Duplexing data section. This field is zero if there is no Asynchronous CF Duplexing data available.
zSADN	INT	2	(IBM name: R744SADN) Number of Asynchronous CF Duplexing data sections.

zSIXC	INT	4	(IBM name: R744SIXC) Number of asynchronous duplex requests that requested sync up with the primary. (Valid if bit 1 0F zSXFL is set.)
zSXSC	INT	4	(IBM name: R744SXSC) Number of asynchronous duplex requests that were suspended waiting for the operations to complete in the secondary structure of the current duplexing instance. (Valid if bit 1 0F zSXFL is set.)
zSXST	INT	8	(IBM name: R744SXST) Summed suspend time, in microseconds, for suspended requests that were waiting for asynchronous duplex operations to complete in the secondary structure of the current duplexing instance. (Valid if bit 1 0F zSXFL is set.)
zSXSQ	INT	8	(IBM name: R744SXSQ) Square of summed suspend times, in square of microseconds, for suspended requests that were waiting for the asynchronous duplex operations to complete in the secondary structure of the current duplexing instance. (Valid if bit 1 0F zSXFL is set.)
zSADO	INT	4	(IBM name: R744SADO) Number of asynchronous duplex operations that were delayed because the primary structure was unable to accept new requests either because it could not forward requests to the secondary CF or because the secondary CF could not process incoming requests. (Valid if bit 0 0F zSXFL is set.)
zSADR	INT	4	(IBM name: R744SADR) Number of asynchronous duplex requests that experienced a delayed operation because the primary CF was unable to accept new requests. (Valid if bit 0 0F zSXFL is set.)
zSQCH	INT	1	(IBM name: R744SQCH) Asynchronous duplex operation queue characteristic. The number of queue entries is the product of: $4096 * 2^{**} zSQCH$

SMF074#04_Request.zSXFL.<fieldname>

zPri	BIT	1	Data for primary instance of asynchronous duplexed structure is valid
zSec	BIT	1	Data for secondary instance of asynchronous duplexed structure is valid
zValid	BIT	1	Data for Write and Read Request Measurements is valid.
zValidCF	BIT	1	Data for CF monopolization delays is valid.

SMF074#04_Request.<fieldname>

zSWDR	INT	4	(IBM name: R744SWDR) Number of requests to write data to the CF structure. (Valid if bit 2 0F zSXFL is set.)
zSWAC	INT	4	(IBM name: R744SWAC) Number of adjunct areas written to the CF structure. (Valid if bit 2 0F zSXFL is set.)
zSRDR	INT	4	(IBM name: R744SRDR) Number of requests to read data from the CF structure. (Valid if bit 2 0F zSXFL is set.)
zSRAC	INT	4	(IBM name: R744SRAC) Number of adjunct areas read from the CF structure. (Valid if bit 2 0F zSXFL is set.)
zSWEC	INT	4	(IBM name: R744SWEC) Number of data entries with data elements that have been written to the CF structure. Includes both single and multi entry write requests. (Valid if bit 2 0F zSXFL is set.)
zSREC	INT	4	(IBM name: R744SREC) Number of data entries with data elements that have been read from the CF structure. Includes both single and multi entry read requests. (Valid if bit 2 0F zSXFL is set.)
zSWED	INT	8	(IBM name: R744SWED) Sum of 256-byte increments accumulated for entry data with data elements written to the CF structure. (Valid if bit 2 0F zSXFL is set.)
zSWES	INT	8	(IBM name: R744SWES) Square of summed number of 256-byte increments accumulated for entry

			data with data elements written to the CF structure. (Valid if bit 2 0F zSXFL is set.)
zSRED	INT	8	(IBM name: R744SRED) Sum of 256-byte increments accumulated for entry data with data elements read from the CF structure. (Valid if bit 2 0F zSXFL is set.)
zSRES	INT	8	(IBM name: R744SRES) Square of summed number of 256-byte increments accumulated for entry data with data elements read from the CF structure. (Valid if bit 2 0F zSXFL is set.)
zSMRC	FLOAT	8	(IBM name: R744SMRC) Number of times a request was found delayed due to coupling facility resource monopolization. (Valid if bit 3 of R744SXFL is set.)
zSMTM	INT	8	(IBM name: R744SMTM) Summed queue time (in microseconds) for operations queued due to coupling facility resource monopolization. (Valid if bit 3 of R744SXFL is set.)
zSMSQ	INT	8	(IBM name: R744SMSQ) Summed queue time squared for operations queued due to coupling facility resource monopolization, in microseconds squared. (Valid if bit 3 of R744SXFL is set.)
zSMTO	FLOAT	8	(IBM name: R744SMTO) Total number of operations queued for CF monopolization avoidance. (Valid if bit 3 of R744SXFL is set.)
zSMHT	FLOAT	8	(IBM name: R744SMHT) Total number of high-priority operations queued for CF monopolization avoidance. (Valid if bit 3 of R744SXFL is set.)
zSMMN	INT	4	(IBM name: R744SMMN) Minimum number of operations queued for CF monopolization avoidance during this interval. (Valid if bit 3 of R744SXFL is set.)
zSMMX	INT	4	(IBM name: R744SMMX) Maximum number of operations queued for CF monopolization avoidance during this interval. (Valid if bit 3 of R744SXFL is set.)
zSMHN	INT	4	(IBM name: R744SMHN) Minimum number of high-priority operations queued for CF monopolization avoidance during this interval. (Valid if bit 3 of R744SXFL is set.)
zSMHX	INT	4	(IBM name: R744SMHX) Maximum number of high-priority operations queued for CF monopolization avoidance during this interval. (Valid if bit 3 of R744SXFL is set.)

Secondary segment: **SMF074#04_Processor_Utilization**

Field Name	Type	Len	Description
<i>SMF074#04_Processor_Utilization.<fieldname></i>			
zPNUM	INT	4	(IBM name: R744PNUM) CPU number.
zPBSY	INT	4	(IBM name: R744PBSY) Busy time (in microseconds).
zPWAI	INT	4	(IBM name: R744PWAI) Wait time (in microseconds).
<i>SMF074#04_Processor_Utilization.zPTYP.<fieldname></i>			
zDedicated	BIT	1	Processor is dedicated. Valid if zFLVL >
<i>SMF074#04_Processor_Utilization.<fieldname></i>			
zPWGT	INT	2	(IBM name: R744PWGT) Shared processor weight. Valid if zFLVL > 14.

Secondary segment: SMF074#04_Cache

Field Name	Type	Len	Description
<i>SMF074#04_Cache.<fieldname></i>			
zCRHC	FLOAT	8	(IBM name: R744CRHC) Read hit counter.
zCRMD	FLOAT	8	(IBM name: R744CRMD) Read miss, directory hit counter.
zCRMA	FLOAT	8	(IBM name: R744CRMA) Read miss, assignment suppressed counter.
zCRMN	FLOAT	8	(IBM name: R744CRMN) Read miss, name assigned counter.
zCRMT	FLOAT	8	(IBM name: R744CRMT) Read miss, target storage class full.
zCWH0	FLOAT	8	(IBM name: R744CWH0) Write hit change bit 0 - NUMBER of times unchanged data was written.
zCWH1	FLOAT	8	(IBM name: R744CWH1) Write hit change bit 1 - NUMBER of times changed data was written.
zCWMN	FLOAT	8	(IBM name: R744CWMN) Write miss not registered counter.
zCWMI	FLOAT	8	(IBM name: R744CWMI) Write miss invalid state counter.
zCWMT	FLOAT	8	(IBM name: R744CWMT) Write miss storage class full counter.
zCDER	FLOAT	8	(IBM name: R744CDER) Directory entry reclaim counter.
zCDTR	FLOAT	8	(IBM name: R744CDTR) Data entry reclaim counter.
zCXDR	FLOAT	8	(IBM name: R744CXDR) XI directory reclaim counter.
zCXFW	FLOAT	8	(IBM name: R744CXFW) XI write counter.
zCXNI	FLOAT	8	(IBM name: R744CXNI) XI name invalidation counter.
zCXCI	FLOAT	8	(IBM name: R744CXCI) XI complement invalidation counter.
zCCOC	FLOAT	8	(IBM name: R744CCOC) Castout counter.
zCRSM	FLOAT	8	(IBM name: R744CRSM) Reference signal miss counter.
zCTSF	FLOAT	8	(IBM name: R744CTSF) Target storage class full counter.
zCDEC	INT	4	(IBM name: R744CDEC) Directory entry counter snapshot.
zCDAC	INT	4	(IBM name: R744CDAC) Data element counter snapshot.
zCTCC	INT	4	(IBM name: R744CTCC) Total changed counter.
zCDTA	INT	4	(IBM name: R744CDTA) Data area counter.
zCRLC	FLOAT	8	(IBM name: R744CRLC) Completed reference list counter.
zCPRL	FLOAT	8	(IBM name: R744CPRL) Partially completed reference list counter.

zCXRL	FLOAT	8	(IBM name: R744CXRL) XI for local cache vector index replacement.
zCWUC	FLOAT	8	(IBM name: R744CWUC) Write unchanged counter.

Secondary segment: **SMF074#04_Remote_Facility**

Field Name	Type	Len	Description
<i>SMF074#04_Remote_Facility.<fieldname></i>			
zRNDE	CHAR	32	(IBM name: R744RNDE) Hardware node descriptor for the remotely connected CF.
zRSYS	CHAR	8	(IBM name: R744RSYS) System identification value for the remotely connected CF.
zRNAM	CHAR	8	(IBM name: R744RNAM) CF name (if applicable, else X'0').
zRPGS	INT	1	(IBM name: R744RPGS) Receiver path group size.
zRRES	INT	4	(IBM name: R744RRES) Ready-to-execute signal counter.
zRRCS	INT	4	(IBM name: R744RRCS) Ready-to-complete signal counter.
zRHES	INT	4	(IBM name: R744RHES) Halt-execution signal counter.
zRRSS	INT	4	(IBM name: R744RRSS) Request-for-suppression signal counter.
zRRSA	INT	4	(IBM name: R744RRSA) Request-for-suppression-accepted signal counter.
zRSST	INT	4	(IBM name: R744RSST) Unused. Value is now in zRSSE.
zRSSS	INT	8	(IBM name: R744RSSS) Total squares of signal service times.
zRDSC	INT	4	(IBM name: R744RDSC) Delayed signal counter.
zRSDT	INT	4	(IBM name: R744RSDT) Total signal delay times in microseconds.
zRSSD	INT	8	(IBM name: R744RSSD) Total squares of signal times.
zRSRS	INT	4	(IBM name: R744RSRS) Signal-redrives signal counter. The following field is available eight times for eight possible receiver/peer channel paths.
zRTAP	CHAR	5	(IBM name: R744RTAP) Channel path type acronym. A CHPID type is provided for each active receiver/peer message path in the path group. The number of valid entries is equal to the receiver path group size.
zRSSE	INT	8	(IBM name: R744RSSE) Sum of signal service times in microseconds. The following field is available eight times for eight possible receiver/peer channel paths.
zRIDP	INT	1	(IBM name: R744RIDP) Channel path identifier for the receiver/peer channel path. The range of values is X'00' to X'FF'.
zRCPI	INT	2	(IBM name: R744RCPI) Index to first channel path data section associated with this remote coupling facility.
zRCPN	INT	2	(IBM name: R744RCPN) Number of channel path data sections for channel paths of type CIB, CFP,

			CL5, or CS5 connected to this remote coupling facility (CF). This includes the receiver/peer channel paths over which signals can be sent from the subject CF to this remote CF and the sender/peer channel paths returning signals from this remote CF to the subject CF. This count matches the number of subsequent channel path data sections associated with this remote CF.
zRSGS	INT	1	(IBM name: R744RSGS) Sender path group size.
zRSAP	CHAR	5	(IBM name: R744RSAP) Channel path type acronym. A CHPID type is provided for each active sender/peer message path in the path group. The number of valid entries is equal to the sender path group size. The following field is available eight times for eight possible sender/peer channel paths.
zRSID	INT	1	(IBM name: R744RSID) Channel path identifier for sender/peer channel path. The range of values is X'00' to X'FF'.
zRSC	INT	4	(IBM name: R744RSC) Number of subchannels associated with the remote CF.
zRAMC	INT	4	(IBM name: R744RAMC) Number of asynchronous messages that are sent to this remote CF. The count includes the number of asynchronous commands that are sent and excludes path management commands and redrives of asynchronous commands.
zRAMST	INT	8	(IBM name: R744RAMST) Total amount of service time for asynchronous messages sent to this remote CF, in microseconds.
zRAMSQ	INT	8	(IBM name: R744RAMSQ) Total amount of squares of service time for asynchronous messages sent to this remote CF, in square of microseconds.
zRAMPB	INT	4	(IBM name: R744RAMPB) Asynchronous message path busy count.
zRAMNS	INT	4	(IBM name: R744RAMNS) Asynchronous message no subchannel count.

Secondary segment: SMF074#04_Channel_Path

Field Name	Type	Len	Description
<i>SMF074#04_Channel_Path.<fieldname></i>			
zHCPI	INT	1	(IBM name: R744HCPI) Channel path identifier. The range of values is X'00' to X'FF'.
zHTAP	CHAR	5	(IBM name: R744HTAP) Channel path type acronym.
<i>SMF074#04_Channel_Path.zHFLA.<fieldname></i>			
zCoupling	BIT	1	Coupling adapter ID and port number are valid.
zOpMode	BIT	1	Channel path operation mode is valid.
zLatency	BIT	1	Channel path latency time is valid.
zDegraded	BIT	1	Degraded status flag is valid.
zIoProc	BIT	4	The corresponding field in the array of I/O processors is valid.
zCHID	BIT	1	Channel ID (CHID) is valid.
<i>SMF074#04_Channel_Path.<fieldname></i>			
zHOPM	INT	1	(IBM name: R744HOPM) Channel path operation mode. It describes the channel path type, data rate, protocol and adapter type. Value Meaning X'01' CFP path supporting a 1.0625 Gbit/s data rate X'02' CFP path supporting a 2.125 Gbit/s data rate X'10' CIB path operating at 1x bandwidth using the IFB protocol,

			adapter type HCA2-O LR X'11' CIB path operating at 12x bandwidth using the IFB protocol, adapter type HCA2-O X'20' CIB path operating at 1x bandwidth using the IFB protocol, adapter type HCA3-O LR X'21' CIB path operating at 12x bandwidth using the IFB protocol, adapter type HCA3-O X'30' CIB path operating at 12x bandwidth using the IFB3 protocol, adapter type HCA3-O X'40' CS5 path operating at 8x bandwidth using the PCIe third generation protocol, adapter type PCIe-O X'50' CL5 path supporting a 10 GBIT/S data rate using the Converged Enhanced Ethernet protocol, adapter type RoCE Other Unknown
--	--	--	--

SMF074#04_Channel_Path.zHCHF.<fieldname>

zDegraded	BIT	1	Channel path is operating at reduced capacity (degraded) or is not operating at the end of the interval.
zSender	BIT	1	Channel path is a sender channel.

SMF074#04_Channel_Path.<fieldname>

zHLAT	INT	4	(IBM name: R744HLAT) Channel path latency time. This is the average round-trip path time in microseconds. A value of 0 MEANS that the time was not measured. A value of 1 MEANS a time less than or equal to one microsecond.
zHPCP	INT	2	(IBM name: R744HPCP) Physical channel ID (PCHID)
zHAID	INT	2	(IBM name: R744HAID) Coupling adapter identifier associated with the CHPID.
zHAPN	INT	1	(IBM name: R744HAPN) Number of the port associated with the CHPID.
zHSAP	INT	1	(IBM name: R744HSAP) I/O processor (System Assist Processor) to which this path is accessible. The range of values is X'00' to X'FF'.

Secondary segment: SMF074#04_Storage_Class_Memory

Field Name	Type	Len	Description
SMF074#04_Storage_Class_Memory.<fieldname>			
zMSMA	INT	8	(IBM name: R744MSMA) Maximum amount of storage class memory the structure can use (4K-block units).
zMALG	INT	1	(IBM name: R744MALG) SCM algorithm type.
zMFAU	INT	4	(IBM name: R744MFAU) Fixed augmented space (4K-block units).
zMIUA	INT	4	(IBM name: R744MIUA) Amount of augmented space that is in use by this structure (4K-block units).
zMIUS	INT	8	(IBM name: R744MIUS) Amount of storage class memory that is in use by this structure (4K-block units).
zMEMA	INT	4	(IBM name: R744MEMA) Estimated maximum amount of space that may be assigned as augmented space for this structure (4K-block units).
zMEML	INT	8	(IBM name: R744MEML) Estimated maximum number of list entries that may reside in storage class memory for this structure.
zMEME	INT	8	(IBM name: R744MEME) Estimated maximum number of list elements that may reside in storage class memory for this structure.
zMENL	INT	8	(IBM name: R744MENL) Number of existing structure list entries that reside in storage class

			memory for this structure.
zMENE	INT	8	(IBM name: R744MENE) Number of existing structure list elements that reside in storage class memory for this structure.
zMSLT	INT	1	(IBM name: R744MSLT) Percentage of the list entry and list element counts that determines the lower threshold for migration from storage class memory to CF storage.
zMSUT	INT	1	(IBM name: R744MSUT) Percentage of the list entry and list element counts that determines the upper threshold for migration from CF storage to storage class memory.
zMSLR	INT	1	(IBM name: R744MSLR) Percentage of the list entry and list element counts that determines the lower threshold regulator for migration from CF storage class memory to CF real storage. The lower threshold regulators are used to stop migration from CF SCM into CF real storage after being triggered by the lower threshold.
zMSUR	INT	1	(IBM name: R744MSUR) Percentage of the list entry and list element counts that determines the upper threshold regulator for migration from CF real storage to CF storage class memory. The upper threshold regulators are used to stop migration from CF real storage into CF SCM after being triggered by the upper threshold.
zMSWC	INT	4	(IBM name: R744MSWC) SCM write count. The number of list write operations performed to storage class memory.
zMRFC	INT	4	(IBM name: R744MRFC) The number of read operations against storage class memory that were initiated by a reference to list structure objects residing in storage class memory.
zMRPC	INT	4	(IBM name: R744MRPC) The number of read operations against storage class memory that were initiated as a prefetch operation in order to retrieve list structure objects in storage class memory that are expected to be referenced.
zMRST	INT	8	(IBM name: R744MRST) Total amount of service times for read operations from storage class memory in microseconds.
zMRSQ	INT	8	(IBM name: R744MRSQ) Total amount of squares of service times for read operations from storage class memory in square-microseconds.
zMWST	INT	8	(IBM name: R744MWST) Total amount of service times for write operations to storage class memory in microseconds.
zMWSQ	INT	8	(IBM name: R744MWSQ) Total amount of squares of service times for write operations to storage class memory in square-microseconds.
zMRBT	INT	8	(IBM name: R744MRBT) SCM read bytes transferred. This is the number of bytes in 4K units transferred from storage class memory to CF storage.
zMWBT	INT	8	(IBM name: R744MWBT) SCM write bytes transferred. This is the number of bytes in 4K units transferred from CF storage to storage class memory.
zMAEC	INT	4	(IBM name: R744MAEC) SCM auxiliary enabled command count. This is the number of commands that required the use of CF auxiliary frames.
zMSRL	INT	4	(IBM name: R744MSRL) The number of references against storage class memory to locate list structure objects.
zMSRR	INT	4	(IBM name: R744MSRR) The number of references against storage class memory to resolve list entry key hashing.
zMSRM	INT	4	(IBM name: R744MSRM) The number of references against storage class memory for the purpose of migrating list structure objects from CF storage to storage class memory to allow the creation of new list structure objects in CF storage.

zMMBL	INT	4	(IBM name: R744MMBL) The maximum number of list entries that can be stored in a single storage class memory buffer.
zMMBE	INT	4	(IBM name: R744MMBE) The maximum number of list elements that can be stored in a single storage class memory buffer.
zMNEL	INT	4	(IBM name: R744MNEL) The minimum number of list elements that must be available for assignment after the specified allocation process completes.
zMNEC	INT	4	(IBM name: R744MNEC) The minimum number of list entries that must be available for assignment after the specified allocation process completes.
zMSRK	INT	4	(IBM name: R744MSRK) The number of references against storage class memory for the purpose of migrating list structure objects from storage class memory to CF storage to allow for key-range initialization to complete.

Secondary segment: **SMF074#04_Asynch_CF_Duplexing**

Field Name	Type	Len	Description
<i>SMF074#04_Asynch_CF_Duplexing.<fieldname></i>			
zAFO	INT	8	(IBM name: R744AFO) The most current failed operation sequence number.
zAHEO	INT	8	(IBM name: R744AHEO) Highest operation sequence number that can be executed and completed in the secondary CF.
zALAOH	INT	8	(IBM name: R744ALAOH) Highest sequence number of the operation that has been executed in the primary structure. (Valid if bit 4 0F zSFLG is set.)
zALAOSH	INT	8	(IBM name: R744ALAOSH) Highest sequence number of the operation that has completed in the primary and has been recognized by the secondary structure.
zALCOH	INT	8	(IBM name: R744ALCOH) Highest sequence number of the operation that has completed in the secondary structure. (Valid if bit 5 0F zSFLG is set.)
zALCOPH	INT	8	(IBM name: R744ALCOPH) Highest sequence number of the operation that has completed in the secondary structure and that has been recognized by the primary structure.
zALAO	INT	8	(IBM name: R744ALAO) Number of asynchronous duplex operations that have been executed in the primary structure. (Valid if bit 4 0F zSFLG is set.)
zALAOS	INT	8	(IBM name: R744ALAOS) Number of asynchronous duplex operations that have executed in the primary and have been recognized in the secondary structure.
zALCO	INT	8	(IBM name: R744ALCO) Number of asynchronous duplex operations transmitted from the primary to the secondary structure that completed in the secondary structure. (Valid if bit 5 0F zSFLG is set.)
zALCOP	INT	8	(IBM name: R744ALCOP) Number of asynchronous duplex operations that have been completed both in the primary and in the secondary structure that has been recognized by the primary structure.
zATPOCT	INT	8	(IBM name: R744ATPOCT) Total number of asynchronous duplex operations that have been transmitted from the primary to the secondary structure.
zATPOC	INT	8	(IBM name: R744ATPOC) Number of asynchronous duplex operations transmitted from the primary to the secondary structure in this interval.
zARCPOT	INT	8	

			(IBM name: R744ARCPOT) Total number of asynchronous duplex operations that have completed in the secondary and have been recognized as complete to the primary structure.
zARCPO	INT	8	(IBM name: R744ARCPO) Number of asynchronous duplex operations transmitted from the primary to the secondary structure and recognized as complete to the primary structure in this interval.
zACQSC	INT	8	(IBM name: R744ACQSC) Number of stalls in the processing of the secondary operation queue.
zAPDT	INT	8	(IBM name: R744APDT) Total amount of primary delay time for asynchronous duplex operations, in microseconds. The primary delay time is the elapsed time in the primary CF between the assignment of the operation to the queue buffer and the first attempt to send the operation to the secondary CF.
zAPDQ	INT	8	(IBM name: R744APDQ) Total amount of squares of primary delay time for asynchronous duplex operations, in square of microseconds.
zAMDT	INT	8	(IBM name: R744AMDT) Total amount of message delay time for asynchronous duplex operations, in microseconds. The message delay time is the elapsed time from the first attempt to send the asynchronous duplex operation in the primary CF to the time that the secondary CF assigns the asynchronous duplex operation to a secondary queue entry.
zAMDQ	INT	8	(IBM name: R744AMDQ) Total amount of squares of message delay time for asynchronous duplex operations, in square of microseconds.
zAQDT	INT	8	(IBM name: R744AQDT) Total amount of secondary queue delay time for asynchronous duplex operations, in microseconds. The secondary queue delay time is the elapsed time from the time the asynchronous duplex operation is assigned to a secondary queue entry to the time of completion of the asynchronous duplex operation.
zAQDQ	INT	8	(IBM name: R744AQDQ) Total amount of squares of secondary queue delay time for asynchronous duplex operations, in square of microseconds.
zAQST	INT	8	(IBM name: R744AQST) Total amount of secondary queue stall time for asynchronous duplex operations, in microseconds.
zAQSQ	INT	8	(IBM name: R744AQSQ) Total amount of squares of secondary queue stall time for asynchronous duplex operations, in square of microseconds.
zACDT	INT	8	(IBM name: R744ACDT) Total amount of secondary reported completion delay time for asynchronous duplex operations, in microseconds. The secondary reported completion delay time is the elapsed time in the secondary CF, from the time the asynchronous duplex operation completes in the secondary to the time that the completion is reported to the primary.
zACDQ	INT	8	(IBM name: R744ACDQ) Total amount of squares of secondary reported completion delay time for asynchronous duplex operations, in square of microseconds.
zARDT	INT	8	(IBM name: R744ARDT) Total amount of response delay time for asynchronous duplex operations, in microseconds. The response delay time is the elapsed time from the launch of the operation response in the secondary CF to the time that the primary CF recognizes the response.
zARDQ	INT	8	(IBM name: R744ARDQ) Total amount of squares of response delay time for asynchronous duplex operations, in square of microseconds.
zAOTT	INT	8	(IBM name: R744AOTT) Total amount of operation transmission time for operations sent from the primary to the secondary structure, in microseconds. (Valid if bit 5 0F zSFLG is set.)
zAOTQ	INT	8	(IBM name: R744AOTQ) Total amount of squares of operation transmission time, in square of

			microseconds. (Valid if bit 5 0F zSFLG is set.)
zASTT	INT	8	(IBM name: R744ASTT) Total amount of service time to transfer the asynchronous duplex operations to the secondary structure and complete the operations in the secondary structure, in microseconds. (Valid if bit 5 0F zSFLG is set.)
zASTQ	INT	8	(IBM name: R744ASTQ) Total amount of squares of service time to transfer the asynchronous duplex operations to the secondary structure and complete the operations in the secondary structure, in square of microseconds. (Valid if bit 5 0F zSFLG is set.)

zFLG	HEX	1	(IBM name: SMF74FLG) System indicator: Bit Meaning when set 0 New SMF record format 1 Subtypes used 2 Reserved. 3-6 Version indicators 7 System is running in PR/SM mode.
zRTY	INT	1	(IBM name: SMF74RTY) Record type 74 (X'4A').
zTME	TSTMP	8	(IBM name: SMF74TME) Date/Time that the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF74SID) System identification (from the SMFPRMxx SID parameter).
zSSI	CHAR	4	(IBM name: SMF74SSI) Subsystem identification ('RMF').
zSTY	INT	2	(IBM name: SMF74STY) Record SubType.
zTRN	INT	2	(IBM name: SMF74TRN) Number of triplets in this record. A triplet is a set of three SMF fields (offset/length/number values) that defines a section of the record. The offset is the offset from the RDW.
zPRS	INT	4	(IBM name: SMF74PRS) Offset to RMF Product section from RDW.
zPRL	INT	2	(IBM name: SMF74PRL) Length of RMF Product section.
zPRN	INT	2	(IBM name: SMF74PRN) Number of RMF Product sections. Individual header extension for SubType 1:
z5CO	INT	4	(IBM name: SMF745CO) Offset to Control section.
z5CL	INT	2	(IBM name: SMF745CL) Length of Control section.
z5CN	INT	2	(IBM name: SMF745CN) Number of Control sections.
z5DO	INT	4	(IBM name: SMF745DO) Offset to Cache Device data section.
z5DL	INT	2	(IBM name: SMF745DL) Length of Cache Device data section.
z5DN	INT	2	(IBM name: SMF745DN) Number of Cache Device data sections.

z5XO	INT	4	(IBM name: SMF745XO) Offset to Cache Device data section extension.
z5XL	INT	2	(IBM name: SMF745XL) Length of Cache Device data section extension.
z5XN	INT	2	(IBM name: SMF745XN) Number of Cache Device data section extensions.
z5SO	INT	4	(IBM name: SMF745SO) Offset to Cache Status data section.
z5SL	INT	2	(IBM name: SMF745SL) Length of Cache Status data section.
z5SN	INT	2	(IBM name: SMF745SN) Number of Cache Status data sections.
z51O	INT	4	(IBM name: SMF7451O) Offset to RAID Rank data sections.
z51L	INT	2	(IBM name: SMF7451L) Length of RAID Rank data section.
z51N	INT	2	(IBM name: SMF7451N) Number of RAID Rank data sections. Individual header extension for SubType 6:

Secondary segment: **SMF074#05_Product**

Field Name	Type	Len	Description
<i>SMF074#05_Product.<fieldname></i>			
zMFV	DEC	2 (3,0)	(IBM name: SMF74MFV) RMF version number.
zPRD	CHAR	8	(IBM name: SMF74PRD) Product name ('RMF').
zIST	DEC	4 (7,0)	(IBM name: SMF74IST) Time that the RMF measurement interval started, in the form 0hhmmssF, where hh is the hours, mm is the minutes, ss is the seconds, and F is the sign.
zDAT	DATE	4	(IBM name: SMF74DAT) Date when the RMF measurement interval started, in the form 0cyydddF.
zINT	DEC	4 (7,0)	(IBM name: SMF74INT) Duration of the RMF measurement interval, in the form mmsstttF where mm is the minutes, ss is the seconds, tt is the milliseconds, and F is the sign. (The end of the measurement interval is the sum of the recorded start time and this field.)
zSAM	INT	4	(IBM name: SMF74SAM) Number of RMF samples.

<i>SMF074#05_Product.zFLA.<fieldname></i>			
zSkip	BIT	1	Samples have been skipped
zMonIII	BIT	1	RECORD was written by RMF Monitor III
zSyncSMF	BIT	1	INTERVAL was synchronized with SMF

<i>SMF074#05_Product.<fieldname></i>			
zCYC	DEC	4 (7,0)	(IBM name: SMF74CYC) Sampling cycle length, in the form 000ttttF, where tttt is the milliseconds and F is the sign (taken from CYCLE option). The range of values is 0.050 to 9.999 seconds.
zMVS	CHAR	8	(IBM name: SMF74MVS) z/OS software level (consists of an acronym and the version, release, and modification level - ZVvrrmm).

zIML	INT	1	(IBM name: SMF74IML) Indicates the type of processor complex on which data measurements were taken. Value Meaning 3 9672, zSeries
------	-----	---	--

SMF074#05_Product.zPRF.<fieldname>

zExpStg	BIT	1	The system has expanded storage
zESCA	BIT	1	The processor is enabled for ES connection architecture (ESCA)
zESCdir	BIT	1	There is an ES connection director in the configuration
zzArc	BIT	1	System is running in z/Architecture® mode
zZAAP	BIT	1	At least one zAAP is currently installed
zZIIP	BIT	1	At least one zIIP is currently installed
zDAT	BIT	1	Enhanced DAT facility

SMF074#05_Product.<fieldname>

zPTN	INT	1	(IBM name: SMF74PTN) PR/SM partition number of the partition that wrote this record.
zSRL	INT	1	(IBM name: SMF74SRL) SMF record level change number (X'8E' for subtype 1 records or X'8F' for subtype 2 records for z/OS V2R4 RMF with RMF Data Gatherer APAR OA59330). This field enables processing of SMF record level changes in an existing release.
zIET	HEX	8	(IBM name: SMF74IET) Interval expiration time token. This token can be used to identify other than RMF records that belong to the same interval (if interval was synchronized with SMF).
zLGO	TIME	8	(IBM name: SMF74LGO) Offset GMT to local time (STCK format).
zRAO	INT	4	(IBM name: SMF74RAO) Offset to reassembly area relative to start of RMF product section.
zRAL	INT	2	(IBM name: SMF74RAL) Length of reassembly area. Area consists of a fixed header and a variable number of information blocks. Length depends on the record type/SubType, but is fixed for a specific type/SubType.
zRAN	INT	2	(IBM name: SMF74RAN) Reassembly area indicator. Value Meaning 0 RECORD is not broken. 1 RECORD is broken. Note: This field is used to indicate whether an SMF record is a broken record. Therefore, offset (SMF70RAO) and length (SMF70RAL) are only valid if SMF70RAN = 1. A reassembly area is only present in broken records.
zOIL	INT	2	(IBM name: SMF74OIL) Original interval length as defined in the session or by SMF (in seconds).
zSYN	INT	2	(IBM name: SMF74SYN) SYNC value in seconds.
zGIE	TIME	8	(IBM name: SMF74GIE) Projected gathering interval end (STCK format) GMT time.
zXNM	CHAR	8	(IBM name: SMF74XNM) Sysplex name as defined in parmlib member COUPLExx.
zSNM	CHAR	8	(IBM name: SMF74SNM) System name for current system as defined in parmlib member IEASYSxx SYSNAME parameter. Reassembly Area:

SMF074#05_Product.Reassembly_Area.<fieldname>

zRBR	INT	2	(IBM name: SMF74RBR) Total number of broken records built from the original large record.
zRSQ	INT	2	(IBM name: SMF74RSQ) Sequence number of this broken record. Every broken record built from the same large record must have a unique sequence number, it is in the range from 1 TO SMF70RBR.

zRIO	INT	4	(IBM name: SMF74RIO) Offset to first reassembly information block relative to start of reassembly area header.
zRIL	INT	2	(IBM name: SMF74RIL) Length of reassembly information block.
zRIN	INT	2	(IBM name: SMF74RIN) Number of reassembly information blocks (same value as SMF70TRN in header section).

SMF074#05_Product.Reassembly_Area.Reassembly_Info.<fieldname>			
zRNN	INT	2	(IBM name: SMF74RNN) Total number of sections in the original large record. This field contains information of how many sections of a specific type were contained in the original SMF record. This field is a copy of the number field of the triplet in the original (non broken) record.
zRPP	INT	2	(IBM name: SMF74RPP) Position of the first of one or more consecutive sections described by this block as in the original record. Values in the range of 1 TO SMF70RNN are valid for correct processing. A value of 0 WILL skip processing of this information block. This field provides information where the sections that are part of this broken record were placed in the original record before the split took place. The actual number of consecutive sections contained in this record is available from the actual triplet in the header extension.

Secondary segment: SMF074#05_Cache_Control

Field Name	Type	Len	Description
<i>SMF074#05_Cache_Control.<fieldname></i>			
zCLVL	INT	1	(IBM name: R745CLVL) Gatherer level.
zCMDL	INT	1	(IBM name: R745CMDL) Caching subsystem model.
zCCNT	INT	1	(IBM name: R745CCNT) Record sequence number.
zCUID	CHAR	1	(IBM name: R745CUID) Real control unit ID.
zCSC	INT	1	(IBM name: R745CSC) Status code. Value Meaning 0 SUCCESSFUL processed. 4 IOS return code zCIOC = 0. 8 IDCSS01 return code zCRTN = 0. 98 SYSTEM or USER ABEND zCEA = 0.
zCAE	INT	3	(IBM name: R745CAE) ABEND CODE (SDWACMPC): First 12 BITS = System completion code. Second 12 BITS = User completion code.
zCRTN	INT	2	(IBM name: R745CRTN) IDCSS01 return code. If not zero, record has no Device data sections (SMF745DN=0).
zCIOC	INT	1	(IBM name: R745CIOC) IOS return code. If not zero, record has no Device data sections (SMF745DN = 0).
zCINT	INT	4	(IBM name: R745CINT) Number of seconds since subsystem statistics last collected.
zCCMT	CHAR	28	(IBM name: R745CCMT) Hardware type and model of the control unit.
zCFDV	INT	3	(IBM name: R745CFDV) Failing device

Secondary segment: **SMF074#05_Cache_Device**

Field Name	Type	Len	Description
<i>SMF074#05_Cache_Device.<fieldname></i>			
zDVOL	CHAR	6	(IBM name: R745DVOL) Volume serial of device.

<i>SMF074#05_Cache_Device.zDFL4.<fieldname></i>			
z4Digit	BIT	1	4-Digit device address.
zSetId	BINT	2	Subchannel set ID.
zDCID	HEX	1	(IBM name: R745DCID) Real control unit type code.
zDCCU	HEX	1	(IBM name: R745DCCU) Configured control unit type code if zCMDL = 1.

<i>SMF074#05_Cache_Device.<fieldname></i>			
zDUNT	CHAR	3	(IBM name: R745DUNT) Unit address for sense command.
zDEVN	HEX	2	(IBM name: R745DEVN) Device number.

<i>SMF074#05_Cache_Device.zDFLG.<fieldname></i>			
zStgUnavail	BIT	1	SUBSYSTEM storage not available; set to 0 for DS8000
zDataFmt1	BINT (ENUM)	3	Format of data returned-1
zDataFmt2	BINT (ENUM)	4	Format of data returned-2

<i>SMF074#05_Cache_Device.<fieldname></i>			
zDVID	INT	1	(IBM name: R745DVID) Device address.

<i>SMF074#05_Cache_Device.zDVS1.<fieldname></i>			
zStatus	BINT (ENUM)	2	(IBM name: R745DVS1) Device caching status
zFastWrite	BINT (ENUM)	2	DASD fast write device status
zPPRCSusp	BIT	1	PPRC copy pair suspended.
zPPRCDupP	BIT	1	PPRC copy pair is duplex pending.
zPPRCStatus	BINT (ENUM)	2	PPRC pair status.

<i>SMF074#05_Cache_Device.zDVS2.<fieldname></i>			
zDevicePinnedData	BINT (ENUM)	2	Applicable when SMF075#05_Cache_Control_Unit_Status.zSFT.zFormat (R745SFT) = 0. Pinned data: B'00' = No pinned data exists for the device. B'01' = Pinned data exists for the device. B'10' = Reserved. B'11' = Not used.
zGlobalMirrorState	BINT (ENUM)	3	Applicable when SMF075#05_Cache_Control_Unit_Status.zSFT.zFormat (R745SFT) = 1 or 2. Global Mirror state: B'000' = No Global Mirror configured. B'001' = Global Mirror running - optimal. B'010' = Global Mirror running - suboptimal. B'011' = Global Mirror running - consistency groups failing.

			B'100' = Global Mirror paused. B'101' = Global Mirror fatal. B'110' = More than one Global Mirror session is running. B'111' = Reserved.
zSessPending	BIT	1	Applicable when SMF075#05_Cache_Control_Unit_Status.zSFT.zFormat (R745SFT) = 1 or 2. Session member is pending.
zVolOnline	BIT	1	Applicable when SMF075#05_Cache_Control_Unit_Status.zSFT.zFormat (R745SFT) = 1 or 2. Volume not allowed online.
zFlashCopy	BIT	1	Advanced FlashCopy enabled.
zFlashCopyFV	BIT	1	FlashCopy full volume enabled.

SMF074#05_Cache_Device.<fieldname>			
zDRCR	FLOAT	4	(IBM name: R745DRCR) Search read caching requests.
zDCRH	FLOAT	4	(IBM name: R745DCRH) Search read caching hits.
zDWRC	FLOAT	4	(IBM name: R745DWRC) Write caching requests.
zDWCH	FLOAT	4	(IBM name: R745DWCH) Write caching request hits.
zDRSR	FLOAT	4	(IBM name: R745DRSR) Read sequential requests.
zDRSH	FLOAT	4	(IBM name: R745DRSH) Read sequential request hits.
zDWSR	FLOAT	4	(IBM name: R745DWSR) Write sequential requests.
zDWSH	FLOAT	4	(IBM name: R745DWSH) Write sequential request hits.
zDRNR	FLOAT	4	(IBM name: R745DRNR) Search read non-retentive requests.
zDNRH	FLOAT	4	(IBM name: R745DNRH) Search read non-retentive request hits.
zDWNR	FLOAT	4	(IBM name: R745DWNR) Write non-retentive requests.
zDWNH	FLOAT	4	(IBM name: R745DWNH) Write non-retentive hits.
zDICL	FLOAT	4	(IBM name: R745DICL) Inhibit cache load requests.
zDBCR	FLOAT	4	(IBM name: R745DBCR) Bypass cache requests.
zDTC	FLOAT	4	(IBM name: R745DTC) Sequential DASD to cache XFRs.
zDNTD	FLOAT	4	(IBM name: R745DNTD) Normal cache requests DASD to cache XFRs.
zDCTD	FLOAT	4	(IBM name: R745DCTD) Cache to DASD XFRs.
zDFWB	FLOAT	4	(IBM name: R745DFWB) DASD Fast Write operations delayed due to non-volatile storage space constraints.
zDFWC	FLOAT	4	(IBM name: R745DFWC) Fast write caching requests.
zDFWS	FLOAT	4	(IBM name: R745DFWS) Fast write sequential requests.

zDCRM	FLOAT	4	(IBM name: R745DCRM) Record cache read misses.
-------	-------	---	---

SMF074#05_Cache_Device.zDSG2.<fieldname>

zVolumeSpace	BINT (ENUM)	2	Volume Space Management.
zFailedNVS	BIT	1	Data exits in failed NVS.
zSoftFenced	BIT	1	Device is in a soft fenced state.
zSPIDFenced	BIT	1	Device is in a SPID fenced state.
zRAIDRebuild	BIT	1	Volume is part of a RAID rank that is undergoing RAID rebuild.
zDevicePinnedDataX	BINT (ENUM)	2	Applicable when SMF075#05_Cache_Control_Unit_Status.zSFT.zFormat (R745SFT) = 1 or 2. Pinned data: B'00' = No pinned data exists for the device. B'01' = Pinned data exists for the device. B'10' = Reserved. B'11' = Not used.

SMF074#05_Cache_Device.<fieldname>

zINCR	INT	1	(IBM name: R745INCR) Status code. 0 TRANSFER statistics not valid. 1 TRANSFER statistics valid. Bytes in units of 128K. Times in units of 16 MILLISECONDS.
zDSID	INT	2	(IBM name: R745DSID) Subsystem ID.
zDCWP	FLOAT	4	(IBM name: R745DCWP) RCD cache write promotions.
zDKDW	FLOAT	4	(IBM name: R745DKDW) CKD writes, collected for 3990-03/06 and 2105.
zDKDH	FLOAT	4	(IBM name: R745DKDH) CKD write hits, collected for 3990-03/06 and 2105.
zDFWR	FLOAT	4	(IBM name: R745DFWR) Operations delayed due to cache space constraints.
zBYTR	FLOAT	4	(IBM name: R745BYTR) Bytes read. See zINCR.
zBYTW	FLOAT	4	(IBM name: R745BYTW) Bytes written. See zINCR.
zRTIR	FLOAT	4	(IBM name: R745RTIR) Response time to read bytes. See zINCR.
zRTIW	FLOAT	4	(IBM name: R745RTIW) Response time to write bytes. See zINCR.

z1HDD	INT	1	(IBM name: R7451HDD) Number of HDDs in RAID rank.
z2XTY	INT (ENUM)	1	(IBM name: R7452XTY) Extent type
z1RTY	INT (ENUM)	1	(IBM name: R7451RTY) RAID rank type
z2XFL	INT	1	Extent pool flag:
z1HSS	INT	2	(IBM name: R7451HSS) HDD sector size.
z1RRQ	FLOAT	4	(IBM name: R7451RRQ) RAID rank read requests.
z2PRO	FLOAT	4	(IBM name: R7452PRO) Physical storage read operations.
z1WRQ	FLOAT	4	(IBM name: R7451WRQ) RAID rank write requests.
z2PWO	FLOAT	4	(IBM name: R7452PWO) Physical storage write operations.
z1SR	FLOAT	4	(IBM name: R7451SR) RAID rank FB sectors read.
z2PBR	FLOAT	4	(IBM name: R7452PBR) Physical storage bytes read. For units, see bits 5 AND 6 OF z1INC.
z1SW	FLOAT	4	(IBM name: R7451SW) RAID rank FB sectors written.
z2PBW	FLOAT	4	(IBM name: R7452PBW) Physical storage bytes written. For units, see bits 5 AND 6 OF z1INC.
z1RMR	FLOAT	4	(IBM name: R7451RMR) Record mode read request.

z1XSF	FLOAT	4	(IBM name: R7451XSF) Extended-Remote-Copy(XRC) or Concurrent-Copy(CC) sidefile read request.
z1XCW	FLOAT	4	(IBM name: R7451XCW) XRC or CC contaminated writes.
z1TSP	FLOAT	4	(IBM name: R7451TSP) Number of tracks transferred to secondary Peer-to-Peer-Remote-Copy(PPRC) volume.
z1NVS	FLOAT	4	(IBM name: R7451NVS) NVS space allocation.
z1RRT	FLOAT	4	(IBM name: R7451RRT) RAID rank read response time (in milliseconds).
z2PRT	FLOAT	4	(IBM name: R7452PRT) Physical storage read response time. For units, see bits 5 AND 6 OF z1INC.
z1WRT	FLOAT	4	(IBM name: R7451WRT) RAID rank write response time (in milliseconds).
z2PWT	FLOAT	4	(IBM name: R7452PWT) Physical storage write response time. For units, see bits 5 AND 6 OF z1INC.
z1CT1	FLOAT	4	(IBM name: R7451CT1) Bytes read. For units, see bits 5 AND 6 OF z1INC.
z1CT2	FLOAT	4	(IBM name: R7451CT2) Bytes written. For units, see bits 5 AND 6 OF z1INC.
z1CT3	FLOAT	4	(IBM name: R7451CT3) Read response time. For units, see bits 5 AND 6 OF z1INC.
z1CT4	FLOAT	4	(IBM name: R7451CT4) Write response time. For units, see bits 5 AND 6 OF z1INC.
z1CT5	FLOAT	4	(IBM name: R7451CT5) Number of zHPF read I/O requests (valid if bit 4 IN z1INC is set).
z1CT6	FLOAT	4	(IBM name: R7451CT6) Number of zHPF write I/O requests (valid if bit 4 IN z1INC is set).
z1ZHL	FLOAT	4	(IBM name: R7451ZHL) zHPF List Pre-fetch I/O Requests. Number of command chains, where the Transport Mode operation specified a non-zero Imbedded Locate Record Count.
z1ZHH	FLOAT	4	(IBM name: R7451ZHH) zHPF List Pre-fetch I/O Request Hits. Number of command chains, where v the Transport Mode operation specified a non-zero Imbedded Locate Record Count. v the chain was completed without requiring access to any DDM.
z1GSF	FLOAT	4	(IBM name: R7451GSF) Global Mirror Collisions sidefile count. A GMC occurs when, during the sending of data in the secondary to create a consistency group, a subsequent host update is attempted before the modified track has been transmitted to the secondary volume. The modified track will be moved to the sidefile before allowing a new host write. The counter will be incremented by one when a track is added to the sidefile.
z1GSS	FLOAT	4	(IBM name: R7451GSS) Global Mirror Collisions synchronous count. When a write collision occurs, the modified track data which belongs to the current consistency group may be sent to the remote control unit before allowing the write. The data may come from the sidefile if it is full or from cache if the collision sidefile is not being utilized.
z1SRR	FLOAT	4	(IBM name: R7451SRR) Number of synchronous I/O cache read requests. (Valid if bit 3 OF z1INC is set.)
z1SRH	FLOAT	4	(IBM name: R7451SRH) Number of synchronous I/O cache read request hits. (Valid if bit 3 OF z1INC is set.)
z1SWR	FLOAT	4	(IBM name: R7451SWR) Number of synchronous I/O cache write requests. (Valid if bit 3 OF z1INC is

			set.)
z1SWH	FLOAT	4	(IBM name: R7451SWH) Number of synchronous I/O cache write request hits. (Valid if bit 3 of z1INC is set.)

Record Type 74 Subtype 6 - Hierarchical File System Statistics

Primary Segment:

- SMF074#06_RMF_HFS_Stats

Secondary Segment(s): 4 (in alphabetical order)

- SMF074#06_HFS_File_System
- SMF074#06_HFS_Global
- SMF074#06_HFS_Global_Buffer
- SMF074#06_Product

Primary segment: SMF074#06_RMF_HFS_Stats

Field Name	Type	Len	Description
SMF074#06_RMF_HFS_Stats.<fieldname>			
SMF074#06_RMF_HFS_Stats.Header_Self_Defining_Section.<fieldname>			
zFLG	HEX	1	(IBM name: SMF74FLG) System indicator: Bit Meaning when set 0 New SMF record format 1 Subtypes used 2 Reserved. 3-6 Version indicators 7 System is running in PR/SM mode.
zRTY	INT	1	(IBM name: SMF74RTY) Record type 74 (X'4A').
zTME	TSTMP	8	(IBM name: SMF74TME) Date/Time that the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF74SID) System identification (from the SMFPRMxx SID parameter).
zSSI	CHAR	4	(IBM name: SMF74SSI) Subsystem identification ('RMF').
zSTY	INT	2	(IBM name: SMF74STY) Record SubType.
zTRN	INT	2	(IBM name: SMF74TRN) Number of triplets in this record. A triplet is a set of three SMF fields (offset/length/number values) that defines a section of the record. The offset is the offset from the RDW.
zPRS	INT	4	(IBM name: SMF74PRS) Offset to RMF Product section from RDW.
zPRL	INT	2	(IBM name: SMF74PRL) Length of RMF Product section.
zPRN	INT	2	(IBM name: SMF74PRN) Number of RMF Product sections. Individual header extension for SubType 1:
z6DO	INT	4	(IBM name: SMF746DO) Offset to HFS Global data section.
z6DL	INT	2	(IBM name: SMF746DL) Length of HFS Global data section.
z6DN	INT	2	(IBM name: SMF746DN) Number of HFS Global data sections.
z6BO	INT	4	(IBM name: SMF746BO) Offset to HFS Global Buffer section.
z6BL	INT	2	(IBM name: SMF746BL) Length of HFS Global Buffer section.
z6BN	INT	2	(IBM name: SMF746BN) Number of HFS Global Buffer sections.
z6FO	INT	4	

			(IBM name: SMF746FO) Offset to HFS File System section.
z6FL	INT	2	(IBM name: SMF746FL) Length of HFS File System section.
z6FN	INT	2	(IBM name: SMF746FN) Number of HFS File System sections. Individual header extension for SubType 7:

Secondary segment: **SMF074#06_Product**

Field Name	Type	Len	Description
<i>SMF074#06_Product.<fieldname></i>			
zMFV	DEC	2 (3,0)	(IBM name: SMF74MFV) RMF version number.
zPRD	CHAR	8	(IBM name: SMF74PRD) Product name ('RMF').
zIST	DEC	4 (7,0)	(IBM name: SMF74IST) Time that the RMF measurement interval started, in the form 0hhmssF, where hh is the hours, mm is the minutes, ss is the seconds, and F is the sign.
zDAT	DATE	4	(IBM name: SMF74DAT) Date when the RMF measurement interval started, in the form 0cyydddF.
zINT	DEC	4 (7,0)	(IBM name: SMF74INT) Duration of the RMF measurement interval, in the form mmsstttF where mm is the minutes, ss is the seconds, ttt is the milliseconds, and F is the sign. (The end of the measurement interval is the sum of the recorded start time and this field.)
zSAM	INT	4	(IBM name: SMF74SAM) Number of RMF samples.

<i>SMF074#06_Product.zFLA.<fieldname></i>			
zSkip	BIT	1	Samples have been skipped
zMonIII	BIT	1	RECORD was written by RMF Monitor III
zSyncSMF	BIT	1	INTERVAL was synchronized with SMF

<i>SMF074#06_Product.<fieldname></i>			
zCYC	DEC	4 (7,0)	(IBM name: SMF74CYC) Sampling cycle length, in the form 000ttttF, where tttt is the milliseconds and F is the sign (taken from CYCLE option). The range of values is 0.050 to 9.999 seconds.
zMVS	CHAR	8	(IBM name: SMF74MVS) z/OS software level (consists of an acronym and the version, release, and modification level - ZVvrrmm).
zIML	INT	1	(IBM name: SMF74IML) Indicates the type of processor complex on which data measurements were taken. Value Meaning 3 9672, zSeries

<i>SMF074#06_Product.zPRF.<fieldname></i>			
zExpStg	BIT	1	The system has expanded storage
zESCA	BIT	1	The processor is enabled for ES connection architecture (ESCA)
zESCdir	BIT	1	There is an ES connection director in the configuration
zzArc	BIT	1	System is running in z/Architecture® mode
zZAAP	BIT	1	At least one zAAP is currently installed
zZIIP	BIT	1	At least one zIIP is currently installed

zEnhDAT	BIT	1	Enhanced DAT facility
SMF074#06_Product.<fieldname>			
zPTN	INT	1	(IBM name: SMF74PTN) PR/SM partition number of the partition that wrote this record.
zSRL	INT	1	(IBM name: SMF74SRL) SMF record level change number (X'8E' for subtype 1 records or X'8F' for subtype 2 records for z/OS V2R4 RMF with RMF Data Gatherer APAR OA59330). This field enables processing of SMF record level changes in an existing release.
zIET	HEX	8	(IBM name: SMF74IET) Interval expiration time token. This token can be used to identify other than RMF records that belong to the same interval (if interval was synchronized with SMF).
zLGO	TIME	8	(IBM name: SMF74LGO) Offset GMT to local time (STCK format).
zRAO	INT	4	(IBM name: SMF74RAO) Offset to reassembly area relative to start of RMF product section.
zRAL	INT	2	(IBM name: SMF74RAL) Length of reassembly area. Area consists of a fixed header and a variable number of information blocks. Length depends on the record type/SubType, but is fixed for a specific type/SubType.
zRAN	INT	2	(IBM name: SMF74RAN) Reassembly area indicator. Value Meaning 0 RECORD is not broken. 1 RECORD is broken. Note: This field is used to indicate whether an SMF record is a broken record. Therefore, offset (SMF70RAO) and length (SMF70RAL) are only valid if SMF70RAN = 1. A reassembly area is only present in broken records.
zOIL	INT	2	(IBM name: SMF74OIL) Original interval length as defined in the session or by SMF (in seconds).
zSYN	INT	2	(IBM name: SMF74SYN) SYNC value in seconds.
zGIE	TIME	8	(IBM name: SMF74GIE) Projected gathering interval end (STCK format) GMT time.
zXNM	CHAR	8	(IBM name: SMF74XNM) Sysplex name as defined in parmlib member COUPLExx.
zSNM	CHAR	8	(IBM name: SMF74SNM) System name for current system as defined in parmlib member IEASYSxx SYSNAME parameter. Reassembly Area:

SMF074#06_Product.Reassembly_Area.<fieldname>			
zRBR	INT	2	(IBM name: SMF74RBR) Total number of broken records built from the original large record.
zRSQ	INT	2	(IBM name: SMF74RSQ) Sequence number of this broken record. Every broken record built from the same large record must have a unique sequence number, it is in the range from 1 TO SMF70RBR.
zRIO	INT	4	(IBM name: SMF74RIO) Offset to first reassembly information block relative to start of reassembly area header.
zRIL	INT	2	(IBM name: SMF74RIL) Length of reassembly information block.
zRIN	INT	2	(IBM name: SMF74RIN) Number of reassembly information blocks (same value as SMF70TRN in header section).

SMF074#06_Product.Reassembly_Area.Reassembly_Info.<fieldname>			
zRNN	INT	2	(IBM name: SMF74RNN) Total number of sections in the original large record. This field contains information of how many sections of a specific type were contained in the original SMF record. This field is a copy of the number field of the triplet in the original (non broken) record.

zRPP	INT	2	(IBM name: SMF74RPP) Position of the first of one or more consecutive sections described by this block as in the original record. Values in the range of 1 TO SMF70RNN are valid for correct processing. A value of 0 WILL skip processing of this information block. This field provides information where the sections that are part of this broken record were placed in the original record before the split took place. The actual number of consecutive sections contained in this record is available from the actual triplet in the header extension.
------	-----	---	--

Secondary segment: SMF074#06_HFS_Global

Field Name	Type	Len	Description
<i>SMF074#06_HFS_Global.<fieldname></i>			
zGMXV	INT	4	(IBM name: R746GMXV) Value of VIRTUAL(MAX) (in MB).
zGUSV	INT	4	(IBM name: R746GUSV) Total amount (in pages) of virtual storage in use.
zGMNF	INT	4	(IBM name: R746GMNF) Value of FIXED(MIN) (in MB).
zGUSF	INT	4	(IBM name: R746GUSF) Total amount (in pages) of permanently fixed storage in use.
zGMC	FLOAT	8	(IBM name: R746GMC) Number of times the metadata for a file was found in virtual storage (cache) during file lookup.
zGMNC	FLOAT	8	(IBM name: R746GMNC) Number of times the metadata for a file was not found in virtual storage (cache) during file lookup and an index call was necessary which may result in an I/O.
zG1C	FLOAT	8	(IBM name: R746G1C) Number of times the first page of a data file was requested and found in virtual storage (cache).
zG1NC	FLOAT	8	(IBM name: R746G1NC) Number of times the first page of a data file was requested and not found in virtual storage (cache) and an I/O was necessary.
zGLRC	INT	4	(IBM name: R746GLRC) Return code from OMVS BPX1PCT for DisplayBufferLimits command.
zGLRS	INT	4	(IBM name: R746GLRS) Reason code from OMVS BPX1PCT for DisplayBufferLimits command.
zGSRC	INT	4	(IBM name: R746GSRC) Return code from OMVS BPX1PCT for DisplayGlobalStats command.
zGSRS	INT	4	(IBM name: R746GSRS) Reason code from OMVS BPX1PCT for DisplayGlobalStats command.

<i>SMF074#06_HFS_Global.zGSFL.<fieldname></i>			
zOMVSNotReady	BIT	1	OMVS kernel not ready
zNoBuffLim	BIT	1	No buffer limit data
zNoGlobal	BIT	1	No global data
zPartial	BIT	1	Partial global data

Secondary segment: SMF074#06_HFS_Global_Buffer

Field Name	Type	Len	Description
<i>SMF074#06_HFS_Global_Buffer.<fieldname></i>			

zGSB	INT	2	(IBM name: R746GSB) Size of buffers in buffer pool (in pages).
zGNDS	INT	2	(IBM name: R746GNDS) Number of data spaces for buffer pool.
zGSBP	INT	4	(IBM name: R746GSBP) Size of buffer pool (in pages).
zGSBF	INT	4	(IBM name: R746GSBF) Size of permanently fixed buffers in buffer pool (in pages).
zGBF	FLOAT	8	(IBM name: R746GBF) Number of times a buffer was already fixed prior to an I/O request in buffer pool.
zGBNF	FLOAT	8	(IBM name: R746GBNF) Number of times a buffer was not already fixed prior to an I/O request in buffer pool.

Secondary segment: **SMF074#06_HFS_File_System**

Field Name	Type	Len	Description
<i>SMF074#06_HFS_File_System.<fieldname></i>			
zFSNM	CHAR	44	(IBM name: R746FSNM) File system name (cataloged dataset name).
zFSNL	INT	1	(IBM name: R746FSNL) Length of file system name.
zFSFL	INT	1	Status flags.
zFCTM	CHAR	8	(IBM name: R746FCTM) Current time stamp (when was data obtained).
zFMTM	CHAR	8	(IBM name: R746FMTM) Mount time stamp.
zFSF	INT	4	(IBM name: R746FSF) Size of file system (in pages).
zFPF	INT	4	(IBM name: R746FPF) Number of pages internally used by HFS.
zFPD	INT	4	(IBM name: R746FPD) Number of pages used for the attribute directory.
zFPC	INT	4	(IBM name: R746FPC) Number of data buffer pages cached by this file system.
zFSFI	FLOAT	8	(IBM name: R746FSFI) Number of sequential file data I/O requests issued.
zFRFI	FLOAT	8	(IBM name: R746FRFI) Number of random file data I/O requests issued.
zFMC	FLOAT	8	(IBM name: R746FMC) Number of times the metadata for a file was found in virtual storage (cache) during file lookup.
zFMNC	FLOAT	8	(IBM name: R746FMNC) Number of times the metadata for a file was not found in virtual storage (cache) during file lookup and an index call was necessary which may result in an I/O.
zF1C	FLOAT	8	(IBM name: R746F1C) Number of times the first page of a data file was requested and found in virtual storage (cache).
zF1NC	FLOAT	8	(IBM name: R746F1NC) Number of times the first page of a data file was requested and not found in virtual storage (cache) and an I/O was necessary.
zFINT	FLOAT	8	(IBM name: R746FINT) Number of index new tops.

zFIS	FLOAT	8	(IBM name: R746FIS) Number of index splits.
zFIJ	FLOAT	8	(IBM name: R746FIJ) Number of index joins.
zFIRH	FLOAT	8	(IBM name: R746FIRH) Number of index page read hits.
zFIRM	FLOAT	8	(IBM name: R746FIRM) Number of index page read misses.
zFIWH	FLOAT	8	(IBM name: R746FIWH) Number of index page write hits.
zFIWM	FLOAT	8	(IBM name: R746FIWM) Number of index page write misses.
zFSRC	INT	4	(IBM name: R746FSRC) Return code from OMVS BPX1PCT for DisplayFSStats command.
zFSRS	INT	4	(IBM name: R746FSRS) Reason code from OMVS BPX1PCT for DisplayFSStats command.

zZIIP	BIT	1	At least one zIIP is currently installed
zDAT	BIT	1	Enhanced DAT facility

SMF074#07_Product.<fieldname>

zPTN	INT	1	(IBM name: SMF74PTN) PR/SM partition number of the partition that wrote this record.
zSRL	INT	1	(IBM name: SMF74SRL) SMF record level change number (X'8E' for subtype 1 records or X'8F' for subtype 2 records for z/OS V2R4 RMF with RMF Data Gatherer APAR OA59330). This field enables processing of SMF record level changes in an existing release.
zIET	HEX	8	(IBM name: SMF74IET) Interval expiration time token. This token can be used to identify other than RMF records that belong to the same interval (if interval was synchronized with SMF).
zLGO	TIME	8	(IBM name: SMF74LGO) Offset GMT to local time (STCK format).
zRAO	INT	4	(IBM name: SMF74RAO) Offset to reassembly area relative to start of RMF product section.
zRAL	INT	2	(IBM name: SMF74RAL) Length of reassembly area. Area consists of a fixed header and a variable number of information blocks. Length depends on the record type/SubType, but is fixed for a specific type/SubType.
zRAN	INT	2	(IBM name: SMF74RAN) Reassembly area indicator. Value Meaning 0 RECORD is not broken. 1 RECORD is broken. Note: This field is used to indicate whether an SMF record is a broken record. Therefore, offset (SMF70RAO) and length (SMF70RAL) are only valid if SMF70RAN = 1. A reassembly area is only present in broken records.
zOIL	INT	2	(IBM name: SMF74OIL) Original interval length as defined in the session or by SMF (in seconds).
zSYN	INT	2	(IBM name: SMF74SYN) SYNC value in seconds.
zGIE	TIME	8	(IBM name: SMF74GIE) Projected gathering interval end (STCK format) GMT time.
zXNM	CHAR	8	(IBM name: SMF74XNM) Sysplex name as defined in parmlib member COUPLExx.
zSNM	CHAR	8	(IBM name: SMF74SNM) System name for current system as defined in parmlib member IEASYSxx SYSNAME parameter. Reassembly Area:

SMF074#07_Product.Reassembly_Area.<fieldname>

zRBR	INT	2	(IBM name: SMF74RBR) Total number of broken records built from the original large record.
zRSQ	INT	2	(IBM name: SMF74RSQ) Sequence number of this broken record. Every broken record built from the same large record must have a unique sequence number, it is in the range from 1 TO SMF70RBR.
zRIO	INT	4	(IBM name: SMF74RIO) Offset to first reassembly information block relative to start of reassembly area header.
zRIL	INT	2	(IBM name: SMF74RIL) Length of reassembly information block.
zRIN	INT	2	(IBM name: SMF74RIN) Number of reassembly information blocks (same value as SMF70TRN in

			header section).
SMF074#07_Product.Reassembly_Area.Reassembly_Info.<fieldname>			
zRNN	INT	2	(IBM name: SMF74RNN) Total number of sections in the original large record. This field contains information of how many sections of a specific type were contained in the original SMF record. This field is a copy of the number field of the triplet in the original (non broken) record.
zRPP	INT	2	(IBM name: SMF74RPP) Position of the first of one or more consecutive sections described by this block as in the original record. Values in the range of 1 TO SMF70RNN are valid for correct processing. A value of 0 WILL skip processing of this information block. This field provides information where the sections that are part of this broken record were placed in the original record before the split took place. The actual number of consecutive sections contained in this record is available from the actual triplet in the header extension.

Secondary segment: **SMF074#07_FCD_Global**

Field Name	Type	Len	Description
SMF074#07_FCD_Global.<fieldname>			
SMF074#07_FCD_Global.zGCFL.<fieldname>			
zInterval	BIT	1	Configuration changed during interval.
zIPL	BIT	1	Configuration changed since IPL.
zIODF	BIT	1	System IPLed by way of IODF.
zValid	BIT	1	I/O configuration token is valid.
SMF074#07_FCD_Global.<fieldname>			
zGNFD	INT	2	(IBM name: R747GNFD) Number of installed FCD switches.
zGINM	CHAR	44	(IBM name: R747GINM) IODF name.
zGISF	CHAR	2	(IBM name: R747GISF) Suffix of IODF name.
zGICI	CHAR	18	(IBM name: R747GICI) IODF creation information.
zGICD	CHAR	10	(IBM name: R747GICD) IODF creation date (mm/dd/yyyy).
zGICT	CHAR	8	(IBM name: R747GICT) IODF creation time (hh.mm.ss).

Secondary segment: **SMF074#07_FCD_Switch**

Field Name	Type	Len	Description
SMF074#07_FCD_Switch.<fieldname>			
zSDEV	INT	2	(IBM name: R747SDEV) Switch device number.
zSLSN	INT	1	(IBM name: R747SLSN) Logical switch number.
SMF074#07_FCD_Switch.zSPFL.<fieldname>			
zSwitch	BIT	1	Status of switch has changed.

zPorts	BIT	1	Number of ports has changed.
zOffline	BIT	1	Switch is offline.
zOnline	BIT	1	Switch is now online.
zCascaded	BIT	1	Cascaded switch.

SMF074#07_FCD_Switch.<fieldname>

zSND	CHAR	32	(IBM name: R747SND) ND associated with switch device.
zSNSP	INT	2	(IBM name: R747SNSP) Number of supported ports for this switch.
zSNIP	INT	2	(IBM name: R747SNIP) Number of installed ports for this switch.

Secondary segment: SMF074#07_FCD_Port

Field Name	Type	Len	Description
SMF074#07_FCD_Port.<fieldname>			
zPNUM	CHAR	1	(IBM name: R747PNUM) Port number.
zPADR	CHAR	1	(IBM name: R747PADR) Port address.

SMF074#07_FCD_Port.zPTFL.<fieldname>

zSingleCU	BIT	1	Port type is single CU.
zMultCU	BIT	1	Port type is multiple CU.
zCHPID	BIT	1	Port type is CHPID.
zSwitch	BIT	1	Port type is switch.

SMF074#07_FCD_Port.zPSFL.<fieldname>

zNonUnique	BIT	1	Port type is not unique.
zIdNonUnique	BIT	1	Id is not unique or not known.
zChnOnCaller	BIT	1	Channel on caller's system.
zInstalled	BIT	1	Port installed.
zChanged	BIT	1	Port status changed.
zRemoved	BIT	1	Port has been removed.
zActivated	BIT	1	Port has been activated.
zNoData	BIT	1	No measurement data available for this port.

SMF074#07_FCD_Port.<fieldname>

zPCU	INT	2	(IBM name: R747PCU) Connector id (CU) or channel path. Note: In case of a channel path, the CHPID can also be addressed as a one-byte field zPCP at offset 5.
zPCUN	INT	1	(IBM name: R747PCUN) Number of connector CUs.
zPNPC	INT	1	(IBM name: R747PNPC) Number of Connector sections.
zPXPC	INT	2	(IBM name: R747PXPC) Index of first Connector section.

SMF074#07_FCD_Port.zPPFL.<fieldname>			
zPortRet	BIT	1	Port information was returned at least once for this port.
zNotInst	BIT	1	Port information showed this port not installed.
zLinkFail	BIT	1	Port information showed link failure condition.
zOffline	BIT	1	Port information showed this port offline.
zStatRet	BIT	1	Statistics were returned at least once for this port.

SMF074#07_FCD_Port.<fieldname>			
zPFPT	FLOAT	8	(IBM name: R747PFPT) Frame pacing time (in units of 2.5 microseconds).
zPNWR	FLOAT	8	(IBM name: R747PNWR) Number of words received.
zPNWT	FLOAT	8	(IBM name: R747PNWT) Number of words transmitted.
zPNFR	FLOAT	8	(IBM name: R747PNFR) Number of frames received.
zPNFT	FLOAT	8	(IBM name: R747PNFT) Number of frames transmitted.
zPNER	FLOAT	8	(IBM name: R747PNER) Number of errors.
zPAND	CHAR	32	(IBM name: R747PAND) Node descriptor of attached unit.

Secondary segment: **SMF074#07_FCD_Connector**

Field Name	Type	Len	Description
SMF074#07_FCD_Connector.<fieldname>			
zCNUM	CHAR	1	(IBM name: R747CNUM) Port number.
zCADR	CHAR	1	(IBM name: R747CADR) Port address.

SMF074#07_FCD_Connector.zCTFL.<fieldname>			
zSingleCPU	BIT	1	Port type is single CU.
zMultCPU	BIT	1	Port type is multiple CU.
zCHPID	BIT	1	Port type is CHPID.
zSwitch	BIT	1	Port type is switch.

SMF074#07_FCD_Connector.zCSFL.<fieldname>			
zNonUnique	BIT	1	Port type is not unique.
zIdNonUnique	BIT	1	Id is not unique or not known.
zChnOnCaller	BIT	1	Channel on caller's system.
zInstalled	BIT	1	Port installed.
zChanged	BIT	1	Port status changed.
zRemoved	BIT	1	Port has been removed.
zActivated	BIT	1	Port has been activated.
zNoData	BIT	1	No measurement data available for this port.

SMF074#07_FCD_Connector.<fieldname>			
zCCU	INT	2	(IBM name: R747CCU) Connector id (CU).
zCCUN	INT	1	(IBM name: R747CCUN) Number of connector CUs.

Record Type 74 Subtype 8 - Enterprise Disk System Statistics

Primary Segment:

- SMF074#08_RMF_Enterprise_Disk_Sys_Stats

Secondary Segment(s): 6 (in alphabetical order)

- SMF074#08_Control
- SMF074#08_Extent_Pool_Stats
- SMF074#08_Link_Stats
- SMF074#08_Product
- SMF074#08_Rank_Array
- SMF074#08_Rank_Stats

Primary segment: SMF074#08_RMF_Enterprise_Disk_Sys_Stats

Field Name	Type	Len	Description
<i>SMF074#08_RMF_Enterprise_Disk_Sys_Stats.<fieldname></i>			
SMF074#08_RMF_Enterprise_Disk_Sys_Stats.Header_Self_Defining_Section.<fieldname>			
zFLG	HEX	1	(IBM name: SMF74FLG) System indicator: Bit Meaning when set 0 New SMF record format 1 Subtypes used 2 Reserved. 3-6 Version indicators 7 System is running in PR/SM mode.
zRTY	INT	1	(IBM name: SMF74RTY) Record type 74 (X'4A').
zTME	TSTMP	8	(IBM name: SMF74TME) Date/Time that the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF74SID) System identification (from the SMFPRMxx SID parameter).
zSSI	CHAR	4	(IBM name: SMF74SSI) Subsystem identification ('RMF').
zSTY	INT	2	(IBM name: SMF74STY) Record SubType.
zTRN	INT	2	(IBM name: SMF74TRN) Number of triplets in this record. A triplet is a set of three SMF fields (offset/length/number values) that defines a section of the record. The offset is the offset from the RDW.
zPRS	INT	4	(IBM name: SMF74PRS) Offset to RMF Product section from RDW.
zPRL	INT	2	(IBM name: SMF74PRL) Length of RMF Product section.
zPRN	INT	2	(IBM name: SMF74PRN) Number of RMF Product sections. Individual header extension for SubType 1:
z8CO	INT	4	(IBM name: SMF748CO) Offset to Control data section.
z8CL	INT	2	(IBM name: SMF748CL) Length of Control data section.
z8CN	INT	2	(IBM name: SMF748CN) Number of Control data sections.
z8LO	INT	4	(IBM name: SMF748LO) Offset to Link Statistics section.
z8LL	INT	2	(IBM name: SMF748LL) Length of Link Statistics section.
z8LN	INT	2	(IBM name: SMF748LN) Number of Link Statistics sections.

z8XO	INT	4	(IBM name: SMF748XO) Offset to Extent Pool Statistics section.
z8XL	INT	2	(IBM name: SMF748XL) Length of Extent Pool Statistics section.
z8XN	INT	2	(IBM name: SMF748XN) Number of Extent Pool Statistics sections.
z8RO	INT	4	(IBM name: SMF748RO) Offset to Rank Statistics section.
z8RL	INT	2	(IBM name: SMF748RL) Length of Rank Statistics section.
z8RN	INT	2	(IBM name: SMF748RN) Number of Rank Statistics sections.
z8AO	INT	4	(IBM name: SMF748AO) Offset to Rank Array data section.
z8AL	INT	2	(IBM name: SMF748AL) Length of Rank Array data section.
z8AN	INT	2	(IBM name: SMF748AN) Number of Rank Array data sections. Individual header extension for SubType 9:

Secondary segment: **SMF074#08_Product**

Field Name	Type	Len	Description
<i>SMF074#08_Product.<fieldname></i>			
zMFV	DEC	2 (3,0)	(IBM name: SMF74MFV) RMF version number.
zPRD	CHAR	8	(IBM name: SMF74PRD) Product name ('RMF').
zIST	DEC	4 (7,0)	(IBM name: SMF74IST) Time that the RMF measurement interval started, in the form 0hhmmssF, where hh is the hours, mm is the minutes, ss is the seconds, and F is the sign.
zDAT	DATE	4	(IBM name: SMF74DAT) Date when the RMF measurement interval started, in the form 0cyydddF.
zINT	DEC	4 (7,0)	(IBM name: SMF74INT) Duration of the RMF measurement interval, in the form mmsstttF where mm is the minutes, ss is the seconds, ttt is the milliseconds, and F is the sign. (The end of the measurement interval is the sum of the recorded start time and this field.)
zSAM	INT	4	(IBM name: SMF74SAM) Number of RMF samples.

<i>SMF074#08_Product.zFLA.<fieldname></i>			
zSkip	BIT	1	Samples have been skipped
zMonIII	BIT	1	RECORD was written by RMF Monitor III
zSyncSMF	BIT	1	INTERVAL was synchronized with SMF

<i>SMF074#08_Product.<fieldname></i>			
zCYC	DEC	4 (7,0)	(IBM name: SMF74CYC) Sampling cycle length, in the form 000ttttF, where tttt is the milliseconds and F is the sign (taken from CYCLE option). The range of values is 0.050 to 9.999 seconds.
zMVS	CHAR	8	(IBM name: SMF74MVS) z/OS software level (consists of an acronym and the version, release, and modification level - ZVvrrmm).

zIML	INT	1	(IBM name: SMF74IML) Indicates the type of processor complex on which data measurements were taken. Value Meaning 3 9672, zSeries
------	-----	---	--

SMF074#08_Product.zPRF.<fieldname>

zExpStg	BIT	1	The system has expanded storage
zESCA	BIT	1	The processor is enabled for ES connection architecture (ESCA)
zESCdir	BIT	1	There is an ES connection director in the configuration
zzArc	BIT	1	System is running in z/Architecture® mode
zZAAP	BIT	1	At least one zAAP is currently installed
zZIIP	BIT	1	At least one zIIP is currently installed
zDAT	BIT	1	Enhanced DAT facility

SMF074#08_Product.<fieldname>

zPTN	INT	1	(IBM name: SMF74PTN) PR/SM partition number of the partition that wrote this record.
zSRL	INT	1	(IBM name: SMF74SRL) SMF record level change number (X'8E' for subtype 1 records or X'8F' for subtype 2 records for z/OS V2R4 RMF with RMF Data Gatherer APAR OA59330). This field enables processing of SMF record level changes in an existing release.
zIET	HEX	8	(IBM name: SMF74IET) Interval expiration time token. This token can be used to identify other than RMF records that belong to the same interval (if interval was synchronized with SMF).
zLGO	TIME	8	(IBM name: SMF74LGO) Offset GMT to local time (STCK format).
zRAO	INT	4	(IBM name: SMF74RAO) Offset to reassembly area relative to start of RMF product section.
zRAL	INT	2	(IBM name: SMF74RAL) Length of reassembly area. Area consists of a fixed header and a variable number of information blocks. Length depends on the record type/SubType, but is fixed for a specific type/SubType.
zRAN	INT	2	(IBM name: SMF74RAN) Reassembly area indicator. Value Meaning 0 RECORD is not broken. 1 RECORD is broken. Note: This field is used to indicate whether an SMF record is a broken record. Therefore, offset (SMF70RAO) and length (SMF70RAL) are only valid if SMF70RAN = 1. A reassembly area is only present in broken records.
zOIL	INT	2	(IBM name: SMF74OIL) Original interval length as defined in the session or by SMF (in seconds).
zSYN	INT	2	(IBM name: SMF74SYN) SYNC value in seconds.
zGIE	TIME	8	(IBM name: SMF74GIE) Projected gathering interval end (STCK format) GMT time.
zXNM	CHAR	8	(IBM name: SMF74XNM) Sysplex name as defined in parmlib member COUPLExx.
zSNM	CHAR	8	(IBM name: SMF74SNM) System name for current system as defined in parmlib member IEASYSxx SYSNAME parameter. Reassembly Area:

SMF074#08_Product.Reassembly_Area.<fieldname>

zRBR	INT	2	(IBM name: SMF74RBR) Total number of broken records built from the original large record.
zRSQ	INT	2	(IBM name: SMF74RSQ) Sequence number of this broken record. Every broken record built from the same large record must have a unique sequence number, it is in the range from 1 TO SMF70RBR.

zRIO	INT	4	(IBM name: SMF74RIO) Offset to first reassembly information block relative to start of reassembly area header.
zRIL	INT	2	(IBM name: SMF74RIL) Length of reassembly information block.
zRIN	INT	2	(IBM name: SMF74RIN) Number of reassembly information blocks (same value as SMF70TRN in header section).

SMF074#08_Product.Reassembly_Area.Reassembly_Info.<fieldname>			
zRNN	INT	2	(IBM name: SMF74RNN) Total number of sections in the original large record. This field contains information of how many sections of a specific type were contained in the original SMF record. This field is a copy of the number field of the triplet in the original (non broken) record.
zRPP	INT	2	(IBM name: SMF74RPP) Position of the first of one or more consecutive sections described by this block as in the original record. Values in the range of 1 TO SMF70RNN are valid for correct processing. A value of 0 WILL skip processing of this information block. This field provides information where the sections that are part of this broken record were placed in the original record before the split took place. The actual number of consecutive sections contained in this record is available from the actual triplet in the header extension.

Secondary segment: **SMF074#08_Control**

Field Name	Type	Len	Description
SMF074#08_Control.<fieldname>			
zCLVL	INT	1	(IBM name: R748CLVL) Gatherer level.
zCTYP	CHAR	6	(IBM name: R748CTYP) Control unit type.
zCMDL	CHAR	3	(IBM name: R748CMDL) Control unit model.
zCSER	CHAR	10	(IBM name: R748CSER) Primary control unit serial number.
zCVSN	INT	1	(IBM name: R748CVSN) Version of link statistics definition: X'00' = Original version of link statistics X'01' = Link statistics extended

SMF074#08_Control.zCAE.<fieldname>			
CCSys	BINT	12	Abend code (SDWACMPC) First 12 BITS = System completion code
CCUser	BINT	12	Abend code (SDWACMPC) Second 12 BITS = User completion code.

SMF074#08_Control.<fieldname>			
zCRTN	INT	2	(IBM name: R748CRTN) IDCSS01 return code.
zCSC	INT	1	(IBM name: R748CSC) Status code: 00 SUCCESSFULLY processed. 04 IOS return code. zCIOC = 0. 08 IDCSS01 return code. zCRTN = 0. 98 SYSTEM or USER ABEND. zCAE = 0.
zCIOC	INT	1	(IBM name: R748CIOC) IOS return code. If this field is not zero, no Link Statistic sections are available.
zCFDV	INT	2	(IBM name: R748CFDV) Failing device.
zCVOL	CHAR	6	(IBM name: R748CVOL) Volume serial of the device from which statistics are measured.

zCDEV	INT	2	(IBM name: R748CDEV) Device number of the device from which statistics are measured.
-------	-----	---	---

SMF074#08_Control.zCFLG.<fieldname>

zValid	BIT	1	Extent pool statistics valid
--------	-----	---	------------------------------

SMF074#08_Control.<fieldname>

zCSCS	INT	1	(IBM name: R748CSCS) ID of the subchannel set which is physically configured to the device from which statistics are measured.
zCINT	INT	4	(IBM name: R748CINT) Number of seconds that passed since the link statistics have been collected for the last time.
zCFTM	CHAR	4	(IBM name: R748CFTM) Time when first record was written. Reserved for duration processing.
zCFDT	CHAR	4	(IBM name: R748CFDT) Date when first record was written. Reserved for duration processing.
zCFCI	CHAR	4	(IBM name: R748CFCI) Interval length of first record. Reserved for duration processing.
zCFSC	INT	1	(IBM name: R748CFSC) Subchannel set ID of failing device.

Secondary segment: SMF074#08_Link_Stats

Field Name	Type	Len	Description
SMF074#08_Link_Stats.<fieldname>			
zLAID	INT	2	(IBM name: R748LAID) Adapter ID.
zLTYP	INT	1	(IBM name: R748LTYP) Link Type: 1 ESCON 2 FIBRE Channel 1 GBIT/S 3 FIBRE Channel 2 GBIT/S 4 FIBRE Channel 4 GBIT/S 5 FIBRE Channel 8 GBIT/S 6 FIBRE Channel 16 GBIT/S 10 ETHERNET Channel 10 GBIT/S

SMF074#08_Link_Stats.zFLG.<fieldname>

zBadBytes	BIT	1	Units of bytes indeterminable. Byte values incorrect.
zBadTime	BIT	1	Units of time indeterminable. Time values incorrect.

SMF074#08_Link_Stats.<fieldname>

zLERB	FLOAT	8	(IBM name: R748LERB) ECKD read activity in units of 128KB.
zLEWB	FLOAT	8	(IBM name: R748LEWB) ECKD write activity in units of 128KB.
zLERO	FLOAT	8	(IBM name: R748LERO) Number of ECKD read operations. For ESCON ports, one count is added per chain which transfers customer data (no administration data) to the host. For FICON ports, one count is added per command which transfers customer data to the host.
zLEWO	FLOAT	8	(IBM name: R748LEWO) Number of ECKD write operations. For ESCON ports, one count is added per chain which transfers customer data (no administration data) from the host. For FICON ports, one count is added per command which transfers customer data from the host.
zLERT	FLOAT	8	(IBM name: R748LERT) Accumulated time for ECKD read activity on the channel in milliseconds. The active processing time for each command is accumulated.
zLEWT	FLOAT	8	

			(IBM name: R748LEWT) Accumulated time for ECKD write activity on the channel in milliseconds. The active processing time for each command is accumulated.
zLPSB	FLOAT	8	(IBM name: R748LPSB) PPRC send activity in units of 128KB.
zLPRB	FLOAT	8	(IBM name: R748LPRB) PPRC received activity in units of 128KB.
zLPPO	FLOAT	8	(IBM name: R748LPPO) PPRC send operations. Each PPRC write command sent by the PPRC primary is counted.
zLPRO	FLOAT	8	(IBM name: R748LPRO) PPRC received operations. Each PPRC write command received by the PPRC secondary is counted.
zLPST	FLOAT	8	(IBM name: R748LPST) Accumulated time for PPRC send activity in milliseconds.
zLPRT	FLOAT	8	(IBM name: R748LPRT) Accumulated time for PPRC received activity in milliseconds.
zLSRB	FLOAT	8	(IBM name: R748LSRB) SCSI read activity in units of 128KB.
zLSWB	FLOAT	8	(IBM name: R748LSWB) SCSI write activity in units of 128KB.
zLSRO	FLOAT	8	(IBM name: R748LSRO) SCSI read operations. Each read operation is counted.
zLSWO	FLOAT	8	(IBM name: R748LSWO) SCSI write operations. Each write operation is counted.
zLSRT	FLOAT	8	(IBM name: R748LSRT) Accumulated time for SCSI read operations on the channel in milliseconds.
zLSWT	FLOAT	8	(IBM name: R748LSWT) Accumulated time for SCSI write operations on the channel in milliseconds.
zLFLF	FLOAT	4	(IBM name: R748LFLF) Fibre channel link failures. Number of times the port lost meaningful communication on the link. This can cause I/O failures.
zLFLY	FLOAT	4	(IBM name: R748LFLY) Fibre channel synchronization failures. Number of times the fibre channel signal lost synchronization.
zLFLS	FLOAT	4	(IBM name: R748LFLS) Fibre channel signal failures. Number of times the fibre channel signal was lost.
zLFPQ	FLOAT	4	(IBM name: R748LFPQ) Number of fibre channel primitive sequence errors. Such errors can occur during loss of synchronization, loss of signal, or during a link failure.
zLFIT	FLOAT	4	(IBM name: R748LFIT) Fibre channel invalid transmission word errors. Number of bit errors, which can lead to a loss of synchronization and/or to lost fibre channel traffic.
zLFCR	FLOAT	4	(IBM name: R748LFCR) Fibre channel Cyclic Redundancy Check (CRC) errors. Number of fibre channel frames lost due to CRC errors. This causes an I/O abort or timeout.
zLFR1	FLOAT	4	(IBM name: R748LFR1) Fibre channel link recovery (LR) sent. Number of times the ESS port reset the link due to a timeout on fibre channel buffer-to-buffer credit to send a frame. Such errors can cause timeouts or aborts or queued I/O frames to be lost.
zLFR2	FLOAT	4	(IBM name: R748LFR2) Fibre channel link recovery (LR) received. Number of times the attached port reset the link due to a timeout on fibre channel buffer-to-buffer credit to send a frame. Such errors can cause timeouts or aborts or queued I/O frames to be lost.
zLFIF	FLOAT	4	(IBM name: R748LFIF) Fibre channel illegal frame errors. Number of frames that violated the Fibre channel protocol. The most common cause is a missing frame. Another

			example is an invalid frame header. Illegal frames will cause I/O aborts or timeouts.
zLFOD	FLOAT	4	(IBM name: R748LFOD) Fibre channel out of order data errors. Number of times that an out of order frame is detected. The most common cause is a missing frame. Such errors will cause I/O aborts or timeouts.
zLFOA	FLOAT	4	(IBM name: R748LFOA) Fibre channel out of order ACK errors. Number of ACK frames identified as out of order. The most common cause is a missing frame. Such errors are not expected during I/O, since I/O does not use ACK.
zLFDF	FLOAT	4	(IBM name: R748LFDF) Fibre channel duplicate frame errors. Number of times a duplicate frame was received. Such errors will cause I/O aborts or timeouts.
zLFIO	FLOAT	4	(IBM name: R748LFIO) Fibre channel invalid relative offset failures. Number of frames that were received with an invalid relative offset field in the frame header. Such errors will cause I/O aborts or timeouts.
zLFTC	FLOAT	4	(IBM name: R748LFTC) Fibre channel sequence timeout errors. Number of times the ESS port has detected a timeout on a receiving sequence initiative for a fibre channel exchange.
zLFBC	INT	4	(IBM name: R748LFBC) Fibre channel bit error rate. A non-zero rate means that bit errors have occurred on the link within the last five minutes. This is not an accumulated error rate, but a snapshot of the last five minute interval.

Secondary segment: SMF074#08_Extent_Pool_Stats

Field Name	Type	Len	Description
<i>SMF074#08_Extent_Pool_Stats.<fieldname></i>			
zXPID	INT	2	(IBM name: R748XPID) Extent pool identifier.
zXPLT	INT	1	(IBM name: R748XPLT) Extent type: Value Meaning 0-3 Reserved 4 FIBER 1Gb 5-131 Reserved 132 CKD 1Gb 133-255 Reserved.
<i>SMF074#08_Extent_Pool_Stats.zXPTQ.<fieldname></i>			
zEncryptXP	BIT	1	Data encrypted extent pool
<i>SMF074#08_Extent_Pool_Stats.<fieldname></i>			
zXRCP	INT	4	(IBM name: R748XRCP) Real extent pool capacity in GB.
zXRNS	INT	4	(IBM name: R748XRNS) Number of real extents in extent pool.
zXRNA	INT	4	(IBM name: R748XRNA) Number of allocated real extents in extent pool.
zXRSC	INT	4	(IBM name: R748XRSC) Real extent conversions. Valid if bit 0 0F zCFLG is set.
zXVCP	INT	4	(IBM name: R748XVCP) Virtual extent pool capacity in GB. Valid if bit 0 0F zCFLG is set.
zXVNS	INT	4	(IBM name: R748XVNS) Number of virtual extents in extent pool. Valid if bit 0 0F zCFLG is set.
zXVSC	INT	4	(IBM name: R748XVSC) Virtual extent conversions. Valid if bit 0 0F zCFLG is set.
zXSDY	INT	4	(IBM name: R748XSDY) Number of extents that were sources of dynamic extent relocations. Valid if bit 0 0F zCFLG is set.

zXTDY	INT	4	(IBM name: R748XTDY) Number of extents that were targets of dynamic extent relocations. Valid if bit 0 0F zCFLG is set.
-------	-----	---	--

Secondary segment: **SMF074#08_Rank_Stats**

Field Name	Type	Len	Description
<i>SMF074#08_Rank_Stats.<fieldname></i>			
zRRID	INT	2	(IBM name: R748RRID) Rank identifier.
zRPNM	INT	2	(IBM name: R748RPNM) Extent pool number.
zRCNT	INT	2	(IBM name: R748RCNT) Count of arrays in rank.
zRAIX	INT	2	(IBM name: R748RAIX) Index to first Array section of rank.
zRBYR	FLOAT	8	(IBM name: R748RBYR) Rank 128 KB read.
zRBYW	FLOAT	8	(IBM name: R748RBYW) Rank 128 KB write.
zRROP	FLOAT	8	(IBM name: R748RROP) Rank read operations.
zRWOP	FLOAT	8	(IBM name: R748RWOP) Rank write operations.
zRKRT	FLOAT	8	(IBM name: R748RKRT) Rank read response time in units of 16 MILLISECONDS.
zRKWT	FLOAT	8	(IBM name: R748RKWT) Rank write response time in units of 16 MILLISECONDS.

SMF074#08_Rank_Stats.zRTQ.<fieldname>

zEncryptRank	BIT	1	Data encrypted rank
zRankID	BIT	1	Rank adapter pair ID valid

SMF074#08_Rank_Stats.<fieldname>

zRAI	CHAR	2	(IBM name: R748RAI) Rank adapter pair ID
------	------	---	---

Secondary segment: **SMF074#08_Rank_Array**

Field Name	Type	Len	Description
<i>SMF074#08_Rank_Array.<fieldname></i>			
zAAID	INT	2	(IBM name: R748AAID) Rank array identifier.
zARID	INT	2	(IBM name: R748ARID) Rank identifier.
zAEBC	CHAR	16	(IBM name: R748AEBC) Description of array type, for example: RAID-10.
zATYP	INT	1	(IBM name: R748ATYP) Array type: Value Meaning 1 RAID-5 2 RAID-10 3 RAID-6
zAASP	INT	1	(IBM name: R748AASP) Array speed in 1000 RPM.

zAAWD	INT	2	(IBM name: R748AAWD) Array width.
zAACP	INT	4	(IBM name: R748AACP) Array capacity in GB.

SMF074#08_Rank_Array.zAAST.<fieldname>

zDevC	BINT (ENUM)	2	(IBM name: R748AAST) Device Class
zRAIDdegraded	BIT	1	RAID degraded
zDDMthrott	BIT	1	DDM throttling
zRPMexception	BIT	1	RPM exception
z	BIT	3	/**/ Reserved.

Record Type 74 Subtype 9 - PCI Express Based Function Activity

Primary segment: SMF074#09_RMF_PCI_Express_Func

Field Name	Type	Len	Description
SMF074#09_RMF_PCI_Express_Func.<fieldname>			
SMF074#09_RMF_PCI_Express_Func.Header_Self_Defining_Section.<fieldname>			
zFLG	HEX	1	(IBM name: SMF74FLG) System indicator: Bit Meaning when set 0 New SMF record format 1 Subtypes used 2 Reserved. 3-6 Version indicators 7 System is running in PR/SM mode.
zRTY	INT	1	(IBM name: SMF74RTY) Record type 74 (X'4A').
zTME	TSTMP	8	(IBM name: SMF74TME) Date/Time that the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF74SID) System identification (from the SMFPRMxx SID parameter).
zSSI	CHAR	4	(IBM name: SMF74SSI) Subsystem identification ('RMF').
zSTY	INT	2	(IBM name: SMF74STY) Record SubType.
zTRN	INT	2	(IBM name: SMF74TRN) Number of triplets in this record. A triplet is a set of three SMF fields (offset/length/number values) that defines a section of the record. The offset is the offset from the RDW.
zPRS	INT	4	(IBM name: SMF74PRS) Offset to RMF Product section from RDW.
zPRL	INT	2	(IBM name: SMF74PRL) Length of RMF Product section.
zPRN	INT	2	(IBM name: SMF74PRN) Number of RMF Product sections. Individual header extension for SubType 1:
z9PO	INT	4	(IBM name: SMF749PO) Offset to PCIE Function data section.
z9PL	INT	2	(IBM name: SMF749PL) Length of PCIE Function data section.
z9PN	INT	2	(IBM name: SMF749PN) Number of PCIE Function data sections.
z9DO	INT	4	(IBM name: SMF749DO) Offset to PCIE Function Type data section.

z9DL	INT	2	(IBM name: SMF749DL) Length of PCIE Function Type data section.
z9DN	INT	2	(IBM name: SMF749DN) Number of PCIE Function Type data sections.
z9FO	INT	4	(IBM name: SMF749FO) Offset to Hardware Accelerator data section.
z9FL	INT	2	(IBM name: SMF749FL) Length of Hardware Accelerator data section.
z9FN	INT	2	(IBM name: SMF749FN) Number of Hardware Accelerator data sections.
z91O	INT	4	(IBM name: SMF7491O) Offset to Hardware Accelerator Compression data section.
z91L	INT	2	(IBM name: SMF7491L) Length of Hardware Accelerator Compression data section.
z91N	INT	2	(IBM name: SMF7491N) Number of Hardware Accelerator Compression data sections.
z9SO	INT	4	(IBM name: SMF749SO) Offset to Synchronous I/O Link data section.
z9SL	INT	2	(IBM name: SMF749SL) Length of Synchronous I/O Link data section.
z9SN	INT	2	(IBM name: SMF749SN) Number of Synchronous I/O Link data sections.
z9RO	INT	4	(IBM name: SMF749RO) Offset to Synchronous I/O Response Time Distribution data section.
z9RL	INT	2	(IBM name: SMF749RL) Length of Synchronous I/O Response Time Distribution data section.
z9RN	INT	2	(IBM name: SMF749RN) Number of Synchronous I/O Response Time Distribution data sections. Individual header extension for SubType 10:

Secondary segment: **SMF074#09_Product**

Field Name	Type	Len	Description
<i>SMF074#09_Product.<fieldname></i>			
zMFV	DEC	2 (3,0)	(IBM name: SMF74MFV) RMF version number.
zPRD	CHAR	8	(IBM name: SMF74PRD) Product name ('RMF').
zIST	DEC	4 (7,0)	(IBM name: SMF74IST) Time that the RMF measurement interval started, in the form 0hhmmssF, where hh is the hours, mm is the minutes, ss is the seconds, and F is the sign.
zDAT	DATE	4	(IBM name: SMF74DAT) Date when the RMF measurement interval started, in the form 0cyyddF.
zINT	DEC	4 (7,0)	(IBM name: SMF74INT) Duration of the RMF measurement interval, in the form mmssttF where mm is the minutes, ss is the seconds, tt is the milliseconds, and F is the sign. (The end of the measurement interval is the sum of the recorded start time and this field.)
zSAM	INT	4	(IBM name: SMF74SAM) Number of RMF samples.
<i>SMF074#09_Product.zFLA.<fieldname></i>			
zSkip	BIT	1	Samples have been skipped
zMonIII	BIT	1	RECORD was written by RMF Monitor III

zSyncSMF	BIT	1	INTERVAL was synchronized with SMF
----------	-----	---	------------------------------------

SMF074#09_Product.<fieldname>

zCYC	DEC	4 (7,0)	(IBM name: SMF74CYC) Sampling cycle length, in the form 000ttttF, where tttt is the milliseconds and F is the sign (taken from CYCLE option). The range of values is 0.050 to 9.999 seconds.
zMVS	CHAR	8	(IBM name: SMF74MVS) z/OS software level (consists of an acronym and the version, release, and modification level - ZVvrrmm).
zIML	INT	1	(IBM name: SMF74IML) Indicates the type of processor complex on which data measurements were taken. Value Meaning 3 9672, zSeries

SMF074#09_Product.zPRF.<fieldname>

zExpStg	BIT	1	The system has expanded storage
zESCA	BIT	1	The processor is enabled for ES connection architecture (ESCA)
zESCdir	BIT	1	There is an ES connection director in the configuration
zzArc	BIT	1	System is running in z/Architecture® mode
zZAAP	BIT	1	At least one zAAP is currently installed
zZIIP	BIT	1	At least one zIIP is currently installed
zDAT	BIT	1	Enhanced DAT facility

SMF074#09_Product.<fieldname>

zPTN	INT	1	(IBM name: SMF74PTN) PR/SM partition number of the partition that wrote this record.
zSRL	INT	1	(IBM name: SMF74SRL) SMF record level change number (X'8E' for subtype 1 records or X'8F' for subtype 2 records for z/OS V2R4 RMF with RMF Data Gatherer APAR OA59330). This field enables processing of SMF record level changes in an existing release.
zIET	HEX	8	(IBM name: SMF74IET) Interval expiration time token. This token can be used to identify other than RMF records that belong to the same interval (if interval was synchronized with SMF).
zLGO	TIME	8	(IBM name: SMF74LGO) Offset GMT to local time (STCK format).
zRAO	INT	4	(IBM name: SMF74RAO) Offset to reassembly area relative to start of RMF product section.
zRAL	INT	2	(IBM name: SMF74RAL) Length of reassembly area. Area consists of a fixed header and a variable number of information blocks. Length depends on the record type/SubType, but is fixed for a specific type/SubType.
zRAN	INT	2	(IBM name: SMF74RAN) Reassembly area indicator. Value Meaning 0 RECORD is not broken. 1 RECORD is broken. Note: This field is used to indicate whether an SMF record is a broken record. Therefore, offset (SMF70RAO) and length (SMF70RAL) are only valid if SMF70RAN = 1. A reassembly area is only present in broken records.
zOIL	INT	2	(IBM name: SMF74OIL) Original interval length as defined in the session or by SMF (in seconds).
zSYN	INT	2	(IBM name: SMF74SYN) SYNC value in seconds.
zGIE	TIME	8	(IBM name: SMF74GIE) Projected gathering interval end (STCK format) GMT time.
zXNM	CHAR	8	(IBM name: SMF74XNM) Sysplex name as defined in parmlib member COUPLExx.
zSNM	CHAR	8	

			(IBM name: SMF74SNM) System name for current system as defined in parmlib member IEASYSxx SYSNAME parameter. Reassembly Area:
--	--	--	---

SMF074#09_Product.Reassembly_Area.<fieldname>

zRBR	INT	2	(IBM name: SMF74RBR) Total number of broken records built from the original large record.
zRSQ	INT	2	(IBM name: SMF74RSQ) Sequence number of this broken record. Every broken record built from the same large record must have a unique sequence number, it is in the range from 1 TO SMF70RBR.
zRIO	INT	4	(IBM name: SMF74RIO) Offset to first reassembly information block relative to start of reassembly area header.
zRIL	INT	2	(IBM name: SMF74RIL) Length of reassembly information block.
zRIN	INT	2	(IBM name: SMF74RIN) Number of reassembly information blocks (same value as SMF70TRN in header section).

SMF074#09_Product.Reassembly_Area.Reassembly_Info.<fieldname>

zRNN	INT	2	(IBM name: SMF74RNN) Total number of sections in the original large record. This field contains information of how many sections of a specific type were contained in the original SMF record. This field is a copy of the number field of the triplet in the original (non broken) record.
zRPP	INT	2	(IBM name: SMF74RPP) Position of the first of one or more consecutive sections described by this block as in the original record. Values in the range of 1 TO SMF70RNN are valid for correct processing. A value of 0 WILL skip processing of this information block. This field provides information where the sections that are part of this broken record were placed in the original record before the split took place. The actual number of consecutive sections contained in this record is available from the actual triplet in the header extension.

Secondary segment: SMF074#09_PCIE_Func

Field Name	Type	Len	Description
SMF074#09_PCIE_Func.<fieldname>			
zPFID	INT	4	(IBM name: R749PFID) PCIE Function ID (PFID) for the PCIE function for which performance data is returned.
zPFFL	INT	2	(IBM name: R749PFFL) PFID function status merged over all MINTIME intervals for this reporting interval. Bit Meaning when set 0 PFID was allocated during this interval. 1 PFID was in status De-Allocate-Pending during this interval. 2 PFID was in error during this interval. 3-15 Reserved.
zPFF1	INT	2	(IBM name: R749PFF1) Final PFID function status at the end of this reporting interval. Bit Meaning when set 0 PFID is de-allocated at the end of this interval. 1 PFID is re-allocated at the end of this interval. 2-15 Reserved.
zERRT	INT	4	(IBM name: R749ERRT) Time in milliseconds for which no valid data was reported for the PCIE function within this reporting interval.
zDEVT	INT	4	(IBM name: R749DEVT) Device type for the PCIE function.
zDEVN	CHAR	24	(IBM name: R749DEVN) Device name for the PCIE function.
zJOBN	CHAR	8	(IBM name: R749JOBN) Job name of owner who allocated the PCIE function.

zASID	INT	2	(IBM name: R749ASID) Address space ID of owner who allocated the PCIE function.
zPCID	INT	2	(IBM name: R749PCID) Physical or virtual channel identifier for the PCIE function.
zATST	TSTMP	8	(IBM name: R749ATST) Timestamp in STCK format, showing the last point in time when a PCIE function was allocated.
zALLT	INT	4	(IBM name: R749ALLT) Time in milliseconds for which the PCIE function was allocated or was in status De-Allocate-Pending.
zSCNT	INT	4	(IBM name: R749SCNT) Sequence number for the last time the PCI operations counters or DMA read/write counters have been updated by the firmware.
zLOOP	INT	8	(IBM name: R749LOOP) Count of PCI Load operations for the PCIE function. Only valid, if bit 2 OF zFLAG is not set.
zSTOP	INT	8	(IBM name: R749STOP) Count of PCI Store operations for the PCIE function. Only valid, if bit 2 OF zFLAG is not set.
zSBOP	INT	8	(IBM name: R749SBOP) Count of PCI Store Block operations for the PCIE function. Only valid, if bit 2 OF zFLAG is not set.
zRFOP	INT	8	(IBM name: R749RFOP) Count of PCI Refresh Translation operations for the PCIE function. Only valid, if bit 2 OF zFLAG is not set.
zDMAO	INT	2	(IBM name: R749DMAO) The PCIE Function Type data blocks for all PCIE functions are grouped together in the record. To get to the PCIE Function Type data block associated with this PCIE Function data section, skip over the number of PCIE Function Type data blocks specified by this field, starting at the first PCIE Function Type data block in the record.
zDMAN	INT	2	(IBM name: R749DMAN) Count of PCIE Function Type data blocks allocated for this PCIE function data section.
zFPFO	INT	2	(IBM name: R749FPFO) The data blocks for all hardware accelerators are grouped together in the record. To get to the hardware accelerator data block associated with this PCIE Function data section, skip over the number of hardware accelerator data blocks specified by this field, starting at the first hardware accelerator block in the record.
zFPFN	INT	2	(IBM name: R749FPFN) Count of hardware accelerator data blocks allocated for this PCIE Function data section.
zFP1O	INT	2	(IBM name: R749FP1O) The data blocks for all hardware accelerators used for compression acceleration are grouped together in the record. To get to the hardware accelerator compression data block associated with this PCIE Function data section, skip over the number of hardware accelerator compression data blocks specified by this field, starting at the first hardware accelerator compression data block in the record.
zFP1N	INT	2	(IBM name: R749FP1N) Count of hardware accelerator compression data blocks allocated for this PCIE Function data section.
zFLAG	INT	1	(IBM name: R749FLAG) Validity flag. Bit Meaning when set 0 PHYSICAL-NETWORK identifiers zNET1 and zNET2 are valid. 1 PCIE function type zPFT is valid. 2 PCI operation rates are invalid. 3 GLOBAL Performance Reporting is enabled. 4-7 Reserved.
zPORT	INT	1	(IBM name: R749PORT) Physical port number for which this PCIE function is associated. If zero, then either the port field is not applicable, or there is more than one port associated with the PCIE function.
zPFT	INT	1	(IBM name: R749PFT) PCIE function type.

zNET1	CHAR	16	(IBM name: R749NET1) Physical-network identifier (PNET ID) that identifies the first port of the adapter. This field is only valid when the PCIE device type is defined as RoCE Express or ISM.
zNET2	CHAR	16	(IBM name: R749NET2) Physical-network identifier (PNET ID) that identifies the second port of the adapter. Only valid when the PCIE device type is defined as RoCE Express.
zWWNN	HEX	8	(IBM name: R749WWNN) Worldwide node name (WWNN) of the storage controller the synchronous I/O link is connected to.
zSIOO	INT	2	(IBM name: R749SIOO) The data blocks for all Synchronous I/O links are grouped together in the record. To get the Synchronous I/O link data block associated with this PCIE Function data section, skip over the number of data blocks specified by this field, starting at the first Synchronous I/O link data block in the record.
zSION	INT	2	(IBM name: R749SION) Count of Synchronous I/O link data blocks allocated for this PCIE Function data section.
zRTDO	INT	2	(IBM name: R749RTDO) The data blocks for all Synchronous I/O response time distribution buckets are grouped together in the record. To get the first Synchronous I/O response time distribution data block associated with this PCIE Function data section, skip over the number of data blocks specified by this field, starting at the first Synchronous I/O response time distribution data block in the record.
zRTDN	INT	2	(IBM name: R749RTDN) Count of Synchronous I/O response time distribution data blocks allocated for this PCIE Function data section.
zLKID	INT	2	(IBM name: R749LKID) The identifier of the synchronous I/O link that is configured in the storage controller.

Secondary segment: SMF074#09_PCIE_Func_Type00

Field Name	Type	Len	Description
<i>SMF074#09_PCIE_Func_Type00.<fieldname></i>			
zDMAR	INT	8	(IBM name: R749DMAR) DMA read counter that reports the number of bytes transferred from all defined DMA address spaces to the PCIE function.
zDMAW	INT	8	(IBM name: R749DMAW) DMA write counter that reports the number of bytes transferred from the PCIE function to all defined DMA address spaces.
zDFMT	INT	1	(IBM name: R749DFMT) Format x'00'

Secondary segment: SMF074#09_PCIE_Func_Type01

Field Name	Type	Len	Description
<i>SMF074#09_PCIE_Func_Type01.<fieldname></i>			
zDBYR	INT	8	(IBM name: R749DBYR) Number of bytes received on the external Ethernet interface.
zDBYT	INT	8	(IBM name: R749DBYT) Number of bytes transmitted on the external Ethernet interface.
zDFMT	INT	1	(IBM name: R749DFMT) Format x'01'

zDPKR	INT	8	(IBM name: R749DPKR) Number of packets received on the external Ethernet interface.
zDPKT	INT	8	(IBM name: R749DPKT) Number of packets transmitted on the external Ethernet interface.

Secondary segment: SMF074#09_PCIE_Func_Type02

Field Name	Type	Len	Description
<i>SMF074#09_PCIE_Func_Type02.<fieldname></i>			
zDWUP	INT	8	(IBM name: R749DWUP) Number of work units processed by the PCI function.
zDWUM	INT	8	(IBM name: R749DWUM) Maximum number of work units that the PCI function is capable of processing per second.
zDFMT	INT	1	(IBM name: R749DFMT) Format x'02'

Secondary segment: SMF074#09_PCIE_Func_Type03

Field Name	Type	Len	Description
<i>SMF074#09_PCIE_Func_Type03.<fieldname></i>			
zDBYX	INT	8	(IBM name: R749DBYX) Number of bytes transmitted by the PCI function.
zDFMT	INT	1	(IBM name: R749DFMT) Format x'03'

Secondary segment: SMF074#09_PCIE_Func_Type04

Field Name	Type	Len	Description
<i>SMF074#09_PCIE_Func_Type04.<fieldname></i>			
zSRBF	INT	8	(IBM name: R749SRBF) Number of bytes read by this synchronous I/O function.
zSWBF	INT	8	(IBM name: R749SWBF) Number of bytes written by this synchronous I/O function.
zDFMT	INT	1	(IBM name: R749DFMT) Format x'04'
zSSRF	INT	8	(IBM name: R749SSRF) Number of successful requests for this synchronous I/O function.
zSLRF	INT	8	(IBM name: R749SLRF) Number of times the command was rejected by the processor (local rejects) for this synchronous I/O function.
zSRRF	INT	8	(IBM name: R749SRRF) Number of times the command was rejected by the storage controller (remote rejects) for this synchronous I/O function.
zSTPF	TIME	8	(IBM name: R749STPF) Total processing time in microseconds for this synchronous I/O function.
zSRBC	INT	8	(IBM name: R749SRBC) Number of bytes read by all synchronous I/O functions that are using this synchronous I/O link on this CPC. Only valid, if bit 3 0F zFLAG is set.

zSWBC	INT	8	(IBM name: R749SWBC) Number of bytes written by all synchronous I/O functions that are using this synchronous I/O link on this CPC. Only valid, if bit 3 0F zFLAG is set.
zSSRC	INT	8	(IBM name: R749SSRC) Number of requests successfully processed by all synchronous I/O functions that are using this synchronous I/O link on this CPC. Only valid, if bit 3 0F zFLAG is set.
zSLRC	INT	8	(IBM name: R749SLRC) Number of local rejects of all synchronous I/O functions that are using this synchronous I/O link on this CPC. Only valid, if bit 3 0F zFLAG is set.
zSRRC	INT	8	(IBM name: R749SRRC) Number of remote rejects of all synchronous I/O functions that are using this synchronous I/O link on this CPC. Only valid, if bit 3 0F zFLAG is set.
zSTPC	TIME	8	(IBM name: R749STPC) Total processing time in microseconds of all synchronous I/O functions that are using this synchronous I/O link on this CPC. Only valid, if bit 3 0F zFLAG is set.

Secondary segment: SMF074#09_Hardware_Accelerator

Field Name	Type	Len	Description
<i>SMF074#09_Hardware_Accelerator.<fieldname></i>			
zFTYP	INT	4	(IBM name: R749FTYP) Hardware accelerator application type.
zFDSC	CHAR	32	(IBM name: R749FDSC) Hardware accelerator application description.
zFRQC	INT	4	(IBM name: R749FRQC) Total number of hardware accelerator requests that completed successfully.
zFRQE	INT	4	(IBM name: R749FRQE) Total number of hardware accelerator requests that completed with an error. Statistics for these requests are not included in the other fields of this data section.
zFQFL	INT	4	(IBM name: R749FQFL) Number of times that the adapter queue was full when a new request was submitted.
zFTET	TIME	8	(IBM name: R749FTET) Total execution time of all requests in microseconds.
zFSQE	HEX	16	(IBM name: R749FSQE) Sum of the squares of the individual execution times.
zFTQT	TIME	8	(IBM name: R749FTQT) Total queue time of all requests in microseconds.
zFSQQ	HEX	16	(IBM name: R749FSQQ) Sum of the squares of the individual queue times.
zFDRD	INT	8	(IBM name: R749FDRD) Total DMA reads in units of 256 BYTES.
zFDWR	INT	8	(IBM name: R749FDWR) Total DMA writes in units of 256 BYTES.

Secondary segment: SMF074#09_Hardware_Accel_Comp

Field Name	Type	Len	Description
<i>SMF074#09_Hardware_Accel_Comp.<fieldname></i>			
z1DIB	INT	8	

			(IBM name: R7491DIB) Total number of deflate input bytes.
z1DIS	HEX	16	(IBM name: R7491DIS) Sum of the squares of the individual deflate input bytes.
z1DOB	INT	8	(IBM name: R7491DOB) Total number of deflate output bytes.
z1DOS	HEX	16	(IBM name: R7491DOS) Sum of the squares of the individual deflate output bytes.
z1DCT	INT	4	(IBM name: R7491DCT) Total number of deflate requests.
z1IIB	INT	8	(IBM name: R7491IIB) Total number of inflate input bytes.
z1IIS	HEX	16	(IBM name: R7491IIS) Sum of the squares of the individual inflate input bytes.
z1IOB	INT	8	(IBM name: R7491IOB) Total number of inflate output bytes.
z1IOS	HEX	16	(IBM name: R7491IOS) Sum of the squares of the individual inflate output bytes.
z1ICT	INT	4	(IBM name: R7491ICT) Total number of inflate requests.
z1BPS	INT	4	(IBM name: R7491BPS) Total size of memory in megabytes allocated to the buffer pool.
z1BPC	INT	8	(IBM name: R7491BPC) Accumulated size of memory in megabytes for in-use buffers.

Secondary segment: SMF074#09_Sync_IO_Link

Field Name	Type	Len	Description
SMF074#09_Sync_IO_Link.<fieldname>			
zSND	CHAR	26	(IBM name: R749SND) Self-describing component of the node descriptor of the storage controller the synchronous I/O link is connected to.

Secondary segment: SMF074#09_Sync_IO_Response

Field Name	Type	Len	Description
SMF074#09_Sync_IO_Response.<fieldname>			
zRFLG	INT	1	(IBM name: R749RFLG) Response time distribution bucket flag. Bit Meaning 0 IF set, response time data measured for synchronous I/O read instructions. 1 IF set, response time data measured for synchronous I/O write instructions. 2-7 Reserved.
zRTRV	INT	4	(IBM name: R749RTRV) Response time distribution bucket range value. The range value of the first read and the first write bucket of a Synchronous I/O link represents response times less than the range value. For example, if the read range value is 10, then this bucket represents read response times less than 10 MICROSECONDS. The range value of the remaining buckets represents response times less than this range value and greater than or equal to the prior range value. For example, if the range value is 30 AND the prior range value was 20, this represents responses r in the range: 20 MICROSECONDS <= r < 30 MICROSECONDS
zRTSC	INT	4	(IBM name: R749RTSC) Response time distribution bucket sample count.

Record Type 74 Subtype 10 - Storage Class Memory (SCM) Statistics

Field Name	Type	Len	Description
SMF074#10_RMF_EADM_Stats.<fieldname>			
SMF074#10_RMF_EADM_Stats.Header_Self_Defining_Section.<fieldname>			
zFLG	HEX	1	(IBM name: SMF74FLG) System indicator: Bit Meaning when set 0 New SMF record format 1 Subtypes used 2 Reserved. 3-6 Version indicators 7 System is running in PR/SM mode.
zRTY	INT	1	(IBM name: SMF74RTY) Record type 74 (X'4A').
zTME	TSTMP	8	(IBM name: SMF74TME) Date/Time that the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF74SID) System identification (from the SMFPRMxx SID parameter).
zSSI	CHAR	4	(IBM name: SMF74SSI) Subsystem identification ('RMF').
zSTY	INT	2	(IBM name: SMF74STY) Record SubType.
zTRN	INT	2	(IBM name: SMF74TRN) Number of triplets in this record. A triplet is a set of three SMF fields (offset/length/number values) that defines a section of the record. The offset is the offset from the RDW.
zPRS	INT	4	(IBM name: SMF74PRS) Offset to RMF Product section from RDW.
zPRL	INT	2	(IBM name: SMF74PRL) Length of RMF Product section.
zPRN	INT	2	(IBM name: SMF74PRN) Number of RMF Product sections. Individual header extension for SubType 1:
z10DO	INT	4	(IBM name: SMF7410DO) Offset to SCM EADM device information section.
z10DL	INT	2	(IBM name: SMF7410DL) Length of SCM EADM device information section.
z10DN	INT	2	(IBM name: SMF7410DN) Number of SCM EADM device information sections.
z10CO	INT	4	(IBM name: SMF7410CO) Offset to SCM configuration measurement sections.
z10CL	INT	2	(IBM name: SMF7410CL) Length of SCM configuration measurement section.
z10CN	INT	2	(IBM name: SMF7410CN) Number of SCM configuration measurement sections.

Secondary segment: **SMF074#10_Product**

Field Name	Type	Len	Description
SMF074#10_Product.<fieldname>			
zMFV	DEC	2 (3,0)	(IBM name: SMF74MFV) RMF version number.
zPRD	CHAR	8	(IBM name: SMF74PRD) Product name ('RMF').
zIST	DEC	4 (7,0)	(IBM name: SMF74IST) Time that the RMF measurement interval started, in the form 0hhmmssF, where hh is the hours, mm is the minutes, ss is the seconds, and F is the sign.
zDAT	DATE	4	(IBM name: SMF74DAT) Date when the RMF measurement interval started, in the form 0cyydddF.
zINT	DEC	4 (7,0)	(IBM name: SMF74INT) Duration of the RMF measurement interval, in the form mmssttF where mm is the minutes, ss is the seconds, tt is the milliseconds, and F is the sign. (The end of the measurement interval is the sum of the recorded start time and this field.)
zSAM	INT	4	(IBM name: SMF74SAM) Number of RMF samples.

SMF074#10_Product.zFLA.<fieldname>			
zSkip	BIT	1	Samples have been skipped
zMonIII	BIT	1	RECORD was written by RMF Monitor III
zSyncSMF	BIT	1	INTERVAL was synchronized with SMF

SMF074#10_Product.<fieldname>			
zCYC	DEC	4 (7,0)	(IBM name: SMF74CYC) Sampling cycle length, in the form 000tttF, where ttt is the milliseconds and F is the sign (taken from CYCLE option). The range of values is 0.050 to 9.999 seconds.
zMVS	CHAR	8	(IBM name: SMF74MVS) z/OS software level (consists of an acronym and the version, release, and modification level - ZVvrrmm).
zIML	INT	1	(IBM name: SMF74IML) Indicates the type of processor complex on which data measurements were taken. Value Meaning 3 9672, zSeries

SMF074#10_Product.zPRF.<fieldname>			
zExpStg	BIT	1	The system has expanded storage
zESCA	BIT	1	The processor is enabled for ES connection architecture (ESCA)
zESCdir	BIT	1	There is an ES connection director in the configuration
zzArc	BIT	1	System is running in z/Architecture® mode
zZAAP	BIT	1	At least one zAAP is currently installed
zZIIP	BIT	1	At least one zIIP is currently installed
zDAT	BIT	1	Enhanced DAT facility

SMF074#10_Product.<fieldname>			
zPTN	INT	1	(IBM name: SMF74PTN) PR/SM partition number of the partition that wrote this record.
zSRL	INT	1	(IBM name: SMF74SRL) SMF record level change number (X'8E' for subtype 1 records or X'8F' for subtype 2 records for z/OS V2R4 RMF with RMF Data Gatherer APAR OA59330). This field enables processing of SMF record level changes in

			an existing release.
zIET	HEX	8	(IBM name: SMF74IET) Interval expiration time token. This token can be used to identify other than RMF records that belong to the same interval (if interval was synchronized with SMF).
zLGO	TIME	8	(IBM name: SMF74LGO) Offset GMT to local time (STCK format).
zRAO	INT	4	(IBM name: SMF74RAO) Offset to reassembly area relative to start of RMF product section.
zRAL	INT	2	(IBM name: SMF74RAL) Length of reassembly area. Area consists of a fixed header and a variable number of information blocks. Length depends on the record type/SubType, but is fixed for a specific type/SubType.
zRAN	INT	2	(IBM name: SMF74RAN) Reassembly area indicator. Value Meaning 0 RECORD is not broken. 1 RECORD is broken. Note: This field is used to indicate whether an SMF record is a broken record. Therefore, offset (SMF70RAO) and length (SMF70RAL) are only valid if SMF70RAN = 1. A reassembly area is only present in broken records.
zOIL	INT	2	(IBM name: SMF74OIL) Original interval length as defined in the session or by SMF (in seconds).
zSYN	INT	2	(IBM name: SMF74SYN) SYNC value in seconds.
zGIE	TIME	8	(IBM name: SMF74GIE) Projected gathering interval end (STCK format) GMT time.
zXNM	CHAR	8	(IBM name: SMF74XNM) Sysplex name as defined in parmlib member COUPLExx.
zSNM	CHAR	8	(IBM name: SMF74SNM) System name for current system as defined in parmlib member IEASYSxx SYSNAME parameter. Reassembly Area:

SMF074#10_Product.Reassembly_Area.<fieldname>

zRBR	INT	2	(IBM name: SMF74RBR) Total number of broken records built from the original large record.
zRSQ	INT	2	(IBM name: SMF74RSQ) Sequence number of this broken record. Every broken record built from the same large record must have a unique sequence number, it is in the range from 1 TO SMF70RBR.
zRIO	INT	4	(IBM name: SMF74RIO) Offset to first reassembly information block relative to start of reassembly area header.
zRIL	INT	2	(IBM name: SMF74RIL) Length of reassembly information block.
zRIN	INT	2	(IBM name: SMF74RIN) Number of reassembly information blocks (same value as SMF70TRN in header section).

SMF074#10_Product.Reassembly_Area.Reassembly_Info.<fieldname>

zRNN	INT	2	(IBM name: SMF74RNN) Total number of sections in the original large record. This field contains information of how many sections of a specific type were contained in the original SMF record. This field is a copy of the number field of the triplet in the original (non broken) record.
zRPP	INT	2	(IBM name: SMF74RPP) Position of the first of one or more consecutive sections described by this block as in the original record. Values in the range of 1 TO SMF70RNN are valid for correct processing. A value of 0 WILL skip processing of this information block. This field provides information where the sections that are part of this broken record were placed in the original record before the split took place. The actual number of consecutive sections contained in this record is available from the actual triplet in the header extension.

Secondary segment: **SMF074#10_SCM_Config**

Field Name	Type	Len	Description
<i>SMF074#10_SCM_Config.<fieldname></i>			
zCRID	INT	2	(IBM name: R7410CRID) SCM resource identifier.
zCPID	INT	2	(IBM name: R7410CPID) Part identifier.
zCDUS	INT	4	(IBM name: R7410CDUS) Data unit size in bytes.
zCRQC	INT	4	(IBM name: R7410CRQC) Internal requests processed at CPC level.
zCRQ	INT	4	(IBM name: R7410CRQ) Internal requests processed at LPAR level.
zCDWC	INT	4	(IBM name: R7410CDWC) Data units written at CPC level.
zCDW	INT	4	(IBM name: R7410CDW) Data units written at LPAR level.
zCDRC	INT	4	(IBM name: R7410CDRC) Data units read at CPC level.
zCDR	INT	4	(IBM name: R7410CDR) Data units read at LPAR level.
zCRTC	INT	4	(IBM name: R7410CRTC) Aggregate time spent on execution of requests involving resource part in units of 128 MICROSECONDS at CPC level.
zCRT	INT	4	(IBM name: R7410CRT) Aggregate time spent on execution of requests involving resource part in units of 128 MICROSECONDS at LPAR level.
zCIQC	INT	4	(IBM name: R7410CIQC) Accumulated IOP queue time in units of 128 MICROSECONDS at CPC level.
zCWUC	INT	4	(IBM name: R7410CWUC) Utilization at CPC level. This value designates the sum of the average CPC utilization per second in percent multiplied by the number of seconds of this interval.
zCWU	INT	4	(IBM name: R7410CWU) Utilization at LPAR level. This value designates the sum of the average LPAR utilization per second in percent multiplied by the number of seconds of this interval.
<i>SMF074#10_SCM_Config.zFLG.<fieldname></i>			
zFlash	BIT	1	SCM resource type is Virtual Flash Memory

Secondary segment: **SMF074#10_EADM_Device_Subchannel**

Field Name	Type	Len	Description
<i>SMF074#10_EADM_Device_Subchannel.<fieldname></i>			
zDSCT	INT	4	(IBM name: R7410DSCT) SSCH count across all devices.
zDNUM	INT	4	(IBM name: R7410DNUM) Number of updates to the time accumulation fields.
zDFPT	INT	8	(IBM name: R7410DFPT) Sum of function pending times across all devices in units of 128

			MICROSECONDS. The time lapse between the SSCH being issued and the acceptance of the first command of the channel program at the device.
zDIQT	INT	8	(IBM name: R7410DIQT) Sum of IOP queue times across all devices in units of 128 MICROSECONDS. The amount of time the request is not accepted at the SCM resource because it would exceed its maximum capacity.
zDCRT	INT	8	(IBM name: R7410DCRT) Sum of initial command response times across all devices in units of 128 MICROSECONDS. The time from when the first command does not immediately proceed to execute until the successful start of execution at the SCM resource part.

SMF074#10_EADM_Device_Subchannel.zDFLG.<fieldname>			
zEADMComp	BIT	1	EADM compression facility is available.

SMF074#10_EADM_Device_Subchannel.<fieldname>			
zDOCC	INT	4	(IBM name: R7410DOCC) Number of compression operations.
zDOCD	INT	4	(IBM name: R7410DOCD) Number of decompression operations.
zDISC	INT	8	(IBM name: R7410DISC) Number of 1 MB input blocks consumed for compression.
zDOSC	INT	8	(IBM name: R7410DOSC) Number of 1 MB output blocks consumed for compression.
zDISD	INT	8	(IBM name: R7410DISD) Number of 1 MB input blocks consumed for decompression.
zDOSD	INT	8	(IBM name: R7410DOSD) Number of 1 MB output blocks consumed for decompression.

SMF075_Product.<fieldname>

zPTN	INT	1	(IBM name: SMF75PTN) PR/SM partition number of the partition that wrote this record.
zSRL	INT	1	(IBM name: SMF75SRL) SMF record level change number (X'8E' for subtype 1 records or X'8F' for subtype 2 records for z/OS V2R4 RMF with RMF Data Gatherer APAR OA59330). This field enables processing of SMF record level changes in an existing release.
zIET	HEX	8	(IBM name: SMF75IET) Interval expiration time token. This token can be used to identify other than RMF records that belong to the same interval (if interval was synchronized with SMF).
zLGO	TIME	8	

			(IBM name: SMF75LGO) Offset GMT to local time (STCK format).
zRAO	INT	4	(IBM name: SMF75RAO) Offset to reassembly area relative to start of RMF product section.
zRAL	INT	2	(IBM name: SMF75RAL) Length of reassembly area. Area consists of a fixed header and a variable number of information blocks. Length depends on the record type/SubType, but is fixed for a specific type/SubType.
zRAN	INT	2	(IBM name: SMF75RAN) Reassembly area indicator. Value Meaning 0 RECORD is not broken. 1 RECORD is broken. Note: This field is used to indicate whether an SMF record is a broken record. Therefore, offset (SMF70RAO) and length (SMF70RAL) are only valid if SMF70RAN = 1. A reassembly area is only present in broken records.
zOIL	INT	2	(IBM name: SMF75OIL) Original interval length as defined in the session or by SMF (in seconds).
zSYN	INT	2	(IBM name: SMF75SYN) SYNC value in seconds.
zGIE	TIME	8	(IBM name: SMF75GIE) Projected gathering interval end (STCK format) GMT time.
zXNM	CHAR	8	(IBM name: SMF75XNM) Sysplex name as defined in parmlib member COUPLExx.
zSNM	CHAR	8	(IBM name: SMF75SNM) System name for current system as defined in parmlib member IEASYSxx SYSNAME parameter. Reassembly Area:

SMF075_Product.Reassembly_Area.<fieldname>

zRBR	INT	2	(IBM name: SMF75RBR) Total number of broken records built from the original large record.
zRSQ	INT	2	(IBM name: SMF75RSQ) Sequence number of this broken record. Every broken record built from the same large record must have a unique sequence number, it is in the range from 1 TO SMF70RBR.
zRIO	INT	4	(IBM name: SMF75RIO) Offset to first reassembly information block relative to start of reassembly area header.
zRIL	INT	2	(IBM name: SMF75RIL) Length of reassembly information block.
zRIN	INT	2	(IBM name: SMF75RIN) Number of reassembly information blocks (same value as SMF70TRN in header section).

SMF075_Product.Reassembly_Area.Reassembly_Info.<fieldname>

zRNN	INT	2	(IBM name: SMF75RNN) Total number of sections in the original large record. This field contains information of how many sections of a specific type were contained in the original SMF record. This field is a copy of the number field of the triplet in the original (non broken) record.
zRPP	INT	2	(IBM name: SMF75RPP) Position of the first of one or more consecutive sections described by this block as in the original record. Values in the range of 1 TO SMF70RNN are valid for correct processing. A value of 0 WILL skip processing of this information block. This field provides information where the sections that are part of this broken record were placed in the original record before the split took place. The actual number of consecutive sections contained in this record is available from the actual triplet in the header extension.

Secondary segment: SMF075_Page_Dataset

Field Name	Type	Len	Description
------------	------	-----	-------------

SMF075_Page_Dataset.<fieldname>			
zDSN	CHAR	44	(IBM name: SMF75DSN) Page data set name. Valid only when bit 4 0F SMF75FL2 is not set.
SMF075_Page_Dataset.zPST.<fieldname>			
zPLPA	BIT	1	PLPA
zCOMMON	BIT	1	COMMON
zLOCAL	BIT	1	LOCAL
zUnusable	BIT	1	Data set unusable
zOnline	BIT	1	Data set brought online during interval
zOffline	BIT	1	Data set taken offline during interval.
SMF075_Page_Dataset.zFL2.<fieldname>			
zVIO	BIT	1	Data set accepts VIO pages
zMultExp	BIT	1	Data set is on a multiple exposure device
zAltCtlUnit	BIT	1	Data set is on a device with an alternate control unit
zValidName	BIT	1	SMF75DEV contains a valid device name
zSCM	BIT	1	Page space type is SCM
SMF075_Page_Dataset.<fieldname>			
zTYP	INT	4	(IBM name: SMF75TYP) Unit type. Valid only when bit 4 0F SMF75FL2 is not set.
zCHA	INT	2	(IBM name: SMF75CHA) Device number in the form hhhh (hex digits). Valid only when bit 4 0F SMF75FL2 is not set.
zVOL	CHAR	6	(IBM name: SMF75VOL) Volume serial number. Valid only when bit 4 0F SMF75FL2 is not set.
zSCS	INT	1	(IBM name: SMF75SCS) Subchannel set ID. Valid only when bit 4 0F SMF75FL2 is not set.
zSLA	INT	4	(IBM name: SMF75SLA) Total number of slots contained within the page data set.
zMXU	INT	4	(IBM name: SMF75MXU) Maximum number of slots used.
zMNU	INT	4	(IBM name: SMF75MNU) Minimum number of slots used.
zAVU	INT	4	(IBM name: SMF75AVU) Average number of slots used.
zBDS	INT	4	(IBM name: SMF75BDS) Number of unusable slots.
zUSE	INT	4	(IBM name: SMF75USE) Number of samples indicating data set was being used by ASM.
zREQ	INT	4	(IBM name: SMF75REQ) The value is the same as SMF75USE.
zSIO	INT	4	(IBM name: SMF75SIO) Number of I/O requests for the data set.
zPGX	INT	4	(IBM name: SMF75PGX) Number of pages transferred to or from page data set.
zDEV	CHAR	8	(IBM name: SMF75DEV) Device name (blank if device name cannot be determined). Valid only when bit 4 0F SMF75FL2 is not set.
zCU	CHAR	8	(IBM name: SMF75CU) Control unit name (blank if control unit name cannot be determined). Valid only when bit 4 0F SMF75FL2 is not set.

Record Type 76 - RMF Trace Activity

SMF Record 76 (RMF Trace Activity) is mapped by structure member "T076".

Primary Segment:

- SMF076_RMF_Trace

Secondary Segment(s): 4 (in alphabetical order)

- SMF076_Product
- SMF076_Trace_Control
- SMF076_Trace_Data
- SMF076_Variable_Trace_Data

Primary segment: SMF076_RMF_Trace

Field Name	Type	Len	Description
<i>SMF076_RMF_Trace.<fieldname></i>			
SMF076_RMF_Trace.Header_Self_defining_Section.<fieldname>			
zFLG	HEX	1	(IBM name: SMF76FLG) System indicator: Bit Meaning when set 0 New SMF record format 1 Subtypes used 2 Reserved. 3-6 Version indicators 7 System is running in PR/SM mode.
zRTY	INT	1	(IBM name: SMF76RTY) Record type 75 (X'4B').
zTME	TSTMP	8	(IBM name: SMF76TME) Date/Time when the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF76SID) System identification (from the SMFPRMxx SID parameter).
zSSI	CHAR	4	(IBM name: SMF76SSI) Subsystem identification ('RMF').
zSTY	INT	2	(IBM name: SMF76STY) Record SubType=1.
zTRN	INT	2	(IBM name: SMF76TRN) Number of triplets in this record. A triplet is a set of three SMF fields (offset/length/number values) that defines a section of the record. The offset is the offset from the RDW.
zPRS	INT	4	(IBM name: SMF76PRS) Offset to RMF Product section from start of record, including record descriptor word (RDW).
zPRL	INT	2	(IBM name: SMF76PRL) Length of RMF Product section.
zPRN	INT	2	(IBM name: SMF76PRN) Number of RMF Product sections.
zTCS	INT	4	(IBM name: SMF76TCS) Offset to Trace Control section from start of record, including record descriptor word (RDW).
zTCL	INT	2	(IBM name: SMF76TCL) Length of Trace Control section.
zTCN	INT	2	(IBM name: SMF76TCN) Number of Trace Control sections.
zTDS	INT	4	(IBM name: SMF76TDS) Offset to Trace data section from start of record, including record descriptor word (RDW).
zTDL	INT	2	(IBM name: SMF76TDL) Length of Trace data section.

zTDN	INT	2	(IBM name: SMF76TDN) Number of Trace data sections.
zVFS	INT	4	(IBM name: SMF76VFS) Offset to variable format set from start of record, including record descriptor word (RDW).
zVFL	INT	2	(IBM name: SMF76VFL) Length of variable format set.
zVFN	INT	4	(IBM name: SMF76VFN) Number of variable format sets.

Secondary segment: SMF076_Product

Field Name	Type	Len	Description
<i>SMF076_Product.<fieldname></i>			
zMFV	DEC	2 (3,0)	(IBM name: SMF76MFV) RMF version number.

zDAT	BIT	1	Enhanced DAT facility

SMF076_Product.<fieldname>			
zPTN	INT	1	(IBM name: SMF76PTN) PR/SM partition number of the partition that wrote this record.
zSRL	INT	1	(IBM name: SMF76SRL) SMF record level change number (X'8E' for subtype 1 records or X'8F' for subtype 2 records for z/OS V2R4 RMF with RMF Data Gatherer APAR OA59330). This field enables processing of SMF record level changes in an existing release.
zIET	HEX	8	(IBM name: SMF76IET) Interval expiration time token. This token can be used to identify other than RMF records that belong to the same interval (if interval was synchronized with SMF).
zLGO	TIME	8	(IBM name: SMF76LGO) Offset GMT to local time (STCK format).
zRAO	INT	4	(IBM name: SMF76RAO) Offset to reassembly area relative to start of RMF product section.
zRAL	INT	2	(IBM name: SMF76RAL) Length of reassembly area. Area consists of a fixed header and a variable number of information blocks. Length depends on the record type/SubType, but is fixed for a specific type/SubType.
zRAN	INT	2	(IBM name: SMF76RAN) Reassembly area indicator. Value Meaning 0 RECORD is not broken. 1 RECORD is broken. Note: This field is used to indicate whether an SMF record is a broken record. Therefore, offset (SMF70RAO) and length (SMF70RAL) are only valid if SMF70RAN = 1. A reassembly area is only present in broken records.
zOIL	INT	2	(IBM name: SMF76OIL) Original interval length as defined in the session or by SMF (in seconds).
zSYN	INT	2	(IBM name: SMF76SYN) SYNC value in seconds.
zGIE	TIME	8	(IBM name: SMF76GIE) Projected gathering interval end (STCK format) GMT time.
zXNM	CHAR	8	(IBM name: SMF76XNM) Sysplex name as defined in parmlib member COUPLExx.
zSNM	CHAR	8	(IBM name: SMF76SNM) System name for current system as defined in parmlib member IEASYSxx SYSNAME parameter. Reassembly Area:

SMF076_Product.Reassembly_Area.<fieldname>			
zRBR	INT	2	(IBM name: SMF76RBR) Total number of broken records built from the original large record.
zRSQ	INT	2	(IBM name: SMF76RSQ) Sequence number of this broken record. Every broken record built from the same large record must have a unique sequence number, it is in the range from 1 TO SMF70RBR.
zRIO	INT	4	(IBM name: SMF76RIO) Offset to first reassembly information block relative to start of reassembly area header.
zRIL	INT	2	(IBM name: SMF76RIL) Length of reassembly information block.
zRIN	INT	2	(IBM name: SMF76RIN) Number of reassembly information blocks (same value as SMF70TRN in header section).

SMF076_Product.Reassembly_Area.Reassembly_Info.<fieldname>			
zRNN	INT	2	

			(IBM name: SMF76RNN) Total number of sections in the original large record. This field contains information of how many sections of a specific type were contained in the original SMF record. This field is a copy of the number field of the triplet in the original (non broken) record.
zRPP	INT	2	(IBM name: SMF76RPP) Position of the first of one or more consecutive sections described by this block as in the original record. Values in the range of 1 TO SMF70RNN are valid for correct processing. A value of 0 WILL skip processing of this information block. This field provides information where the sections that are part of this broken record were placed in the original record before the split took place. The actual number of consecutive sections contained in this record is available from the actual triplet in the header extension.

Secondary segment: SMF076_Trace_Control

Field Name	Type	Len	Description
<i>SMF076_Trace_Control.<fieldname></i>			
zNUM	INT	2	(IBM name: SMF76NUM) Number of sample sets (lines of data) in the trace.

Secondary segment: SMF076_Trace_Data

Field Name	Type	Len	Description
<i>SMF076_Trace_Data.<fieldname></i>			
zNAM	CHAR	8	(IBM name: SMF76NAM) Field name.

<i>SMF076_Trace_Data.zOPT.<fieldname></i>			
zMin	BIT	1	Minimum value of the field is contained in the SMF record
zMax	BIT	1	Maximum value of the field is contained in the SMF record
zSum	BIT	1	The sum of the values required to calculate the average of the field is contained in the SMF record
zSqured	BIT	1	The sum of the squared values required to calculate the standard deviation of the field is contained in the SMF record
zEnd	BIT	1	End value of the field is contained in the SMF record
zAll	BIT	1	All options selected
zTerm	BIT	1	Domain tracing terminated
zDomain	BIT	1	This entry is a domain field.

<i>SMF076_Trace_Data.zOP1.<fieldname></i>			
zLPBreq	BIT	1	LPB trace requested
zLPBend	BIT	1	LPB trace request ended
zValid	BIT	1	Traced data in record is valid

<i>SMF076_Trace_Data.<fieldname></i>			
zSLN	INT	1	(IBM name: SMF76SLN) Length of a set.
zDLN	INT	1	(IBM name: SMF76DLN) Length of a field sampled.
zSSS	INT	2	

			(IBM name: SMF76SSS) Standard samples per set used.
zSSL	INT	2	(IBM name: SMF76SSL) Samples per set.
zMIN	INT	4	(IBM name: SMF76MIN) Minimum value during interval.
zMAX	INT	4	(IBM name: SMF76MAX) Maximum value during interval.
zAVG	INT	8	(IBM name: SMF76AVG) Accumulated value used to compute the average.
zSTD	HEX	12	(IBM name: SMF76STD) Sum of squares (used to compute standard deviation).
zENV	INT	4	(IBM name: SMF76ENV) End value of field.

Secondary segment: SMF076_Variable_Trace_Data

Field Name	Type	Len	Description
<i>SMF076_Variable_Trace_Data.<fieldname></i>			
zCorD	INT	4	(IBM name: N/A) Trace values collected for each set, stored in an array of either fullwords or halfwords, depending on the length of the field being sampled (SMF76C if fullwords. SMF76D if halfwords). There will be one group of values for each sample set (line of data) in the trace.

Record Type 77 - RMF Enqueue Activity

SMF Record 77 (RMF Enqueue Activity) is mapped by structure member "T077".

Primary Segment:

- [SMF077_RMF_Enqueue](#)

Secondary Segment(s): 3 (in alphabetical order)

- [SMF077_Enqueue_Control_Section](#)
- [SMF077_Enqueue_Data_Section](#)
- [SMF077_RMF_Product_Section](#)

Primary segment: [SMF077_RMF_Enqueue](#)

Field Name	Type	Len	Description
<i>SMF077_RMF_Enqueue.<fieldname></i>			
<i>SMF077_RMF_Enqueue.Header_Self_defining_Section.<fieldname></i>			
zFLG	HEX	1	(IBM name: SMF77FLG) System indicator: Bit Meaning when set 0 New SMF record format 1 Subtypes used 2 Reserved. 3-6 Version indicators 7 System is running in PR/SM mode.
zRTY	INT	1	(IBM name: SMF77RTY) Record type 77 (X'4D').
zTME	TSTMP	8	(IBM name: SMF77TME) Date/Time when the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF77SID) System identification (from the SMFPRMxx SID parameter).
zSSI	CHAR	4	(IBM name: SMF77SSI) Subsystem identification ("RMF").
zSTY	INT	2	(IBM name: SMF77STY) Record SubType=1.
zTRN	INT	2	(IBM name: SMF77TRN) Number of triplets in this record. A triplet is a set of three SMF fields (offset/length/number values) that defines a section of the record.
zPRS	INT	4	(IBM name: SMF77PRS) Offset to RMF Product section from start of record, including record descriptor word (RDW).
zPRL	INT	2	(IBM name: SMF77PRL) Length of RMF Product section from start of record, including record descriptor word (RDW).
zPRN	INT	2	(IBM name: SMF77PRN) Number of RMF Product sections.
zEQS	INT	4	(IBM name: SMF77EQS) Offset to Enqueue Control section from start of record, including record descriptor word (RDW).
zEQL	INT	2	(IBM name: SMF77EQL) Length of Enqueue Control section.
zEQN	INT	2	(IBM name: SMF77EQN) Number of Enqueue Control sections.
zEDS	INT	4	(IBM name: SMF77EDS) Offset to Enqueue data section from start of record, including record descriptor word (RDW).
zEDL	INT	2	(IBM name: SMF77EDL) Length of Enqueue data section.
zEDN	INT	2	

			(IBM name: SMF77EDN) Number of Enqueue data sections.
--	--	--	--

Secondary segment: SMF077_RMF_Product_Section

Field Name	Type	Len	Description
<i>SMF077_RMF_Product_Section.<fieldname></i>			
zMFV	DEC	2 (3,0)	(IBM name: SMF77MFV) RMF version number.
zPRD	CHAR	8	(IBM name: SMF77PRD) Product name ('RMF').
zIST	TSTMP	8	(IBM name: SMF77IST) Date/Time that the RMF measurement interval started, in the form 0hhmmssF, where hh is the hours, mm is the minutes, ss is the seconds, and F is the sign.
zINT	DEC	4 (7,0)	(IBM name: SMF77INT) Duration of RMF measurement interval, in the form mmsstttF where mm is the minutes, ss is the seconds, ttt is the milliseconds, and F is the sign. (The end of the measurement interval is the sum of the recorded start time and this field.)
zSAM	INT	4	(IBM name: SMF77SAM) Number of RMF samples.

<i>SMF077_RMF_Product_Section.zFLA.<fieldname></i>			
zSampSkp	BIT	1	Samples have been skipped
zRMFMtr3	BIT	1	Record was written by RMF Monitor III
zIntvlSync	BIT	1	Interval was synchronized with SMF

<i>SMF077_RMF_Product_Section.<fieldname></i>			
zCYC	DEC	4 (7,0)	(IBM name: SMF77CYC) Sampling cycle length, in the form 000ttttF, where tttt is the milliseconds and F is the sign (taken from CYCLE option). The range of values is 0.050 to 9.999 seconds.
zMVS	CHAR	8	(IBM name: SMF77MVS) z/OS software level (consists of an acronym and the version, release, and modification level - ZVvrrmm).
zIML	INT	1	(IBM name: SMF77IML) Indicates the type of processor complex on which data measurements were taken. Value Meaning 3 9672, zSeries

<i>SMF077_RMF_Product_Section.zPRF.<fieldname></i>			
zExpStg	BIT	1	The system has expanded storage
zESCA	BIT	1	The processor is enabled for ES connection architecture (ESCA)
zESDir	BIT	1	There is an ES connection director in the configuration
zzArch	BIT	1	System is running in z/Architecture mode

zzIIP	BIT	1	At least one zIIP is currently installed
zDAT1	BIT	1	Enhanced DAT facility 1 available
zDAT2	BIT	1	Enhanced DAT facility 2 available

<i>SMF077_RMF_Product_Section.<fieldname></i>			
zPTN	INT	1	(IBM name: SMF77PTN) PR/SM partition number of the partition that wrote this record.

zSRL	INT	1	(IBM name: SMF77SRL) SMF record level change number (X'8E' for subtype 1 records or X'8F' for subtype 2 records for z/OS V2R4 RMF with RMF Data Gatherer APAR OA59330). This field enables processing of SMF record level changes in an existing release.
zIET	HEX	8	(IBM name: SMF77IET) Interval expiration time token. This token can be used to identify other than RMF records that belong to the same interval (if interval was synchronized with SMF).
zLGO	TIME	8	(IBM name: SMF77LGO) Offset GMT to local time (STCK format).
zRAO	INT	4	(IBM name: SMF77RAO) Offset to reassembly area relative to start of RMF Product section.
zRAL	INT	2	(IBM name: SMF77RAL) Length of reassembly area. Area consists of a fixed header and a variable number of information blocks. Length depends on the record type/SubType, but is fixed for a specific type/SubType.
zRAN	INT	2	(IBM name: SMF77RAN) Reassembly area indicator. Value Meaning 0 Record is not broken 1 Record is broken. Note: This field is used to indicate whether an SMF record is a broken record. Therefore, offset (SMF77RAO) and length (SMF77RAL) are only valid if SMF77RAN = 1. A reassembly area is only present in broken records.
zOIL	INT	2	(IBM name: SMF77OIL) Original interval length as defined in the session or by SMF (in seconds).
zSYN	INT	2	(IBM name: SMF77SYN) SYNC value in seconds.
zGIE	TSTMP	8	(IBM name: SMF77GIE) Projected gathering interval end (STCK format) GMT time.
zXNM	CHAR	8	(IBM name: SMF77XNM) Sysplex name as defined in parmlib member COUPLExx.
zSNM	CHAR	8	(IBM name: SMF77SNM) System name for current system as defined in parmlib member IEASYSxx SYSNAME parameter. Reassembly Area:

SMF077_RMF_Product_Section.SMF077_RMF_Reassembly_Area.<fieldname>

zRBR	INT	2	(IBM name: SMF77RBR) Total number of broken records built from the original large record.
zRSQ	INT	2	(IBM name: SMF77RSQ) Sequence number of this broken record. Every broken record built from the same large record must have a unique sequence number, it is in the range from 1 to SMF77RBR.
zRIO	INT	4	(IBM name: SMF77RIO) Offset to first reassembly information block relative to start of reassembly area header.
zRIL	INT	2	(IBM name: SMF77RIL) Length of reassembly information block.
zRIN	INT	2	(IBM name: SMF77RIN) Number of reassembly information blocks (same value as SMF77TRN in header section).

SMF077_RMF_Product_Section.SMF077_RMF_Reassembly_Area.SMF077_RMF_Reassembly_Area_Info.<fieldname>

zRNN	INT	2	(IBM name: SMF77RNN) Total number of sections in the original large record. This field contains information of how many sections of a specific type were contained in the original SMF record. This field is a copy of the number field of the triplet in the original (non broken) record.
zRPP	INT	2	(IBM name: SMF77RPP) Position of the first of one or more consecutive sections described by this block as in the original record. Values in the range of 1 to SMF77RNN are valid for correct processing. A value of 0 WILL skip processing of this information block. This field provides information where the sections that are part of this broken record were placed in the original record before the

			split took place. The actual number of consecutive sections contained in this record is available from the actual triplet in the header extension.

Secondary segment: SMF077_Enqueue_Data_Section

Field Name	Type	Len	Description
<i>SMF077_Enqueue_Data_Section.<fieldname></i>			
zQNM	CHAR	8	(IBM name: SMF77QNM) Major name of resource.
zRNM	CHAR	44	(IBM name: SMF77RNM) Minor name of resource.
zWTM	TIME	4	(IBM name: SMF77WTM) Minimum resource contention time during the measurement interval, in 1024-microsecond units. After an internal RMF restart (for example, due to a change of gatherer options) the contention time can be larger than the measurement interval.
zWTX	TIME	4	(IBM name: SMF77WTX) Maximum resource contention time during the measurement interval, in 1024-microsecond units. After an internal RMF restart (for example, due to a change of gatherer options) the contention time can be larger than the measurement interval.
zWTT	TIME	4	(IBM name: SMF77WTT) Total resource contention time during the measurement interval, in 1024-microsecond units. After an internal RMF restart (for example, due to a change of gatherer options) the contention time can be larger than the measurement interval.
zQL1	INT	2	(IBM name: SMF77QL1) Counter for queue length of 1.
zQL2	INT	2	(IBM name: SMF77QL2) Counter for queue length of 2.
zQL3	INT	2	(IBM name: SMF77QL3) Counter for queue length of 3.

zQL4	INT	2	(IBM name: SMF77QL4) Counter for queue length of 4 or more.
zEXM	INT	2	(IBM name: SMF77EXM) Minimum number of exclusive requests waiting.
zEXX	INT	2	(IBM name: SMF77EXX) Maximum number of exclusive requests waiting.
zSHM	INT	2	(IBM name: SMF77SHM) Minimum number of share requests waiting.
zSHX	INT	2	(IBM name: SMF77SHX) Maximum number of share requests waiting.
zEVT	INT	2	(IBM name: SMF77EVT) Total number of contention events that occurred during the measurement interval. A contention event is the period starting from the time when the resource has contention until the resource no longer has contention.
zRLN	INT	1	(IBM name: SMF77RLN) Minor name length.

SMF077_Enqueue_Data_Section.zDFG.<fieldname>

zContention	BIT	1	Resource still in contention
zMultSystems	BIT	1	ON - scope of systems Off - scope of system
zExcl	BIT	1	ON - owner has exclusive control of the resource Off - owner shares the resource
zJob1Excl	BIT	1	ON - first job is waiting for exclusive use Off - first job is waiting for shared use
zJob2Excl	BIT	1	ON - second job is waiting for exclusive use Off - second job is waiting for shared use
zGlobal	BIT	1	Resource is global

SMF077_Enqueue_Data_Section.<fieldname>

zDOW	INT	2	(IBM name: SMF77DOW) Number of owners using the resource at maximum contention.
zDWR	INT	2	(IBM name: SMF77DWR) Number of jobs waiting for the resource at maximum contention.
zDO1	CHAR	8	(IBM name: SMF77DO1) Job name 1 of resource owner during period of maximum contention.
zDO2	CHAR	8	(IBM name: SMF77DO2) Job name 2 of resource owner during period of maximum contention.
zDW1	CHAR	8	(IBM name: SMF77DW1) Job name 1 WAITING for the resource owner during period of maximum contention.
zDW2	CHAR	8	(IBM name: SMF77DW2) Job name 2 WAITING for the resource owner during period of maximum contention.
zSY1	CHAR	8	(IBM name: SMF77SY1) System identifier of job name 1 (Resource owner at maximum contention).
zSY2	CHAR	8	(IBM name: SMF77SY2) System identifier of job name 2 (Resource owner at maximum contention).
zSY3	CHAR	8	(IBM name: SMF77SY3) System identifier of job name 1 (WAITING for the resource at maximum contention).
zSY4	CHAR	8	(IBM name: SMF77SY4) System identifier of job name 2 (WAITING for the resource at maximum contention).
zAQL	INT	4	(IBM name: SMF77AQL) Total number of waiting requests during the measurement interval.
zCSC	INT	4	(IBM name: SMF77CSC) Total number of contention status change events that occurred during the

			measurement interval.
zNOD	INT	4	(IBM name: SMF77NOD) Total number of contention status change events accumulated during the measurement interval which did not provide separate contention detail data.

Record Type 78 - RMF Virtual Storage and I/O Queuing Activity

SMF Record 78 (RMF Virtual Storage and I/O Queuing Activity) has a number of subtypes, each mapped by a structure member name of the format "T078STnn".

Record Type 78 Subtype 2 - Virtual Storage Activity

Primary Segment:

- [SMF078#02_RMF_Virtual_Storage](#)

Secondary Segment(s): 4 (in alphabetical order)

- [SMF078#02_Product](#)
- [SMF078#02_VStor_Common_Storage](#)
- [SMF078#02_VStor_Private_Area](#)
- [SMF078#02_VStor_Private_Area_Subpool](#)

Primary segment: [SMF078#02_RMF_Virtual_Storage](#)

Field Name	Type	Len	Description
SMF078#02_RMF_Virtual_Storage.<fieldname>			
SMF078#02_RMF_Virtual_Storage.Header_Self_defining_Section.<fieldname>			
zFLG	HEX	1	(IBM name: SMF78FLG) System indicator: Bit Meaning when set 0 New SMF record format 1 Subtypes used 2 Reserved. 3-6 Version indicators 7 System is running in PR/SM mode.
zRTY	INT	1	(IBM name: SMF78RTY) Record type 78 (X'4E').
zTME	TSTMP	8	(IBM name: SMF78TME) Date/Time when the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF78SID) System identification (from the SMFPRMxx SID parameter).
zSSI	CHAR	4	(IBM name: SMF78SSI) Subsystem identification ('RMF').
zSTY	INT	2	(IBM name: SMF78STY) SubType.
zTRN	INT	2	(IBM name: SMF78TRN) Number of triplets in record. A triplet is a set of three SMF fields (offset/length/number values) that defines a section of the record.
zPRS	INT	4	(IBM name: SMF78PRS) Offset to RMF Product section from start of record, including record descriptor word (RDW).
zPRL	INT	2	(IBM name: SMF78PRL) Length of RMF Product section.
zPRN	INT	2	(IBM name: SMF78PRN) Number of RMF Product sections. Individual header extension for SubType 2:
zDCS	INT	4	(IBM name: SMF78DCS) Offset to Virtual Storage Common Storage data section.
zDCL	INT	2	(IBM name: SMF78DCL) Length of Virtual Storage Common Storage data section.
zDCN	INT	2	(IBM name: SMF78DCN) Number of Virtual Storage Common Storage data sections.

zASS	INT	4	(IBM name: SMF78ASS) Offset to Virtual Storage Private Area data section.
zASL	INT	2	(IBM name: SMF78ASL) Length of Virtual Storage Private Area data section.
zASN	INT	2	(IBM name: SMF78ASN) Number of Virtual Storage Private Area data sections.
zSPS	INT	4	(IBM name: SMF78SPS) Offset to Private Area Subpool section.
zSPL	INT	2	(IBM name: SMF78SPL) Length of Private Area Subpool section.
zSPN	INT	2	(IBM name: SMF78SPN) Number of Private Area Subpool sections. Individual header extension for SubType 3:

Secondary segment: **SMF078#02_Product**

zRBR	INT	2	(IBM name: SMF78RBR) Total number of broken records built from the original large record.
zRSQ	INT	2	(IBM name: SMF78RSQ) Sequence number of this broken record. Every broken record built from the same large record must have a unique sequence number, it is in the range from 1 TO SMF70RBR.
zRIO	INT	4	(IBM name: SMF78RIO) Offset to first reassembly information block relative to start of reassembly area header.
zRIL	INT	2	(IBM name: SMF78RIL) Length of reassembly information block.
zRIN	INT	2	(IBM name: SMF78RIN) Number of reassembly information blocks (same value as SMF70TRN in

			header section).
SMF078#02_Product.Reassembly_Area.Reassembly_Info.<fieldname>			
zRNN	INT	2	(IBM name: SMF78RNN) Total number of sections in the original large record. This field contains information of how many sections of a specific type were contained in the original SMF record. This field is a copy of the number field of the triplet in the original (non broken) record.
zRPP	INT	2	(IBM name: SMF78RPP) Position of the first of one or more consecutive sections described by this block as in the original record. Values in the range of 1 TO SMF70RNN are valid for correct processing. A value of 0 WILL skip processing of this information block. This field provides information where the sections that are part of this broken record were placed in the original record before the split took place. The actual number of consecutive sections contained in this record is available from the actual triplet in the header extension.

Secondary segment: **SMF078#02_VStor_Common_Storage**

Field Name	Type	Len	Description
SMF078#02_VStor_Common_Storage.<fieldname>			
zPA	INT	4	(IBM name: R782PA) Private area address below 16 MEGABYTES.
zPS	INT	4	(IBM name: R782PS) Private area size (in bytes) below 16 MEGABYTES.
zEPA	INT	4	(IBM name: R782EPA) Private area address above 16 MEGABYTES.
zEPS	INT	4	(IBM name: R782EPS) Private area size (in bytes) above 16 MEGABYTES.
zCA	INT	4	(IBM name: R782CA) CSA address below 16 MEGABYTES.
zCS	INT	4	(IBM name: R782CS) CSA size (in bytes) below 16 MEGABYTES.
zECA	INT	4	(IBM name: R782ECA) CSA address above 16 MEGABYTES.
zECS	INT	4	(IBM name: R782ECS) CSA size (in bytes) above 16 MEGABYTES.

SMF078#02_VStor_Common_Storage.zFLG.<fieldname>			
zRUCSA	BIT	1	Restricted use common service area (RUCSA) is defined.

SMF078#02_VStor_Common_Storage.<fieldname>			
zMLA	INT	4	(IBM name: R782MLA) Modified link pack area (MLPA) address below 16 MEGABYTES.
zMLS	INT	4	(IBM name: R782MLS) Modified link pack area (MLPA) size (in bytes) below 16 MEGABYTES.
zEMLA	INT	4	(IBM name: R782EMLA) Modified link pack area (MLPA) address above 16 MEGABYTES.
zEMLS	INT	4	(IBM name: R782EMLS) Modified link pack area (MLPA) size (in bytes) above 16 MEGABYTES.
zFLA	INT	4	(IBM name: SMF78FLA) Fixed link pack area (FLPA) address below 16 MEGABYTES.
zFLS	INT	4	(IBM name: R782FLS) Fixed link pack area (FLPA) size (in bytes) below 16 MEGABYTES.
zEFLA	INT	4	(IBM name: R782EFLA) Fixed link pack area (FLPA) address above 16 MEGABYTES.

zEFLS	INT	4	(IBM name: R782EFLS) Fixed link pack area (FLPA) size (in bytes) above 16 MEGABYTES.
zPLA	INT	4	(IBM name: R782PLA) Pageable link pack area (PLPA) address below 16 MEGABYTES.
zPLS	INT	4	(IBM name: R782PLS) Pageable link pack area (PLPA) size (in bytes) below 16 MEGABYTES.
zELPA	INT	4	(IBM name: R782ELPA) Pageable link pack area (PLPA) address above 16 MEGABYTES.
zELPS	INT	4	(IBM name: R782ELPS) Pageable link pack area (PLPA) size (in bytes) above 16 MEGABYTES.
zSA	INT	4	(IBM name: R782SA) System queue area (SQA) address below 16 MEGABYTES.
zSS	INT	4	(IBM name: R782SS) System queue area (SQA) size (in bytes) below 16 MEGABYTES.
zESA	INT	4	(IBM name: R782ESA) System queue area (SQA) address above 16 MEGABYTES.
zESS	INT	4	(IBM name: R782ESS) System queue area (SQA) size (in bytes) above 16 MEGABYTES.
zNA	INT	4	(IBM name: R782NA) Nucleus address below 16 MEGABYTES.
zNS	INT	4	(IBM name: R782NS) Nucleus size (in bytes) below 16 MEGABYTES.
zENA	INT	4	(IBM name: R782ENA) Nucleus address above 16 MEGABYTES.
zENS	INT	4	(IBM name: R782ENS) Nucleus size (in bytes) above 16 MEGABYTES.
zNL	INT	4	(IBM name: R782NL) Pageable link pack area (PLPA) space redundant with MLPA/FLPA below 16 MEGABYTES.
zENL	INT	4	(IBM name: R782ENL) Pageable link pack area (PLPA) space redundant with MLPA/FLPA above 16 MEGABYTES.
zLPAI	INT	4	(IBM name: R782LPAI) Intermodule space in Pageable link pack area (PLPA) below 16 MEGABYTES.
zELPI	INT	4	(IBM name: R782ELPI) Intermodule space in Pageable link pack area (PLPA) above 16 MEGABYTES.
zMR	INT	4	(IBM name: R782MR) Maximum possible user region below 16 MEGABYTES.
zEMR	INT	4	(IBM name: R782EMR) Maximum possible user region above 16 MEGABYTES.

SMF078#02_VStor_Common_Storage.zSQUA.<fieldname>

zBMIN	INT	4	(IBM name: N/A) Minimum value for below 16 MEGABYTES.
zBNTME	TSTMP	4	(IBM name: N/A) Time stamp for minimum. Format is high-order bytes of time-of-day (TOD) clock.
zBMAX	INT	4	(IBM name: N/A) Maximum value for below 16 MEGABYTES.
zBXTME	TSTMP	4	(IBM name: N/A) Time stamp for maximum. Format is high-order bytes of time-of-day (TOD) clock.
zBTOTL	FLOAT	4	(IBM name: N/A) Total for all samples below 16 MEGABYTES (used to calculate average). See SMF78SAM to calculate averages for Common Storage data section fields, and zSAMP to calculate averages for private area data and Private Subpool section fields.

zAMIN	INT	4	(IBM name: N/A) Minimum value for above 16 MEGABYTES.
zANTME	TSTMP	4	(IBM name: N/A) Time stamp for minimum. Format is high-order bytes of time-of-day (TOD) clock.
zAMAX	INT	4	(IBM name: N/A) Maximum value for above 16 MEGABYTES.
zAXTME	TSTMP	4	(IBM name: N/A) Time stamp for maximum. Format is high-order bytes of time-of-day (TOD) clock.
zATOTL	FLOAT	4	(IBM name: N/A) Total for all samples above 16 MEGABYTES (used to calculate average).

SMF078#02_VStor_Common_Storage.zCSAU.<fieldname>

zBMIN	INT	4	(IBM name: N/A) Minimum value for below 16 MEGABYTES.
zBNTME	TSTMP	4	(IBM name: N/A) Time stamp for minimum. Format is high-order bytes of time-of-day (TOD) clock.
zBMAX	INT	4	(IBM name: N/A) Maximum value for below 16 MEGABYTES.
zBXTME	TSTMP	4	(IBM name: N/A) Time stamp for maximum. Format is high-order bytes of time-of-day (TOD) clock.
zBTOTL	FLOAT	4	(IBM name: N/A) Total for all samples below 16 MEGABYTES (used to calculate average). See SMF78SAM to calculate averages for Common Storage data section fields, and zSAMP to calculate averages for private area data and Private Subpool section fields.
zAMIN	INT	4	(IBM name: N/A) Minimum value for above 16 MEGABYTES.
zANTME	TSTMP	4	(IBM name: N/A) Time stamp for minimum. Format is high-order bytes of time-of-day (TOD) clock.
zAMAX	INT	4	(IBM name: N/A) Maximum value for above 16 MEGABYTES.
zAXTME	TSTMP	4	(IBM name: N/A) Time stamp for maximum. Format is high-order bytes of time-of-day (TOD) clock.
zATOTL	FLOAT	4	(IBM name: N/A) Total for all samples above 16 MEGABYTES (used to calculate average).

SMF078#02_VStor_Common_Storage.zCSAK.<fieldname>

zRUCA	INT	4	(IBM name: R782RUCA) RUCSA address below 16 megabytes.
zRUCS	INT	4	(IBM name: R782RUCS) RUCSA size (in bytes) below 16 megabytes. Zero when RUCSA is not defined.
zERUCA	INT	4	(IBM name: R782ERUCA) RUCSA address above 16 megabytes. Equal to R782EPA when extended RUCSA (ERUCSA) is not defined.
zERUCS	INT	4	(IBM name: R782ERUCS) RUCSA size (in bytes) above 16 megabytes. Zero when ERUCSA is not defined.

Secondary segment: SMF078#02_VStor_Private_Area

Field Name	Type	Len	Description
SMF078#02_VStor_Private_Area.<fieldname>			
zJOBN	CHAR	8	(IBM name: R782JOBN) Name of job being monitored.
zRDTM	INT	4	(IBM name: R782RDTM) Reader start time.
zRDDT	DEC	4 (7,0)	(IBM name: R782RDDT) Reader start date.
zSUBI	INT	2	(IBM name: R782SUBI) Index of first subpool entry in the Private Area Subpool section for this job. This field provides the first array element for this job's Private Area Subpool sections.
zSUBN	INT	2	

			(IBM name: R782SUBN) Index of last subpool entry for this job. This field provides the last array element for this job's private area subpools.
zSTEP	CHAR	8	(IBM name: R782STEP) Name of step active when monitoring began.
zPGMN	CHAR	8	(IBM name: R782PGMN) Program name (taken from PGM= parameter on EXEC card) of job being monitored.

SMF078#02_VStor_Private_Area.zFLGS.<fieldname>

zActive	BIT	1	Job active at start of interval
zTerm	BIT	1	Job terminated during interval
zGETMAIN	BIT	1	GETMAIN limit changed during interval
zAbend	BIT	1	Data incorrect because RMF terminated abnormally while sampling

SMF078#02_VStor_Private_Area.<fieldname>

zSAMP	INT	4	(IBM name: R782SAMP) Number of samples. This field is used to calculate the averages in the private area data and Private Area Subpool sections.
zREGR	INT	4	(IBM name: R782REGR) Region requested by JCL (in bytes).
zRGAB	INT	4	(IBM name: R782RGAB) Region below 16 MEGABYTES assigned by exits (in bytes).
zRGAA	INT	4	(IBM name: R782RGAA) Region above 16 MEGABYTES assigned by exits (in bytes).
zGMLB	INT	4	(IBM name: R782GMLB) GETMAIN limit below 16 MEGABYTES (in bytes).
zGMLA	INT	4	(IBM name: R782GMLA) GETMAIN limit above 16 MEGABYTES (in bytes).
zURAB	INT	4	(IBM name: R782URAB) User region address below 16 MEGABYTES.
zURAA	INT	4	(IBM name: R782URAA) User region address above 16 MEGABYTES.

SMF078#02_VStor_Private_Area.zLSFP.<fieldname>

zBMIN	INT	4	(IBM name: N/A) Minimum value for below 16 MEGABYTES.
zBNTME	TSTMP	4	(IBM name: N/A) Time stamp for minimum. Format is high-order bytes of time-of-day (TOD) clock.
zBMAX	INT	4	(IBM name: N/A) Maximum value for below 16 MEGABYTES.
zBXTME	TSTMP	4	(IBM name: N/A) Time stamp for maximum. Format is high-order bytes of time-of-day (TOD) clock.
zBTOTL	FLOAT	4	(IBM name: N/A) Total for all samples below 16 MEGABYTES (used to calculate average). See SMF78SAM to calculate averages for Common Storage data section fields, and zSAMP to calculate averages for private area data and Private Subpool section fields.
zAMIN	INT	4	(IBM name: N/A) Minimum value for above 16 MEGABYTES.
zANTME	TSTMP	4	(IBM name: N/A) Time stamp for minimum. Format is high-order bytes of time-of-day (TOD) clock.
zAMAX	INT	4	(IBM name: N/A) Maximum value for above 16 MEGABYTES.

zAXTME	TSTMP	4	(IBM name: N/A) Time stamp for maximum. Format is high-order bytes of time-of-day (TOD) clock.
zATOTL	FLOAT	4	(IBM name: N/A) Total for all samples above 16 MEGABYTES (used to calculate average).

SMF078#02_VStor_Private_Area.zLSFB.<fieldname>

zBMIN	INT	4	(IBM name: N/A) Minimum value for below 16 MEGABYTES.
zBNTME	TSTMP	4	(IBM name: N/A) Time stamp for minimum. Format is high-order bytes of time-of-day (TOD) clock.
zBMAX	INT	4	(IBM name: N/A) Maximum value for below 16 MEGABYTES.
zBXTME	TSTMP	4	(IBM name: N/A) Time stamp for maximum. Format is high-order bytes of time-of-day (TOD) clock.
zBTOTL	FLOAT	4	(IBM name: N/A) Total for all samples below 16 MEGABYTES (used to calculate average). See SMF78SAM to calculate averages for Common Storage data section fields, and zSAMP to calculate averages for private area data and Private Subpool section fields.
zAMIN	INT	4	(IBM name: N/A) Minimum value for above 16 MEGABYTES.
zANTME	TSTMP	4	(IBM name: N/A) Time stamp for minimum. Format is high-order bytes of time-of-day (TOD) clock.
zAMAX	INT	4	(IBM name: N/A) Maximum value for above 16 MEGABYTES.
zAXTME	TSTMP	4	(IBM name: N/A) Time stamp for maximum. Format is high-order bytes of time-of-day (TOD) clock.
zATOTL	FLOAT	4	(IBM name: N/A) Total for all samples above 16 MEGABYTES (used to calculate average).

zANTME	TSTMP	4	(IBM name: N/A) Time stamp for minimum. Format is high-order bytes of time-of-day (TOD) clock.

zAMAX	INT	4	(IBM name: N/A) Maximum value for above 16 MEGABYTES.
zAXTME	TSTMP	4	(IBM name: N/A) Time stamp for maximum. Format is high-order bytes of time-of-day (TOD) clock.
zATOTL	FLOAT	4	(IBM name: N/A) Total for all samples above 16 MEGABYTES (used to calculate average).

Record Type 78 Subtype 3 - I/O Queuing Activity

Primary Segment:

- SMF078#03_RMF_IO_Queueing

Secondary Segment(s): 7 (in alphabetical order)

- SMF078#03_HyperPAV_SuperPAV
- SMF078#03_IOP_Initiative_Queue
- SMF078#03_IOQ_Config_Data
- SMF078#03_IOQ_Control
- SMF078#03_IOQ_Data
- SMF078#03_IOQ_Global
- SMF078#03_Product

Primary segment: SMF078#03_RMF_IO_Queueing

Field Name	Type	Len	Description
SMF078#03_RMF_IO_Queueing.<fieldname>			
SMF078#03_RMF_IO_Queueing.Header_Self_defining_Section.<fieldname>			
zFLG	HEX	1	(IBM name: SMF78FLG) System indicator: Bit Meaning when set 0 New SMF record format 1 Subtypes used 2 Reserved. 3-6 Version indicators 7 System is running in PR/SM mode.
zRTY	INT	1	(IBM name: SMF78RTY) Record type 78 (X'4E').
zTME	TSTMP	8	(IBM name: SMF78TME) Date/Time when the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF78SID) System identification (from the SMFPRMxx SID parameter).
zSSI	CHAR	4	(IBM name: SMF78SSI) Subsystem identification ('RMF').
zSTY	INT	2	(IBM name: SMF78STY) SubType.
zTRN	INT	2	(IBM name: SMF78TRN) Number of triplets in record. A triplet is a set of three SMF fields (offset/length/number values) that defines a section of the record.
zPRS	INT	4	(IBM name: SMF78PRS) Offset to RMF Product section from start of record, including record descriptor word (RDW).
zPRL	INT	2	(IBM name: SMF78PRL) Length of RMF Product section.
zPRN	INT	2	(IBM name: SMF78PRN) Number of RMF Product sections. Individual header extension for SubType 2:
zDCS	INT	4	(IBM name: SMF78DCS) Offset to Queuing control section.
zDCL	INT	2	(IBM name: SMF78DCL) Length of Queuing control section.
zDCN	INT	2	(IBM name: SMF78DCN) Number of Queuing control sections.
zASS	INT	4	(IBM name: SMF78ASS) Offset to Queuing data section.
zASL	INT	2	(IBM name: SMF78ASL) Length of Queuing data section.
zASN	INT	2	

			(IBM name: SMF78ASN) Number of Queueing data sections.
zQDS	INT	4	(IBM name: SMF78QDS) Offset to I/O Queue (IOQ) global section.
zQDL	INT	2	(IBM name: SMF78QDL) Length of IOQ global section.
zQDN	INT	2	(IBM name: SMF78QDN) Number of IOQ global sections.
zHPS	INT	4	(IBM name: SMF78HPS) Offset to HyperPAV/SuperPAV data section.
zHPL	INT	2	(IBM name: SMF78HPL) Length of HyperPAV/SuperPAV data section.
zHPN	INT	2	(IBM name: SMF78HPN) Number of HyperPAV/SuperPAV data sections.

Secondary segment: **SMF078#03_Product**

Field Name	Type	Len	Description
<i>SMF078#03_Product.<fieldname></i>			
zMFV	DEC	2 (3,0)	(IBM name: SMF78MFV) RMF version number.
zPRD	CHAR	8	(IBM name: SMF78PRD) Product name ('RMF').
zIST	DEC	4 (7,0)	(IBM name: SMF78IST) Time that the RMF measurement interval started, in the form 0hhmmssF, where hh is the hours, mm is the minutes, ss is the seconds, and F is the sign.
zDAT	DATE	4	(IBM name: SMF78DAT) Date when the RMF measurement interval started, in the form 0cyydddF.
zINT	DEC	4 (7,0)	(IBM name: SMF78INT) Duration of the RMF measurement interval, in the form mmsstttF where mm is the minutes, ss is the seconds, ttt is the milliseconds, and F is the sign. (The end of the measurement interval is the sum of the recorded start time and this field.)
zSAM	INT	4	(IBM name: SMF78SAM) Number of RMF samples.

<i>SMF078#03_Product.zFLA.<fieldname></i>			
zSkip	BIT	1	Samples have been skipped
zMonIII	BIT	1	RECORD was written by RMF Monitor III
zSyncSMF	BIT	1	INTERVAL was synchronized with SMF

<i>SMF078#03_Product.<fieldname></i>			
zCYC	DEC	4 (7,0)	(IBM name: SMF78CYC) Sampling cycle length, in the form 000ttttF, where tttt is the milliseconds and F is the sign (taken from CYCLE option). The range of values is 0.050 to 9.999 seconds.
zMVS	CHAR	8	(IBM name: SMF78MVS) z/OS software level (consists of an acronym and the version, release, and modification level - ZVvrrmm).
zIML	INT	1	(IBM name: SMF78IML) Indicates the type of processor complex on which data measurements were taken. Value Meaning 3 9672, zSeries

<i>SMF078#03_Product.zPRF.<fieldname></i>			
---	--	--	--

zExpStg	BIT	1	The system has expanded storage
zESCA	BIT	1	The processor is enabled for ES connection architecture (ESCA)
zESCdir	BIT	1	There is an ES connection director in the configuration
zzArc	BIT	1	System is running in z/Architecture® mode
zZAAP	BIT	1	At least one zAAP is currently installed
zZIIP	BIT	1	At least one zIIP is currently installed
zDAT	BIT	1	Enhanced DAT facility

SMF078#03_Product.<fieldname>

zPTN	INT	1	(IBM name: SMF78PTN) PR/SM partition number of the partition that wrote this record.
zSRL	INT	1	(IBM name: SMF78SRL) SMF record level change number (X'8E' for subtype 1 records or X'8F' for subtype 2 records for z/OS V2R4 RMF with RMF Data Gatherer APAR OA59330). This field enables processing of SMF record level changes in an existing release.
zIET	HEX	8	(IBM name: SMF78IET) Interval expiration time token. This token can be used to identify other than RMF records that belong to the same interval (if interval was synchronized with SMF).
zLGO	TIME	8	(IBM name: SMF78LGO) Offset GMT to local time (STCK format).
zRAO	INT	4	(IBM name: SMF78RAO) Offset to reassembly area relative to start of RMF product section.
zRAL	INT	2	(IBM name: SMF78RAL) Length of reassembly area. Area consists of a fixed header and a variable number of information blocks. Length depends on the record type/SubType, but is fixed for a specific type/SubType.
zRAN	INT	2	(IBM name: SMF78RAN) Reassembly area indicator. Value Meaning 0 RECORD is not broken. 1 RECORD is broken. Note: This field is used to indicate whether an SMF record is a broken record. Therefore, offset (SMF70RAO) and length (SMF70RAL) are only valid if SMF70RAN = 1. A reassembly area is only present in broken records.
zOIL	INT	2	(IBM name: SMF78OIL) Original interval length as defined in the session or by SMF (in seconds).
zSYN	INT	2	(IBM name: SMF78SYN) SYNC value in seconds.
zGIE	TIME	8	(IBM name: SMF78GIE) Projected gathering interval end (STCK format) GMT time.
zXNM	CHAR	8	(IBM name: SMF78XNM) Sysplex name as defined in parmlib member COUPLExx.
zSNM	CHAR	8	(IBM name: SMF78SNM) System name for current system as defined in parmlib member IEASYSxx SYSNAME parameter. Reassembly Area:

SMF078#03_Product.Reassembly_Area.<fieldname>

zRBR	INT	2	(IBM name: SMF78RBR) Total number of broken records built from the original large record.
zRSQ	INT	2	(IBM name: SMF78RSQ) Sequence number of this broken record. Every broken record built from the same large record must have a unique sequence number, it is in the range from 1 TO SMF70RBR.
zRIO	INT	4	(IBM name: SMF78RIO) Offset to first reassembly information block relative to start of reassembly area header.
zRIL	INT	2	(IBM name: SMF78RIL) Length of reassembly information block.

zRIN	INT	2	(IBM name: SMF78RIN) Number of reassembly information blocks (same value as SMF70TRN in header section).
SMF078#03_Product.Reassembly_Area.Reassembly_Info.<fieldname>			
zRNN	INT	2	(IBM name: SMF78RNN) Total number of sections in the original large record. This field contains information of how many sections of a specific type were contained in the original SMF record. This field is a copy of the number field of the triplet in the original (non broken) record.
zRPP	INT	2	(IBM name: SMF78RPP) Position of the first of one or more consecutive sections described by this block as in the original record. Values in the range of 1 TO SMF70RNN are valid for correct processing. A value of 0 WILL skip processing of this information block. This field provides information where the sections that are part of this broken record were placed in the original record before the split took place. The actual number of consecutive sections contained in this record is available from the actual triplet in the header extension.

Secondary segment: **SMF078#03_IOQ_Global**

Field Name	Type	Len	Description
SMF078#03_IOQ_Global.<fieldname>			
SMF078#03_IOQ_Global.zGFLG.<fieldname>			
zCMFail	BIT	1	Incorrect data because channel measurement facility failed
zDiagFail	BIT	1	DIAGNOSE interface failed
zSTQNotSupp	BIT	1	Store primary queue data not supported
zDCM	BIT	1	DCM supported by hardware
zDCMMgd	BIT	1	Configuration contains DCM managed channels
zIOP	BIT	1	IOP utilization data supported
zResponse	BIT	1	Initial command response time measurements supported
zFTRD	BIT	1	First-transfer-ready-disabled data available
SMF078#03_IOQ_Global.zGFLX.<fieldname>			
zALIAS	BIT	1	ALIAS management groups available.
zEADM	BIT	1	EADM compression facility available.
zSCMMF	BIT	1	Storage-class memory measurement facility available.
SMF078#03_IOQ_Global.<fieldname>			
zGNTR	INT	2	(IBM name: R783GNTR) Number of descriptor triplets following.
zGIDS	INT	4	(IBM name: R783GIDS) Offset to I/O Processor (IOP) Initiative Queue data section.
zGIDL	INT	2	(IBM name: R783GIDL) Length of I/O Processor (IOP) Initiative Queue data section.
zGIDN	INT	2	(IBM name: R783GIDN) Number of I/O Processor (IOP) Initiative Queue data sections.
zTSR	INT	2	(IBM name: R783TSR) Total number of small records written during interval.
zTOT	INT	4	(IBM name: R783TOT) Total number of data sections recorded during the interval.
zNXT	INT	4	(IBM name: R783NXT) Total number of data sections in the following record.

SMF078#03_IOQ_Global.zCFL.<fieldname>			
zChg	BIT	1	Configuration changed. Used to decide whether to provide the text 'POR' or 'ACTIVATE' on reports. Also used to check whether data can be combined in a duration report.
zSincePOR	BIT	1	Configuration change since power on reset (POR).
zIOC	BIT	1	POR using IOC data set that contains a token.
zIOTokValid	BIT	1	I/O token is valid.
zMultiChann	BIT	1	Hardware allows multiple channel subsystems.

SMF078#03_IOQ_Global.<fieldname>			
zCSS	INT	1	(IBM name: R783CSS) Channel Subsystem ID. Only valid if bit 4 0F zCFL is set.
zTNM	CHAR	44	(IBM name: R783TNM) IODF name.
zTSF	CHAR	2	(IBM name: R783TSF) IODF name suffix.

SMF078#03_IOQ_Global.zTOK.<fieldname>			
zTDT	CHAR	8	(IBM name: R783TDT) IODF creation date, in the form mm/dd/yy.
zTTM	CHAR	8	(IBM name: R783TTM) IODF creation time, in the form hh.mm.ss.

SMF078#03_IOQ_Global.<fieldname>			
zTDY	CHAR	10	(IBM name: R783TDY) IODF creation date, in the form mm/dd/yyyy.

Secondary segment: **SMF078#03_IOP_Initiative_Queue**

Field Name	Type	Len	Description
SMF078#03_IOP_Initiative_Queue.<fieldname>			
zIQID	INT	2	(IBM name: R783IQID) Input output processor (IOP) initiative queue identifier.

SMF078#03_IOP_Initiative_Queue.zIFLG.<fieldname>			
zIOP	BIT	1	Input output processor (IOP) is installed.

SMF078#03_IOP_Initiative_Queue.zDSTX.<fieldname>			
zFICON	BIT	1	LCU contains at least one FICON channel.
zInvalConn	BIT	1	Connect time of at least one device is invalid.
zInvalDisc	BIT	1	Disconnect time of at least one device is invalid.

SMF078#03_IOP_Initiative_Queue.<fieldname>			
zIQSM	INT	4	(IBM name: R783IQSM) Accumulator is incremented by the current queue length in the Input output processor (IOP) whenever a request is enqueued.
zIQCT	INT	4	(IBM name: R783IQCT) Number of elements enqueued on the Input output processor (IOP) initiative queue.
zIIPB	FLOAT	8	(IBM name: R783IIPB) Number of times the I/O processor was busy.

zIIP1	FLOAT	8	(IBM name: R783IIP1) Number of times the I/O processor was idle.
zIIFS	FLOAT	8	(IBM name: R783IIFS) Number of I/O functions initially started.
zIPII	FLOAT	8	(IBM name: R783IPII) Number of processed I/O interrupts.
zICPB	FLOAT	8	(IBM name: R783ICPB) Number of times an I/O was retried due to channel path busy.
zIDPB	FLOAT	8	(IBM name: R783IDPB) Number of times an I/O was retried due to director port busy.
zICUB	FLOAT	8	(IBM name: R783ICUB) Number of times an I/O was retried due to control unit busy.
zIDVB	FLOAT	8	(IBM name: R783IDVB) Number of times an I/O was retried due to device busy.
zISCB	FLOAT	8	(IBM name: R783ISCB) Number of times the I/O processor was busy with SCM operations.
zIECB	FLOAT	8	(IBM name: R783IECB) Number of times the I/O processor was busy with compression or decompression.

Secondary segment: SMF078#03_IOQ_Control

Field Name	Type	Len	Description
<i>SMF078#03_IOQ_Control.<fieldname></i>			
zID1	INT	2	(IBM name: R783ID1) Logical control unit identifier.
zNTR	INT	2	(IBM name: R783NTR) Number of triplets following.
zCPDS	INT	4	(IBM name: R783CPDS) Offset to I/O Queuing Configuration data section from start of section.
zCPDL	INT	2	(IBM name: R783CPDL) Length of I/O Queuing Configuration data section.
zCPDN	INT	2	(IBM name: R783CPDN) Number of I/O Queuing Configuration data sections.
zAMGC	INT	1	(IBM name: R783AMGC) The alias management group number defined on the physical controller for this LCU. This number is valid, if the LCU is assigned to a DASD subsystem that supports alias management groups and bit 7 0F zDST is set.
zAMGS	INT	4	(IBM name: R783AMGS) The alias management group number assigned by z/OS for this LCU on this system. This number is valid, if the LCU is assigned to a DASD subsystem that supports alias management groups and bit 7 0F zDST is set.

Secondary segment: SMF078#03_IOQ_Config_Data

Field Name	Type	Len	Description
<i>SMF078#03_IOQ_Config_Data.<fieldname></i>			
zCPID	INT	1	(IBM name: R783CPID) Channel path identifier.
<i>SMF078#03_IOQ_Config_Data.zCPST.<fieldname></i>			

zCPInst	BIT	1	Channel path installed
zCPOnline	BIT	1	Channel path online
zCPVaried	BIT	1	Channel path varied
zCPOffline	BIT	1	Channel path offline to all devices of the LCU
zCPVary	BIT	1	Channel path connection to all devices of the LCU altered by VARY PATH command during interval
zCPErrror	BIT	1	Measured channel path data incorrect
zCPDCM	BIT	1	Channel path is DCM managed
zCPRreset	BIT	1	CHPID manipulated, requiring data reset

SMF078#03_IOQ_Config_Data.<fieldname>

zCUN	INT	2	(IBM name: R783CUN) Number of control units attached.
zCU1	INT	2	(IBM name: R783CU1) First control unit attached.
zCU2	INT	2	(IBM name: R783CU2) Second control unit attached.
zCU3	INT	2	(IBM name: R783CU3) Third control unit attached.
zCU4	INT	2	(IBM name: R783CU4) Fourth control unit attached.
zCUB	INT	4	(IBM name: R783CUB) Number of times control unit was busy.
zPT	INT	4	(IBM name: R783PT) Number of times channel path was taken.
zDPB	INT	4	(IBM name: R783DPB) Number of times that the Director Port was busy.
zCBT	INT	4	(IBM name: R783CBT) Delay time of an I/O request because the control unit was busy.
zCMR	INT	4	(IBM name: R783CMR) Initial command response time until the first command is indicated as accepted by the device.
zSBS	INT	4	(IBM name: R783SBS) Switch busy count summation: contains the switch busy counts received for all partitions.

SMF078#03_IOQ_Config_Data.zCPXF.<fieldname>

zFmt1	BIT	1	Extended I/O measurement-block format-1 data available
zFmt2	BIT	1	Extended I/O measurement-block format-2 data available
zFTRD	BIT	1	FIRST-TRANSFER-READY-DISABLED supported

SMF078#03_IOQ_Config_Data.<fieldname>

zCPAT	INT	1	(IBM name: R783CPAT) Path attributes Value Meaning 0 NOT specified for this path. 1 PREFERRED path. 2 NON-PREFERRED path.
zCTMW	INT	4	(IBM name: R783CTMW) Transport mode write count
zCTRD	INT	4	(IBM name: R783CTRD) First-transfer-ready-disabled write count

Secondary segment: **SMF078#03_IOQ_Data**

Field Name	Type	Len	Description
<i>SMF078#03_IOQ_Data.<fieldname></i>			
zID2	INT	2	(IBM name: R783ID2) Logical control unit identifier.

<i>SMF078#03_IOQ_Data.zDST.<fieldname></i>			
zNA	BIT	1	No hardware measurements available
zChanged	BIT	1	Dynamically changed
zAdded	BIT	1	Dynamically added
zAttempted	BIT	1	Configuration change attempted
zDCM	BIT	1	LCU contains DCM managed channels
zPathValid	BIT	1	Path attributes are valid.
zHyperPAV	BIT	1	LCU has HyperPAV devices.
zSuperPAV	BIT	1	LCU has SuperPAV devices.

<i>SMF078#03_IOQ_Data.<fieldname></i>			
zQSM	INT	4	(IBM name: R783QSM) Sum of total length of the CU-HDR queue.
zQCT	INT	4	(IBM name: R783QCT) Number of entries on the CU-HDR queue.
zMCMN	INT	2	(IBM name: R783MCMN) Minimum number of DCM managed channels used.
zMCMX	INT	2	(IBM name: R783MCMX) Maximum number of DCM managed channels used.
zMCDF	INT	2	(IBM name: R783MCDF) Defined number of DCM managed channels.
zPTM	INT	4	(IBM name: R783PTM) Accumulated path taken count for DCM managed channels.
zDPBM	INT	4	(IBM name: R783DPBM) Accumulated director port busy count for DCM managed channels.
zCUBM	INT	4	(IBM name: R783CUBM) Accumulated control unit busy count for DCM managed channels.
zCBTM	INT	4	(IBM name: R783CBTM) Accumulated delay time for DCM-managed channels because of a busy control unit.
zCMRM	INT	4	(IBM name: R783CMRM) Accumulated initial command response time for DCM-managed channels.
zSBSM	INT	4	(IBM name: R783SBSM) Switch busy count summation for DCM-managed channels.
zDCTM	INT	4	(IBM name: R783DCTM) Accumulated device connect time in units of 128 MICROSECONDS.
zDDTM	INT	4	(IBM name: R783DDTM) Accumulated device disconnect time in units of 128 MICROSECONDS.
zCSST	INT	4	(IBM name: R783CSST) Channel subsystem wait time in units of 128 MICROSECONDS.
zHCNT	INT	2	(IBM name: R783HCNT) Number of HyperPAV/SuperPAV data sections for that LCU.
zHIX	INT	2	(IBM name: R783HIX) Index to first HyperPAV/SuperPAV data section for that LCU.
zTMWM	INT	4	(IBM name: R783TMWM) Accumulated transport mode write count for DCM managed channels.
zTRDM	INT	4	

			(IBM name: R783TRDM) Accumulated first-transfer-ready-disabled write count for DCM managed channels.
--	--	--	---

Secondary segment: **SMF078#03_HyperPAV_SuperPAV**

Field Name	Type	Len	Description
<i>SMF078#03_HyperPAV_SuperPAV.<fieldname></i>			
zHLCU	INT	2	(IBM name: R783HLCU) HyperPAV Logical control unit identifier.
zHCU	INT	2	(IBM name: R783HCU) HyperPAV control unit identifier.
zHNAI	FLOAT	4	(IBM name: R783HNAI) The number of times an I/O could not start because no HyperPAV-aliases were available.
zHTIO	FLOAT	4	(IBM name: R783HTIO) The total number of HyperPAV I/O requests for the LSS.
zHAIU	INT	4	(IBM name: R783HAIU) The high water mark of the number of in-use HyperPAV-alias devices for the LSS (does not include borrowed alias devices).
zHCAD	INT	4	(IBM name: R783HCAD) The high water mark of the number of aliases concurrently in use by one of the HyperPAV-base devices of the LSS (including loaned alias devices).
zHIOQ	INT	4	(IBM name: R783HIOQ) The high water mark of queued I/O requests.
zXANC	FLOAT	4	(IBM name: R783XANC) The number of times an alias was needed to start an I/O.
zXAUC	FLOAT	4	(IBM name: R783XAUC) The number of times an alias was needed to start an I/O and one was used.
zXNHC	FLOAT	4	(IBM name: R783XNHC) The number of times an alias was needed to start an I/O, but none was available in the home LCU. Valid only if bit 7 0F zDST is set.
zXABC	FLOAT	4	(IBM name: R783XABC) The number of times an alias was borrowed from a peer LCU. Valid only if bit 7 0F zDST is set.
zXCBC	INT	4	(IBM name: R783XCBC) The number of aliases concurrently borrowed from peer LCUs. Valid only if bit 7 0F zDST is set.
zXHBC	INT	4	(IBM name: R783XHBC) The high water mark of concurrently borrowed aliases from peer LCUs. Valid only if bit 7 0F zDST is set.
zXALC	FLOAT	4	(IBM name: R783XALC) The number of times an alias was loaned to a peer LCU. Valid only if bit 7 0F zDST is set.
zXCLC	INT	4	(IBM name: R783XCLC) The number of aliases concurrently loaned to peer LCUs. Valid only if bit 7 0F zDST is set.
zXHLC	INT	4	(IBM name: R783XHLC) The high water mark of concurrently loaned aliases to peer LCUs. Valid only if bit 7 0F zDST is set.
zXNAG	FLOAT	4	(IBM name: R783XNAG) The number of attempts that were made to borrow an alias from peer LCUs, but none were available. Valid only if bit 7 0F zDST is set.
zXCQD	FLOAT	4	(IBM name: R783XCQD) The cumulative number of I/Os queued at the subsystem level when aliases were needed.

zXCIU	FLOAT	4	(IBM name: R783XCIU) The cumulative number of aliases defined to this subsystem that were in use when aliases were needed.
-------	-------	---	---

Record Type 79 - RMF Monitor II activity

SMF Record 79 (RMF Monitor II Activity) has a number of subtypes, each mapped by a structure member name of the format "T079STnn".

Record Type 79 Subtype 1 - Address Space State Data

Primary Segment:

- SMF079#01_RMF_Address_Space_State

Secondary Segment(s): 3 (in alphabetical order)

- SMF079#01_ASD_and_ASDJ
- SMF079#01_Monitor_II_Control
- SMF079#01_Product

Primary segment: SMF079#01_RMF_Address_Space_State

Field Name	Type	Len	Description
<i>SMF079#01_RMF_Address_Space_State.<fieldname></i>			
SMF079#01_RMF_Address_Space_State.Header_Self_defining_Section.<fieldname>			
zFLG	HEX	1	(IBM name: SMF79FLG) System indicator: Bit Meaning when set 0 New SMF record format 1 Subtypes used 2 Reserved. 3-6 Version indicators 7 System is running in PR/SM mode.
zRTY	INT	1	(IBM name: SMF79RTY) Record type 79 (X'4F').
zTME	TSTMP	8	(IBM name: SMF79TME) Date/Time when the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF79SID) System identification (from the SMFPRMxx SID parameter).
zSSI	CHAR	4	(IBM name: SMF79SSI) Sub-system identification ('RMF').
zSTY	INT	2	(IBM name: SMF79STY) Record SubType.
zTRN	INT	2	(IBM name: SMF79TRN) Number of triplets in this record. A triplet is a set of three SMF fields (offset/length/number values) that defines a section of the record.
zPRS	INT	4	(IBM name: SMF79PRS) Offset to RMF Product section from start of record, including record descriptor word (RDW).
zPRL	INT	2	(IBM name: SMF79PRL) Length of RMF Product section.
zPRN	INT	2	(IBM name: SMF79PRN) Number of RMF Product sections. Individual header extension for SubTypes 1 - 14:
zMCS	INT	4	(IBM name: SMF79MCS) Offset to Monitor II control section from start of record, including record descriptor word (RDW).
zMCL	INT	2	(IBM name: SMF79MCL) Length of Monitor II control section.
zMCN	INT	2	(IBM name: SMF79MCN) Number of Monitor II control sections.

zASS	INT	4	(IBM name: SMF79ASS) Offset to data section from start of record, including record descriptor word (RDW).
zASL	INT	2	(IBM name: SMF79ASL) Length of data section.
zASN	INT	2	(IBM name: SMF79ASN) Number of data sections.
zDCS	INT	4	(IBM name: SMF79DCS) Offset to control section from start of record, including record descriptor word (RDW).
zDCL	INT	2	(IBM name: SMF79DCL) Length of control section.
zDCN	INT	2	(IBM name: SMF79DCN) Number of control sections.
zQSS	INT	4	(IBM name: SMF79QSS) Offset to Input/Output Queue (IOQ) queuing control from start of record, including record descriptor word (RDW).
zQSL	INT	2	(IBM name: SMF79QSL) Length of Input/Output Queue (IOQ) global section.
zQSN	INT	2	(IBM name: SMF79QSN) Number of Input/Output Queue (IOQ) global sections. Individual header extension for SubType 15:

Secondary segment: **SMF079#01_Product**

Field Name	Type	Len	Description
<i>SMF079#01_Product.<fieldname></i>			
zMFV	DEC	2 (3,0)	(IBM name: SMF79MFV) RMF version number.
zPRD	CHAR	8	(IBM name: SMF79PRD) Product name ('RMF').
zIST	DEC	4 (7,0)	(IBM name: SMF79IST) Time that the RMF measurement interval started, in the form 0hhmmssF, where hh is the hours, mm is the minutes, ss is the seconds, and F is the sign.
zDAT	DATE	4	(IBM name: SMF79DAT) Date when the RMF measurement interval started, in the form 0ccyddF.
zINT	DEC	4 (7,0)	(IBM name: SMF79INT) Duration of the RMF measurement interval, in the form mmssttF where mm is the minutes, ss is the seconds, tt is the milliseconds, and F is the sign. (The end of the measurement interval is the sum of the recorded start time and this field.)
zSAM	INT	4	(IBM name: SMF79SAM) Number of RMF samples.

<i>SMF079#01_Product.zFLA.<fieldname></i>			
zSkip	BIT	1	Samples have been skipped
zMonIII	BIT	1	Record was written by RMF Monitor III
zSyncSMF	BIT	1	INTERVAL was synchronized with SMF
z_zIIP_Boost	BIT	1	zIIP boost was active at some point within the interval.
z_Speed_Boost	BIT	1	Speed boost was active at some point within the interval.
z_Boost_Class	BINT (ENUM)	3	

<i>SMF079#01_Product.<fieldname></i>
--

zCYC	DEC	4 (7,0)	(IBM name: SMF79CYC) Sampling cycle length, in the form 000ttttF, where tttt is the milliseconds and F is the sign (taken from CYCLE option). The range of values is 0.050 to 9.999 seconds.
zMVS	CHAR	8	(IBM name: SMF79MVS) z/OS software level (consists of an acronym and the version, release, and modification level - ZVvrrmm).
zIML	INT	1	(IBM name: SMF79IML) Indicates the type of processor complex on which data measurements were taken. Value Meaning 3 9672, zSeries

SMF079#01_Product.zPRF.<fieldname>

zExpStg	BIT	1	The system has expanded storage
zESCA	BIT	1	The processor is enabled for ES connection architecture (ESCA)
zESCdir	BIT	1	There is an ES connection director in the configuration
zzArc	BIT	1	System is running in z/Architecture® mode
zZAAP	BIT	1	At least one zAAP is currently installed
zZIIP	BIT	1	At least one zIIP is currently installed
zDAT	BIT	1	Enhanced DAT facility

SMF079#01_Product.<fieldname>

zPTN	INT	1	(IBM name: SMF79PTN) PR/SM partition number of the partition that wrote this record.
zSRL	INT	1	(IBM name: SMF79SRL) SMF record level change number (X'8E' for subtype 1 records or X'8F' for subtype 2 records for z/OS V2R4 RMF with RMF Data Gatherer APAR OA59330). This field enables processing of SMF record level changes in an existing release.
zIET	HEX	8	(IBM name: SMF79IET) Interval expiration time token. This token can be used to identify other than RMF records that belong to the same interval (if interval was synchronized with SMF).
zLGO	TIME	8	(IBM name: SMF79LGO) Offset GMT to local time (STCK format).
zRAO	INT	4	(IBM name: SMF79RAO) Offset to reassembly area relative to start of RMF product section.
zRAL	INT	2	(IBM name: SMF79RAL) Length of reassembly area. Area consists of a fixed header and a variable number of information blocks. Length depends on the record type/SubType, but is fixed for a specific type/SubType.
zRAN	INT	2	(IBM name: SMF79RAN) Reassembly area indicator. Value Meaning 0 RECORD is not broken. 1 RECORD is broken. Note: This field is used to indicate whether an SMF record is a broken record. Therefore, offset (SMF70RAO) and length (SMF70RAL) are only valid if SMF70RAN = 1. A reassembly area is only present in broken records.
zOIL	INT	2	(IBM name: SMF79OIL) Original interval length as defined in the session or by SMF (in seconds).
zSYN	INT	2	(IBM name: SMF79SYN) SYNC value in seconds.
zGIE	TIME	8	(IBM name: SMF79GIE) Projected gathering interval end (STCK format) GMT time.
zXNM	CHAR	8	(IBM name: SMF79XNM) Sysplex name as defined in parmlib member COUPLExx.
zSNM	CHAR	8	(IBM name: SMF79SNM) System name for current system as defined in parmlib member IEASYSxx SYSNAME parameter. Reassembly Area:

SMF079#01_Product.Reassembly_Area.<fieldname>

zRBR	INT	2	(IBM name: SMF79RBR) Total number of broken records built from the original large record.
zRSQ	INT	2	(IBM name: SMF79RSQ) Sequence number of this broken record. Every broken record built from the same large record must have a unique sequence number, it is in the range from 1 TO SMF70RBR.
zRIO	INT	4	(IBM name: SMF79RIO) Offset to first reassembly information block relative to start of reassembly area header.
zRIL	INT	2	(IBM name: N/A) Length of reassembly information block.
zRIN	INT	2	(IBM name: SMF79RIN) Number of reassembly information blocks (same value as SMF70TRN in header section).

SMF079#01_Product.Reassembly_Area.Reassembly_Info.<fieldname>			
zRNN	INT	2	(IBM name: SMF79RNN) Total number of sections in the original large record. This field contains information of how many sections of a specific type were contained in the original SMF record. This field is a copy of the number field of the triplet in the original (non broken) record.
zRPP	INT	2	(IBM name: SMF79RPP) Position of the first of one or more consecutive sections described by this block as in the original record. Values in the range of 1 TO SMF70RNN are valid for correct processing. A value of 0 WILL skip processing of this information block. This field provides information where the sections that are part of this broken record were placed in the original record before the split took place. The actual number of consecutive sections contained in this record is available from the actual triplet in the header extension.

Secondary segment: **SMF079#01_Monitor_II_Control**

Field Name	Type	Len	Description
SMF079#01_Monitor_II_Control.<fieldname>			
zGTOD	DEC	4 (7,0)	(IBM name: R79GTOD) Time when the call to data gatherer was issued, in the form 0hhmmssF, where hh is the hours, mm is the minutes, ss is the seconds, and F is the sign.

SMF079#01_Monitor_II_Control.zLF2.<fieldname>			
zInComplete	BIT	1	Not enough relocate data sections to complete data gathering
zSortSTG	BIT	1	Report will be sorted by storage group
zBadRSM	BIT	1	Incorrect RSM data obtained
zBadTrans	BIT	1	Invalid transaction data
zSRMMode	BIT	1	SRM mode changed
zBadMonI	BIT	1	Invalid data from Monitor I (DEV PGSP IOQ).
zActiveDevs	BIT	1	Incomplete device data due to too many active devices in the system.

SMF079#01_Monitor_II_Control.<fieldname>			
zSES	CHAR	2	(IBM name: R79SES) RMF session identifier.
zRID	CHAR	8	(IBM name: R79RID) Measurement name.
zCTXTL	INT	2	(IBM name: R79CTXTL) Length of command text.
zCTEXT	CHAR	32	

			(IBM name: R79CTEXT) Text of command.
zDTXTL	INT	2	(IBM name: R79DTXTL) Length of data reporter default text.
zDTEXT	CHAR	32	(IBM name: R79DTEXT) Default data reporter text.
zIST	CHAR	4	(IBM name: SMF79IST) Monitor I internal start time, in the form 0hhmmssF, where hh is the hours, mm is the minutes, ss is the seconds, and F is the sign.
zTSR	INT	2	(IBM name: R79TSR) Total number of small records.
zTOT	INT	4	(IBM name: R79TOT) Total number of data sections in large record.
zNXT	INT	4	(IBM name: R79NXT) Number of data sections in following small records.
zIWMTK	CHAR	8	(IBM name: R79IWMTK) Token returned from IWMRCOLL service.

Secondary segment: SMF079#01_ASD_and_ASDJ

Field Name	Type	Len	Description
<i>SMF079#01_ASD_and_ASDJ.<fieldname></i>			
zASID	INT	2	(IBM name: R791ASID) Address space identifier.
zJBN	CHAR	8	(IBM name: R791JBN) Name of job.
zDMN	INT	2	(IBM name: R791DMN) Reserved.
zNPG	INT	2	(IBM name: R791NPG) Reserved.
zPGP	INT	2	(IBM name: R791PGP) Reserved.
zTTOD	INT	4	(IBM name: R791TTOD) Real time into transaction (milliseconds).
zCL	CHAR	2	(IBM name: R791CL) Current location. (Set to IN when all other indicators are off.) Contents Meaning DL Out queue/delayed IN In storage LO Logically swapped out NS Non-swappable PR Privileged OT Swapped out and ready WL Wait queue/long wait WM Wait queue/MSO WO Wait queue/reasons other than WM, WL, or WT WT Wait queue/terminal wait >> Transitioning out << Transitioning in.
zTAS	INT (ENUM)	2	(IBM name: R791TAS) Type of user Contents
zSRC	CHAR	2	(IBM name: R791SRC) Reason for last swap-out Contents Meaning TO Terminal output TI Terminal input LW Long wait XS Auxiliary storage shortage RS Central storage shortage DW Detected wait MP Memory Pool shortage NQ CAP enqueue EX CAP exchange US CAP uni-swap TS Transition swap IC Improve central storage usage IP Improve system paging rate MR Make room for a user who has been swapped out too long AW APPC WAIT (swapped out, because waiting for APPC services) IW OMVS input wait OW OMVS output wait SR In-real swap 00 UNKN0WN.
zDP	INT	2	(IBM name: R791DP) Dispatcher priority.
zSWC	INT	2	(IBM name: R791SWC) Transaction swap count.
zSWMR	INT	2	

			(IBM name: R791SWMR) SRM work load recommendation value.
zWMS	INT	4	(IBM name: R791WMS) SRM service for the current transaction since the last swap-in.
zTCPU	INT	4	(IBM name: R791TCPU) CPU time (TCB + SRB) for current job step, in milliseconds.
zESCT	INT	4	(IBM name: R791ESCT) Number of pages on expanded storage frames.
zPIN	INT	4	(IBM name: R791PIN) Page-in count.
zTRTM	INT	4	(IBM name: R791TRTM) Transaction residency time, in milliseconds.

SMF079#01_ASD_and_ASDJ.zFLG.<fieldname>

zXMem	BIT	1	Cross memory address space
zCTARval	BIT	1	Data in zCTAR is valid
zVALval	BIT	1	Data in zVAL is valid
zServer	BIT	1	If ON: this address space is a server address space If OFF: goal specified for this address space is being honored by WLM
zRESET	BIT	1	Address space has been quiesced by a RESET command
zRule	BIT	1	Address space matched a classification rule in the active policy which prevents managing the region based on the response time goals of its served transactions
zAffinity	BIT	1	Server has temporal affinity to clients.

SMF079#01_ASD_and_ASDJ.zFLG2.<fieldname>

zF2#0	BIT	1	Service class assigned by classification, or RESET SRVCLASS was designated CPU-critical in the active policy.
zF2#1	BIT	1	Address space matched a classification rule in the active policy which was designated storage-critical.
zF2#2	BIT	1	Address space is serving transactions which belong to a service class that was designated storage-critical in the active policy's classification rules, or is running in SYSTEM/SYSSTC.
zF2#3	BIT	1	Cpu protection was assigned either to the address space or to transaction service classes being served by the space.
zF2#4	BIT	1	Storage protection was assigned either to the address space or to transaction service classes being served by the space.
zF2#5	BIT	1	The dispatching priority of the address space is currently promoted due to a chronic resource contention.
zF2#6	BIT	1	Address space is a CICS TOR that matched a classification rule in the active policy which allows managing the region based on the region goals but also ensures that completed transactions are reported and used for management of the CICS AORs.
zF2#7	BIT	1	Honor priority ineligibility was assigned either to the address space or to transaction service classes being served by the space.

SMF079#01_ASD_and_ASDJ.<fieldname>

zFMCT	INT	4	(IBM name: R791FMCT) Number of central storage frames.
zWSS	INT	4	(IBM name: R791WSS) Working set at last swap in.
zTWSS	INT	4	(IBM name: R791TWSS) RSM target working set size.
zESHP	INT	4	(IBM name: R791ESHP) Number of hiperspace expanded storage pages used by job.
zESVI	INT	4	

			(IBM name: R791ESVI) Number of VIO expanded storage pages used by job.
zHIN	INT	4	(IBM name: R791HIN) Number of ESO hiperspace page-ins by block.
zHRMS	INT	4	(IBM name: R791HRMS) Number of ESO hiperspace read misses by job (a read miss is an attempt to read a frame that is not in expanded storage).
zBPIN	INT	4	(IBM name: R791BPIN) Number of blocked pages brought in from DASD.
zPINE	INT	4	(IBM name: R791PINE) Number of pages brought in from expanded storage.
zBPNE	INT	4	(IBM name: R791BPNE) Number of blocked pages brought in from expanded storage.
zCTAR	INT	4	(IBM name: R791CTAR) Central storage target number of frames.
zVAL	INT	4	(IBM name: R791VAL) Recommendation value for working-set-managed address spaces.
zSCL	CHAR	8	(IBM name: R791SCL) Service class name.
zSCP	INT	2	(IBM name: R791SCP) Service class period.
zWKLD	CHAR	8	(IBM name: R791WKLD) Workload name.
zRGRP	CHAR	8	(IBM name: R791RGRP) Resource group name.
zSPI	INT	4	(IBM name: R791SPI) Number of page-ins from auxiliary storage for shared page groups.
zCMNI	INT	4	(IBM name: R791CMNI) Number of common pages for current transaction.
zPNV	INT	4	(IBM name: R791PNV) Number of non-VIO pages for current transaction.
zPVIO	INT	4	(IBM name: R791PVIO) Number of VIO pages for current transaction.
zEXCT	INT	4	(IBM name: R791EXCT) EXCP count for this step.
zTCPC	INT	4	(IBM name: R791TCPC) Total CPU time consumed in this address space, in milliseconds.
zASST	INT	4	(IBM name: R791ASST) CPU time consumed by preemptible-class SRBs running on behalf of this address space, in milliseconds.
zPHTM	INT	4	(IBM name: R791PHTM) CPU time consumed by preemptible-class SRBs running in this address space, in milliseconds.
zRCL	CHAR	8	(IBM name: R791RCL) Report class name.
zMLIM	INT	8	(IBM name: R791MLIM) Address space memory limit, in megabytes.
zTIFA	INT	4	(IBM name: R791TIFA) CPU time in milliseconds consumed on zAAPs.
zTCP	INT	4	(IBM name: R791TCP) CPU time in milliseconds consumed on standard CPs. Only valid if zAAPs or zIIPs are in the configuration.
zTIFC	INT	4	(IBM name: R791TIFC) CPU time in milliseconds consumed on standard CPs by work that was eligible for zAAP.
zNFFI	INT	4	(IBM name: R791NFFI) Normalization factor for zAAP time. Used to convert between real zAAP times and 'normalized' zAAP times, that is, the equivalent time on a

			standard CP. Multiply zTIFA by this value and divide by 256 T0 calculate the normalized zAAP time.
zTSUP	INT	4	(IBM name: R791TSUP) CPU time in milliseconds consumed on zIIPs
zTSUC	INT	4	(IBM name: R791TSUC) CPU time in milliseconds consumed on standard CPs by work that was eligible for zIIP.
zNFFS	INT	4	(IBM name: R791NFFS) Normalization factor for zIIP time. Used to convert between real zIIP times and 'normalized' zIIP times, that is, the equivalent time on a standard CP. Multiply zTSUP by this value and divide by 256 T0 calculate the normalized zIIP time.
zEXCW	INT	8	(IBM name: R791EXCW) EXCP count (double word).
zPHTA	INT	4	(IBM name: R791PHTA) zAAP-only equivalent of zPHTM. This is normalized time.
zPHTI	INT	4	(IBM name: R791PHTI) zIIP-only equivalent of zPHTM. This is normalized time.

SMF079#01_ASD_and_ASDJ.zFLG3.<fieldname>			
zF3#0	BIT	1	Service class was assigned by classification, or RESET SRVCLASS belongs to I/O priority group HIGH in the active policy.
zF3#1	BIT	1	I/O priority group HIGH was assigned either to the address space or to transaction service classes served by the address space.
zF3#2	BIT	1	zRGRP is the name of a tenant resource group and zRCL is the name of a tenant report class.
zF3#3	BIT	1	General purpose and specialty processor consumption is considered by WLM capping algorithms for this address space.

Record Type 79 Subtype 2 - Address Space Resource Data

Primary Segment:

- SMF079#02_RMF_Address_Space_Resource

Secondary Segment(s): 3 (in alphabetical order)

- SMF079#02_ARD_and_ARDJ
- SMF079#02_Monitor_II_Control
- SMF079#02_Product

Primary segment: SMF079#02_RMF_Address_Space_Resource

Field Name	Type	Len	Description
SMF079#02_RMF_Address_Space_Resource.<fieldname>			
SMF079#02_RMF_Address_Space_Resource.Header_Self_defining_Section.<fieldname>			
zFLG	HEX	1	(IBM name: SMF79FLG) System indicator: Bit Meaning when set 0 New SMF record format 1 Subtypes used 2 Reserved. 3-6 Version indicators 7 System is running in PR/SM mode.
zRTY	INT	1	(IBM name: SMF79RTY) Record type 79 (X'4F').
zTME	TSTMP	8	(IBM name: SMF79TME) Date/Time when the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF79SID) System identification (from the SMFPRMxx SID parameter).
zSSI	CHAR	4	(IBM name: SMF79SSI) Sub-system identification ('RMF').
zSTY	INT	2	(IBM name: SMF79STY) Record SubType.
zTRN	INT	2	(IBM name: SMF79TRN) Number of triplets in this record. A triplet is a set of three SMF fields (offset/length/number values) that defines a section of the record.
zPRS	INT	4	(IBM name: SMF79PRS) Offset to RMF Product section from start of record, including record descriptor word (RDW).
zPRL	INT	2	(IBM name: SMF79PRL) Length of RMF Product section.
zPRN	INT	2	(IBM name: SMF79PRN) Number of RMF Product sections. Individual header extension for SubTypes 1 - 14:
zMCS	INT	4	(IBM name: SMF79MCS) Offset to Monitor II control section from start of record, including record descriptor word (RDW).
zMCL	INT	2	(IBM name: SMF79MCL) Length of Monitor II control section.
zMCN	INT	2	(IBM name: SMF79MCN) Number of Monitor II control sections.
zASS	INT	4	(IBM name: SMF79ASS) Offset to data section from start of record, including record descriptor word (RDW).
zASL	INT	2	(IBM name: SMF79ASL) Length of data section.
zASN	INT	2	(IBM name: SMF79ASN) Number of data sections.

zDCS	INT	4	(IBM name: SMF79DCS) Offset to control section from start of record, including record descriptor word (RDW).
zDCL	INT	2	(IBM name: SMF79DCL) Length of control section.
zDCN	INT	2	(IBM name: SMF79DCN) Number of control sections.
zQSS	INT	4	(IBM name: SMF79QSS) Offset to Input/Output Queue (IOQ) queuing control from start of record, including record descriptor word (RDW).
zQSL	INT	2	(IBM name: SMF79QSL) Length of Input/Output Queue (IOQ) global section.
zQSN	INT	2	(IBM name: SMF79QSN) Number of Input/Output Queue (IOQ) global sections. Individual header extension for SubType 15:

Secondary segment: **SMF079#02_Product**

Field Name	Type	Len	Description
<i>SMF079#02_Product.<fieldname></i>			
zMFV	DEC	2 (3,0)	(IBM name: SMF79MFV) RMF version number.
zPRD	CHAR	8	(IBM name: SMF79PRD) Product name ('RMF').
zIST	DEC	4 (7,0)	(IBM name: SMF79IST) Time that the RMF measurement interval started, in the form 0hhmmssF, where hh is the hours, mm is the minutes, ss is the seconds, and F is the sign.
zDAT	DATE	4	(IBM name: SMF79DAT) Date when the RMF measurement interval started, in the form 0cyydddF.
zINT	DEC	4 (7,0)	(IBM name: SMF79INT) Duration of the RMF measurement interval, in the form mmsstttF where mm is the minutes, ss is the seconds, tt is the milliseconds, and F is the sign. (The end of the measurement interval is the sum of the recorded start time and this field.)
zSAM	INT	4	(IBM name: SMF79SAM) Number of RMF samples.

<i>SMF079#02_Product.zFLA.<fieldname></i>			
zSkip	BIT	1	Samples have been skipped
zMonIII	BIT	1	RECORD was written by RMF Monitor III
zSyncSMF	BIT	1	INTERVAL was synchronized with SMF
z_zIIP_Boost	BIT	1	zIIP boost was active at some point within the interval.
z_Speed_Boost	BIT	1	Speed boost was active at some point within the interval.
z_Boost_Class	BINT (ENUM)	3	

<i>SMF079#02_Product.<fieldname></i>			
zCYC	DEC	4 (7,0)	(IBM name: SMF79CYC) Sampling cycle length, in the form 000ttttF, where tttt is the milliseconds and F is the sign (taken from CYCLE option). The range of values is 0.050 to 9.999 seconds.
zMVS	CHAR	8	(IBM name: SMF79MVS) z/OS software level (consists of an acronym and the version, release, and modification level - ZVvrrmm).

zIML	INT	1	(IBM name: SMF79IML) Indicates the type of processor complex on which data measurements were taken. Value Meaning 3 9672, zSeries
------	-----	---	--

SMF079#02_Product.zPRF.<fieldname>

zExpStg	BIT	1	The system has expanded storage
zESCA	BIT	1	The processor is enabled for ES connection architecture (ESCA)
zESCdir	BIT	1	There is an ES connection director in the configuration
zzArc	BIT	1	System is running in z/Architecture® mode
zZAAP	BIT	1	At least one zAAP is currently installed
zZIIP	BIT	1	At least one zIIP is currently installed
zDAT	BIT	1	Enhanced DAT facility

SMF079#02_Product.<fieldname>

zPTN	INT	1	(IBM name: SMF79PTN) PR/SM partition number of the partition that wrote this record.
zSRL	INT	1	(IBM name: SMF79SRL) SMF record level change number (X'8E' for subtype 1 records or X'8F' for subtype 2 records for z/OS V2R4 RMF with RMF Data Gatherer APAR OA59330). This field enables processing of SMF record level changes in an existing release.
zIET	HEX	8	(IBM name: SMF79IET) Interval expiration time token. This token can be used to identify other than RMF records that belong to the same interval (if interval was synchronized with SMF).
zLGO	TIME	8	(IBM name: SMF79LGO) Offset GMT to local time (STCK format).
zRAO	INT	4	(IBM name: SMF79RAO) Offset to reassembly area relative to start of RMF product section.
zRAL	INT	2	(IBM name: SMF79RAL) Length of reassembly area. Area consists of a fixed header and a variable number of information blocks. Length depends on the record type/SubType, but is fixed for a specific type/SubType.
zRAN	INT	2	(IBM name: SMF79RAN) Reassembly area indicator. Value Meaning 0 RECORD is not broken. 1 RECORD is broken. Note: This field is used to indicate whether an SMF record is a broken record. Therefore, offset (SMF70RAO) and length (SMF70RAL) are only valid if SMF70RAN = 1. A reassembly area is only present in broken records.
zOIL	INT	2	(IBM name: SMF79OIL) Original interval length as defined in the session or by SMF (in seconds).
zSYN	INT	2	(IBM name: SMF79SYN) SYNC value in seconds.
zGIE	TIME	8	(IBM name: SMF79GIE) Projected gathering interval end (STCK format) GMT time.
zXNM	CHAR	8	(IBM name: SMF79XNM) Sysplex name as defined in parmlib member COUPLExx.
zSNM	CHAR	8	(IBM name: SMF79SNM) System name for current system as defined in parmlib member IEASYSxx SYSNAME parameter. Reassembly Area:

SMF079#02_Product.Reassembly_Area.<fieldname>

zRBR	INT	2	(IBM name: SMF79RBR) Total number of broken records built from the original large record.
zRSQ	INT	2	(IBM name: SMF79RSQ) Sequence number of this broken record. Every broken record built from the same large record must have a unique sequence number, it is in the range from 1 TO SMF70RBR.

zRIO	INT	4	(IBM name: SMF79RIO) Offset to first reassembly information block relative to start of reassembly area header.
zRIL	INT	2	(IBM name: N/A) Length of reassembly information block.
zRIN	INT	2	(IBM name: SMF79RIN) Number of reassembly information blocks (same value as SMF70TRN in header section).

SMF079#02_Product.Reassembly_Area.Reassembly_Info.<fieldname>			
zRNN	INT	2	(IBM name: SMF79RNN) Total number of sections in the original large record. This field contains information of how many sections of a specific type were contained in the original SMF record. This field is a copy of the number field of the triplet in the original (non broken) record.
zRPP	INT	2	(IBM name: SMF79RPP) Position of the first of one or more consecutive sections described by this block as in the original record. Values in the range of 1 TO SMF70RNN are valid for correct processing. A value of 0 WILL skip processing of this information block. This field provides information where the sections that are part of this broken record were placed in the original record before the split took place. The actual number of consecutive sections contained in this record is available from the actual triplet in the header extension.

Secondary segment: **SMF079#02_Monitor_II_Control**

Field Name	Type	Len	Description
SMF079#02_Monitor_II_Control.<fieldname>			
zGTOD	DEC	4 (7,0)	(IBM name: R79GTOD) Time when the call to data gatherer was issued, in the form 0hhmmssF, where hh is the hours, mm is the minutes, ss is the seconds, and F is the sign.

SMF079#02_Monitor_II_Control.zLF2.<fieldname>			
zInComplete	BIT	1	Not enough relocate data sections to complete data gathering
zSortSTG	BIT	1	Report will be sorted by storage group
zBadRSM	BIT	1	Incorrect RSM data obtained
zBadTrans	BIT	1	Invalid transaction data
zSRMMode	BIT	1	SRM mode changed
zBadMonI	BIT	1	Invalid data from Monitor I (DEV PGSP IOQ).
zActiveDevs	BIT	1	Incomplete device data due to too many active devices in the system.

SMF079#02_Monitor_II_Control.<fieldname>			
zSES	CHAR	2	(IBM name: R79SES) RMF session identifier.
zRID	CHAR	8	(IBM name: R79RID) Measurement name.
zCTXTL	INT	2	(IBM name: R79CTXTL) Length of command text.
zCTEXT	CHAR	32	(IBM name: R79CTEXT) Text of command.
zDTXTL	INT	2	(IBM name: R79DTXTL) Length of data reporter default text.
zDTEXT	CHAR	32	(IBM name: R79DTEXT) Default data reporter text.

zIST	CHAR	4	(IBM name: SMF79IST) Monitor I internal start time, in the form 0hhmmssF, where hh is the hours, mm is the minutes, ss is the seconds, and F is the sign.
zTSR	INT	2	(IBM name: R79TSR) Total number of small records.
zTOT	INT	4	(IBM name: R79TOT) Total number of data sections in large record.
zNXT	INT	4	(IBM name: R79NXT) Number of data sections in following small records.
zIWMTK	CHAR	8	(IBM name: R79IWMTK) Token returned from IWMRCOLL service.

Secondary segment: **SMF079#02_ARD_and_ARDJ**

Field Name	Type	Len	Description
<i>SMF079#02_ARD_and_ARDJ.<fieldname></i>			
zASID	INT	2	(IBM name: R792ASID) Address space identifier.
zJBN	CHAR	8	(IBM name: R792JBN) Name of job.
zDMN	INT	2	(IBM name: R792DMN) Reserved.
zNPG	INT	2	(IBM name: R792NPG) Reserved.
zCL	CHAR	2	(IBM name: R792CL) Current location Contents Meaning DL Out queue/delayed IN In storage LO Logically swapped out NS Non-swappable PR Privileged OT Swapped out and ready WL Wait queue/long wait WM Wait queue/MSO WO Wait queue/reasons other than WM, WL, or WT WT Wait queue/terminal wait >> Transitioning out << Transitioning in.
zTAS	INT (ENUM)	2	(IBM name: R792TAS) Type of user Contents
zTRC	INT	2	(IBM name: R792TRC) Transaction count.
zTTOD	INT	4	(IBM name: R792TTOD) Transaction elapsed time, in milliseconds.
zPRFX	INT	4	(IBM name: R792PRFX) Number of private fixed frames.
zSVAR	INT	4	(IBM name: R792SVAR) SRM service absorption rate for step.
zTCPU	INT	4	(IBM name: R792TCPU) Total TCB time for step, in milliseconds.
zPSS1	INT	4	(IBM name: R792PSS1) High order word - CPU page seconds, in milliseconds. One page in storage for one second is one page second.
zPSS2	INT	4	(IBM name: R792PSS2) Low order word - step product of frame, in milliseconds. One page in storage for one second is one page second.
zEJST	INT	4	(IBM name: R792EJST) Total processor time (TCB+SRB), in milliseconds.
zTSRM	INT	4	(IBM name: R792TSRM) Total SRM service for job or session.
zRTM	INT	4	(IBM name: R792RTM) Resident time for step, in milliseconds.
zEXCP	INT	2	

			(IBM name: R792EXCP) EXCP count for this step.
zCMNI	INT	4	(IBM name: R792CMNI) Number of common pages for current transaction.
zPNV	INT	4	(IBM name: R792PNV) Number of non-VIO pages for current transaction.
zPVIO	INT	4	(IBM name: R792PVIO) Number of VIO pages for current transaction.
zFXBL	INT	4	(IBM name: R792FXBL) Number of fixed frames below 16 MEGABYTES.
zPSWP	INT	4	(IBM name: R792PSWP) Number of pages swapped in and out for current transaction.
zLPAI	INT	4	(IBM name: R792LPAI) Number of link pack area (LPA) pages paged in for current transaction.
zCSAI	INT	4	(IBM name: R792CSAI) Number of CSA pages paged in for current transaction.
zLSQA	INT	4	(IBM name: R792LSQA) Number of fixed local system queue area (LSQA) fixed frames.
zNLQF	INT	4	(IBM name: R792NLQF) Number of non-local system queue area (LSQA) fixed frames. 96 5E zTDEV 4 BINARY Total device connect time in milliseconds.
zPIN	INT	4	(IBM name: R792PIN) Page-in count.
zTRTM	INT	4	(IBM name: R792TRTM) Transaction residency time.

SMF079#02_ARD_and_ARDJ.zFLG.<fieldname>

zXMem	BIT	1	Cross memory address space
zINCORRECT	BIT	1	Incorrect RSM data obtained for address space
zServer	BIT	1	If ON: this address space is a server address space If OFF: goal specified for this address space is being honored by WLM
zRESET	BIT	1	Address space has been quiesced by a RESET command
zRule	BIT	1	Address space matched a classification rule in the active policy which prevents managing the region based on the response time goals of its served transactions
zAffinity	BIT	1	Server has temporal affinity to clients.

SMF079#02_ARD_and_ARDJ.<fieldname>

zFLG2	INT	1	Additional bits.
zLSQR	INT	4	(IBM name: R792LSQR) Local system queue area (LSQA) pages in central storage.
zLSQE	INT	4	(IBM name: R792LSQE) Local system queue area (LSQA) pages in expanded storage.
zARS	INT	4	(IBM name: R792ARS) Average number of real frames for step.
zTWSS	INT	4	(IBM name: R792TWSS) SRM target working set size for this job.
zPHSP	INT	4	(IBM name: R792PHSP) Number of hiperspace pages for the current transaction.
zEXCT	INT	4	(IBM name: R792EXCT) EXCP count for this step.
zSCL	CHAR	8	(IBM name: R792SCL) Service class name.
zSCP	INT	2	(IBM name: R792SCP) Service class period.

zWKLD	CHAR	8	(IBM name: R792WKLD) Workload name.
zRGRP	CHAR	8	(IBM name: R792RGRP) Resource group name.
zTCPC	INT	4	(IBM name: R792TCPC) Total CPU time consumed in this address space, in milliseconds.
zASST	INT	4	(IBM name: R792ASST) CPU time consumed by preemptible-class SRBs running on behalf of this address space, in milliseconds.
zPHTM	INT	4	(IBM name: R792PHTM) CPU time consumed by preemptible-class SRBs running in this address space, in milliseconds.
zFXAB	INT	4	(IBM name: R792FXAB) Number of fixed frames between 16M and 2G (z/Architecture mode).
zTIFA	INT	4	(IBM name: R792TIFA) CPU time in milliseconds consumed on zAAPs.
zTCP	INT	4	(IBM name: R792TCP) CPU time in milliseconds consumed on standard CPs. Only valid if zAAPs or zIIPs are in the configuration.
zTIFC	INT	4	(IBM name: R792TIFC) CPU time in milliseconds consumed on standard CPs by work that was eligible for zAAP.
zNFFI	INT	4	(IBM name: R792NFFI) Normalization factor for zAAP time. Used to convert between real zAAP times and 'normalized' zAAP times, that is, the equivalent time on a standard CP. Multiply zTIFA by this value and divide by 256 T0 calculate the normalized zAAP time.
zTSUP	INT	4	(IBM name: R792TSUP) CPU time in milliseconds consumed on zIIPs.
zTSUC	INT	4	(IBM name: R792TSUC) CPU time in milliseconds consumed on standard CPs by work that was eligible for zIIP.
zNFFS	INT	4	(IBM name: R792NFFS) Normalization factor for zIIP time. Used to convert between real zIIP times and 'normalized' zIIP times, that is, the equivalent time on a standard CP. Multiply zTSUP by this value and divide by 256 T0 calculate the normalized zIIP time.
zEXCW	INT	8	(IBM name: R792EXCW) EXCP count (double word).
zPHTA	INT	4	(IBM name: R792PHTA) zAAP-only equivalent of zPHTM. This is normalized time.
zPHTI	INT	4	(IBM name: R792PHTI) zIIP-only equivalent of zPHTM. This is normalized time.
zFLG3	INT	1	Additional flags.

Record Type 79 Subtype 3 - Storage/Processor Data

Primary Segment:

- SMF079#03_RMF_Storage_Processor

Secondary Segment(s): 3 (in alphabetical order)

- SMF079#03_Monitor_II_Control
- SMF079#03_Product
- SMF079#03_SRCS

Primary segment: SMF079#03_RMF_Storage_Processor

Field Name	Type	Len	Description
SMF079#03_RMF_Storage_Processor.<fieldname>			
SMF079#03_RMF_Storage_Processor.Header_Self_defining_Section.<fieldname>			
zFLG	HEX	1	(IBM name: SMF79FLG) System indicator: Bit Meaning when set 0 New SMF record format 1 Subtypes used 2 Reserved. 3-6 Version indicators 7 System is running in PR/SM mode.
zRTY	INT	1	(IBM name: SMF79RTY) Record type 79 (X'4F').
zTME	TSTMP	8	(IBM name: SMF79TME) Date/Time when the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF79SID) System identification (from the SMFPRMxx SID parameter).
zSSI	CHAR	4	(IBM name: SMF79SSI) Sub-system identification ('RMF').
zSTY	INT	2	(IBM name: SMF79STY) Record SubType.
zTRN	INT	2	(IBM name: SMF79TRN) Number of triplets in this record. A triplet is a set of three SMF fields (offset/length/number values) that defines a section of the record.
zPRS	INT	4	(IBM name: SMF79PRS) Offset to RMF Product section from start of record, including record descriptor word (RDW).
zPRL	INT	2	(IBM name: SMF79PRL) Length of RMF Product section.
zPRN	INT	2	(IBM name: SMF79PRN) Number of RMF Product sections. Individual header extension for SubTypes 1 - 14:
zMCS	INT	4	(IBM name: SMF79MCS) Offset to Monitor II control section from start of record, including record descriptor word (RDW).
zMCL	INT	2	(IBM name: SMF79MCL) Length of Monitor II control section.
zMCN	INT	2	(IBM name: SMF79MCN) Number of Monitor II control sections.
zASS	INT	4	(IBM name: SMF79ASS) Offset to data section from start of record, including record descriptor word (RDW).
zASL	INT	2	(IBM name: SMF79ASL) Length of data section.
zASN	INT	2	(IBM name: SMF79ASN) Number of data sections.

zDCS	INT	4	(IBM name: SMF79DCS) Offset to control section from start of record, including record descriptor word (RDW).
zDCL	INT	2	(IBM name: SMF79DCL) Length of control section.
zDCN	INT	2	(IBM name: SMF79DCN) Number of control sections.
zQSS	INT	4	(IBM name: SMF79QSS) Offset to Input/Output Queue (IOQ) queuing control from start of record, including record descriptor word (RDW).
zQSL	INT	2	(IBM name: SMF79QSL) Length of Input/Output Queue (IOQ) global section.
zQSN	INT	2	(IBM name: SMF79QSN) Number of Input/Output Queue (IOQ) global sections. Individual header extension for SubType 15:

Secondary segment: **SMF079#03_Product**

Field Name	Type	Len	Description
<i>SMF079#03_Product.<fieldname></i>			
zMFV	DEC	2 (3,0)	(IBM name: SMF79MFV) RMF version number.
zPRD	CHAR	8	(IBM name: SMF79PRD) Product name ('RMF').
zIST	DEC	4 (7,0)	(IBM name: SMF79IST) Time that the RMF measurement interval started, in the form 0hhmmssF, where hh is the hours, mm is the minutes, ss is the seconds, and F is the sign.
zDAT	DATE	4	(IBM name: SMF79DAT) Date when the RMF measurement interval started, in the form 0cyydddF.
zINT	DEC	4 (7,0)	(IBM name: SMF79INT) Duration of the RMF measurement interval, in the form mmsstttF where mm is the minutes, ss is the seconds, tt is the milliseconds, and F is the sign. (The end of the measurement interval is the sum of the recorded start time and this field.)
zSAM	INT	4	(IBM name: SMF79SAM) Number of RMF samples.

<i>SMF079#03_Product.zFLA.<fieldname></i>			
zSkip	BIT	1	Samples have been skipped
zMonIII	BIT	1	RECORD was written by RMF Monitor III
zSyncSMF	BIT	1	INTERVAL was synchronized with SMF
z_zIIP_Boost	BIT	1	zIIP boost was active at some point within the interval.
z_Speed_Boost	BIT	1	Speed boost was active at some point within the interval.
z_Boost_Class	BINT (ENUM)	3	

<i>SMF079#03_Product.<fieldname></i>			
zCYC	DEC	4 (7,0)	(IBM name: SMF79CYC) Sampling cycle length, in the form 000ttttF, where tttt is the milliseconds and F is the sign (taken from CYCLE option). The range of values is 0.050 to 9.999 seconds.
zMVS	CHAR	8	(IBM name: SMF79MVS) z/OS software level (consists of an acronym and the version, release, and modification level - ZVvrrmm).

zIML	INT	1	(IBM name: SMF79IML) Indicates the type of processor complex on which data measurements were taken. Value Meaning 3 9672, zSeries
------	-----	---	--

SMF079#03_Product.zPRF.<fieldname>

zExpStg	BIT	1	The system has expanded storage
zESCA	BIT	1	The processor is enabled for ES connection architecture (ESCA)
zESCdir	BIT	1	There is an ES connection director in the configuration
zzArc	BIT	1	System is running in z/Architecture® mode
zZAAP	BIT	1	At least one zAAP is currently installed
zZIIP	BIT	1	At least one zIIP is currently installed
zDAT	BIT	1	Enhanced DAT facility

SMF079#03_Product.<fieldname>

zPTN	INT	1	(IBM name: SMF79PTN) PR/SM partition number of the partition that wrote this record.
zSRL	INT	1	(IBM name: SMF79SRL) SMF record level change number (X'8E' for subtype 1 records or X'8F' for subtype 2 records for z/OS V2R4 RMF with RMF Data Gatherer APAR OA59330). This field enables processing of SMF record level changes in an existing release.
zIET	HEX	8	(IBM name: SMF79IET) Interval expiration time token. This token can be used to identify other than RMF records that belong to the same interval (if interval was synchronized with SMF).
zLGO	TIME	8	(IBM name: SMF79LGO) Offset GMT to local time (STCK format).
zRAO	INT	4	(IBM name: SMF79RAO) Offset to reassembly area relative to start of RMF product section.
zRAL	INT	2	(IBM name: SMF79RAL) Length of reassembly area. Area consists of a fixed header and a variable number of information blocks. Length depends on the record type/SubType, but is fixed for a specific type/SubType.
zRAN	INT	2	(IBM name: SMF79RAN) Reassembly area indicator. Value Meaning 0 RECORD is not broken. 1 RECORD is broken. Note: This field is used to indicate whether an SMF record is a broken record. Therefore, offset (SMF70RAO) and length (SMF70RAL) are only valid if SMF70RAN = 1. A reassembly area is only present in broken records.
zOIL	INT	2	(IBM name: SMF79OIL) Original interval length as defined in the session or by SMF (in seconds).
zSYN	INT	2	(IBM name: SMF79SYN) SYNC value in seconds.
zGIE	TIME	8	(IBM name: SMF79GIE) Projected gathering interval end (STCK format) GMT time.
zXNM	CHAR	8	(IBM name: SMF79XNM) Sysplex name as defined in parmlib member COUPLExx.
zSNM	CHAR	8	(IBM name: SMF79SNM) System name for current system as defined in parmlib member IEASYSxx SYSNAME parameter. Reassembly Area:

SMF079#03_Product.Reassembly_Area.<fieldname>

zRBR	INT	2	(IBM name: SMF79RBR) Total number of broken records built from the original large record.
zRSQ	INT	2	(IBM name: SMF79RSQ) Sequence number of this broken record. Every broken record built from the same large record must have a unique sequence number, it is in the range from 1 TO SMF70RBR.

zRIO	INT	4	(IBM name: SMF79RIO) Offset to first reassembly information block relative to start of reassembly area header.
zRIL	INT	2	(IBM name: N/A) Length of reassembly information block.
zRIN	INT	2	(IBM name: SMF79RIN) Number of reassembly information blocks (same value as SMF70TRN in header section).

SMF079#03_Product.Reassembly_Area.Reassembly_Info.<fieldname>			
zRNN	INT	2	(IBM name: SMF79RNN) Total number of sections in the original large record. This field contains information of how many sections of a specific type were contained in the original SMF record. This field is a copy of the number field of the triplet in the original (non broken) record.
zRPP	INT	2	(IBM name: SMF79RPP) Position of the first of one or more consecutive sections described by this block as in the original record. Values in the range of 1 TO SMF70RNN are valid for correct processing. A value of 0 WILL skip processing of this information block. This field provides information where the sections that are part of this broken record were placed in the original record before the split took place. The actual number of consecutive sections contained in this record is available from the actual triplet in the header extension.

Secondary segment: **SMF079#03_Monitor_II_Control**

Field Name	Type	Len	Description
SMF079#03_Monitor_II_Control.<fieldname>			
zGTOD	DEC	4 (7,0)	(IBM name: R79GTOD) Time when the call to data gatherer was issued, in the form 0hhmmssF, where hh is the hours, mm is the minutes, ss is the seconds, and F is the sign.

SMF079#03_Monitor_II_Control.zLF2.<fieldname>			
zInComplete	BIT	1	Not enough relocate data sections to complete data gathering
zSortSTG	BIT	1	Report will be sorted by storage group
zBadRSM	BIT	1	Incorrect RSM data obtained
zBadTrans	BIT	1	Invalid transaction data
zSRMMode	BIT	1	SRM mode changed
zBadMonI	BIT	1	Invalid data from Monitor I (DEV PGSP IOQ).
zActiveDevs	BIT	1	Incomplete device data due to too many active devices in the system.

SMF079#03_Monitor_II_Control.<fieldname>			
zSES	CHAR	2	(IBM name: R79SES) RMF session identifier.
zRID	CHAR	8	(IBM name: R79RID) Measurement name.
zCTXTL	INT	2	(IBM name: R79CTXTL) Length of command text.
zCTEXT	CHAR	32	(IBM name: R79CTEXT) Text of command.
zDTXTL	INT	2	(IBM name: R79DTXTL) Length of data reporter default text.
zDTEXT	CHAR	32	(IBM name: R79DTEXT) Default data reporter text.

zIST	CHAR	4	(IBM name: SMF79IST) Monitor I internal start time, in the form 0hhmmssF, where hh is the hours, mm is the minutes, ss is the seconds, and F is the sign.
zTSR	INT	2	(IBM name: R79TSR) Total number of small records.
zTOT	INT	4	(IBM name: R79TOT) Total number of data sections in large record.
zNXT	INT	4	(IBM name: R79NXT) Number of data sections in following small records.
zIWMTK	CHAR	8	(IBM name: R79IWMTK) Token returned from IWMRCOLL service.

Secondary segment: **SMF079#03_SRC**

Field Name	Type	Len	Description
<i>SMF079#03_SRC.<fieldname></i>			
zCRI	INT	2	(IBM name: R793CRI) Current system UIC (MCTCurSystemUIC).
zSQA	INT	2	(IBM name: R793SQA) Number of system queue area (SQA) frames (replaced by zSQA4).
zCMNF	INT	2	(IBM name: R793CMNF) Number of frames allocated to the common area (replaced by zCMN4).
zCMFF	INT	2	(IBM name: R793CMFF) Number of common (LPA + CSA) fixed frames (replaced by zCMF4).
zPRFX	INT	2	(IBM name: R793PRFX) Number of private fixed frames (local system queue area (LSQA) + non-LSQA) (replaced by zPFX4).
zCPUU	INT	2	(IBM name: R793CPUU) LPAR utilization, if in LPAR mode and RMF Monitor I is active. X'7FFF' indicates no value available in PR/SM environment.
zDQ	INT	2	(IBM name: R793DQ) Length of out wait queue.
zINC	INT	2	(IBM name: R793INC) Number of address spaces swapped in storage (SRM in queue).
zOUTU	INT	2	(IBM name: R793OUTU) Number of address spaces swapped out of storage (SRM out queue).
zLPAF	INT	2	(IBM name: R793LPAF) Number of link pack area (LPA) pageable frames (replaced by zLPF4).
zCSAF	INT	2	(IBM name: R793CSAF) Number of CSA pageable frames (replaced by zCSF4).
zLPFX	INT	2	(IBM name: R793LPFX) Number of link pack area (LPA) fixed frames (replaced by zLFX4).
zCSFX	INT	2	(IBM name: R793CSFX) Number of CSA fixed frames (replaced by zCFX4).
zLSQA	INT	2	(IBM name: R793LSQA) Number of local system queue area (LSQA) frames (replaced by zLSQ4).
zNLQF	INT	2	(IBM name: R793NLQF) Number of private non-local system queue area (LSQA) fixed frames (replaced by zNLF4).
zLOUT	INT	2	(IBM name: R793LOUT) Number of address spaces logically swapped out.
zSQR	INT	4	(IBM name: R793SQR) System queue area (SQA) pages in central storage.
zSQE	INT	4	(IBM name: R793SQE) System queue area (SQA) pages in expanded storage.

zLSQR	INT	4	(IBM name: R793LSQR) Local system queue area (LSQA) pages in central storage.
zLSQE	INT	4	(IBM name: R793LSQE) Local system queue area (LSQA) pages in expanded storage.
zAFC	INT	4	(IBM name: R793AFC) Number of available frames.
zCUT	INT	4	(IBM name: R793CUT) MVS utilization, that is, MVS non-wait time as a percentage of the interval length. For systems not running in LPAR mode in a PR/SM environment, this field is identical to zCPUU. For details, see z/OS RMF Report Analysis.
zSQA4	INT	4	(IBM name: R793SQA4) binary Number of fixed system queue area (SQA) frames (replaces zSQA).
zCMN4	INT	4	(IBM name: R793CMN4) binary Number of common (LPA+CSA) pageable and fixed frames (replaces zCMNF).
zCMF4	INT	4	(IBM name: R793CMF4) binary Number of common (LPA+CSA) fixed frames (replaces zCMFF).
zPFX4	INT	4	(IBM name: R793PFX4) binary Number of private fixed frames (LSQA+NON-LSQA) (replaces zPRFX).
zLPF4	INT	4	(IBM name: R793LPF4) binary Number of total link pack area (LPA) frames (replaces zLPAF).
zCSF4	INT	4	(IBM name: R793CSF4) binary Number of total CSA frames (replaces zCSAF) including user-key common storage allocated in restricted use common service area (RUCSA).
zLFX4	INT	4	(IBM name: R793LFX4) binary Number of link pack area (LPA) fixed frames (replaces zLPFX).
zCFX4	INT	4	(IBM name: R793CFX4) binary Number of CSA fixed frames (replaces zCSFX) including user-key common storage allocated in RUCSA.
zLSQ4	INT	4	(IBM name: R793LSQ4) binary Number of fixed local system queue area (LSQA) frames (replaces zLSQA).
zNLF4	INT	4	(IBM name: R793NLF4) binary Number of private NON-LSQA fixed frames (replaces zNLQF).

Record Type 79 Subtype 4 - Paging Activity

Primary Segment:

- SMF079#04_RMF_Paging

Secondary Segment(s): 3 (in alphabetical order)

- SMF079#04_Monitor_II_Control
- SMF079#04_Product
- SMF079#04_SPAG

Primary segment: SMF079#04_RMF_Paging

Field Name	Type	Len	Description
SMF079#04_RMF_Paging.<fieldname>			
SMF079#04_RMF_Paging.Header_Self_defining_Section.<fieldname>			
zFLG	HEX	1	(IBM name: SMF79FLG) System indicator: Bit Meaning when set 0 New SMF record format 1 Subtypes used 2 Reserved. 3-6 Version indicators 7 System is running in PR/SM mode.
zRTY	INT	1	(IBM name: SMF79RTY) Record type 79 (X'4F').
zTME	TSTMP	8	(IBM name: SMF79TME) Date/Time when the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF79SID) System identification (from the SMFPRMxx SID parameter).
zSSI	CHAR	4	(IBM name: SMF79SSI) Sub-system identification ('RMF').
zSTY	INT	2	(IBM name: SMF79STY) Record SubType.
zTRN	INT	2	(IBM name: SMF79TRN) Number of triplets in this record. A triplet is a set of three SMF fields (offset/length/number values) that defines a section of the record.
zPRS	INT	4	(IBM name: SMF79PRS) Offset to RMF Product section from start of record, including record descriptor word (RDW).
zPRL	INT	2	(IBM name: SMF79PRL) Length of RMF Product section.
zPRN	INT	2	(IBM name: SMF79PRN) Number of RMF Product sections. Individual header extension for SubTypes 1 - 14:
zMCS	INT	4	(IBM name: SMF79MCS) Offset to Monitor II control section from start of record, including record descriptor word (RDW).
zMCL	INT	2	(IBM name: SMF79MCL) Length of Monitor II control section.
zMCN	INT	2	(IBM name: SMF79MCN) Number of Monitor II control sections.
zASS	INT	4	(IBM name: SMF79ASS) Offset to data section from start of record, including record descriptor word (RDW).
zASL	INT	2	(IBM name: SMF79ASL) Length of data section.
zASN	INT	2	(IBM name: SMF79ASN) Number of data sections.

zDCS	INT	4	(IBM name: SMF79DCS) Offset to control section from start of record, including record descriptor word (RDW).
zDCL	INT	2	(IBM name: SMF79DCL) Length of control section.
zDCN	INT	2	(IBM name: SMF79DCN) Number of control sections.
zQSS	INT	4	(IBM name: SMF79QSS) Offset to Input/Output Queue (IOQ) queuing control from start of record, including record descriptor word (RDW).
zQSL	INT	2	(IBM name: SMF79QSL) Length of Input/Output Queue (IOQ) global section.
zQSN	INT	2	(IBM name: SMF79QSN) Number of Input/Output Queue (IOQ) global sections. Individual header extension for SubType 15:

Secondary segment: **SMF079#04_Product**

Field Name	Type	Len	Description
<i>SMF079#04_Product.<fieldname></i>			
zMFV	DEC	2 (3,0)	(IBM name: SMF79MFV) RMF version number.
zPRD	CHAR	8	(IBM name: SMF79PRD) Product name ('RMF').
zIST	DEC	4 (7,0)	(IBM name: SMF79IST) Time that the RMF measurement interval started, in the form 0hhmmssF, where hh is the hours, mm is the minutes, ss is the seconds, and F is the sign.
zDAT	DATE	4	(IBM name: SMF79DAT) Date when the RMF measurement interval started, in the form 0cyydddF.
zINT	DEC	4 (7,0)	(IBM name: SMF79INT) Duration of the RMF measurement interval, in the form mmsstttF where mm is the minutes, ss is the seconds, tt is the milliseconds, and F is the sign. (The end of the measurement interval is the sum of the recorded start time and this field.)
zSAM	INT	4	(IBM name: SMF79SAM) Number of RMF samples.

<i>SMF079#04_Product.zFLA.<fieldname></i>			
zSkip	BIT	1	Samples have been skipped
zMonIII	BIT	1	RECORD was written by RMF Monitor III
zSyncSMF	BIT	1	INTERVAL was synchronized with SMF
z_zIIP_Boost	BIT	1	zIIP boost was active at some point within the interval.
z_Speed_Boost	BIT	1	Speed boost was active at some point within the interval.
z_Boost_Class	BINT (ENUM)	3	

<i>SMF079#04_Product.<fieldname></i>			
zCYC	DEC	4 (7,0)	(IBM name: SMF79CYC) Sampling cycle length, in the form 000ttttF, where tttt is the milliseconds and F is the sign (taken from CYCLE option). The range of values is 0.050 to 9.999 seconds.
zMVS	CHAR	8	(IBM name: SMF79MVS) z/OS software level (consists of an acronym and the version, release, and modification level - ZVvrrmm).

zIML	INT	1	(IBM name: SMF79IML) Indicates the type of processor complex on which data measurements were taken. Value Meaning 3 9672, zSeries
------	-----	---	--

SMF079#04_Product.zPRF.<fieldname>

zExpStg	BIT	1	The system has expanded storage
zESCA	BIT	1	The processor is enabled for ES connection architecture (ESCA)
zESCdir	BIT	1	There is an ES connection director in the configuration
zzArc	BIT	1	System is running in z/Architecture® mode
zZAAP	BIT	1	At least one zAAP is currently installed
zZIIP	BIT	1	At least one zIIP is currently installed
zDAT	BIT	1	Enhanced DAT facility

SMF079#04_Product.<fieldname>

zPTN	INT	1	(IBM name: SMF79PTN) PR/SM partition number of the partition that wrote this record.
zSRL	INT	1	(IBM name: SMF79SRL) SMF record level change number (X'8E' for subtype 1 records or X'8F' for subtype 2 records for z/OS V2R4 RMF with RMF Data Gatherer APAR OA59330). This field enables processing of SMF record level changes in an existing release.
zIET	HEX	8	(IBM name: SMF79IET) Interval expiration time token. This token can be used to identify other than RMF records that belong to the same interval (if interval was synchronized with SMF).
zLGO	TIME	8	(IBM name: SMF79LGO) Offset GMT to local time (STCK format).
zRAO	INT	4	(IBM name: SMF79RAO) Offset to reassembly area relative to start of RMF product section.
zRAL	INT	2	(IBM name: SMF79RAL) Length of reassembly area. Area consists of a fixed header and a variable number of information blocks. Length depends on the record type/SubType, but is fixed for a specific type/SubType.
zRAN	INT	2	(IBM name: SMF79RAN) Reassembly area indicator. Value Meaning 0 RECORD is not broken. 1 RECORD is broken. Note: This field is used to indicate whether an SMF record is a broken record. Therefore, offset (SMF70RAO) and length (SMF70RAL) are only valid if SMF70RAN = 1. A reassembly area is only present in broken records.
zOIL	INT	2	(IBM name: SMF79OIL) Original interval length as defined in the session or by SMF (in seconds).
zSYN	INT	2	(IBM name: SMF79SYN) SYNC value in seconds.
zGIE	TIME	8	(IBM name: SMF79GIE) Projected gathering interval end (STCK format) GMT time.
zXNM	CHAR	8	(IBM name: SMF79XNM) Sysplex name as defined in parmlib member COUPLExx.
zSNM	CHAR	8	(IBM name: SMF79SNM) System name for current system as defined in parmlib member IEASYSxx SYSNAME parameter. Reassembly Area:

SMF079#04_Product.Reassembly_Area.<fieldname>

zRBR	INT	2	(IBM name: SMF79RBR) Total number of broken records built from the original large record.
zRSQ	INT	2	(IBM name: SMF79RSQ) Sequence number of this broken record. Every broken record built from the same large record must have a unique sequence number, it is in the range from 1 TO SMF70RBR.

zRIO	INT	4	(IBM name: SMF79RIO) Offset to first reassembly information block relative to start of reassembly area header.
zRIL	INT	2	(IBM name: N/A) Length of reassembly information block.
zRIN	INT	2	(IBM name: SMF79RIN) Number of reassembly information blocks (same value as SMF70TRN in header section).

SMF079#04_Product.Reassembly_Area.Reassembly_Info.<fieldname>			
zRNN	INT	2	(IBM name: SMF79RNN) Total number of sections in the original large record. This field contains information of how many sections of a specific type were contained in the original SMF record. This field is a copy of the number field of the triplet in the original (non broken) record.
zRPP	INT	2	(IBM name: SMF79RPP) Position of the first of one or more consecutive sections described by this block as in the original record. Values in the range of 1 TO SMF70RNN are valid for correct processing. A value of 0 WILL skip processing of this information block. This field provides information where the sections that are part of this broken record were placed in the original record before the split took place. The actual number of consecutive sections contained in this record is available from the actual triplet in the header extension.

Secondary segment: **SMF079#04_Monitor_II_Control**

Field Name	Type	Len	Description
SMF079#04_Monitor_II_Control.<fieldname>			
zGTOD	DEC	4 (7,0)	(IBM name: R79GTOD) Time when the call to data gatherer was issued, in the form 0hhmmssF, where hh is the hours, mm is the minutes, ss is the seconds, and F is the sign.

SMF079#04_Monitor_II_Control.zLF2.<fieldname>			
zInComplete	BIT	1	Not enough relocate data sections to complete data gathering
zSortSTG	BIT	1	Report will be sorted by storage group
zBadRSM	BIT	1	Incorrect RSM data obtained
zBadTrans	BIT	1	Invalid transaction data
zSRMMode	BIT	1	SRM mode changed
zBadMonI	BIT	1	Invalid data from Monitor I (DEV PGSP IOQ).
zActiveDevs	BIT	1	Incomplete device data due to too many active devices in the system.

SMF079#04_Monitor_II_Control.<fieldname>			
zSES	CHAR	2	(IBM name: R79SES) RMF session identifier.
zRID	CHAR	8	(IBM name: R79RID) Measurement name.
zCTXTL	INT	2	(IBM name: R79CTXTL) Length of command text.
zCTEXT	CHAR	32	(IBM name: R79CTEXT) Text of command.
zDTXTL	INT	2	(IBM name: R79DTXTL) Length of data reporter default text.
zDTEXT	CHAR	32	(IBM name: R79DTEXT) Default data reporter text.

zIST	CHAR	4	(IBM name: SMF79IST) Monitor I internal start time, in the form 0hhmmssF, where hh is the hours, mm is the minutes, ss is the seconds, and F is the sign.
zTSR	INT	2	(IBM name: R79TSR) Total number of small records.
zTOT	INT	4	(IBM name: R79TOT) Total number of data sections in large record.
zNXT	INT	4	(IBM name: R79NXT) Number of data sections in following small records.
zIWMTK	CHAR	8	(IBM name: R79IWMTK) Token returned from IWMRCOLL service.

Secondary segment: **SMF079#04_SPAG**

Field Name	Type	Len	Description
<i>SMF079#04_SPAG.<fieldname></i>			
zCMNI	INT	4	(IBM name: R794CMNI) System common (LPA + CSA) pages in to central storage from auxiliary storage.
zCMNO	INT	4	(IBM name: R794CMNO) System common (CSA) pages out from central storage to auxiliary storage.
zSWPO	INT	4	(IBM name: R794SWPO) Number of swap-outs between central storage and auxiliary storage.
zPSPI	INT	4	(IBM name: R794PSPI) Number of pages swapped in to central storage from auxiliary storage.
zPSPO	INT	4	(IBM name: R794PSPO) Number of pages swapped out from central storage to auxiliary storage.
zPRVI	INT	4	(IBM name: R794PRVI) Number of private pages (VIO + non-VIO) swapped in to central storage from auxiliary storage.
zPRVO	INT	4	(IBM name: R794PRVO) Number of private pages (VIO + non-VIO) swapped out from central storage to auxiliary storage.
zVIO	INT	4	(IBM name: R794VIO) Number of VIO pages (in + out) between central storage and auxiliary storage.
zCRI	INT	2	(IBM name: R794CRI) Current system UIC (MCTCurSystemUIC).
zLPAI	INT	4	(IBM name: R794LPAI) System link pack area (LPA) pages in to central storage from auxiliary storage.
zCSAI	INT	4	(IBM name: R794CSAI) System CSA pages out from central storage to auxiliary storage.
zERTE	INT	4	(IBM name: R794ERTE) Number of pages sent from central storage to expanded storage.
zEVAL	INT	4	(IBM name: R794EVAL) Number of available expanded storage frames not in use.
zMRTE	INT	4	(IBM name: R794MRTE) Number of pages migrated from expanded storage to auxiliary storage.
zMAGE	INT	4	(IBM name: R794MAGE) Migration age.
zAFC	INT	4	(IBM name: R794AFC) Number of available frames.
zTWSS	INT	4	(IBM name: R794TWSS) Target working set size for the common area.

zHSP	INT	4	(IBM name: R794HSP) Number of hiperspace pages (in + out) between central storage and auxiliary storage.
zPPIA	INT	4	(IBM name: R794PPIA) Number of blocked pages paged in from private auxiliary storage.
zLPIA	INT	4	(IBM name: R794LPIA) Number of blocks paged in from private auxiliary storage.

Record Type 79 Subtype 5 - Address Space SRM Data

Primary Segment:

- SMF079#05_RMF_Address_Space_SRM

Secondary Segment(s): 3 (in alphabetical order)

- SMF079#05_ASRM_and_ASRMJ
- SMF079#05_Monitor_II_Control
- SMF079#05_Product

Primary segment: SMF079#05_RMF_Address_Space_SRM

Field Name	Type	Len	Description
SMF079#05_RMF_Address_Space_SRM.<fieldname>			
SMF079#05_RMF_Address_Space_SRM.Header_Self_defining_Section.<fieldname>			
zFLG	HEX	1	(IBM name: SMF79FLG) System indicator: Bit Meaning when set 0 New SMF record format 1 Subtypes used 2 Reserved. 3-6 Version indicators 7 System is running in PR/SM mode.
zRTY	INT	1	(IBM name: SMF79RTY) Record type 79 (X'4F').
zTME	TSTMP	8	(IBM name: SMF79TME) Date/Time when the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF79SID) System identification (from the SMFPRMxx SID parameter).
zSSI	CHAR	4	(IBM name: SMF79SSI) Sub-system identification ('RMF').
zSTY	INT	2	(IBM name: SMF79STY) Record SubType.
zTRN	INT	2	(IBM name: SMF79TRN) Number of triplets in this record. A triplet is a set of three SMF fields (offset/length/number values) that defines a section of the record.
zPRS	INT	4	(IBM name: SMF79PRS) Offset to RMF Product section from start of record, including record descriptor word (RDW).
zPRL	INT	2	(IBM name: SMF79PRL) Length of RMF Product section.
zPRN	INT	2	(IBM name: SMF79PRN) Number of RMF Product sections. Individual header extension for SubTypes 1 - 14:
zMCS	INT	4	(IBM name: SMF79MCS) Offset to Monitor II control section from start of record, including record descriptor word (RDW).
zMCL	INT	2	(IBM name: SMF79MCL) Length of Monitor II control section.
zMCN	INT	2	(IBM name: SMF79MCN) Number of Monitor II control sections.
zASS	INT	4	(IBM name: SMF79ASS) Offset to data section from start of record, including record descriptor word (RDW).
zASL	INT	2	(IBM name: SMF79ASL) Length of data section.
zASN	INT	2	(IBM name: SMF79ASN) Number of data sections.

zDCS	INT	4	(IBM name: SMF79DCS) Offset to control section from start of record, including record descriptor word (RDW).
zDCL	INT	2	(IBM name: SMF79DCL) Length of control section.
zDCN	INT	2	(IBM name: SMF79DCN) Number of control sections.
zQSS	INT	4	(IBM name: SMF79QSS) Offset to Input/Output Queue (IOQ) queuing control from start of record, including record descriptor word (RDW).
zQSL	INT	2	(IBM name: SMF79QSL) Length of Input/Output Queue (IOQ) global section.
zQSN	INT	2	(IBM name: SMF79QSN) Number of Input/Output Queue (IOQ) global sections. Individual header extension for SubType 15:

Secondary segment: **SMF079#05_Product**

Field Name	Type	Len	Description
<i>SMF079#05_Product.<fieldname></i>			
zMFV	DEC	2 (3,0)	(IBM name: SMF79MFV) RMF version number.
zPRD	CHAR	8	(IBM name: SMF79PRD) Product name ('RMF').
zIST	DEC	4 (7,0)	(IBM name: SMF79IST) Time that the RMF measurement interval started, in the form 0hhmmssF, where hh is the hours, mm is the minutes, ss is the seconds, and F is the sign.
zDAT	DATE	4	(IBM name: SMF79DAT) Date when the RMF measurement interval started, in the form 0cyydddF.
zINT	DEC	4 (7,0)	(IBM name: SMF79INT) Duration of the RMF measurement interval, in the form mmsstttF where mm is the minutes, ss is the seconds, tt is the milliseconds, and F is the sign. (The end of the measurement interval is the sum of the recorded start time and this field.)
zSAM	INT	4	(IBM name: SMF79SAM) Number of RMF samples.

<i>SMF079#05_Product.zFLA.<fieldname></i>			
zSkip	BIT	1	Samples have been skipped
zMonIII	BIT	1	RECORD was written by RMF Monitor III
zSyncSMF	BIT	1	INTERVAL was synchronized with SMF
z_zIIP_Boost	BIT	1	zIIP boost was active at some point within the interval.
z_Speed_Boost	BIT	1	Speed boost was active at some point within the interval.
z_Boost_Class	BINT (ENUM)	3	

<i>SMF079#05_Product.<fieldname></i>			
zCYC	DEC	4 (7,0)	(IBM name: SMF79CYC) Sampling cycle length, in the form 000ttttF, where tttt is the milliseconds and F is the sign (taken from CYCLE option). The range of values is 0.050 to 9.999 seconds.
zMVS	CHAR	8	(IBM name: SMF79MVS) z/OS software level (consists of an acronym and the version, release, and modification level - ZVvrrmm).

zIML	INT	1	(IBM name: SMF79IML) Indicates the type of processor complex on which data measurements were taken. Value Meaning 3 9672, zSeries
------	-----	---	--

SMF079#05_Product.zPRF.<fieldname>

zExpStg	BIT	1	The system has expanded storage
zESCA	BIT	1	The processor is enabled for ES connection architecture (ESCA)
zESCdir	BIT	1	There is an ES connection director in the configuration
zzArc	BIT	1	System is running in z/Architecture® mode
zZAAP	BIT	1	At least one zAAP is currently installed
zZIIP	BIT	1	At least one zIIP is currently installed
zDAT	BIT	1	Enhanced DAT facility

SMF079#05_Product.<fieldname>

zPTN	INT	1	(IBM name: SMF79PTN) PR/SM partition number of the partition that wrote this record.
zSRL	INT	1	(IBM name: SMF79SRL) SMF record level change number (X'8E' for subtype 1 records or X'8F' for subtype 2 records for z/OS V2R4 RMF with RMF Data Gatherer APAR OA59330). This field enables processing of SMF record level changes in an existing release.
zIET	HEX	8	(IBM name: SMF79IET) Interval expiration time token. This token can be used to identify other than RMF records that belong to the same interval (if interval was synchronized with SMF).
zLGO	TIME	8	(IBM name: SMF79LGO) Offset GMT to local time (STCK format).
zRAO	INT	4	(IBM name: SMF79RAO) Offset to reassembly area relative to start of RMF product section.
zRAL	INT	2	(IBM name: SMF79RAL) Length of reassembly area. Area consists of a fixed header and a variable number of information blocks. Length depends on the record type/SubType, but is fixed for a specific type/SubType.
zRAN	INT	2	(IBM name: SMF79RAN) Reassembly area indicator. Value Meaning 0 RECORD is not broken. 1 RECORD is broken. Note: This field is used to indicate whether an SMF record is a broken record. Therefore, offset (SMF70RAO) and length (SMF70RAL) are only valid if SMF70RAN = 1. A reassembly area is only present in broken records.
zOIL	INT	2	(IBM name: SMF79OIL) Original interval length as defined in the session or by SMF (in seconds).
zSYN	INT	2	(IBM name: SMF79SYN) SYNC value in seconds.
zGIE	TIME	8	(IBM name: SMF79GIE) Projected gathering interval end (STCK format) GMT time.
zXNM	CHAR	8	(IBM name: SMF79XNM) Sysplex name as defined in parmlib member COUPLExx.
zSNM	CHAR	8	(IBM name: SMF79SNM) System name for current system as defined in parmlib member IEASYSxx SYSNAME parameter. Reassembly Area:

SMF079#05_Product.Reassembly_Area.<fieldname>

zRBR	INT	2	(IBM name: SMF79RBR) Total number of broken records built from the original large record.
zRSQ	INT	2	(IBM name: SMF79RSQ) Sequence number of this broken record. Every broken record built from the same large record must have a unique sequence number, it is in the range from 1 TO SMF70RBR.

zRIO	INT	4	(IBM name: SMF79RIO) Offset to first reassembly information block relative to start of reassembly area header.
zRIL	INT	2	(IBM name: N/A) Length of reassembly information block.
zRIN	INT	2	(IBM name: SMF79RIN) Number of reassembly information blocks (same value as SMF70TRN in header section).

SMF079#05_Product.Reassembly_Area.Reassembly_Info.<fieldname>			
zRNN	INT	2	(IBM name: SMF79RNN) Total number of sections in the original large record. This field contains information of how many sections of a specific type were contained in the original SMF record. This field is a copy of the number field of the triplet in the original (non broken) record.
zRPP	INT	2	(IBM name: SMF79RPP) Position of the first of one or more consecutive sections described by this block as in the original record. Values in the range of 1 TO SMF70RNN are valid for correct processing. A value of 0 WILL skip processing of this information block. This field provides information where the sections that are part of this broken record were placed in the original record before the split took place. The actual number of consecutive sections contained in this record is available from the actual triplet in the header extension.

zRBR	INT	2	(IBM name: SMF79RBR) Total number of broken records built from the original large record.
zRSQ	INT	2	(IBM name: SMF79RSQ) Sequence number of this broken record. Every broken record built from the same large record must have a unique sequence number, it is in the range from 1 TO SMF70RBR.

zRIO	INT	4	(IBM name: SMF79RIO) Offset to first reassembly information block relative to start of reassembly area header.
zRIL	INT	2	(IBM name: N/A) Length of reassembly information block.
zRIN	INT	2	(IBM name: SMF79RIN) Number of reassembly information blocks (same value as SMF70TRN in header section).

SMF079#06_Product.Reassembly_Area.Reassembly_Info.<fieldname>

zRNN	INT	2	(IBM name: SMF79RNN) Total number of sections in the original large record. This field contains information of how many sections of a specific type were contained in the original SMF record. This field is a copy of the number field of the triplet in the original (non broken) record.
zRPP	INT	2	(IBM name: SMF79RPP) Position of the first of one or more consecutive sections described by this block as in the original record. Values in the range of 1 TO SMF70RNN are valid for correct processing. A value of 0 WILL skip processing of this information block. This field provides information where the sections that are part of this broken record were placed in the original record before the split took place. The actual number of consecutive sections contained in this record is available from the actual triplet in the header extension.

Secondary segment: SMF079#06_Monitor_II_Control

Field Name	Type	Len	Description
SMF079#06_Monitor_II_Control.<fieldname>			
zGTOD	DEC	4 (7,0)	(IBM name: R79GTOD) Time when the call to data gatherer was issued, in the form 0hhmmssF, where hh is the hours, mm is the minutes, ss is the seconds, and F is the sign.

SMF079#06_Monitor_II_Control.zLF2.<fieldname>

zInComplete	BIT	1	Not enough relocate data sections to complete data gathering
zSortSTG	BIT	1	Report will be sorted by storage group
zBadRSM	BIT	1	Incorrect RSM data obtained
zBadTrans	BIT	1	Invalid transaction data
zSRMMode	BIT	1	SRM mode changed
zBadMonI	BIT	1	Invalid data from Monitor I (DEV PGSP IOQ).
zActiveDevs	BIT	1	Incomplete device data due to too many active devices in the system.

SMF079#06_Monitor_II_Control.<fieldname>

zSES	CHAR	2	(IBM name: R79SES) RMF session identifier.
zRID	CHAR	8	(IBM name: R79RID) Measurement name.
zCTXTL	INT	2	(IBM name: R79CTXTL) Length of command text.
zCTEXT	CHAR	32	(IBM name: R79CTEXT) Text of command.
zDTXTL	INT	2	(IBM name: R79DTXTL) Length of data reporter default text.
zDTEXT	CHAR	32	(IBM name: R79DTEXT) Default data reporter text.

zIST	CHAR	4	(IBM name: SMF79IST) Monitor I internal start time, in the form 0hhmmssF, where hh is the hours, mm is the minutes, ss is the seconds, and F is the sign.
zTSR	INT	2	(IBM name: R79TSR) Total number of small records.
zTOT	INT	4	(IBM name: R79TOT) Total number of data sections in large record.
zNXT	INT	4	(IBM name: R79NXT) Number of data sections in following small records.
zIWMTK	CHAR	8	(IBM name: R79IWMTK) Token returned from IWMRCOLL service.

Secondary segment: **SMF079#06_SENQR**

Field Name	Type	Len	Description
<i>SMF079#06_SENQR.<fieldname></i>			
zASID	INT	2	(IBM name: R796ASID) Address space ID of the job that issued the RESERVE.
zMAJ	CHAR	8	(IBM name: R796MAJ) Major name of the resource.
zMIN	CHAR	44	(IBM name: R796MIN) Minor name of the resource.
zJBN	CHAR	8	(IBM name: R796JBN) Name of the job that issued the RESERVE.
zVOLS	CHAR	6	(IBM name: R796VOLS) Volume serial of the volume against which the RESERVE was issued.
zUCB	CHAR	3	(IBM name: R796UCB) Device number or 'UCB' for 4-digit device numbers.
zREQ	CHAR	2	(IBM name: R796REQ) Type and status of request for the resource.
zMINL	INT	2	(IBM name: R796MINL) Length of the minor name field (used for reporting).
<i>SMF079#06_SENQR.zFLG.<fieldname></i>			
zDevResv	BIT	1	Device reserved by this processor
zTrunc	BIT	1	Minor name truncated
zGlobal	BIT	1	Global resource
zGlobEnq	BIT	1	Reserve request converted to global enqueue
<i>SMF079#06_SENQR.<fieldname></i>			
zSID	CHAR	8	(IBM name: SMF79SID) System identifier of the job that issued the RESERVE.
zDVN	INT	2	(IBM name: R796DVN) Device number (binary).
zSCS	INT	1	(IBM name: R796SCS) Subchannel set ID.

Record Type 79 Subtype 7 - Enqueue Contention Data

Primary Segment:

- SMF079#07_RMF_Enqueue_Contention

Secondary Segment(s): 3 (in alphabetical order)

- SMF079#07_Monitor_II_Control
- SMF079#07_Product
- SMF079#07_SENQ

Primary segment: SMF079#07_RMF_Enqueue_Contention

Field Name	Type	Len	Description
SMF079#07_RMF_Enqueue_Contention.<fieldname>			
SMF079#07_RMF_Enqueue_Contention.Header_Self_defining_Section.<fieldname>			
zFLG	HEX	1	(IBM name: SMF79FLG) System indicator: Bit Meaning when set 0 New SMF record format 1 Subtypes used 2 Reserved. 3-6 Version indicators 7 System is running in PR/SM mode.
zRTY	INT	1	(IBM name: SMF79RTY) Record type 79 (X'4F').
zTME	TSTMP	8	(IBM name: SMF79TME) Date/Time when the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF79SID) System identification (from the SMFPRMxx SID parameter).
zSSI	CHAR	4	(IBM name: SMF79SSI) Sub-system identification ('RMF').
zSTY	INT	2	(IBM name: SMF79STY) Record SubType.
zTRN	INT	2	(IBM name: SMF79TRN) Number of triplets in this record. A triplet is a set of three SMF fields (offset/length/number values) that defines a section of the record.
zPRS	INT	4	(IBM name: SMF79PRS) Offset to RMF Product section from start of record, including record descriptor word (RDW).
zPRL	INT	2	(IBM name: SMF79PRL) Length of RMF Product section.
zPRN	INT	2	(IBM name: SMF79PRN) Number of RMF Product sections. Individual header extension for SubTypes 1 - 14:
zMCS	INT	4	(IBM name: SMF79MCS) Offset to Monitor II control section from start of record, including record descriptor word (RDW).
zMCL	INT	2	(IBM name: SMF79MCL) Length of Monitor II control section.
zMCN	INT	2	(IBM name: SMF79MCN) Number of Monitor II control sections.
zASS	INT	4	(IBM name: SMF79ASS) Offset to data section from start of record, including record descriptor word (RDW).
zASL	INT	2	(IBM name: SMF79ASL) Length of data section.
zASN	INT	2	(IBM name: SMF79ASN) Number of data sections.

zDCS	INT	4	(IBM name: SMF79DCS) Offset to control section from start of record, including record descriptor word (RDW).
zDCL	INT	2	(IBM name: SMF79DCL) Length of control section.
zDCN	INT	2	(IBM name: SMF79DCN) Number of control sections.
zQSS	INT	4	(IBM name: SMF79QSS) Offset to Input/Output Queue (IOQ) queuing control from start of record, including record descriptor word (RDW).
zQSL	INT	2	(IBM name: SMF79QSL) Length of Input/Output Queue (IOQ) global section.
zQSN	INT	2	(IBM name: SMF79QSN) Number of Input/Output Queue (IOQ) global sections. Individual header extension for SubType 15:

Secondary segment: **SMF079#07_Product**

Field Name	Type	Len	Description
<i>SMF079#07_Product.<fieldname></i>			
zMFV	DEC	2 (3,0)	(IBM name: SMF79MFV) RMF version number.
zPRD	CHAR	8	(IBM name: SMF79PRD) Product name ('RMF').
zIST	DEC	4 (7,0)	(IBM name: SMF79IST) Time that the RMF measurement interval started, in the form 0hhmmssF, where hh is the hours, mm is the minutes, ss is the seconds, and F is the sign.
zDAT	DATE	4	(IBM name: SMF79DAT) Date when the RMF measurement interval started, in the form 0cyydddF.
zINT	DEC	4 (7,0)	(IBM name: SMF79INT) Duration of the RMF measurement interval, in the form mmsstttF where mm is the minutes, ss is the seconds, tt is the milliseconds, and F is the sign. (The end of the measurement interval is the sum of the recorded start time and this field.)
zSAM	INT	4	(IBM name: SMF79SAM) Number of RMF samples.

<i>SMF079#07_Product.zFLA.<fieldname></i>			
zSkip	BIT	1	Samples have been skipped
zMonIII	BIT	1	RECORD was written by RMF Monitor III
zSyncSMF	BIT	1	INTERVAL was synchronized with SMF
z_zIIP_Boost	BIT	1	zIIP boost was active at some point within the interval.
z_Speed_Boost	BIT	1	Speed boost was active at some point within the interval.
z_Boost_Class	BINT (ENUM)	3	

<i>SMF079#07_Product.<fieldname></i>			
zCYC	DEC	4 (7,0)	(IBM name: SMF79CYC) Sampling cycle length, in the form 000ttttF, where tttt is the milliseconds and F is the sign (taken from CYCLE option). The range of values is 0.050 to 9.999 seconds.
zMVS	CHAR	8	(IBM name: SMF79MVS) z/OS software level (consists of an acronym and the version, release, and modification level - ZVvrrmm).

zIML	INT	1	(IBM name: SMF79IML) Indicates the type of processor complex on which data measurements were taken. Value Meaning 3 9672, zSeries
------	-----	---	--

SMF079#07_Product.zPRF.<fieldname>

zExpStg	BIT	1	The system has expanded storage
zESCA	BIT	1	The processor is enabled for ES connection architecture (ESCA)
zESCdir	BIT	1	There is an ES connection director in the configuration
zzArc	BIT	1	System is running in z/Architecture® mode
zZAAP	BIT	1	At least one zAAP is currently installed
zZIIP	BIT	1	At least one zIIP is currently installed
zDAT	BIT	1	Enhanced DAT facility

SMF079#07_Product.<fieldname>

zPTN	INT	1	(IBM name: SMF79PTN) PR/SM partition number of the partition that wrote this record.
zSRL	INT	1	(IBM name: SMF79SRL) SMF record level change number (X'8E' for subtype 1 records or X'8F' for subtype 2 records for z/OS V2R4 RMF with RMF Data Gatherer APAR OA59330). This field enables processing of SMF record level changes in an existing release.
zIET	HEX	8	(IBM name: SMF79IET) Interval expiration time token. This token can be used to identify other than RMF records that belong to the same interval (if interval was synchronized with SMF).
zLGO	TIME	8	(IBM name: SMF79LGO) Offset GMT to local time (STCK format).
zRAO	INT	4	(IBM name: SMF79RAO) Offset to reassembly area relative to start of RMF product section.
zRAL	INT	2	(IBM name: SMF79RAL) Length of reassembly area. Area consists of a fixed header and a variable number of information blocks. Length depends on the record type/SubType, but is fixed for a specific type/SubType.
zRAN	INT	2	(IBM name: SMF79RAN) Reassembly area indicator. Value Meaning 0 RECORD is not broken. 1 RECORD is broken. Note: This field is used to indicate whether an SMF record is a broken record. Therefore, offset (SMF70RAO) and length (SMF70RAL) are only valid if SMF70RAN = 1. A reassembly area is only present in broken records.
zOIL	INT	2	(IBM name: SMF79OIL) Original interval length as defined in the session or by SMF (in seconds).
zSYN	INT	2	(IBM name: SMF79SYN) SYNC value in seconds.
zGIE	TIME	8	(IBM name: SMF79GIE) Projected gathering interval end (STCK format) GMT time.
zXNM	CHAR	8	(IBM name: SMF79XNM) Sysplex name as defined in parmlib member COUPLExx.
zSNM	CHAR	8	(IBM name: SMF79SNM) System name for current system as defined in parmlib member IEASYSxx SYSNAME parameter. Reassembly Area:

SMF079#07_Product.Reassembly_Area.<fieldname>

zRBR	INT	2	(IBM name: SMF79RBR) Total number of broken records built from the original large record.
zRSQ	INT	2	(IBM name: SMF79RSQ) Sequence number of this broken record. Every broken record built from the same large record must have a unique sequence number, it is in the range from 1 TO SMF70RBR.

zRIO	INT	4	(IBM name: SMF79RIO) Offset to first reassembly information block relative to start of reassembly area header.
zRIL	INT	2	(IBM name: N/A) Length of reassembly information block.
zRIN	INT	2	(IBM name: SMF79RIN) Number of reassembly information blocks (same value as SMF70TRN in header section).

SMF079#07_Product.Reassembly_Area.Reassembly_Info.<fieldname>			
zRNN	INT	2	(IBM name: SMF79RNN) Total number of sections in the original large record. This field contains information of how many sections of a specific type were contained in the original SMF record. This field is a copy of the number field of the triplet in the original (non broken) record.
zRPP	INT	2	(IBM name: SMF79RPP) Position of the first of one or more consecutive sections described by this block as in the original record. Values in the range of 1 TO SMF70RNN are valid for correct processing. A value of 0 WILL skip processing of this information block. This field provides information where the sections that are part of this broken record were placed in the original record before the split took place. The actual number of consecutive sections contained in this record is available from the actual triplet in the header extension.

Secondary segment: **SMF079#07_Monitor_II_Control**

Field Name	Type	Len	Description
SMF079#07_Monitor_II_Control.<fieldname>			
zGTOD	DEC	4 (7,0)	(IBM name: R79GTOD) Time when the call to data gatherer was issued, in the form 0hhmmssF, where hh is the hours, mm is the minutes, ss is the seconds, and F is the sign.

SMF079#07_Monitor_II_Control.zLF2.<fieldname>

zSRMMode	BIT	1	SRM mode changed
zBadMonI	BIT	1	Invalid data from Monitor I (DEV PGSP IOQ).
zActiveDevs	BIT	1	Incomplete device data due to too many active devices in the system.

SMF079#07_Monitor_II_Control.<fieldname>			
zSES	CHAR	2	(IBM name: R79SES) RMF session identifier.
zRID	CHAR	8	(IBM name: R79RID) Measurement name.
zCTXTL	INT	2	(IBM name: R79CTXTL) Length of command text.
zCTEXT	CHAR	32	(IBM name: R79CTEXT) Text of command.
zDTXTL	INT	2	(IBM name: R79DTXTL) Length of data reporter default text.
zDTEXT	CHAR	32	(IBM name: R79DTEXT) Default data reporter text.

zIST	CHAR	4	(IBM name: SMF79IST) Monitor I internal start time, in the form 0hhmmssF, where hh is the hours, mm is the minutes, ss is the seconds, and F is the sign.
zTSR	INT	2	(IBM name: R79TSR) Total number of small records.
zTOT	INT	4	(IBM name: R79TOT) Total number of data sections in large record.
zNXT	INT	4	(IBM name: R79NXT) Number of data sections in following small records.
zIWMTK	CHAR	8	(IBM name: R79IWMTK) Token returned from IWMRCOLL service.

Secondary segment: **SMF079#07_SENQ**

Field Name	Type	Len	Description
<i>SMF079#07_SENQ.<fieldname></i>			
zMAJ	CHAR	8	(IBM name: R797MAJ) Major name of resource.
zMIN	CHAR	44	(IBM name: R797MIN) Minor name of resource.
zFLG	INT	1	Data type flags
zMINL	INT	4	(IBM name: R797MINL) Length of the minor name field (used for reporting).
zOWN	INT	2	(IBM name: R797OWN) Count of requestors that own the resource.
zEXCW	INT	2	(IBM name: R797EXCW) Count of requestors waiting for exclusive use of a resource.
zSHRW	INT	2	(IBM name: R797SHRW) Count of requestors waiting for shared use of a resource.
zREQ	CHAR	2	(IBM name: R797REQ) Type and status of request for a resource ('SO', 'SW', 'EO', or 'EW').
zJBN	CHAR	8	(IBM name: R797JBN) Name of the job that issued the ENQ.
zASID	INT	2	(IBM name: R797ASID) Address space ID of the job that issued the ENQ.
zSCOP	CHAR	4	(IBM name: R797SCOP) Scope of the resource ('SYS', 'SYSS', or 'STEP').
zSID	CHAR	8	(IBM name: SMF79SID) System identifier of the job that issued the ENQ.

zBadRSM	BIT	1	Incorrect RSM data obtained
zBadTrans	BIT	1	Invalid transaction data
zSRMMode	BIT	1	SRM mode changed
zBadMonI	BIT	1	Invalid data from Monitor I (DEV PGSP IOQ).
zActiveDevs	BIT	1	Incomplete device data due to too many active devices in the system.

SMF079#09_Monitor_II_Control.<fieldname>			
zSES	CHAR	2	(IBM name: R79SES) RMF session identifier.
zRID	CHAR	8	(IBM name: R79RID) Measurement name.
zCTXTL	INT	2	(IBM name: R79CTXTL) Length of command text.
zCTEXT	CHAR	32	(IBM name: R79CTEXT) Text of command.
zDTXTL	INT	2	(IBM name: R79DTXTL) Length of data reporter default text.
zDTEXT	CHAR	32	(IBM name: R79DTEXT) Default data reporter text.

zIST	CHAR	4	(IBM name: SMF79IST) Monitor I internal start time, in the form 0hhmmssF, where hh is the hours, mm is the minutes, ss is the seconds, and F is the sign.
zTSR	INT	2	(IBM name: R79TSR) Total number of small records.
zTOT	INT	4	(IBM name: R79TOT) Total number of data sections in large record.
zNXT	INT	4	(IBM name: R79NXT) Number of data sections in following small records.
zIWMTK	CHAR	8	(IBM name: R79IWMTK) Token returned from IWMRCOLL service.

Secondary segment: **SMF079#09_Device**

Field Name	Type	Len	Description
<i>SMF079#09_Device.<fieldname></i>			
zNUM	DEC	2 (3,0)	(IBM name: R799NUM) Device number.
zLCU	INT	2	(IBM name: R799LCU) Logical control unit number X'00' to X'FF'.

<i>SMF079#09_Device.zCNF.<fieldname></i>			
zBadIOSQueueLen	BIT	1	IOS queue-length incorrect
zNoLCU	BIT	1	No logical control unit information
zBadData	BIT	1	Data contained in fields zSSC through zDIS is incorrect
zBadTime	BIT	1	Connect, pending, or disconnect time for device is not valid
zReconfig	BIT	1	Device was reconfigured or DDR activity was detected through Monitor I interval
zOnline	BIT	1	Device is currently online.

<i>SMF079#09_Device.<fieldname></i>			
zSER	CHAR	6	(IBM name: R799SER) Volume serial number of the volume mounted on this device.
zTYP	INT	4	(IBM name: R799TYP) Device type.
zNUX	INT	4	(IBM name: R799NUX) Number of base and alias devices for a parallel access volume (PAV). This field is 1 FOR a non-PAV device. For HyperPAV base devices (bit 6 OF zCNX is set), this is the accumulated number of HyperPAV aliases.
zSSC	INT	4	(IBM name: R799SSC) Start subchannel (SSCH) count.
zMEC	INT	4	(IBM name: R799MEC) Measurement event count. number of SSCH instructions for which connect, pending, and active times were stored.
zCNN	INT	4	(IBM name: R799CNN) Device connect time.
zPEN	INT	4	(IBM name: R799PEN) Function pending time.
zATV	INT	4	(IBM name: R799ATV) Function active time.
zDIS	INT	4	(IBM name: R799DIS) Device disconnect time.
zQUE	INT	4	

			(IBM name: R799QUE) Number of requests queued in IOS for this device.
zUTL	INT	4	(IBM name: R799UTL) Number of samples when the device was reserved but an SSCH had not been issued to the device.
zRSV	INT	4	(IBM name: R799RSV) Number of samples taken during the measurement interval that indicated that the device was reserved.
zALC	INT	4	(IBM name: R799ALC) Number of samples taken during the measurement interval that indicated that the device was allocated.
zDVB	INT	4	(IBM name: R799DVB) Device busy delay time.
zCUB	INT	4	(IBM name: R799CUB) Shows control unit busy delay time if bit 4 IN zCNX is set off.
zICT	INT	2	(IBM name: R799ICT) Incorrect sample count.

SMF079#09_Device.zCNX.<fieldname>

zParallel	BIT	1	Base exposure of a parallel access volume
zAliasExp	BIT	1	Number of alias exposures has changed
zTimingNA	BIT	1	Timing facility not active
zCMBx	BIT	1	Extended CMB mode
zSTSCHModNA	BIT	1	Model-dependant data not available by STSCH
zResponse	BIT	1	Initial command response time available
zHyperPAV	BIT	1	HyperPAV base device.
zInterruptDelayTime	BIT	1	Interrupt-Delay-Time facility is provided by channel subsystem.

SMF079#09_Device.<fieldname>

zSGN	CHAR	8	(IBM name: R799SGN) Storage group name.
zNDA	INT	4	(IBM name: R799NDA) Total number of allocations in effect for the device.
zDPB	INT	4	(IBM name: R799DPB) Shows the amount of time during the measurement interval that I/O requests to a device were delayed because a director port was busy if bit 4 0F zCNX is set off.
zCMR	INT	4	(IBM name: R799CMR) binary Shows initial command response time in units of 128 MICROSECONDS if bit 5 0F zCNX is set on.
zPCT	INT	4	(IBM name: R799PCT) Number of unsuccessful PAV samples.
zPSM	INT	4	(IBM name: R799PSM) Number of successful PAV samples.
zIDT	INT	4	(IBM name: R799IDT) Interrupt delay time in units of 128 MICROSECONDS. This field is zero if not supported by the hardware.
zCUQ	INT	4	(IBM name: R799CUQ) Control Unit Queuing Time.

SMF079#09_Device.zCN2.<fieldname>

zFICON	BIT	1	Device connected to FICON.
--------	-----	---	----------------------------

SMF079#09_Device.<fieldname>

zSCS	INT	1	(IBM name: R799SCS) Subchannel set ID.
------	-----	---	---

zNM2	INT	2	(IBM name: R799NM2) Device number (same as zNUM).
zIOS	INT	4	(IBM name: R799IOS) IOS Queue time in microseconds

Record Type 79 Subtype 11 - Page Data Set Activity

Primary Segment:

- SMF079#11_RMF_Page_Dataset

Secondary Segment(s): 4 (in alphabetical order)

- SMF079#11_Monitor_II_Control
- SMF079#11_Product
- SMF079#11_PGSP_Control
- SMF079#11_PGSP_Dataset

Primary segment: SMF079#11_RMF_Page_Dataset

Field Name	Type	Len	Description
SMF079#11_RMF_Page_Dataset.<fieldname>			
SMF079#11_RMF_Page_Dataset.Header_Self_defining_Section.<fieldname>			
zFLG	HEX	1	(IBM name: SMF79FLG) System indicator: Bit Meaning when set 0 New SMF record format 1 Subtypes used 2 Reserved. 3-6 Version indicators 7 System is running in PR/SM mode.
zRTY	INT	1	(IBM name: SMF79RTY) Record type 79 (X'4F').
zTME	TSTMP	8	(IBM name: SMF79TME) Date/Time when the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF79SID) System identification (from the SMFPRMxx SID parameter).
zSSI	CHAR	4	(IBM name: SMF79SSI) Sub-system identification ('RMF').
zSTY	INT	2	(IBM name: SMF79STY) Record SubType.
zTRN	INT	2	(IBM name: SMF79TRN) Number of triplets in this record. A triplet is a set of three SMF fields (offset/length/number values) that defines a section of the record.
zPRS	INT	4	(IBM name: SMF79PRS) Offset to RMF Product section from start of record, including record descriptor word (RDW).
zPRL	INT	2	(IBM name: SMF79PRL) Length of RMF Product section.
zPRN	INT	2	(IBM name: SMF79PRN) Number of RMF Product sections. Individual header extension for SubTypes 1 - 14:
zMCS	INT	4	(IBM name: SMF79MCS) Offset to Monitor II control section from start of record, including record descriptor word (RDW).
zMCL	INT	2	(IBM name: SMF79MCL) Length of Monitor II control section.
zMCN	INT	2	(IBM name: SMF79MCN) Number of Monitor II control sections.
zASS	INT	4	(IBM name: SMF79ASS) Offset to data section from start of record, including record descriptor word (RDW).
zASL	INT	2	(IBM name: SMF79ASL) Length of data section.
zASN	INT	2	(IBM name: SMF79ASN) Number of data sections.

zDCS	INT	4	(IBM name: SMF79DCS) Offset to control section from start of record, including record descriptor word (RDW).
zDCL	INT	2	(IBM name: SMF79DCL) Length of control section.
zDCN	INT	2	(IBM name: SMF79DCN) Number of control sections.
zQSS	INT	4	(IBM name: SMF79QSS) Offset to Input/Output Queue (IOQ) queuing control from start of record, including record descriptor word (RDW).
zQSL	INT	2	(IBM name: SMF79QSL) Length of Input/Output Queue (IOQ) global section.
zQSN	INT	2	(IBM name: SMF79QSN) Number of Input/Output Queue (IOQ) global sections. Individual header extension for SubType 15:

Secondary segment: **SMF079#11_Product**

Field Name	Type	Len	Description
<i>SMF079#11_Product.<fieldname></i>			
zMFV	DEC	2 (3,0)	(IBM name: SMF79MFV) RMF version number.
zPRD	CHAR	8	(IBM name: SMF79PRD) Product name ('RMF').
zIST	DEC	4 (7,0)	(IBM name: SMF79IST) Time that the RMF measurement interval started, in the form 0hhmmssF, where hh is the hours, mm is the minutes, ss is the seconds, and F is the sign.
zDAT	DATE	4	(IBM name: SMF79DAT) Date when the RMF measurement interval started, in the form 0cyydddF.
zINT	DEC	4 (7,0)	(IBM name: SMF79INT) Duration of the RMF measurement interval, in the form mmsstttF where mm is the minutes, ss is the seconds, tt is the milliseconds, and F is the sign. (The end of the measurement interval is the sum of the recorded start time and this field.)
zSAM	INT	4	(IBM name: SMF79SAM) Number of RMF samples.

<i>SMF079#11_Product.zFLA.<fieldname></i>			
zSkip	BIT	1	Samples have been skipped
zMonIII	BIT	1	RECORD was written by RMF Monitor III
zSyncSMF	BIT	1	INTERVAL was synchronized with SMF
z_zIIP_Boost	BIT	1	zIIP boost was active at some point within the interval.
z_Speed_Boost	BIT	1	Speed boost was active at some point within the interval.
z_Boost_Class	BINT (ENUM)	3	

<i>SMF079#11_Product.<fieldname></i>			
zCYC	DEC	4 (7,0)	(IBM name: SMF79CYC) Sampling cycle length, in the form 000ttttF, where tttt is the milliseconds and F is the sign (taken from CYCLE option). The range of values is 0.050 to 9.999 seconds.
zMVS	CHAR	8	(IBM name: SMF79MVS) z/OS software level (consists of an acronym and the version, release, and modification level - ZVvrrmm).

zIML	INT	1	(IBM name: SMF79IML) Indicates the type of processor complex on which data measurements were taken. Value Meaning 3 9672, zSeries
------	-----	---	--

SMF079#11_Product.zPRF.<fieldname>

zExpStg	BIT	1	The system has expanded storage
zESCA	BIT	1	The processor is enabled for ES connection architecture (ESCA)
zESCdir	BIT	1	There is an ES connection director in the configuration
zzArc	BIT	1	System is running in z/Architecture® mode
zZAAP	BIT	1	At least one zAAP is currently installed
zZIIP	BIT	1	At least one zIIP is currently installed
zDAT	BIT	1	Enhanced DAT facility

SMF079#11_Product.<fieldname>

zPTN	INT	1	(IBM name: SMF79PTN) PR/SM partition number of the partition that wrote this record.
zSRL	INT	1	(IBM name: SMF79SRL) SMF record level change number (X'8E' for subtype 1 records or X'8F' for subtype 2 records for z/OS V2R4 RMF with RMF Data Gatherer APAR OA59330). This field enables processing of SMF record level changes in an existing release.
zIET	HEX	8	(IBM name: SMF79IET) Interval expiration time token. This token can be used to identify other than RMF records that belong to the same interval (if interval was synchronized with SMF).
zLGO	TIME	8	(IBM name: SMF79LGO) Offset GMT to local time (STCK format).
zRAO	INT	4	(IBM name: SMF79RAO) Offset to reassembly area relative to start of RMF product section.
zRAL	INT	2	(IBM name: SMF79RAL) Length of reassembly area. Area consists of a fixed header and a variable number of information blocks. Length depends on the record type/SubType, but is fixed for a specific type/SubType.
zRAN	INT	2	(IBM name: SMF79RAN) Reassembly area indicator. Value Meaning 0 RECORD is not broken. 1 RECORD is broken. Note: This field is used to indicate whether an SMF record is a broken record. Therefore, offset (SMF70RAO) and length (SMF70RAL) are only valid if SMF70RAN = 1. A reassembly area is only present in broken records.
zOIL	INT	2	(IBM name: SMF79OIL) Original interval length as defined in the session or by SMF (in seconds).
zSYN	INT	2	(IBM name: SMF79SYN) SYNC value in seconds.
zGIE	TIME	8	(IBM name: SMF79GIE) Projected gathering interval end (STCK format) GMT time.
zXNM	CHAR	8	(IBM name: SMF79XNM) Sysplex name as defined in parmlib member COUPLExx.
zSNM	CHAR	8	(IBM name: SMF79SNM) System name for current system as defined in parmlib member IEASYSxx SYSNAME parameter. Reassembly Area:

SMF079#11_Product.Reassembly_Area.<fieldname>

zRBR	INT	2	(IBM name: SMF79RBR) Total number of broken records built from the original large record.
zRSQ	INT	2	(IBM name: SMF79RSQ) Sequence number of this broken record. Every broken record built from the same large record must have a unique sequence number, it is in the range from 1 TO SMF70RBR.

zRIO	INT	4	(IBM name: SMF79RIO) Offset to first reassembly information block relative to start of reassembly area header.
zRIL	INT	2	(IBM name: N/A) Length of reassembly information block.
zRIN	INT	2	(IBM name: SMF79RIN) Number of reassembly information blocks (same value as SMF70TRN in header section).

SMF079#11_Product.Reassembly_Area.Reassembly_Info.<fieldname>			
zRNN	INT	2	(IBM name: SMF79RNN) Total number of sections in the original large record. This field contains information of how many sections of a specific type were contained in the original SMF record. This field is a copy of the number field of the triplet in the original (non broken) record.
zRPP	INT	2	(IBM name: SMF79RPP) Position of the first of one or more consecutive sections described by this block as in the original record. Values in the range of 1 TO SMF70RNN are valid for correct processing. A value of 0 WILL skip processing of this information block. This field provides information where the sections that are part of this broken record were placed in the original record before the split took place. The actual number of consecutive sections contained in this record is available from the actual triplet in the header extension.

Secondary segment: **SMF079#11_Monitor_II_Control**

Field Name	Type	Len	Description
SMF079#11_Monitor_II_Control.<fieldname>			
zGTOD	DEC	4 (7,0)	(IBM name: R79GTOD) Time when the call to data gatherer was issued, in the form 0hhmmssF, where hh is the hours, mm is the minutes, ss is the seconds, and F is the sign.

SMF079#11_Monitor_II_Control.zLF2.<fieldname>			
zInComplete	BIT	1	Not enough relocate data sections to complete data gathering
zSortSTG	BIT	1	Report will be sorted by storage group
zBadRSM	BIT	1	Incorrect RSM data obtained
zBadTrans	BIT	1	Invalid transaction data
zSRMMode	BIT	1	SRM mode changed
zBadMonI	BIT	1	Invalid data from Monitor I (DEV PGSP IOQ).
zActiveDevs	BIT	1	Incomplete device data due to too many active devices in the system.

SMF079#11_Monitor_II_Control.<fieldname>			
zSES	CHAR	2	(IBM name: R79SES) RMF session identifier.
zRID	CHAR	8	(IBM name: R79RID) Measurement name.
zCTXTL	INT	2	(IBM name: R79CTXTL) Length of command text.
zCTEXT	CHAR	32	(IBM name: R79CTEXT) Text of command.
zDTXTL	INT	2	(IBM name: R79DTXTL) Length of data reporter default text.
zDTEXT	CHAR	32	(IBM name: R79DTEXT) Default data reporter text.

zIST	CHAR	4	(IBM name: SMF79IST) Monitor I internal start time, in the form 0hhmmssF, where hh is the hours, mm is the minutes, ss is the seconds, and F is the sign.
zTSR	INT	2	(IBM name: R79TSR) Total number of small records.
zTOT	INT	4	(IBM name: R79TOT) Total number of data sections in large record.
zNXT	INT	4	(IBM name: R79NXT) Number of data sections in following small records.
zIWMTK	CHAR	8	(IBM name: R79IWMTK) Token returned from IWMRCOLL service.

Secondary segment: **SMF079#11_PGSP_Control**

Field Name	Type	Len	Description
<i>SMF079#11_PGSP_Control.<fieldname></i>			
zETYP	CHAR	1	(IBM name: R79BETYP) Type of data that follows: P - PAGE data sets

Secondary segment: **SMF079#11_PGSP_Dataset**

Field Name	Type	Len	Description
<i>SMF079#11_PGSP_Dataset.<fieldname></i>			
zSALC	INT	4	(IBM name: R79BSALC) Number of slots/sets in this data set.
zSAVL	INT	4	(IBM name: R79BSAVL) Number of slots/sets available.
zSLBD	INT	4	(IBM name: R79BSLBD) Number of bad slots/sets.
zSUSE	INT	4	(IBM name: R79BSUSE) Number of samples that indicate ASM is using the data set.
zSIOS	INT	4	(IBM name: R79BSIOS) Number of SSCH instructions issued for the data set.
zREQS	INT	4	(IBM name: R79BREQS) Number of pages transferred to/from the data set.

SMF079#11_PGSP_Dataset.zFLG.<fieldname>

zBad	BIT	1	Indicates that the data set is bad
zPLPA	BIT	1	Indicates a pageable link pack area (PLPA) data set
zCommon	BIT	1	Indicates a common data set
zLocal	BIT	1	Indicates a local data set
zPaging	BIT	1	Indicates a paging data
zVIO	BIT	1	Indicates that the data set accepts VIO pages.

SMF079#11_PGSP_Dataset.<fieldname>

zDEV	INT	1	(IBM name: R79BDEV) Device type.
zDADR	CHAR	3	(IBM name: R79BDADR) Device number or 'UCB' for 4-digit device numbers.

zVSER	CHAR	6	(IBM name: R79BVSER) Volume serial number.
zDSN	CHAR	44	(IBM name: R79BDSN) Data set name.

SMF079#11_PGSP_Dataset.zFL2.<fieldname>

zAlternate	BIT	1	Alternate control unit device indicator
zzDEVN	BIT	1	zDEVN contains a valid device name
zSCM	BIT	1	Page space type SCM

SMF079#11_PGSP_Dataset.<fieldname>

zDEVN	CHAR	8	(IBM name: R79BDEVN) Device name (blank if device name cannot be determined).
zCU	CHAR	8	(IBM name: R79BCU) Control unit name (blank if control unit name cannot be determined).
zDVN	INT	2	(IBM name: R79BDVN) Device number (binary).
zSCS	INT	1	(IBM name: R79BSCS) Subchannel set ID.

Record Type 79 Subtype 12 - Channel Path Activity

Therefore, offset (SMF70RAO) and length (SMF70RAL) are only valid if SMF70RAN = 1. A reassembly area is only present in broken records.
zOIL	INT	2	(IBM name: SMF79OIL) Original interval length as defined in the session or by SMF (in seconds).
zSYN	INT	2	(IBM name: SMF79SYN) SYNC value in seconds.
zGIE	TIME	8	(IBM name: SMF79GIE) Projected gathering interval end (STCK format) GMT time.
zXNM	CHAR	8	(IBM name: SMF79XNM) Sysplex name as defined in parmlib member COUPLExx.
zSNM	CHAR	8	(IBM name: SMF79SNM) System name for current system as defined in parmlib member IEASYSxx SYSNAME parameter. Reassembly Area:

SMF079#12_Product.Reassembly_Area.<fieldname>

zRBR	INT	2	(IBM name: SMF79RBR) Total number of broken records built from the original large record.
------	-----	---	--

zRSQ	INT	2	(IBM name: SMF79RSQ) Sequence number of this broken record. Every broken record built from the same large record must have a unique sequence number, it is in the range from 1 TO SMF70RBR.
zRIO	INT	4	(IBM name: SMF79RIO) Offset to first reassembly information block relative to start of reassembly area header.
zRIL	INT	2	(IBM name: N/A) Length of reassembly information block.
zRIN	INT	2	(IBM name: SMF79RIN) Number of reassembly information blocks (same value as SMF70TRN in header section).

SMF079#12_Product.Reassembly_Area.Reassembly_Info.<fieldname>

zRNN	INT	2	(IBM name: SMF79RNN) Total number of sections in the original large record. This field contains information of how many sections of a specific type were contained in the original SMF record. This field is a copy of the number field of the triplet in the original (non broken) record.
zRPP	INT	2	(IBM name: SMF79RPP) Position of the first of one or more consecutive sections described by this block as in the original record. Values in the range of 1 TO SMF70RNN are valid for correct processing. A value of 0 WILL skip processing of this information block. This field provides information where the sections that are part of this broken record were placed in the original record before the split took place. The actual number of consecutive sections contained in this record is available from the actual triplet in the header extension.

Secondary segment: SMF079#12_Monitor_II_Control

Field Name	Type	Len	Description
SMF079#12_Monitor_II_Control.<fieldname>			
zGTOD	DEC	4 (7,0)	(IBM name: R79GTOD) Time when the call to data gatherer was issued, in the form 0hhmmssF, where hh is the hours, mm is the minutes, ss is the seconds, and F is the sign.

SMF079#12_Monitor_II_Control.zLF2.<fieldname>

zInComplete	BIT	1	Not enough relocate data sections to complete data gathering
zSortSTG	BIT	1	Report will be sorted by storage group
zBadRSM	BIT	1	Incorrect RSM data obtained
zBadTrans	BIT	1	Invalid transaction data
zSRMMode	BIT	1	SRM mode changed
zBadMonI	BIT	1	Invalid data from Monitor I (DEV PGSP IOQ).
zActiveDevs	BIT	1	Incomplete device data due to too many active devices in the system.

SMF079#12_Monitor_II_Control.<fieldname>

zSES	CHAR	2	(IBM name: R79SES) RMF session identifier.
zRID	CHAR	8	(IBM name: R79RID) Measurement name.
zCTXTL	INT	2	(IBM name: R79CTXTL) Length of command text.
zCTEXT	CHAR	32	(IBM name: R79CTEXT) Text of command.
zDTXTL	INT	2	

			(IBM name: R79DTXTL) Length of data reporter default text.
zDTEXT	CHAR	32	(IBM name: R79DTEXT) Default data reporter text.
zIST	CHAR	4	(IBM name: SMF79IST) Monitor I internal start time, in the form 0hhmmssF, where hh is the hours, mm is the minutes, ss is the seconds, and F is the sign.
zTSR	INT	2	(IBM name: R79TSR) Total number of small records.
zTOT	INT	4	(IBM name: R79TOT) Total number of data sections in large record.
zNXT	INT	4	(IBM name: R79NXT) Number of data sections in following small records.
zIWMTK	CHAR	8	(IBM name: R79IWMTK) Token returned from IWMRCOLL service.

Secondary segment: SMF079#12_CP_Control

Field Name	Type	Len	Description
<i>SMF079#12_CP_Control.<fieldname></i>			
zSMP	INT	4	(IBM name: R79CSMP) Number of samples as weighted by SRM. Only valid if bit 5 0F zFLG1 is not set.

<i>SMF079#12_CP_Control.zFLG1.<fieldname></i>			
zCPMFavail	BIT	1	CPMF (channel path measurement facility) available
zChg	BIT	1	Configuration changed. Used to decide whether to provide the text 'POR' or 'ACTIVATE' on reports. Also used to check whether data can be combined in a duration report.
zDCM	BIT	1	DCM supported by hardware
zDCMchann	BIT	1	Configuration contains DCM managed channels
zRMFNA	BIT	1	RMF address space not active
zMLCS	BIT	1	Hardware allows multiple logical channel subsystems
zECMF	BIT	1	Enhanced channel path measurement facility available

<i>SMF079#12_CP_Control.<fieldname></i>			
zCMI	INT (ENUM)	1	(IBM name: R79CCMI) CPMF mode.
zCFRC	INT	4	(IBM name: R79CCFRC) CPMF (channel path measurement facility) restart count. 12 12 zCFSC 4 BINARY CPMF (channel path measurement facility) sample count.
zCSS	INT	1	(IBM name: R79CCSS) Channel subsystem ID. Only valid if bit 5 0F zFLG1 is set.

Secondary segment: SMF079#12_CP_Data

Field Name	Type	Len	Description
<i>SMF079#12_CP_Data.<fieldname></i>			
zCPID	INT	1	(IBM name: R79CCPID) Channel path identification. The range of values is X'00' to X'FF'.

SMF079#12_CP_Data.zFG2.<fieldname>			
zBlockMP	BIT	1	Block multiplexor
zByteMP	BIT	1	Byte multiplexor
zESconv	BIT	1	ES conversion channel
zESconn	BIT	1	ES connection channel
zESdir	BIT	1	ES connection director attached to channel path
zCTC	BIT	1	CTC adapter.

SMF079#12_CP_Data.zFG3.<fieldname>			
zCPShr	BIT	1	Channel path is shared between logical partitions
zCPMF	BIT	1	CPMF (channel path measurement facility) indicator, this entry is not valid
zCv3090	BIT	1	Channel converter 3090
zDCM	BIT	1	Channel path is DCM managed
zChg	BIT	1	Channel characteristics changed
zCPExt	BIT	1	Extended channel path measurements are supported

SMF079#12_CP_Data.<fieldname>			
zCPD	INT	1	(IBM name: R79CCPD) Channel path description. For an explanation, you can issue the command D M=CHP.
zBSY	INT	4	(IBM name: R79CBSY) Number of samples in which the channel path was busy, weighted by SRM.
zPBY	INT	4	(IBM name: R79CPBY) Channel-path-busy time of the partition since the last interval in units of 128 MICROSECONDS.
zCPTS	INT	3	(IBM name: R79CCPTS) Last CPMB (channel path measurement block) entry time stamp in units of 128 MICROSECONDS. This value wraps approximately every 35.79 minutes.
zACR	CHAR	5	(IBM name: R79CACR) Channel path acronym.
zCMG	INT	1	(IBM name: R79CCMG) CPMF Channel measurement group.
zFG4	INT	1	CPMF validation flags - each bit (if on) indicates that the corresponding measurement data is available and valid. This refers to the first five words of the channel measurement data in field zCCM.
zCPP	INT	1	(IBM name: R79CCPP) Channel path parameter.
zCCM	HEX	48	(IBM name: R79CCCM) CPMF Channel measurement data (extended mode). The contents of this field is different for each measurement group, as described in the following tables.
zGEN	INT	1	(IBM name: R79CGEN) Channel type generation.
zCCMX	HEX	32	(IBM name: R79CCMX) CPMF measurement data. This field is only available for measurement group 2.

Secondary segment: **SMF079#12_CPMF_Channel_Measurement_1**

Field Name	Type	Len	Description
------------	------	-----	-------------

SMF079#12_CPMF_Channel_Measurement_1.<fieldname>			
zTUT	INT	4	(IBM name: R79CTUT) Total channel path busy time (in units of 128 MICROSECONDS).
zPUT	INT	4	(IBM name: R79CPUT) LPAR channel path busy time (in units of 128 MICROSECONDS).

Secondary segment: SMF079#12_CPMF_Channel_Measurement_2

Field Name	Type	Len	Description
SMF079#12_CPMF_Channel_Measurement_2.<fieldname>			
zMBC	INT	4	(IBM name: R79CMBC) Maximum bus cycles per second.
zMCU	INT	4	(IBM name: R79CMCU) Maximum channel work units per second.
zMWU	INT	4	(IBM name: R79CMWU) Maximum WRITE data units per second.
zMRU	INT	4	(IBM name: R79CMRU) Maximum READ data units per second.
zUS	INT	4	(IBM name: R79CUS) Data unit size (in bytes).
zTBC	INT	4	(IBM name: R79CTBC) Total bus cycles count.
zTUC	INT	4	(IBM name: R79CTUC) Total channel work unit count.
zPUC	INT	4	(IBM name: R79CPUC) LPAR channel work units count.
zTWU	INT	4	(IBM name: R79CTWU) Total WRITE data units count.
zPWU	INT	4	(IBM name: R79CPWU) LPAR WRITE data units count.
zTRU	INT	4	(IBM name: R79CTRU) Total READ data units count.
zPRU	INT	4	(IBM name: R79CPRU) LPAR READ data units count.

Secondary segment: SMF079#12_CPMF_Channel_Measurement_3

Field Name	Type	Len	Description
SMF079#12_CPMF_Channel_Measurement_3.<fieldname>			
zPDU	INT	4	(IBM name: R79CPDU) LPAR data unit size (in bytes).
zTDU	INT	4	(IBM name: R79CTDU) Total data unit size (in bytes).
zPUM	INT	4	(IBM name: R79CPUM) LPAR message sent unit size (in bytes)
zTUM	INT	4	(IBM name: R79CTUM) Total message sent unit size (in bytes)
zPMS	INT	4	(IBM name: R79CPMS) LPAR count of message sent units.
zTMS	INT	4	(IBM name: R79CTMS) Total count of message sent units.

zPUS	INT	4	(IBM name: R79CPUS) LPAR count of unsuccessful attempts to send messages.
zPUB	INT	4	(IBM name: R79CPUB) LPAR count of unsuccessful attempts to receive messages due to unavailable buffers.
zTUB	INT	4	(IBM name: R79CTUB) Total count of unsuccessful attempts to receive messages due to unavailable buffers.
zPDS	INT	4	(IBM name: R79CPDS) LPAR count of data units sent.
zTDS	INT	4	(IBM name: R79CTDS) Total count of data units sent.

Secondary segment: **SMF079#12_CPMF_Extended**

Field Name	Type	Len	Description
<i>SMF079#12_CPMF_Extended.<fieldname></i>			
zXOC	INT	4	(IBM name: R79CXOC) Total number of FICON command-mode operations (CPC) that have been attempted by the channel.
zXOD	INT	4	(IBM name: R79CXOD) Total number of FICON command-mode operations (CPC) that could not be initiated by the channel because of a lack of available resources.
zXOS	INT	8	(IBM name: R79CXOS) Summation count of FICON command-mode operations (CPC). Each time the number of FICON command-mode operations is incremented, the number of FICON command-mode operations active at the channel, including the one being initiated, is added to this field.
zXTC	INT	4	(IBM name: R79CXTC) Total number of FICON transport-mode operations (CPC) that have been attempted by the channel. Zero when zHPF is not available.
zXTD	INT	4	(IBM name: R79CXTD) Total number of FICON transport-mode operations (CPC) that could not be initiated by the channel because of a lack of available resources. Zero when zHPF is not available.
zXTS	INT	8	(IBM name: R79CXTS) Summation count of FICON transport-mode operations (CPC). Each time the number of FICON transport-mode operations is incremented, the number of transport-mode operations active at the channel, including the one being initiated, is added to this field. Zero when zHPF is not available.

Record Type 79 Subtype 12 - Channel Path Activity

Primary Segment:

- SMF079#14_RMF_IO_Queueing

Secondary Segment(s): 6 (in alphabetical order)

- SMF079#14_IOQ_Config_Data
- SMF079#14_IOQ_Control
- SMF079#14_IOQ_Data
- SMF079#14_IOQ_Global
- SMF079#14_Monitor_II_Control
- SMF079#14_Product

Primary segment: SMF079#14_RMF_IO_Queueing

Field Name	Type	Len	Description
SMF079#14_RMF_IO_Queueing.<fieldname>			
SMF079#14_RMF_IO_Queueing.Header_Self_defining_Section.<fieldname>			
zFLG	HEX	1	(IBM name: SMF79FLG) System indicator: Bit Meaning when set 0 New SMF record format 1 Subtypes used 2 Reserved. 3-6 Version indicators 7 System is running in PR/SM mode.
zRTY	INT	1	(IBM name: SMF79RTY) Record type 79 (X'4F').
zTME	TSTMP	8	(IBM name: SMF79TME) Date/Time when the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF79SID) System identification (from the SMFPRMxx SID parameter).
zSSI	CHAR	4	(IBM name: SMF79SSI) Sub-system identification ('RMF').
zSTY	INT	2	(IBM name: SMF79STY) Record SubType.
zTRN	INT	2	(IBM name: SMF79TRN) Number of triplets in this record. A triplet is a set of three SMF fields (offset/length/number values) that defines a section of the record.
zPRS	INT	4	(IBM name: SMF79PRS) Offset to RMF Product section from start of record, including record descriptor word (RDW).
zPRL	INT	2	(IBM name: SMF79PRL) Length of RMF Product section.
zPRN	INT	2	(IBM name: SMF79PRN) Number of RMF Product sections. Individual header extension for SubTypes 1 - 14:
zMCS	INT	4	(IBM name: SMF79MCS) Offset to Monitor II control section from start of record, including record descriptor word (RDW).
zMCL	INT	2	(IBM name: SMF79MCL) Length of Monitor II control section.
zMCN	INT	2	(IBM name: SMF79MCN) Number of Monitor II control sections.
zASS	INT	4	(IBM name: SMF79ASS) Offset to data section from start of record, including record descriptor word (RDW).
zASL	INT	2	(IBM name: SMF79ASL) Length of data section.

zASN	INT	2	(IBM name: SMF79ASN) Number of data sections.
zDCS	INT	4	(IBM name: SMF79DCS) Offset to control section from start of record, including record descriptor word (RDW).
zDCL	INT	2	(IBM name: SMF79DCL) Length of control section.
zDCN	INT	2	(IBM name: SMF79DCN) Number of control sections.
zQSS	INT	4	(IBM name: SMF79QSS) Offset to Input/Output Queue (IOQ) queuing control from start of record, including record descriptor word (RDW).
zQSL	INT	2	(IBM name: SMF79QSL) Length of Input/Output Queue (IOQ) global section.
zQSN	INT	2	(IBM name: SMF79QSN) Number of Input/Output Queue (IOQ) global sections. Individual header extension for SubType 15:

Secondary segment: **SMF079#14_Product**

Field Name	Type	Len	Description
<i>SMF079#14_Product.<fieldname></i>			
zMFV	DEC	2 (3,0)	(IBM name: SMF79MFV) RMF version number.
zPRD	CHAR	8	(IBM name: SMF79PRD) Product name ('RMF').
zIST	DEC	4 (7,0)	(IBM name: SMF79IST) Time that the RMF measurement interval started, in the form 0hhmmssF, where hh is the hours, mm is the minutes, ss is the seconds, and F is the sign.
zDAT	DATE	4	(IBM name: SMF79DAT) Date when the RMF measurement interval started, in the form 0ccyddF.
zINT	DEC	4 (7,0)	(IBM name: SMF79INT) Duration of the RMF measurement interval, in the form mmssttF where mm is the minutes, ss is the seconds, tt is the milliseconds, and F is the sign. (The end of the measurement interval is the sum of the recorded start time and this field.)
zSAM	INT	4	(IBM name: SMF79SAM) Number of RMF samples.

<i>SMF079#14_Product.zFLA.<fieldname></i>			
zSkip	BIT	1	Samples have been skipped
zMonIII	BIT	1	RECORD was written by RMF Monitor III
zSyncSMF	BIT	1	INTERVAL was synchronized with SMF
z_zIIP_Boost	BIT	1	zIIP boost was active at some point within the interval.
z_Speed_Boost	BIT	1	Speed boost was active at some point within the interval.
z_Boost_Class	BINT (ENUM)	3	

<i>SMF079#14_Product.<fieldname></i>			
zCYC	DEC	4 (7,0)	(IBM name: SMF79CYC) Sampling cycle length, in the form 000ttttF, where tttt is the milliseconds and F is the sign (taken from CYCLE option). The range of values is 0.050 to 9.999 seconds.
zMVS	CHAR	8	

			(IBM name: SMF79MVS) z/OS software level (consists of an acronym and the version, release, and modification level - ZVvrrmm).
zIML	INT	1	(IBM name: SMF79IML) Indicates the type of processor complex on which data measurements were taken. Value Meaning 3 9672, zSeries

SMF079#14_Product.zPRF.<fieldname>

zExpStg	BIT	1	The system has expanded storage
zESCA	BIT	1	The processor is enabled for ES connection architecture (ESCA)
zESCdir	BIT	1	There is an ES connection director in the configuration
zzArc	BIT	1	System is running in z/Architecture® mode
zZAAP	BIT	1	At least one zAAP is currently installed
zZIIP	BIT	1	At least one zIIP is currently installed
zDAT	BIT	1	Enhanced DAT facility

SMF079#14_Product.<fieldname>

zPTN	INT	1	(IBM name: SMF79PTN) PR/SM partition number of the partition that wrote this record.
zSRL	INT	1	(IBM name: SMF79SRL) SMF record level change number (X'8E' for subtype 1 records or X'8F' for subtype 2 records for z/OS V2R4 RMF with RMF Data Gatherer APAR OA59330). This field enables processing of SMF record level changes in an existing release.
zIET	HEX	8	(IBM name: SMF79IET) Interval expiration time token. This token can be used to identify other than RMF records that belong to the same interval (if interval was synchronized with SMF).
zLGO	TIME	8	(IBM name: SMF79LGO) Offset GMT to local time (STCK format).
zRAO	INT	4	(IBM name: SMF79RAO) Offset to reassembly area relative to start of RMF product section.
zRAL	INT	2	(IBM name: SMF79RAL) Length of reassembly area. Area consists of a fixed header and a variable number of information blocks. Length depends on the record type/SubType, but is fixed for a specific type/SubType.
zRAN	INT	2	(IBM name: SMF79RAN) Reassembly area indicator. Value Meaning 0 RECORD is not broken. 1 RECORD is broken. Note: This field is used to indicate whether an SMF record is a broken record. Therefore, offset (SMF70RAO) and length (SMF70RAL) are only valid if SMF70RAN = 1. A reassembly area is only present in broken records.
zOIL	INT	2	(IBM name: SMF79OIL) Original interval length as defined in the session or by SMF (in seconds).
zSYN	INT	2	(IBM name: SMF79SYN) SYNC value in seconds.
zGIE	TIME	8	(IBM name: SMF79GIE) Projected gathering interval end (STCK format) GMT time.
zXNM	CHAR	8	(IBM name: SMF79XNM) Sysplex name as defined in parmlib member COUPLExx.
zSNM	CHAR	8	(IBM name: SMF79SNM) System name for current system as defined in parmlib member IEASYSxx SYSNAME parameter. Reassembly Area:

SMF079#14_Product.Reassembly_Area.<fieldname>

zRBR	INT	2	(IBM name: SMF79RBR) Total number of broken records built from the original large record.
zRSQ	INT	2	

			(IBM name: SMF79RSQ) Sequence number of this broken record. Every broken record built from the same large record must have a unique sequence number, it is in the range from 1 TO SMF70RBR.
zRIO	INT	4	(IBM name: SMF79RIO) Offset to first reassembly information block relative to start of reassembly area header.
zRIL	INT	2	(IBM name: N/A) Length of reassembly information block.
zRIN	INT	2	(IBM name: SMF79RIN) Number of reassembly information blocks (same value as SMF70TRN in header section).

SMF079#14_Product.Reassembly_Area.Reassembly_Info.<fieldname>

zRNN	INT	2	(IBM name: SMF79RNN) Total number of sections in the original large record. This field contains information of how many sections of a specific type were contained in the original SMF record. This field is a copy of the number field of the triplet in the original (non broken) record.
zRPP	INT	2	(IBM name: SMF79RPP) Position of the first of one or more consecutive sections described by this block as in the original record. Values in the range of 1 TO SMF70RNN are valid for correct processing. A value of 0 WILL skip processing of this information block. This field provides information where the sections that are part of this broken record were placed in the original record before the split took place. The actual number of consecutive sections contained in this record is available from the actual triplet in the header extension.

Secondary segment: SMF079#14_Monitor_II_Control

Field Name	Type	Len	Description
SMF079#14_Monitor_II_Control.<fieldname>			
zGTOD	DEC	4 (7,0)	(IBM name: R79GTOD) Time when the call to data gatherer was issued, in the form 0hhmmssF, where hh is the hours, mm is the minutes, ss is the seconds, and F is the sign.

SMF079#14_Monitor_II_Control.zLF2.<fieldname>

zInComplete	BIT	1	Not enough relocate data sections to complete data gathering
zSortSTG	BIT	1	Report will be sorted by storage group
zBadRSM	BIT	1	Incorrect RSM data obtained
zBadTrans	BIT	1	Invalid transaction data
zSRMMode	BIT	1	SRM mode changed
zBadMonI	BIT	1	Invalid data from Monitor I (DEV PGSP IOQ).
zActiveDevs	BIT	1	Incomplete device data due to too many active devices in the system.

SMF079#14_Monitor_II_Control.<fieldname>

zSES	CHAR	2	(IBM name: R79SES) RMF session identifier.
zRID	CHAR	8	(IBM name: R79RID) Measurement name.
zCTXTL	INT	2	(IBM name: R79CTXTL) Length of command text.
zCTEXT	CHAR	32	(IBM name: R79CTEXT) Text of command.
zDTXTL	INT	2	

			(IBM name: R79DTXTL) Length of data reporter default text.
zDTEXT	CHAR	32	(IBM name: R79DTEXT) Default data reporter text.
zIST	CHAR	4	(IBM name: SMF79IST) Monitor I internal start time, in the form 0hhmmssF, where hh is the hours, mm is the minutes, ss is the seconds, and F is the sign.
zTSR	INT	2	(IBM name: R79TSR) Total number of small records.
zTOT	INT	4	(IBM name: R79TOT) Total number of data sections in large record.
zNXT	INT	4	(IBM name: R79NXT) Number of data sections in following small records.
zIWMTK	CHAR	8	(IBM name: R79IWMTK) Token returned from IWMRCOLL service.

Secondary segment: **SMF079#14_IOQ_Global**

Field Name	Type	Len	Description
<i>SMF079#14_IOQ_Global.<fieldname></i>			
<i>SMF079#14_IOQ_Global.zGFLG.<fieldname></i>			
zInvalid	BIT	1	Data is invalid due to failure of the channel measurement facility
zDiagFail	BIT	1	Diagnose interface failure
zESCON	BIT	1	ESCON director in the configuration
zCHSC	BIT	1	CHSC store secondary queue data not supported
zDCM	BIT	1	DCM is supported by hardware
zDCMMgd	BIT	1	Configuration contains DCM managed channels
zResponse	BIT	1	Measurement of initial command response time supported
zFTRD	BIT	1	FIRST-TRANSFER-READY-DISABLED data available
<i>SMF079#14_IOQ_Global.<fieldname></i>			
zGSMP	INT	4	(IBM name: R79EGSMP) Number of RMF samples for store secondary queue data

Secondary segment: **SMF079#14_IOQ_Control**

Field Name	Type	Len	Description
<i>SMF079#14_IOQ_Control.<fieldname></i>			
zID1	CHAR	2	(IBM name: R79EID1) Logical control unit identifier.
zNTR	INT	2	(IBM name: R79ENTR) Number of triplets following.
zCPDS	INT	4	(IBM name: R79ECPDS) Offset to I/O Queuing Configuration data section (relative to beginning of I/O Queuing Configuration control section).
zCPDL	INT	2	(IBM name: R79ECPDL) Length of I/O Queuing Configuration data section.
zCPDN	INT	2	(IBM name: R79ECPDN) Number of I/O Queuing Configuration data sections for the LCU.

Secondary segment: **SMF079#14_IOQ_Config_Data**

Field Name	Type	Len	Description
SMF079#14_IOQ_Config_Data.<fieldname>			
zCPID	INT	1	(IBM name: R79ECPID) Channel path identifier.
SMF079#14_IOQ_Config_Data.zCPST.<fieldname>			
zCPInst	BIT	1	Channel path installed
zCPOnline	BIT	1	Channel path online
zCPVaried	BIT	1	Channel path varied
zCPOffline	BIT	1	Channel path offline to all devices of the LCU
zCPVary	BIT	1	Channel path connection to all devices of the LCU altered by VARY PATH command during interval
zCPDCM	BIT	1	Channel path is DCM managed
zCPReset	BIT	1	CHPID manipulated, requiring data reset
SMF079#14_IOQ_Config_Data.<fieldname>			
zCUN	INT	2	(IBM name: R79ECUN) Number of control units attached.
zCU1	INT	2	(IBM name: R79ECU1) First control unit identifier.
zCU2	INT	2	(IBM name: R79ECU2) Second control unit identifier.
zCU3	INT	2	(IBM name: R79ECU3) Third control unit identifier.
zCU4	INT	2	(IBM name: R79ECU4) Fourth control unit identifier.
zCUB	INT	4	(IBM name: R79ECUB) Number of initial selection attempts that were unsuccessful because the control unit was busy.
zPT	INT	4	(IBM name: R79EPT) Number of I/O operations accepted on this channel path.
zDPBC	INT	4	(IBM name: R79EDPBC) Number of initial selection attempts that were unsuccessful because the director port was busy.
zCBT	INT	4	(IBM name: R79ECBT) Control unit busy delay time.
zCMR	INT	4	(IBM name: R79ECMR) Initial command response time.
zSBS	INT	4	(IBM name: R79ESBS) Switch busy count summation. contains the switch busy counts received for all partitions.
zCPXF	INT	1	Channel path extended flags
zCPAT	INT	1	(IBM name: R79ECPAT) Path attributes Value Meaning 0 NOT specified for this path. 1 PREFERRED path. 2 NON-PREFERRED path.
zCTMW	INT	4	(IBM name: R79ECTMW) Transport mode write count
zCTRD	INT	4	(IBM name: R79ECTR) First-transfer-ready-disabled write count

Secondary segment: **SMF079#14_IOQ_Data**

Field Name	Type	Len	Description
<i>SMF079#14_IOQ_Data.<fieldname></i>			
zID2	CHAR	2	(IBM name: R79EID2) Logical control unit identifier.
<i>SMF079#14_IOQ_Data.zDST.<fieldname></i>			
zNA	BIT	1	No hardware measurements available
zDCM	BIT	1	LCU contains DCM managed channels
zPathValid	BIT	1	Path attributes are valid.
<i>SMF079#14_IOQ_Data.<fieldname></i>			
zQSM	INT	4	(IBM name: R79EQSM) Accumulated length of CU-HDR queue.
zQCT	INT	4	(IBM name: R79EQCT) Number of entries placed on the CU-HDR queue.
zMCMN	INT	2	(IBM name: R79EMCMN) Minimum number of DCM managed channels used.
zMCMX	INT	2	(IBM name: R79EMCMX) Maximum number of DCM managed channels used.
zMCDF	INT	2	(IBM name: R79EMCDF) Defined number of DCM managed channels.
zPTM	INT	4	(IBM name: R79EPTM) Accumulated path taken count for DCM managed channels.
zDPBM	INT	4	(IBM name: R79EDPBM) Accumulated director port busy count for DCM managed channels.
zCUBM	INT	4	(IBM name: R79ECUBM) Accumulated control unit busy count for DCM managed channels.
zCBTM	INT	4	(IBM name: R79ECBTM) Accumulated control unit busy delay time for DCM managed channels.
zCMRM	INT	4	(IBM name: R79ECMRM) Accumulated initial command response time for DCM managed channels.
zSBSM	INT	4	(IBM name: R79ESBSM) Accumulated switch busy count summation for DCM managed channels.
zTMWM	INT	4	(IBM name: R79ETMWM) Accumulated transport mode write count for DCM managed channels
zTRDM	INT	4	(IBM name: R79ETRDM) Accumulated first-transfer-ready-disabled write count for DCM managed channels
zCSST	INT	4	(IBM name: R79ECSST) Channel subsystem wait time.

Record Type 79 Subtype 15 - IRLM Long Lock Detection

Primary Segment:

- SMF079#15_RMF_IRLM_Long_Lock_Detection

Secondary Segment(s): 2 (in alphabetical order)

- SMF079#15_IMS_Long_Lock
- SMF079#15_Product

Primary segment: SMF079#15_RMF_IRLM_Long_Lock_Detection

Field Name	Type	Len	Description
SMF079#15_RMF_IRLM_Long_Lock_Detection.<fieldname>			
SMF079#15_RMF_IRLM_Long_Lock_Detection.Header_Self_defining_Section.<fieldname>			
zFLG	HEX	1	(IBM name: SMF79FLG) System indicator: Bit Meaning when set 0 New SMF record format 1 Subtypes used 2 Reserved. 3-6 Version indicators 7 System is running in PR/SM mode.
zRTY	INT	1	(IBM name: SMF79RTY) Record type 79 (X'4F').
zTME	TSTMP	8	(IBM name: SMF79TME) Date/Time when the record was moved into the SMF buffer.
zSID	CHAR	4	(IBM name: SMF79SID) System identification (from the SMFPRMxx SID parameter).
zSSI	CHAR	4	(IBM name: SMF79SSI) Sub-system identification ('RMF').
zSTY	INT	2	(IBM name: SMF79STY) Record SubType.
zTRN	INT	2	(IBM name: SMF79TRN) Number of triplets in this record. A triplet is a set of three SMF fields (offset/length/number values) that defines a section of the record.
zPRS	INT	4	(IBM name: SMF79PRS) Offset to RMF Product section from start of record, including record descriptor word (RDW).
zPRL	INT	2	(IBM name: SMF79PRL) Length of RMF Product section.
zPRN	INT	2	(IBM name: SMF79PRN) Number of RMF Product sections. Individual header extension for SubTypes 1 - 14:
zFPO	INT	4	(IBM name: SMF79FPO) Offset to IMS Long Lock data section.
zFPL	INT	2	(IBM name: SMF79FPL) Length of IMS Long Lock data section.
zFPN	INT	2	(IBM name: SMF79FPN) Number of IMS Long Lock data sections.

Secondary segment: SMF079#15_Product

Field Name	Type	Len	Description
SMF079#15_Product.<fieldname>			
zMFV	DEC		

		2 (3,0)	(IBM name: SMF79MFV) RMF version number.
zPRD	CHAR	8	(IBM name: SMF79PRD) Product name ('RMF').
zIST	DEC	4 (7,0)	(IBM name: SMF79IST) Time that the RMF measurement interval started, in the form 0hhmmssF, where hh is the hours, mm is the minutes, ss is the seconds, and F is the sign.
zDAT	DATE	4	(IBM name: SMF79DAT) Date when the RMF measurement interval started, in the form 0cyydddF.
zINT	DEC	4 (7,0)	(IBM name: SMF79INT) Duration of the RMF measurement interval, in the form mmsstttF where mm is the minutes, ss is the seconds, tt is the milliseconds, and F is the sign. (The end of the measurement interval is the sum of the recorded start time and this field.)
zSAM	INT	4	(IBM name: SMF79SAM) Number of RMF samples.

SMF079#15_Product.zFLA.<fieldname>

zSkip	BIT	1	Samples have been skipped
zMonIII	BIT	1	RECORD was written by RMF Monitor III
zSyncSMF	BIT	1	INTERVAL was synchronized with SMF
z_zIIP_Boost	BIT	1	zIIP boost was active at some point within the interval.
z_Speed_Boost	BIT	1	Speed boost was active at some point within the interval.
z_Boost_Class	BINT (ENUM)	3	

SMF079#15_Product.<fieldname>

zCYC	DEC	4 (7,0)	(IBM name: SMF79CYC) Sampling cycle length, in the form 000ttttF, where tttt is the milliseconds and F is the sign (taken from CYCLE option). The range of values is 0.050 to 9.999 seconds.
zMVS	CHAR	8	(IBM name: SMF79MVS) z/OS software level (consists of an acronym and the version, release, and modification level - ZVvrrmm).
zIML	INT	1	(IBM name: SMF79IML) Indicates the type of processor complex on which data measurements were taken. Value Meaning 3 9672, zSeries

SMF079#15_Product.zPRF.<fieldname>

zExpStg	BIT	1	The system has expanded storage
zESCA	BIT	1	The processor is enabled for ES connection architecture (ESCA)
zESCdir	BIT	1	There is an ES connection director in the configuration
zzArc	BIT	1	System is running in z/Architecture® mode
zZAAP	BIT	1	At least one zAAP is currently installed
zZIIP	BIT	1	At least one zIIP is currently installed
zDAT	BIT	1	Enhanced DAT facility

SMF079#15_Product.<fieldname>

zPTN	INT	1	(IBM name: SMF79PTN) PR/SM partition number of the partition that wrote this record.
zSRL	INT	1	(IBM name: SMF79SRL) SMF record level change number (X'8E' for subtype 1 records or X'8F' for subtype 2 records for z/OS V2R4 RMF with RMF Data Gatherer APAR OA59330). This field enables processing of SMF record level changes in an existing release.

zIET	HEX	8	(IBM name: SMF79IET) Interval expiration time token. This token can be used to identify other than RMF records that belong to the same interval (if interval was synchronized with SMF).
zLGO	TIME	8	(IBM name: SMF79LGO) Offset GMT to local time (STCK format).
zRAO	INT	4	(IBM name: SMF79RAO) Offset to reassembly area relative to start of RMF product section.
zRAL	INT	2	(IBM name: SMF79RAL) Length of reassembly area. Area consists of a fixed header and a variable number of information blocks. Length depends on the record type/SubType, but is fixed for a specific type/SubType.
zRAN	INT	2	(IBM name: SMF79RAN) Reassembly area indicator. Value Meaning 0 RECORD is not broken. 1 RECORD is broken. Note: This field is used to indicate whether an SMF record is a broken record. Therefore, offset (SMF70RAO) and length (SMF70RAL) are only valid if SMF70RAN = 1. A reassembly area is only present in broken records.
zOIL	INT	2	(IBM name: SMF79OIL) Original interval length as defined in the session or by SMF (in seconds).
zSYN	INT	2	(IBM name: SMF79SYN) SYNC value in seconds.
zGIE	TIME	8	(IBM name: SMF79GIE) Projected gathering interval end (STCK format) GMT time.
zXNM	CHAR	8	(IBM name: SMF79XNM) Sysplex name as defined in parmlib member COUPLExx.
zSNM	CHAR	8	(IBM name: SMF79SNM) System name for current system as defined in parmlib member IEASYSxx SYSNAME parameter. Reassembly Area:

SMF079#15_Product.Reassembly_Area.<fieldname>

zRBR	INT	2	(IBM name: SMF79RBR) Total number of broken records built from the original large record.
zRSQ	INT	2	(IBM name: SMF79RSQ) Sequence number of this broken record. Every broken record built from the same large record must have a unique sequence number, it is in the range from 1 TO SMF70RBR.
zRIO	INT	4	(IBM name: SMF79RIO) Offset to first reassembly information block relative to start of reassembly area header.
zRIL	INT	2	(IBM name: N/A) Length of reassembly information block.
zRIN	INT	2	(IBM name: SMF79RIN) Number of reassembly information blocks (same value as SMF70TRN in header section).

SMF079#15_Product.Reassembly_Area.Reassembly_Info.<fieldname>

zRNN	INT	2	(IBM name: SMF79RNN) Total number of sections in the original large record. This field contains information of how many sections of a specific type were contained in the original SMF record. This field is a copy of the number field of the triplet in the original (non broken) record.
zRPP	INT	2	(IBM name: SMF79RPP) Position of the first of one or more consecutive sections described by this block as in the original record. Values in the range of 1 TO SMF70RNN are valid for correct processing. A value of 0 WILL skip processing of this information block. This field provides information where the sections that are part of this broken record were placed in the original record before the split took place. The actual number of consecutive sections contained in this record is available from the actual triplet in the header extension.

Secondary segment: SMF079#15_IMS_Long_Lock

Field Name	Type	Len	Description
<i>SMF079#15_IMS_Long_Lock.<fieldname></i>			
zISTN	CHAR	16	(IBM name: R79FISTN) IRLM lock structure name.
zDLKC	INT	4	(IBM name: R79FDLKC) Dead lock cycle number.
zETYP	CHAR	1	(IBM name: R79FETYP) 'B'=Blocker / 'W'=Waiter.
zIMSI	CHAR	8	(IBM name: R79FIMSI) IMS subsystem ID.
zPSTN	CHAR	2	(IBM name: R79FPSTN) PST number.
zPSBN	CHAR	8	(IBM name: R79FPSBN) PSB name.
zRGTY	CHAR	1	(IBM name: R79FRGTY) Region type.
zRCVT	CHAR	16	(IBM name: R79FRCVT) Recovery token.
zCTID	CHAR	8	(IBM name: R79FCTID) CICS task ID (if CICS).
zLHTI	TIME	8	(IBM name: R79FLHTI) Scheduled elapsed time (TOD format).
zLHCN	INT	4	(IBM name: R79FLHCN) Max lock held.
zLKNA	CHAR	16	(IBM name: R79FLKNA) Lock name.
zTRNM	CHAR	8	(IBM name: R79FTRNM) Transaction name / Job name.
zRSNA	CHAR	8	(IBM name: R79FRSNA) Resource (DB/Area) name.

Record Type 80 - Security Product Processing

SMF Record 80 (Security Product Processing) is mapped by structure member "T080".
